
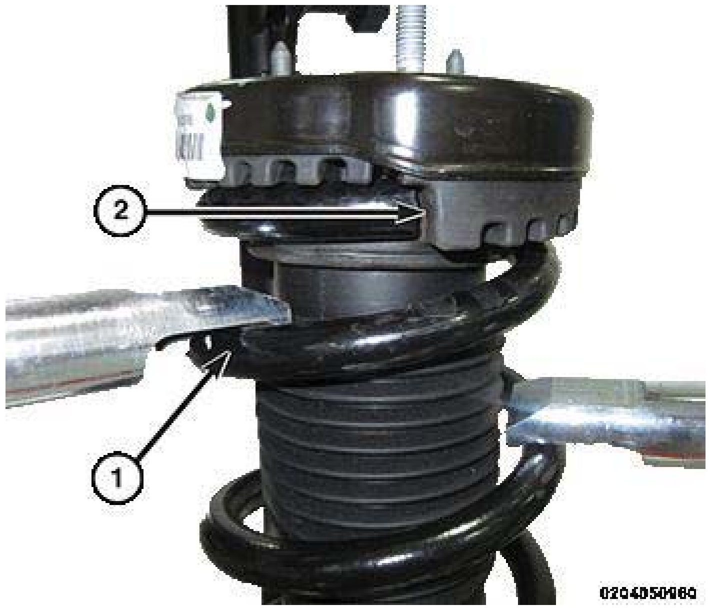

Fig. 53: Coil Spring & Upper Mount
Courtesy of CHRYSLER GROUP, LLC

4. If separated, install upper mount (1) onto coil spring (2). Match step in upper isolator to end of spring coil.

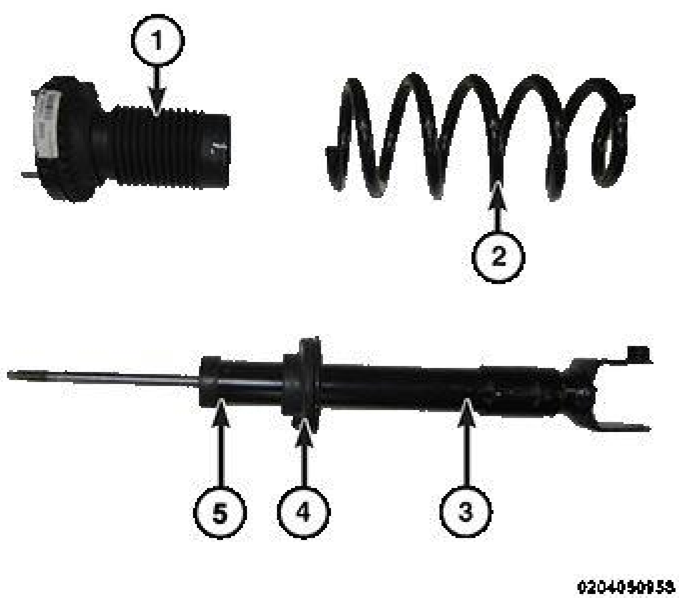

Fig. 54: Coil Spring Isolators, Coil Spring & Shock
Courtesy of CHRYSLER GROUP, LLC

5. Install lower spring isolator (4) on shock body (3).
6. Install jounce bumper on shock shaft, small end first.

Fig. 55: Matching Step Built Into Isolator To Lower Coil End
Courtesy of CHRYSLER GROUP, LLC

7. Install shock through bottom of coil spring until lower spring isolator (on shock) contacts lower end of coil spring. Match step built into isolator (1) to lower coil end.
8. Install clamp to hold shock and coil spring together.

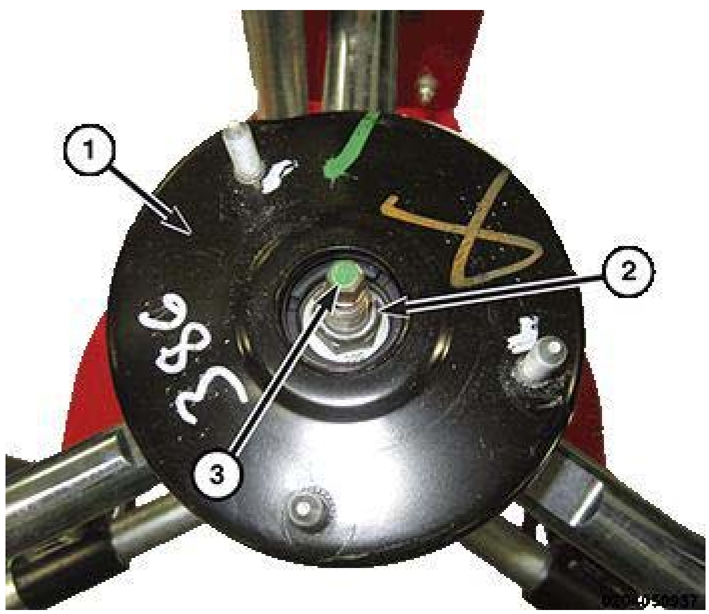

Fig. 56: Removing/Installing Shock Absorber Shaft Nut
Courtesy of CHRYSLER GROUP, LLC

9. Install the shock absorber shaft nut (2) on shock shaft (1). Tighten to the proper specification, while holding shock shaft from turning. Refer to FRONT, SPECIFICATIONS.
10. Slowly release tension from coil spring by backing off compressor drive fully. As tension is relieved,

make sure shock components are properly in place.

11. Remove clamp from lower end of coil spring and shock. Push back spring compressor upper and lower hooks, then remove shock assembly from spring compressor.
12. Install shock assembly on vehicle. Refer to **SHOCK ABSORBER, SUSPENSION, COIL-OVER, INSTALLATION**.

INSTALLATION

NON SRT

NOTE: Installation process is the same for both sides of the vehicle.

1. Place the strut assembly into front suspension using reverse direction in which it was removed.
2. Install the upper ball joint into the knuckle. Refer to **ARM, UPPER CONTROL, INSTALLATION**.

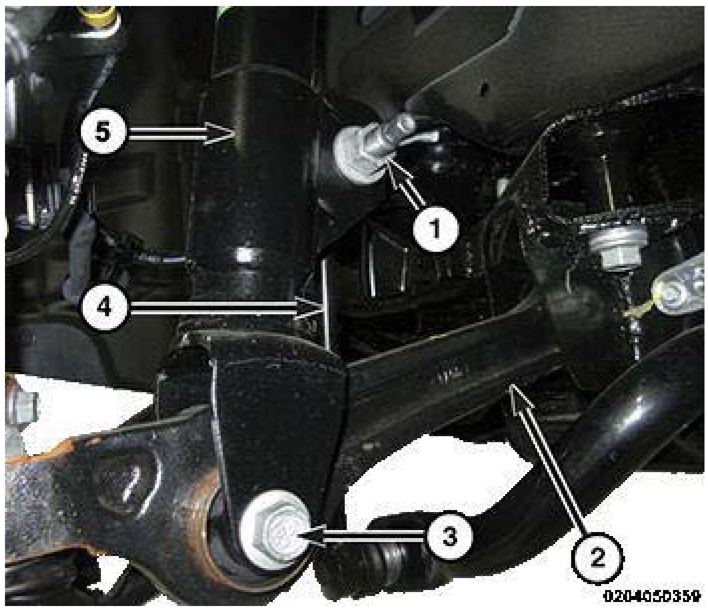

Fig. 57: Stabilizer Link To Strut Nut, Lower Control Arm, Lower Control Arm Bolt, Stabilizer Link & Shock/Strut Assembly
Courtesy of CHRYSLER GROUP, LLC

3. Install the strut to lower control arm bolt (3). **Do not tighten bolt at this time.**
4. Install the stabilizer link (4) into shock assembly from front. Install the stabilizer link to strut nut (1). Tighten by holding the stabilizer link stud while turning nut, tighten to the proper specification. Refer to **FRONT, SPECIFICATIONS**.
5. Install the tire and wheel assembly. Refer to **INSTALLATION** .
6. Remove the support and lower the vehicle.

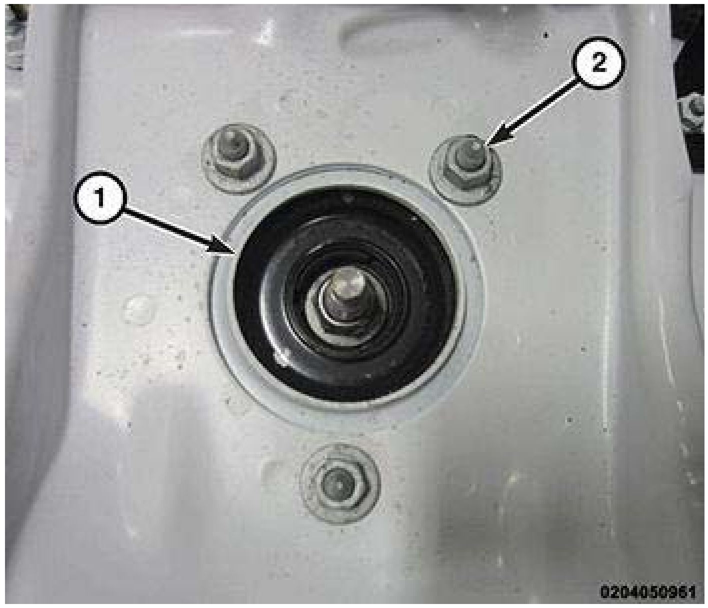

Fig. 58: Shock Tower & Nut
Courtesy of CHRYSLER GROUP, LLC

7. Install the three strut mount to body nuts (2), and tighten to the proper specification. Refer to **FRONT, SPECIFICATIONS**.
8. If equipped, align shock tower cap with shock mounting nuts and snap into place.

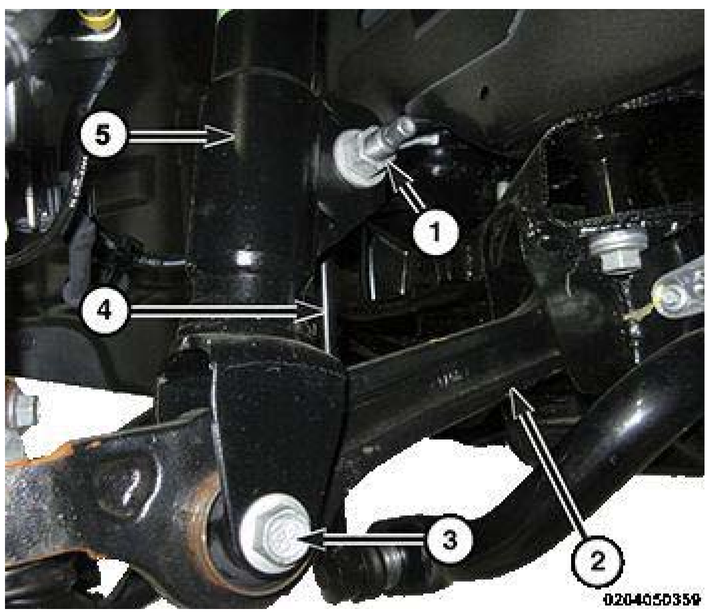

Fig. 59: Stabilizer Link To Strut Nut, Lower Control Arm, Lower Control Arm Bolt, Stabilizer Link & Shock/Strut Assembly
Courtesy of CHRYSLER GROUP, LLC

9. Tighten the strut to lower control arm bolt (3) to the proper specification. Refer to **FRONT, SPECIFICATIONS**.

SRT

NOTE: **Installation process is the same for both sides of the vehicle.**

1. Place shock assembly into front suspension using reverse direction in which it was removed.
2. Install the upper ball joint into the knuckle. Refer to **ARM, UPPER CONTROL, INSTALLATION**.

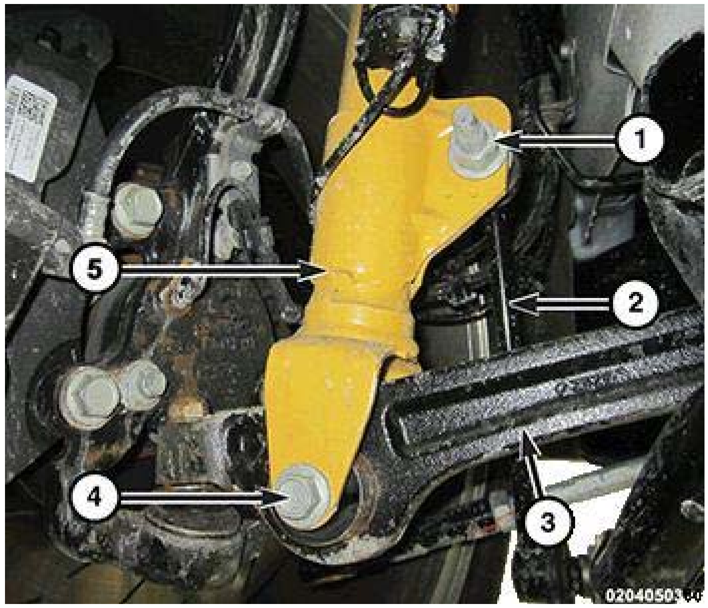

Fig. 60: Stabilizer Link To Strut Nut, Stabilizer Link, Lower Control Arm, Lower Control Arm Bolt & Shock/Strut Assembly
Courtesy of CHRYSLER GROUP, LLC

3. Install the strut to lower control arm bolt (4). **Do not tighten bolt at this time.**
4. Install the stabilizer link (2) into shock assembly from front. Install the stabilizer link to strut nut (1). Tighten by holding the stabilizer link stud while turning nut, tighten to the proper specification. Refer to **FRONT, SPECIFICATIONS**.

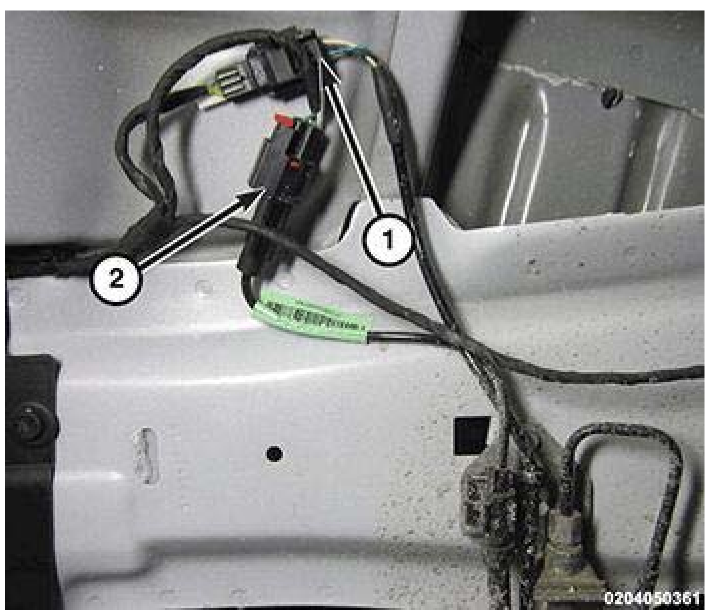

Fig. 61: Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

5. Connect the Active Damping System (ADS) shock wiring harness connector (1).

6. Install the splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** .
7. Install the tire and wheel assembly. Refer to **INSTALLATION** .
8. Remove the support and lower the vehicle.

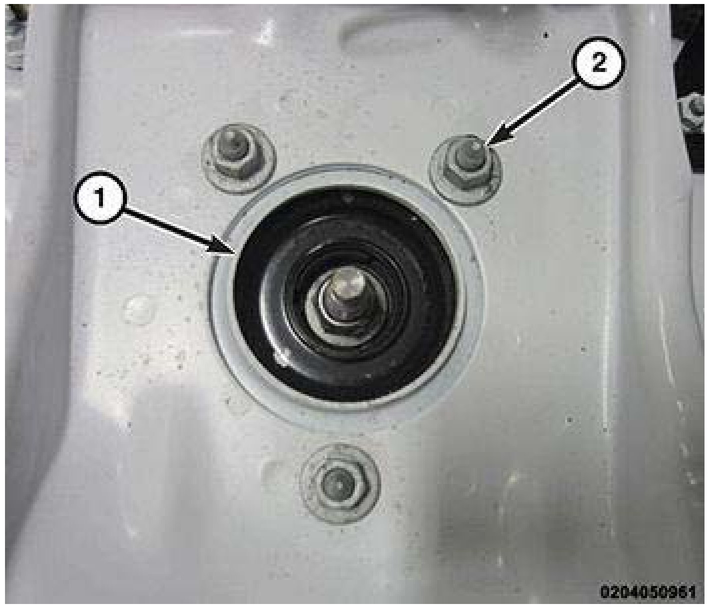

Fig. 62: Shock Tower & Nut
Courtesy of CHRYSLER GROUP, LLC

9. Install the three strut mount to body nuts (2), and tighten to the proper specification. Refer to **FRONT, SPECIFICATIONS**.
10. If equipped, align shock tower cap with shock mounting nuts and snap into place.
11. If right front strut was removed, install the supercharger coolant recovery container. Refer to **RESERVOIR, COOLANT, INSTALLATION** .

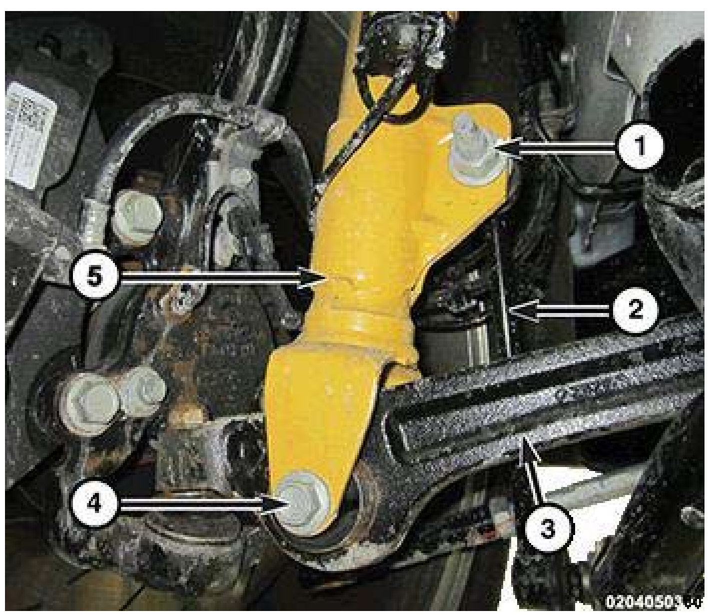

Fig. 63: Stabilizer Link To Strut Nut, Stabilizer Link, Lower Control Arm, Lower Control Arm Bolt & Shock/Strut Assembly
Courtesy of CHRYSLER GROUP, LLC

12. Tighten the strut to lower control arm bolt (4) to the proper specification. Refer to **FRONT, SPECIFICATIONS**.

STABILIZER BAR, FRONT

REMOVAL

REMOVAL

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove belly pan. Refer to **BELLY PAN, REMOVAL** and **BELLY PAN, ENGINE, REMOVAL** .

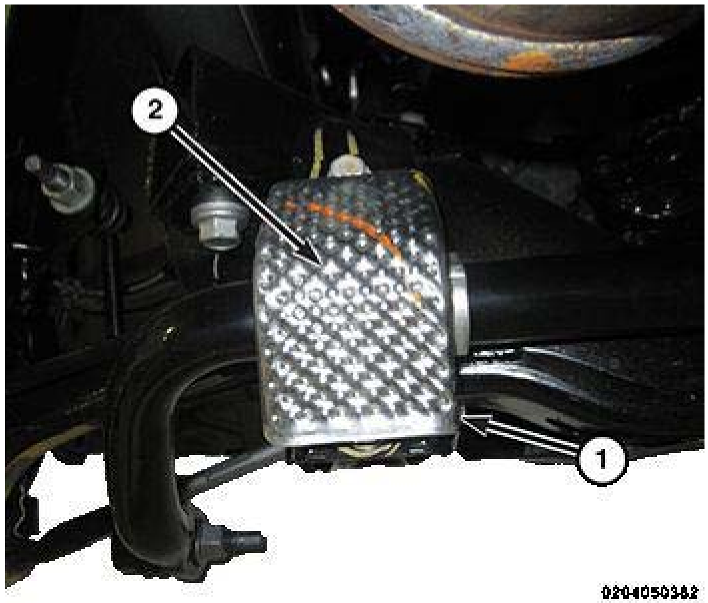

Fig. 64: Stabilizer Bar Heat Shield & Bolt
Courtesy of CHRYSLER GROUP, LLC

3. On each side of vehicle, remove the stabilizer bar heat shield to crossmember bolts (1). Remove heat shield (2).

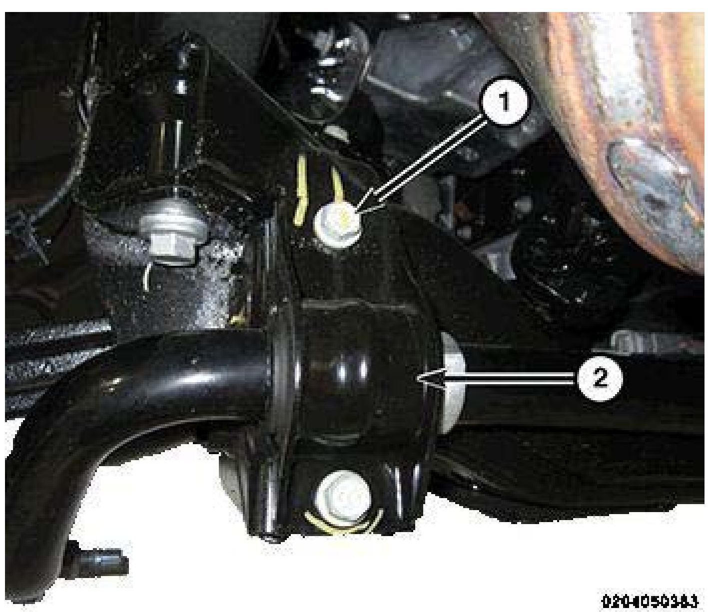

Fig. 65: Stabilizer Bar To Crossmember Bolts
Courtesy of CHRYSLER GROUP, LLC

4. On each side of vehicle, remove the stabilizer bar to crossmember bolts (1).

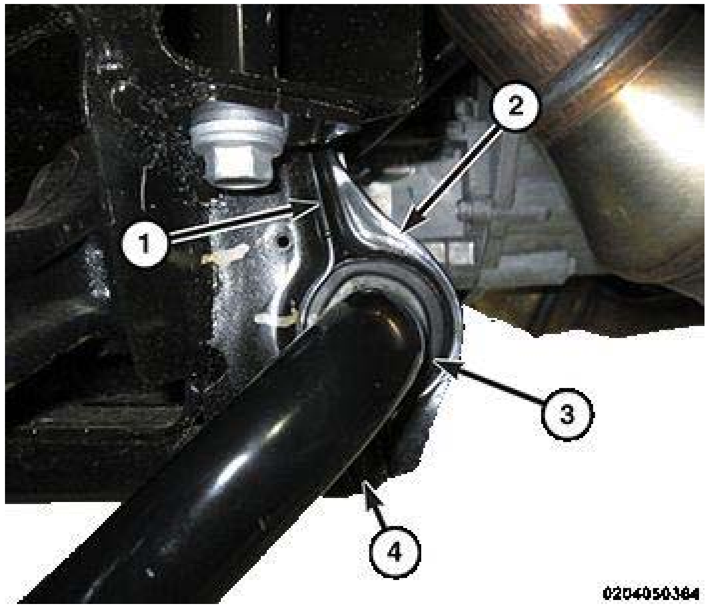

Fig. 66: Stabilizer Bar Isolator & Retainer Halves
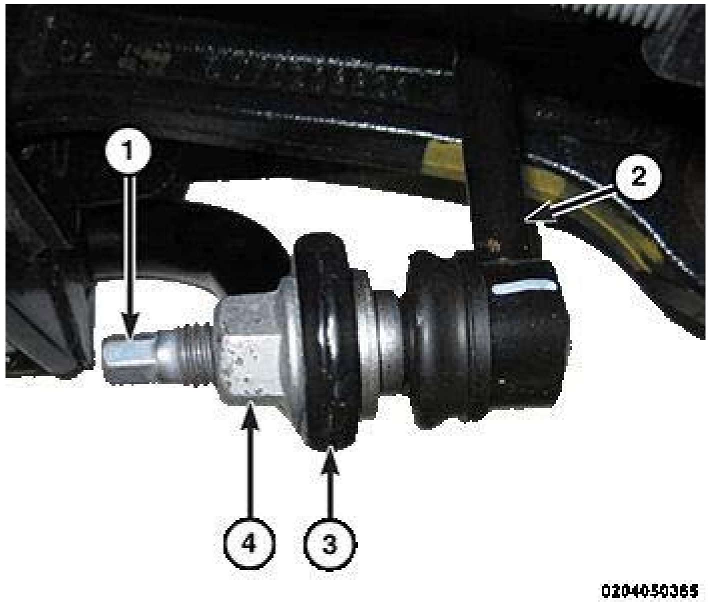
Courtesy of CHRYSLER GROUP, LLC

5. On each side of vehicle, remove retainer halves (1, 2) from around stabilizer bar isolator (3).

Fig. 67: Stabilizer Bar & Isolator
Courtesy of CHRYSLER GROUP, LLC

6. Utilizing slit, remove each isolator (2) from stabilizer bar (1).

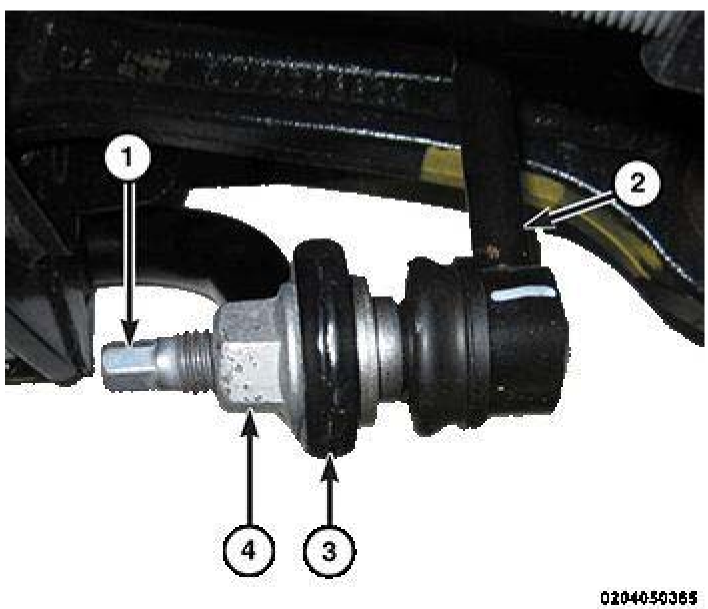


[Fig. 68: Ball Joint Stem, Stabilizer Link, Stabilizer Bar & Stabilizer Link to Stabilizer Bar Nut]
Courtesy of CHRYSLER GROUP, LLC

7. On each side of vehicle, remove the stabilizer link to stabilizer bar nut (4). Slide link ball joint stem (1) from bar (3), then remove bar from vehicle.

INSTALLATION

INSTALLATION



[Fig. 69: Ball Joint Stem, Stabilizer Link, Stabilizer Bar & Stabilizer Link to Stabilizer Bar Nut]
Courtesy of CHRYSLER GROUP, LLC

NOTE: **When attaching stabilizer link to stabilizer bar, make sure link ball joint stem is pointed inboard toward engine cradle.**

1. On each side of vehicle, raise stabilizer bar (3) to stabilizer link (2) and slide the stabilizer link stud (1)

through mounting hole in bar. Loosely install nut (4) at this time.

Fig. 70: Stabilizer Bar & Isolator
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Because of stabilizer isolator outer shape, it is very important to install isolators in position discussed in following step.

2. Utilizing slit in isolator, install each stabilizer bar isolator (2) on bar resting against locating collar (1) as shown in illustration. Make sure slit in isolator is positioned toward rear of vehicle.

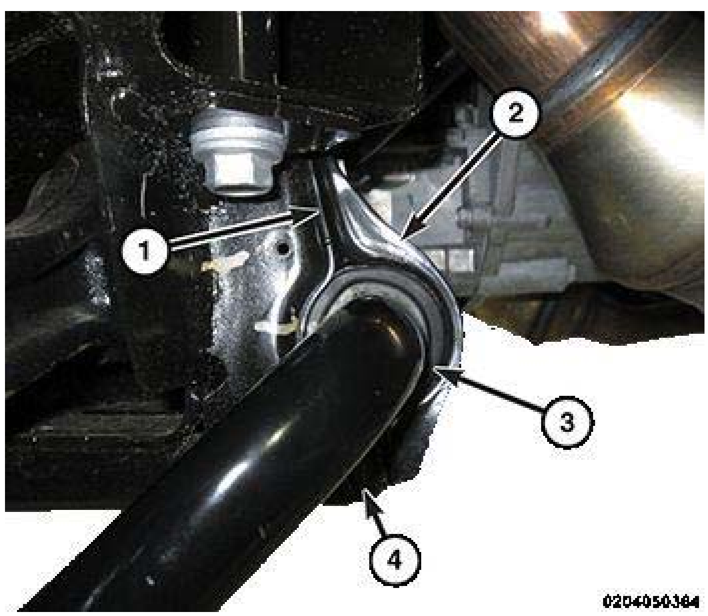


Fig. 71: Stabilizer Bar Isolator & Retainer Halves
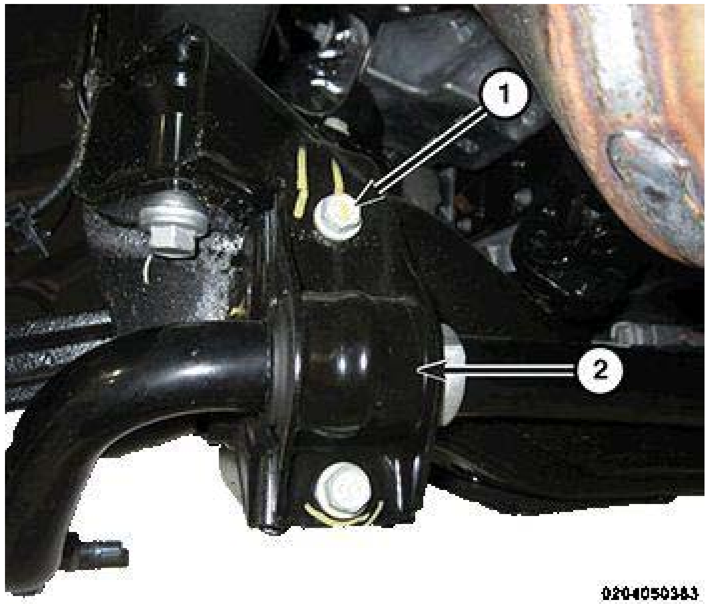
Courtesy of CHRYSLER GROUP, LLC

3. On each side of vehicle, install stabilizer bar isolator retainer halves (1, 2) around isolator (3).



[**Fig. 72: Stabilizer Bar To Crossmember Bolts**](#)
Courtesy of CHRYSLER GROUP, LLC

4. On each side of vehicle, install the stabilizer bar to crossmember bolts (2). Tighten bolts to the proper specification. Refer to **FRONT, SPECIFICATIONS**.

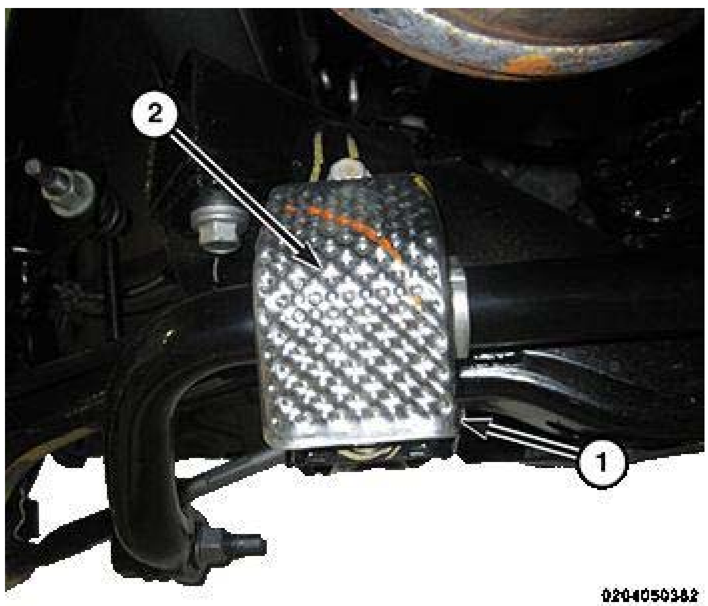


Fig. 73: Stabilizer Bar Heat Shield & Bolt
Courtesy of CHRYSLER GROUP, LLC

5. On each side of vehicle, install the stabilizer bar heat shield (2). Install the stabilizer bar heat shield to crossmember bolts (1), and tighten to the proper specification. Refer to **FRONT, SPECIFICATIONS**.

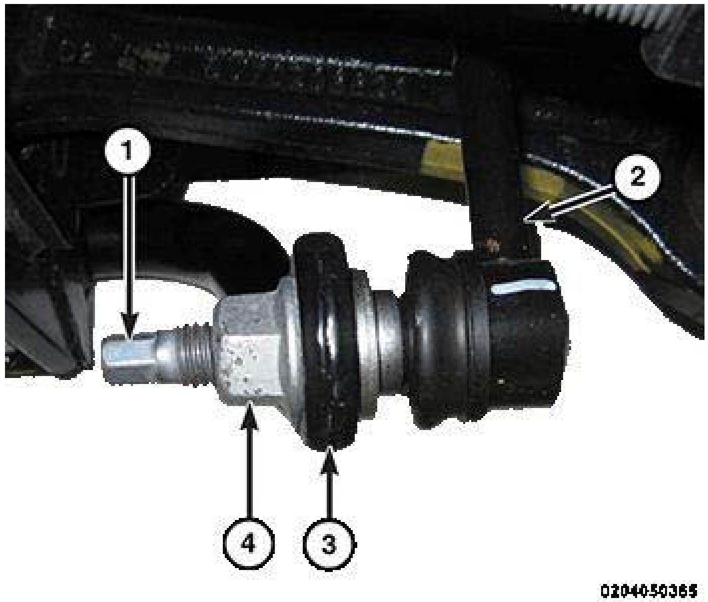

Fig. 74: Ball Joint Stem, Stabilizer Link, Stabilizer Bar & Stabilizer Link to Stabilizer Bar Nut
Courtesy of CHRYSLER GROUP, LLC

6. While holding the stabilizer link stud from rotating (1), tighten stabilizer link to stabilizer bar nut (4) to the proper specification. Refer to **FRONT, SPECIFICATIONS**.
7. Install belly pan. Refer to **BELLY PAN, INSTALLATION** and **BELLY PAN, ENGINE, INSTALLATION** .
8. Remove the support and lower the vehicle.

LINK, STABILIZER BAR

REMOVAL

REMOVAL

NOTE: **Removal process is the same for both sides of the vehicle.**

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

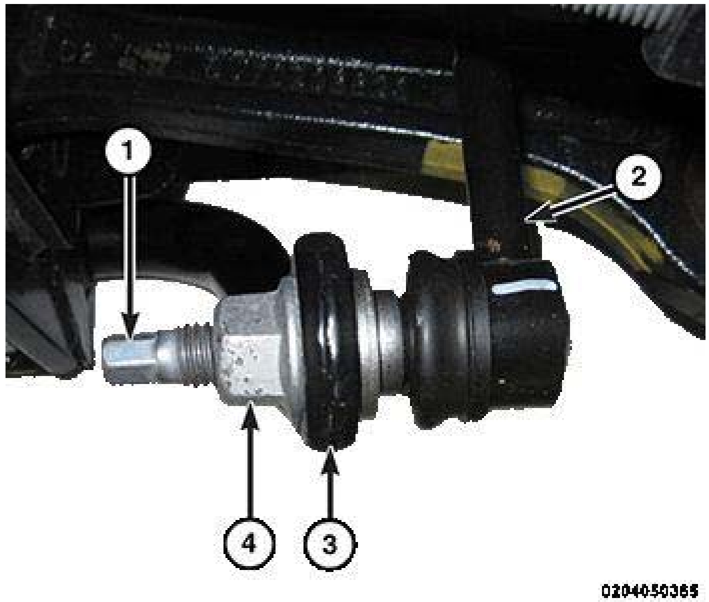

Fig. 75: Ball Joint Stem, Stabilizer Link, Stabilizer Bar & Stabilizer Link to Stabilizer Bar Nut
Courtesy of CHRYSLER GROUP, LLC

2. Remove the stabilizer link to stabilizer bar nut (4).

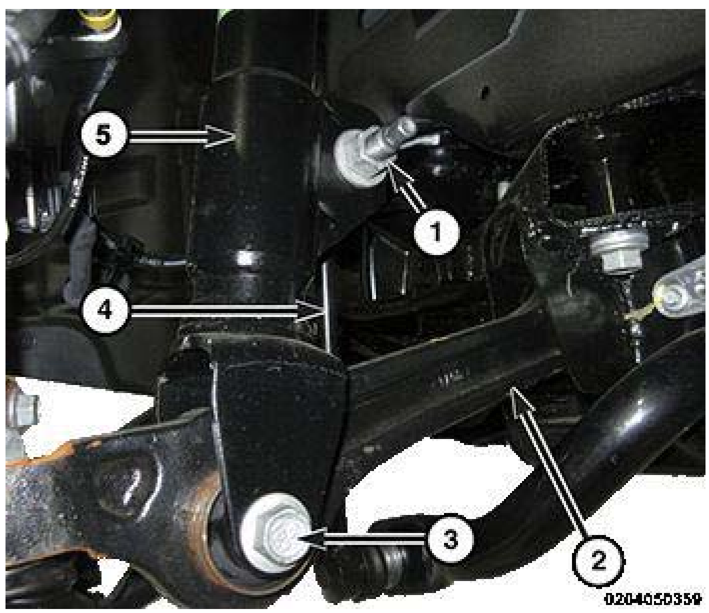

Fig. 76: Stabilizer Link To Strut Nut, Lower Control Arm, Lower Control Arm Bolt, Stabilizer Link & Shock/Strut Assembly
Courtesy of CHRYSLER GROUP, LLC

3. Remove the stabilizer link to strut nut (1).
4. Remove stabilizer link (4).

INSTALLATION

INSTALLATION

NOTE: **Installation process is the same for both sides of the vehicle.**

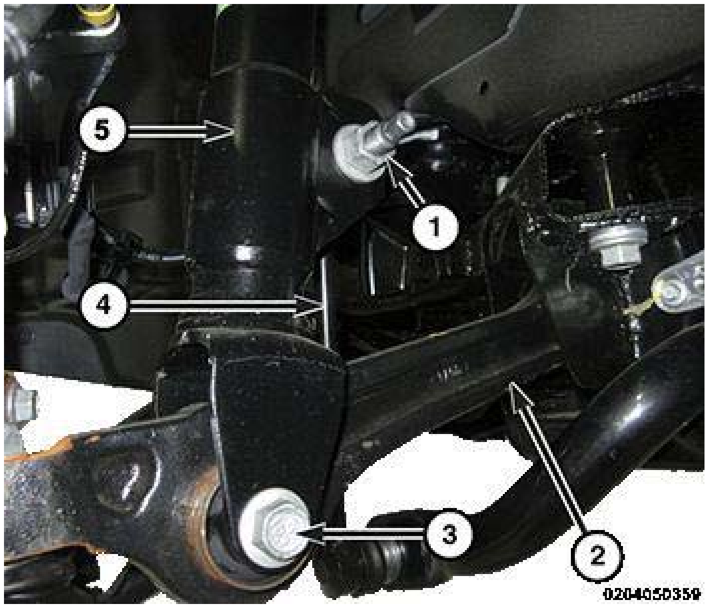

Fig. 77: Stabilizer Link To Strut Nut, Lower Control Arm, Lower Control Arm Bolt, Stabilizer Link & Shock/Strut Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Position stabilizer link (4) into position.
2. Install the stabilizer link to strut nut (1), and tighten to the proper specification. Refer to FRONT, SPECIFICATIONS.

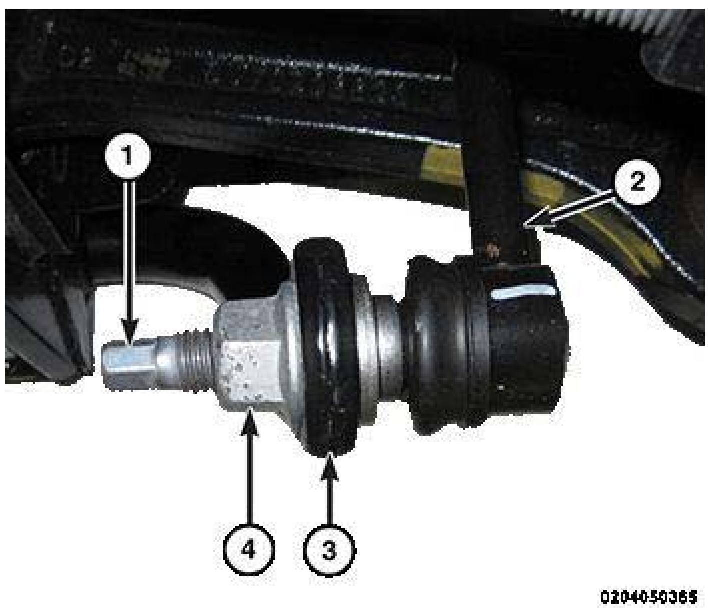

Fig. 78: Ball Joint Stem, Stabilizer Link, Stabilizer Bar & Stabilizer Link to Stabilizer Bar Nut
Courtesy of CHRYSLER GROUP, LLC

3. Install the stabilizer link to stabilizer bar nut (4), and tighten to the proper specification. Refer to FRONT, SPECIFICATIONS.
4. Remove the support and lower the vehicle.

STRUT, TENSION

REMOVAL

REMOVAL

NOTE: **Removal process is the same for both sides of the vehicle.**

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the tire and wheel assembly. Refer to **REMOVAL** .
3. Remove belly pan. Refer to **BELLY PAN, REMOVAL** and **BELLY PAN, ENGINE, REMOVAL** .

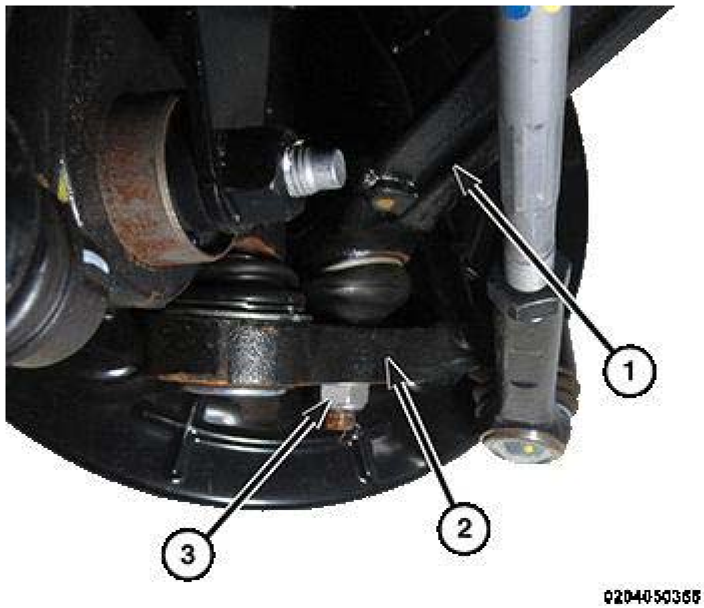

Fig. 79: Knuckle & Tension Strut To Knuckle Nut
Courtesy of CHRYSLER GROUP, LLC

4. Loosen tension strut to knuckle nut (3). Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

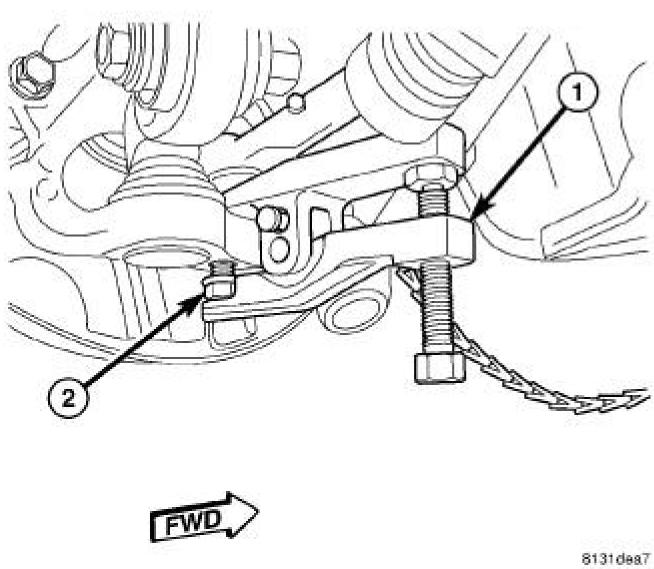

Fig. 80: Using Puller On Ball Joint

Courtesy of CHRYSLER GROUP, LLC

CAUTION: In following step, use care not to damage ball joint seal boot while sliding into place past seal boot.

5. Using Ball Joint Remover (special tool #9360, Remover, Ball Joint) (1) separate tension strut ball joint stud (2) from knuckle.

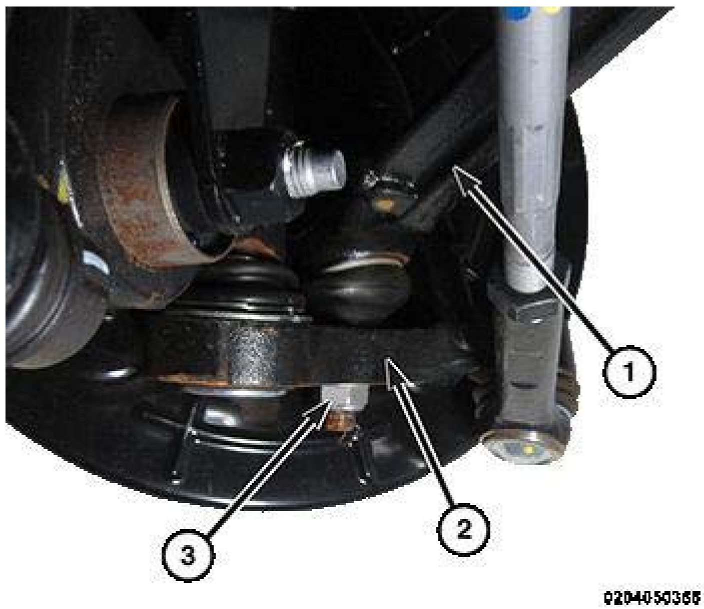

Fig. 81: Knuckle & Tension Strut To Knuckle Nut
Courtesy of CHRYSLER GROUP, LLC

6. Remove the tension strut to knuckle nut (3).
7. Rotate the knuckle (2) outward and push ball joint upward, out of knuckle.

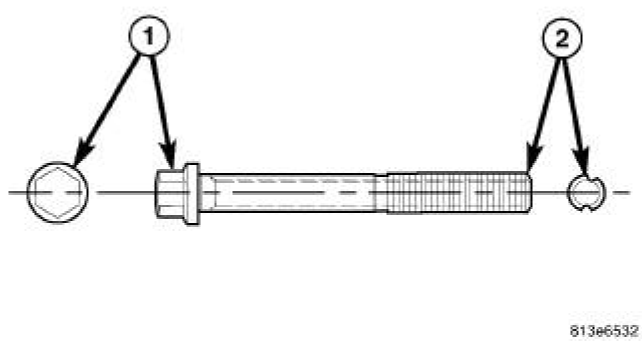

Fig. 82: Wheel Alignment Adjustment Bolt
Courtesy of CHRYSLER GROUP, LLC

CAUTION: If the tension strut bolt at the engine cradle has a lengthwise grooved shaft (2), it is a special wheel alignment adjustment bolt and the bolt head (1) must not be rotated in the vehicle or damage to the bolt and engine cradle will result. While holding the bolt in place with a wrench, remove the nut, then slide the bolt out of the bushing and cradle taking note of bolt

positioning in engine cradle for reassembly purposes. The bolt needs to be installed in the same position as removed to make sure wheel camber and caster return to adjusted position.**

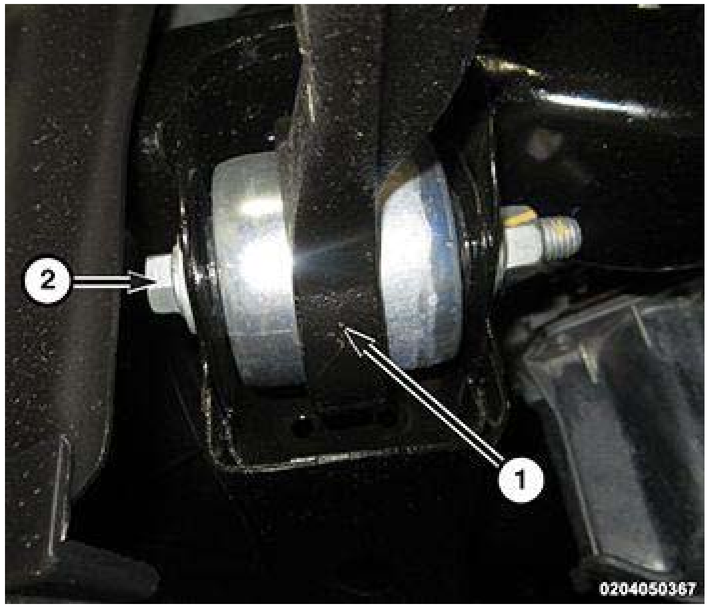

Fig. 83: Tension Strut & Tension Strut To Cradle Bolt And Nut
Courtesy of CHRYSLER GROUP, LLC

8. Remove the tension strut to cradle bolt and nut (2).
9. Slide tension strut (1) out of the cradle and remove from vehicle.

INSTALLATION

INSTALLATION

NOTE: **Installation process is the same for both sides of the vehicle.**

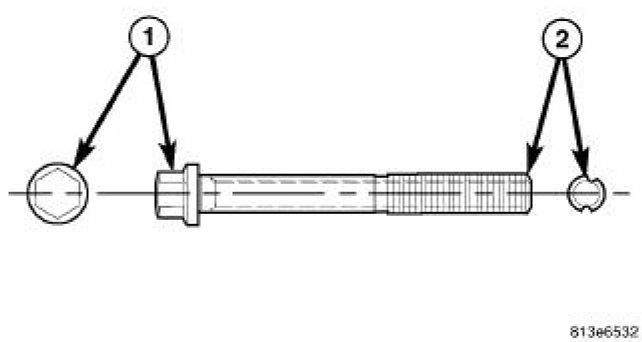

Fig. 84: Wheel Alignment Adjustment Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: **If installing a tension strut engine cradle bolt that is a wheel alignment adjustment bolt (lengthwise grooved shaft (2), make sure to install it in the same position which it was in upon removal. For more details on installation of**

this special bolt, refer to WHEEL ALIGNMENT, STANDARD PROCEDURE.

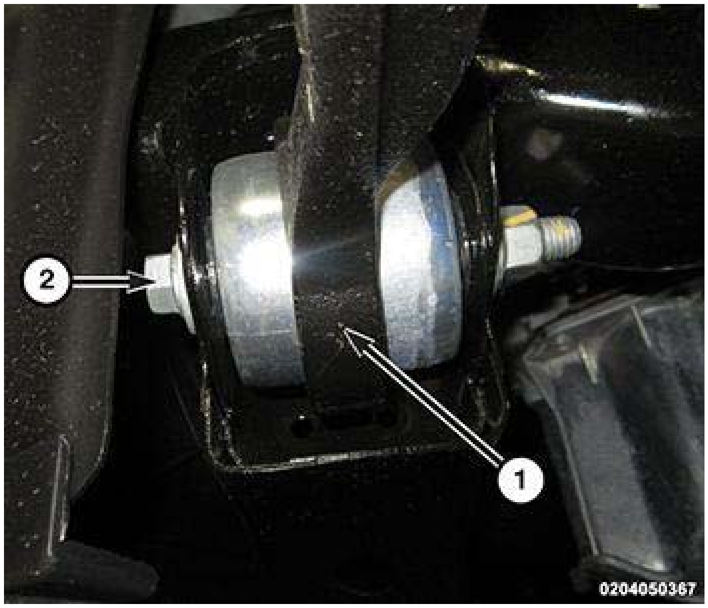

Fig. 85: Tension Strut & Tension Strut To Cradle Bolt And Nut
Courtesy of CHRYSLER GROUP, LLC

1. Position tension strut (1) into the cradle.
2. Install the tension strut to cradle bolt and nut (2), but **do not tighten at this time** .

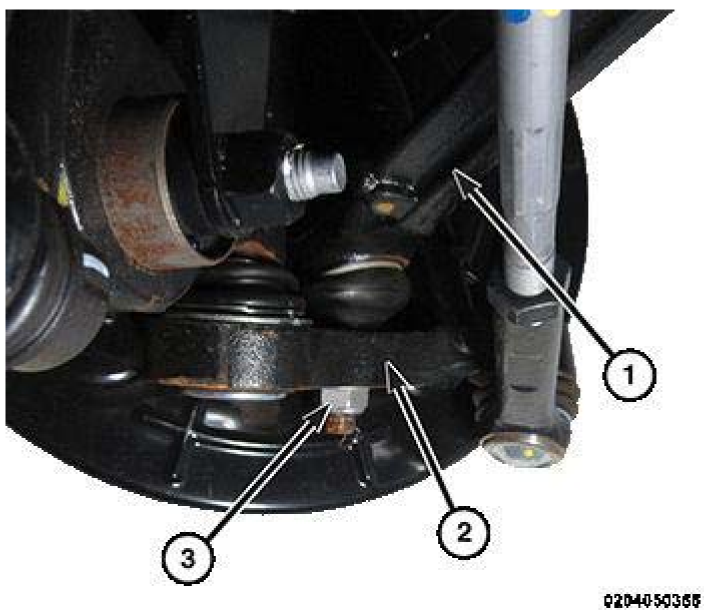

Fig. 86: Knuckle & Tension Strut To Knuckle Nut
Courtesy of CHRYSLER GROUP, LLC

3. Install the tension strut ball joint stud downward, into the knuckle (2).
4. Install a **NEW** tension strut to knuckle nut (3). Tighten tension strut to knuckle nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten to the proper specification. Refer to **FRONT, SPECIFICATIONS**.
5. Install the tire and wheel assembly. Refer to **INSTALLATION** .

6. Remove the support and lower the vehicle.
7. Position vehicle on an alignment rack/drive-on lift.

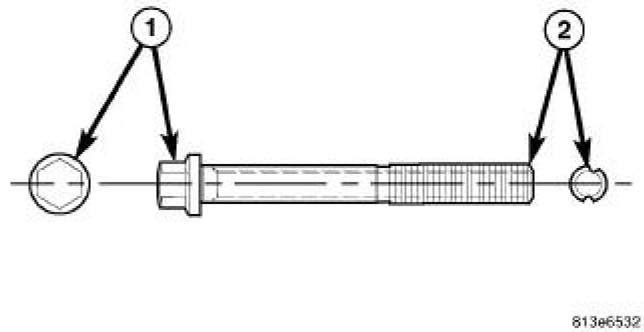

Fig. 87: Wheel Alignment Adjustment Bolt
Courtesy of CHRYSLER GROUP, LLC

8. Perform front toe adjustment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.

CAUTION: If the tension strut engine cradle bolt is a wheel alignment adjustment bolt (lengthwise grooved shaft (2)), be sure to only tighten the nut. Do not rotate the bolt head (1) or damage to the bushing will occur.

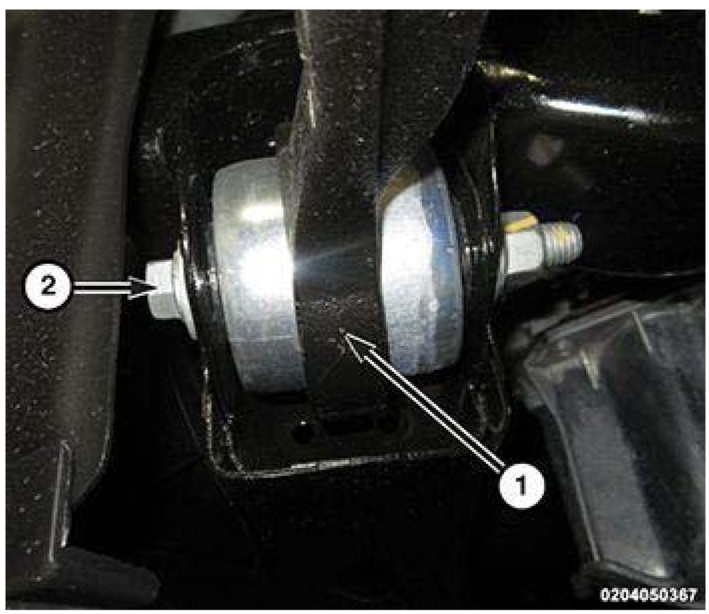

Fig. 88: Tension Strut & Tension Strut To Cradle Bolt And Nut
Courtesy of CHRYSLER GROUP, LLC

9. Once front toe is found to be within specifications, tighten tension strut to cradle bolt and nut (2) to the proper specification. Refer to **FRONT, SPECIFICATIONS**.
10. Install belly pan. Refer to **BELLY PAN, INSTALLATION** and **BELLY PAN, ENGINE, INSTALLATION** .

WHEEL ALIGNMENT

DIAGNOSIS AND TESTING

SUSPENSION AND STEERING

CONDITION	POSSIBLE CAUSES	CORRECTION
Front End Whine On Turns	1. Defective wheel bearing	1. Replace wheel bearing.
	2. Incorrect wheel alignment	2. Check and reset wheel alignment.
	3. Worn tires	3. Replace tires.
Front End Growl Or Grinding On Turns	1. Defective wheel bearing	1. Replace wheel bearing.
	2. Engine mount grounding	2. Check for motor mount hitting frame rail and reposition engine as required.
	3. Loose wheel lug nuts	3. Verify wheel lug nut torque.
	4. Incorrect wheel alignment	4. Check and reset wheel alignment.
	5. Worn tires	5. Replace tires.
Front End Clunk Or Snap On Turns	1. Loose lug nuts	1. Tighten wheel lug nuts to specifications.
	2. Worn or loose tie rod	2. Tighten or replace tie rod end.
	3. Worn or loose ball joint	3. Tighten or replace ball joint.
	4. Worn/loose control arm bushing	4. Replace control arm or bushing.
	5. Loose control arm fasteners	5. Tighten control arm fasteners to specified torque.
	6. Loose stabilizer bar	6. Tighten stabilizer bar fasteners to specified torque.
	7. Loose crossmember bolts	7. Tighten crossmember bolts to specified torque.
Front End Whine With Vehicle Going Straight At A Constant Speed	1. Defective wheel bearing	1. Replace hub and bearing assembly.
	2. Incorrect wheel alignment	2. Check and reset wheel alignment.
	3. Worn tires	3. Replace tires.
Front End Growl Or Grinding With Vehicle Going Straight At A Constant Speed	1. Engine mount grounding	1. Reposition engine/mount as required.
Front End Clunk When Accelerating Or Decelerating	1. Worn or broken engine mount	1. Replace engine mount.
	2. Loose lug nuts	2. Tighten wheel lug nuts to specified torque.
	3. Worn or loose ball joint	3. Replace ball joint/control arm.
	4. Worn or loose control arm bushing	4. Replace control arm or bushing.
	5. Loose control arm fasteners	5. Tighten fasteners to specified torque.
	6. Loose crossmember bolts	6. Tighten crossmember bolts to specified torque.
	7. Worn tie rod end	7. Replace tie rod end.

CONDITION	POSSIBLE CAUSES	CORRECTION
Road Wander	1. Incorrect tire pressure	1. Inflate tires to recommended pressure.
	2. Incorrect front or rear wheel toe	2. Check and reset wheel toe.
	3. Worn wheel bearing	3. Replace hub and bearing.
	4. Worn control arm bushings	4. Replace control arm or bushing.
	5. Excessive friction in steering gear	5. Replace steering gear.
	6. Excessive friction in steering shaft coupling	6. Replace steering intermediate shaft/coupler.
Lateral Pull	1. Unequal tire pressure	1. Inflate all tires to recommended pressure.
	2. Radial tire lead	2. Perform lead correction procedure.
	3. Incorrect front wheel camber	3. Check and reset front wheel camber.
	4. Power steering gear imbalance	4. Replace power steering gear.
	5. Wheel braking	5. Correct braking condition causing lateral pull.
Excessive Steering Free Play	1. Incorrect steering gear adjustment	1. Replace steering gear.
	2. Worn or loose tie rod ends	2. Replace tie rod ends.
	3. Loose steering gear mounting bolts	3. Tighten steering gear mounting bolts to specified torque.
	4. Loose or worn steering shaft coupler	4. Replace steering intermediate shaft/coupler.
Excessive Steering Effort	1. Low tire pressure	1. Inflate all tires to recommended pressure.
	2. Lack of lubricant in steering gear	2. Replace steering gear.
	3. Low power steering fluid level	3. Fill power steering fluid reservoir to correct level. Bleed as necessary.
	4. Loose drive belt	4. Replace adjuster or drive belt.
	5. Lack of lubricant in ball joints	5. Replace ball joints.
	6. Steering gear malfunction	6. Replace steering gear.
	7. Lack of lubricant in steering shaft coupler	7. Replace steering intermediate shaft/coupler.

VEHICLE LEAD/PULL

To assure correct diagnosis, it is important to follow the steps outlined below in the order shown. Road test the vehicle before and after each step to verify that the lead condition has been corrected. When evaluating a vehicle, always drive the same road in both directions to get a feel for the effect of road crown and cross wind. A neutral vehicle will exhibit a small amount of drift on both right and left crowned roads (normal crown sensitivity). A vehicle with pronounced lead/pull may have one or more of the following conditions:

1. UNEQUAL TIRE PRESSURE. Adjust tire pressure to the pressure stated on door placard. Make sure the tire pressure is equal on all four tires and evaluate the car. Also verify that the tire size and type are

correct and match each other. If the car still has a lead condition go to step 2.

2. TIRE CONICITY. Excessive tire conicity is one of the more frequent causes of vehicle lead. Cross-switch the front tires and evaluate the car. If the car still leads in the same direction or gets worse, return the front tires to their original position, then go to step 3.
3. SUSPENSION ALIGNMENT. Check and record the wheel alignment settings. Non-symmetrical front caster or camber can sometimes cause a lead condition or can be used to fix a lead condition. Adjust the wheel alignment as necessary to preferred settings. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**. If the car still leads, go to step 4.
4. STEERING GEAR VALVE IMBALANCE. Steering gear valve imbalance can sometimes cause a vehicle lead. Although there is no quick test or measurement that can be performed to verify a good or bad steering gear valve, generally the steering efforts will feel much lighter in the lead direction and heavier in the opposite direction with an unbalanced valve. Replace the steering gear only as a "last resort" to solve the problem. To replace the steering gear, refer to **GEAR, REMOVAL** .

STANDARD PROCEDURE

WHEEL ALIGNMENT

PRE-WHEEL ALIGNMENT INSPECTION

Before any attempt is made to change or correct the wheel alignment, the following inspection and necessary corrections must be made to ensure proper alignment.

1. Verify that the fuel tank is full of fuel. If the tank is not full, the reduction in weight will affect the curb height of the vehicle and the alignment angles.
2. The vehicle's passenger and luggage compartments should be free of any load that is not factory equipment.
3. Check the tires on the vehicle. All tires must be the same size and in good condition with approximately the same amount of tread wear. Inflate all the tires to the recommended air pressure.
4. Check the wheel and tire assemblies for excessive radial runout.
5. Inspect lower ball joints and all steering linkage for looseness, binding, wear or damage. Repair as necessary.
6. Check suspension fasteners for proper torque and tighten as necessary. Refer to **FRONT, SPECIFICATIONS**.
7. Inspect all suspension component rubber bushings for signs of wear or deterioration. Replace any faulty bushings or components before aligning the vehicle.
8. Check the vehicle's curb height to verify it is within specifications. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.

WHEEL ALIGNMENT SETUP

NOTE: **Confirm the wheel alignment equipment is calibrated to the manufacturers requirements prior to attempting any wheel alignment.**

1. Position the vehicle on an alignment rack.
2. Install all required alignment equipment on the vehicle per the alignment equipment manufacturer's instructions. On this vehicle, a four-wheel alignment is recommended.

NOTE: **Prior to reading the vehicle's alignment readouts, the front and rear of vehicle should be jounced (suspension compressed/released). Induce jounce (rear first, then front) by grasping the center of the bumper and jouncing each end of vehicle an equal number of times. The bumper should always be released when vehicle is at the bottom of the jounce cycle.**

3. Read the vehicle's current front and rear alignment settings. Compare the vehicle's current alignment settings to the vehicle specifications for camber, caster and toe. Refer to **WHEEL ALIGNMENT, SPECIFICATIONS**.
4. If front camber and caster are not within specifications, proceed to **CAMBER AND CASTER**. If caster and camber are within specifications, proceed to **TOE**. Rear camber can be adjusted. Refer to **CAMBER AND CASTER**. Rear caster is not adjustable. If found not to be within specifications, reinspect for damaged suspension or body components and replace as necessary. If rear toe is not within specifications, adjust rear toe before proceeding to adjust front toe.

CAMBER AND CASTER

Camber and caster settings on this vehicle are determined at the time the vehicle is designed, by the location of the vehicle's suspension components. This is referred to as NET BUILD. The result is no required adjustment of camber and caster after the vehicle is built or when servicing the suspension components. Thus, when performing a wheel alignment, caster and camber are not normally considered adjustable angles. Camber and caster should be checked to ensure they meet vehicle specifications.

CAUTION: **Do not attempt to adjust a vehicles wheel alignment by heating, bending or by performing any other modification to the vehicle's suspension components or body.**

If individual front camber or caster is found not to meet alignment specifications, each can be adjusted by shifting the engine cradle if cross-camber and cross-caster are within specifications, or by using an available service adjustment bolt package. Always try to shift the cradle first **(if camber and caster are off slightly)** to correct the misalignment before installing an adjustment bolt package. If an adjustment bolt package installation is necessary, inspect the suspension components for any signs of damage or bending first. Refer to the following procedures for adjustments.

If individual rear camber is found not to meet alignment specifications, repair camber links are available in Plus or Minus One Millimeter (1 mm) lengths. A Plus or Minus 1 mm repair camber link will change camber approximately 0.5-0.7 degrees in the preferred direction. Before installing non-standard length camber links on a vehicle found to be outside the specifications, inspect the suspension components for any signs of damage or bending. To install either repair camber link. Refer to **LINK, CAMBER, INSTALLATION** .

ADJUSTMENT BY SHIFTING CRADLE

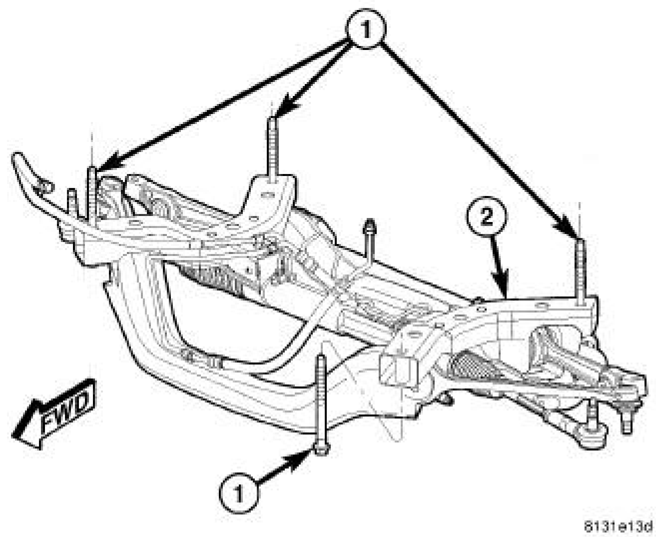

Fig. 89: Engine Cradle Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Always use care when shifting cradle to avoid damaging other components on the vehicle.

1. Loosen the four bolts (1) fastening the engine cradle (2) to the frame just enough to allow movement of the cradle.
2. Shift cradle as necessary to bring camber or caster into specifications. When shifting cradle, use care not to move other angles (camber or caster) that are within specifications, out of specifications.
3. Tighten the four bolts (1) fastening the engine cradle (2) to the frame to the proper specification. Refer to **SPECIFICATIONS** .
4. Jounce the rear, then front of the vehicle an equal amount of times.
5. Measure camber and caster. If camber and caster are within specifications, proceed to **TOE**. If camber or caster cannot be brought into specifications, perform the **ADJUSTMENT BOLT PACKAGE INSTALLATION**.

ADJUSTMENT BOLT PACKAGE INSTALLATION

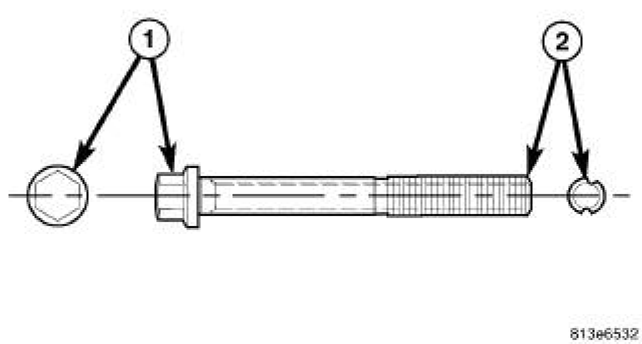

Fig. 90: Wheel Alignment Adjustment Bolt
Courtesy of CHRYSLER GROUP, LLC

The adjustment bolt package contains 2 special bolts (1). These bolts can be identified by the offset grooves cut into the thread section (2). These bolts are designed to replace the inboard mounting bolts of the lower control arm and tension strut. Each bolt allows approximately 0.3 degrees of movement. To adjust camber only, use both bolts, one at the tension strut and the other at the lower control arm. To adjust caster only, use one bolt at the tension strut only.

1. Raise the vehicle by the frame until the tires are not supporting the weight of the vehicle.
2. Remove the belly pan as necessary. Refer to **BELLY PAN, REMOVAL** and **BELLY PAN, ENGINE, REMOVAL** .
3. Lower control arm bolt only:
    a. Remove the screws fastening the heat shields covering the stabilizer bar bushing retainers to the cradle. Remove the heat shields.
    b. Remove the four bolts (two each) fastening the stabilizer bar bushing retainers to the cradle.
    c. Swing the stabilizer bar rearward and down out of the way of the control arm mounting bolts.

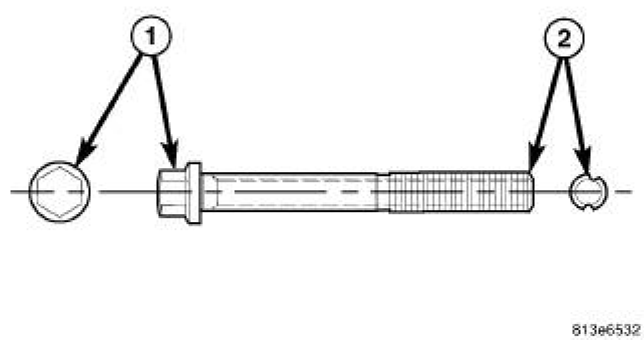

Fig. 91: Wheel Alignment Adjustment Bolt
Courtesy of CHRYSLER GROUP, LLC

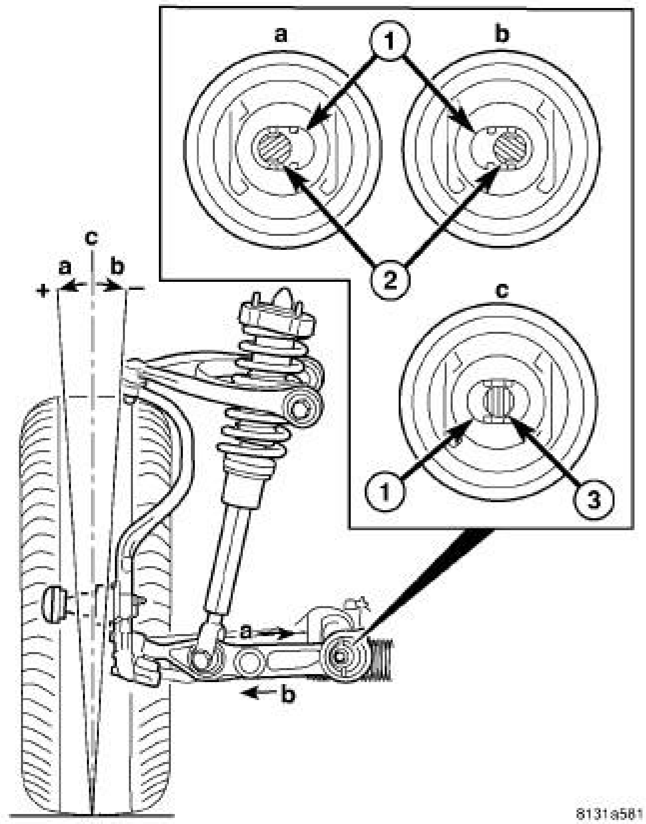
CAUTION: **Wheel alignment adjustment bolts have offset grooves cut into the length of the bolt (2). If removing or installing lower control arm or tension strut mounting bolts that have these grooves, DO NOT ROTATE THE BOLT. To remove the bolt, hold the bolt head stationary and rotate the nut, then slide the bolt straight out of the bushing. This is necessary to avoid damaging the bat wings in the bushing inner metal or cradle.**

4. Hold the head of the control arm or tension strut mounting bolt stationary and remove the nut. Slide the bolt straight out of the bushing and discard.

CAUTION: **When installing an adjustment bolt, be sure to install it in the correct direction. Lower control arm bolts must be installed from the rear-forward to avoid contact with the stabilizer bar upon installation. Tension strut bolts must be installed from the front-rearward.**

NOTE: **The grooves on the adjustment bolts are off-center forcing the bolt to be installed in one of two ways depending on whether more positive or negative camber or caster is necessary. The Bolts must be rotated 180Ā°**

to achieve either more positive or negative camber or caster. DO NOT force the adjustment bolt.



[Fig. 92: Installing Camber Bolt](#)
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The original (non-grooved) mounting bolt (3) lies through the center of the hole (1), between the "bat wings" (c).**

5. Camber Adjustment - The adjustment bolts are designed to work in conjunction with "bat wing" holes that are formed into the inner metal of the lower control arm bushing (1) allowing for lower control arm movement approximately 0.3Ā° in either direction.
   - To achieve more positive camber, refer to (a) in the illustration. Move the control arm or tension strut in the desired direction, then insert the adjustment bolt (2) with a washer installed through the round hole in the engine cradle and bat wing hole (1) in the bushing inner metal.
   - To achieve more negative camber, refer to (b) in the illustration. Move the control arm or tension strut in the desired direction, then insert the adjustment bolt (2) with a washer installed through the round hole in the engine cradle and bat wing hole (1) in the bushing inner metal.

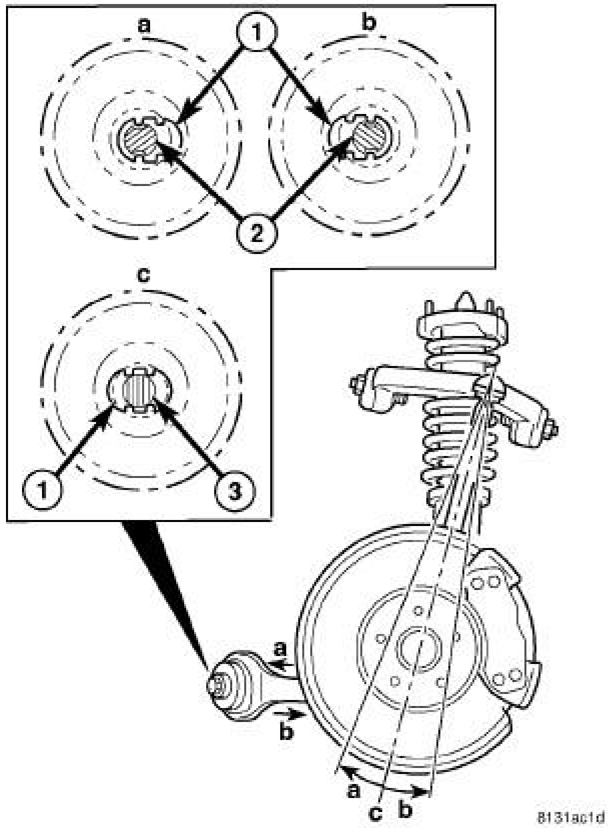


Fig. 93: Installing Caster Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: The original (non-grooved) mounting bolt (3) lies through the center of the hole (1), between the "bat wings" (c).

6. Caster Adjustment - The adjustment bolts are designed to work in conjunction with "bat wings" that are formed into the engine cradle (1) allowing for tension strut movement approximately 0.3Â° in either direction.
   - To achieve more positive caster, refer to (a) in the illustration. Move the tension strut in the desired direction, then insert the adjustment bolt (2) with a washer installed through the bat wing hole in the engine cradle (1) and the round hole in the bushing inner metal.
   - To achieve more negative caster, refer to (b) in the illustration. Move the tension strut in the desired direction, then insert the adjustment bolt (2) with a washer installed through the bat wing hole in the engine cradle (1) and the round hole in the bushing inner metal.
7. Start a **NEW** nut and a washer on the end of the mounting bolt by hand, then while holding the head of the bolt stationary, install the nut. **Do not tighten the nut at this time.**
8. Lower the vehicle to curb position. Jounce the rear, then the front of the vehicle an equal amount of times.
9. Using a crowfoot wrench, tighten the adjustment bolt **nut** to the proper specification while holding the bolt stationary. Refer to **FRONT, SPECIFICATIONS**.
10. Lower control arm adjustment bolt only - Reinstall the stabilizer bar and heat shields.
11. Measure camber and caster. If camber and caster are not within specifications, inspect the suspension components for any signs of damage or bending. If camber and caster (and cross-camber and cross-caster)

are within specifications, proceed with **TOE** to check and adjust toe.

12. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** and **BELLY PAN, ENGINE, INSTALLATION** .

TOE

CAUTION: If the steering wheel is excessively off-center while driving, outside of Chassis specifications, inadvertent ESC activations may occur on a vehicle so equipped.

1. Center the steering wheel and lock in place using a steering wheel clamp.

NOTE: When performing the toe adjustment procedure, set rear toe to specifications before setting front toe.

2. If rear toe is not within specifications, perform the **REAR TOE** procedure.
3. If front toe is not within specifications, perform the **FRONT TOE** procedure.
4. Remove the steering wheel clamp.
5. Remove the alignment equipment.
6. Road test the vehicle to verify the steering wheel is straight and the vehicle does not wander or pull.

REAR TOE

NOTE: Perform the following procedure to each side of the vehicle as necessary.

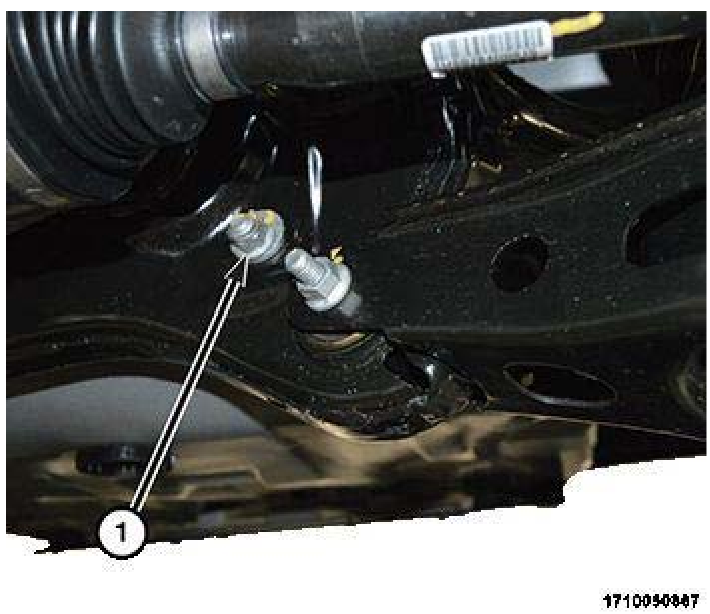

Fig. 94: Toe Link Nut
Courtesy of CHRYSLER GROUP, LLC

1. Loosen the cam bolt and nut (1) securing the toe link to the rear crossmember (front of rear crossmember) just enough to rotate the cam bolt.

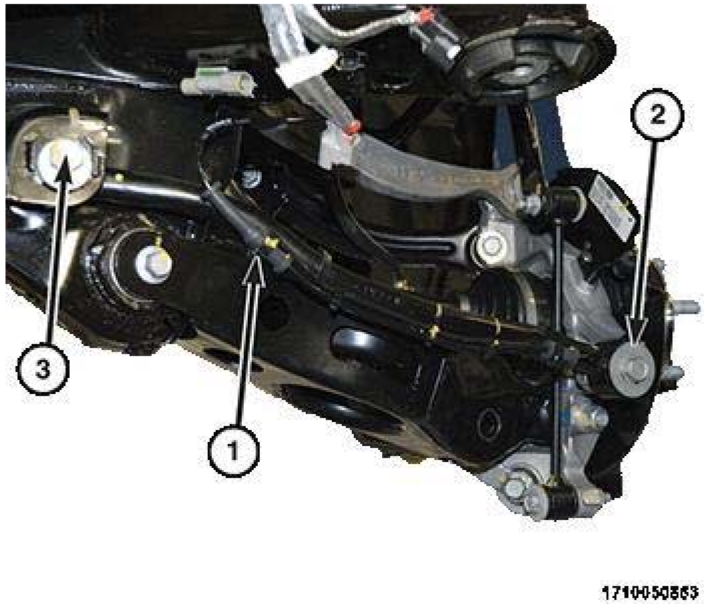

Fig. 95: Wheel Speed Sensor Cable, Toe Link To Knuckle Bolt & Adjustment Cam To Crossmember Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: **When adjusting rear toe, the eccentric lobes on the toe adjustment cam bolts and washers are not to be facing downward. The lobes should only be facing upward or up to 90Â° to one side or the other from the 12 O'clock position.**

2. Rotate the cam bolt head (3) on the opposite side (rear) of the crossmember in either direction until the preferred alignment specification is obtained. Refer to **WHEEL ALIGNMENT, SPECIFICATIONS**.
3. While holding the cam bolt (3) from turning, tighten the toe link to crossmember nut to the proper specification. Refer to **SPECIFICATIONS** .
4. Adjust rear toe on opposite side of vehicle using above procedure as necessary.
5. Once rear toe is set, proceed to **FRONT TOE** to set the vehicle's front toe.

FRONT TOE

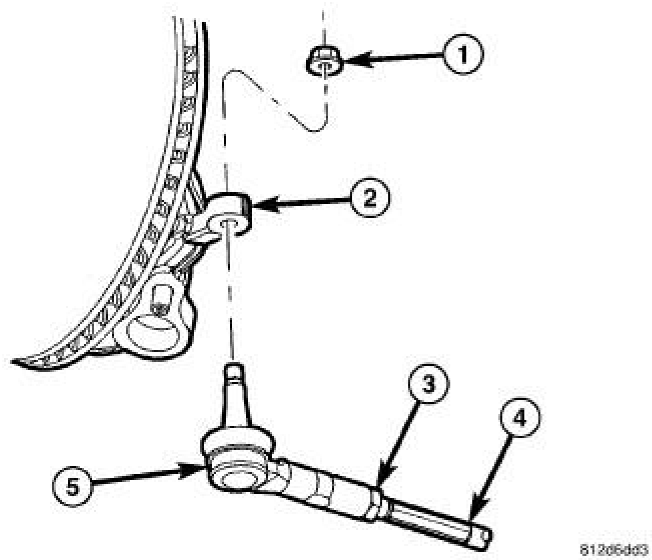

Fig. 96: Front Outer Tie Rod
Courtesy of CHRYSLER GROUP, LLC

CAUTION: **Do not twist the inner tie rod-to-steering gear boots during front wheel Toe adjustment. Remove the boot clamps (2) at the inner tie rods and make sure the boots move freely on the inner tie rods.**

NOTE: **Perform the following procedure to each side of the vehicle as necessary.**

1. Loosen the jam nut (3) at the inner-to-outer tie rod (4-5) connection.

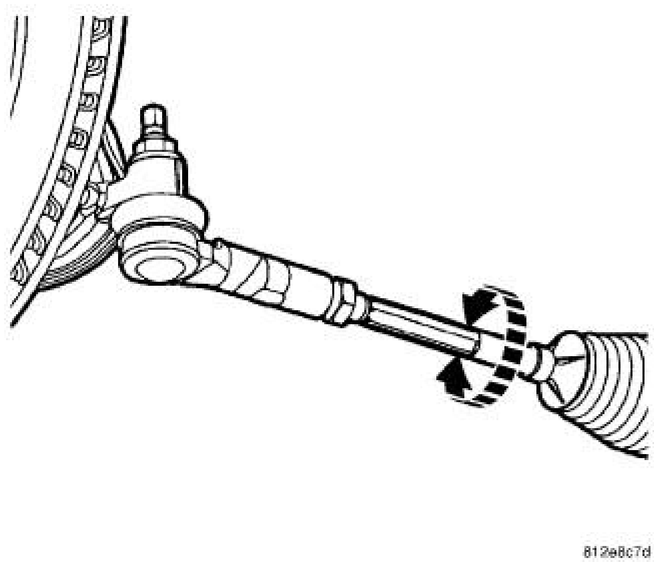

Fig. 97: Front Toe Adjustment
Courtesy of CHRYSLER GROUP, LLC

2. Grasp the inner tie rod at the hex and rotate as necessary to adjust front toe to the preferred toe specification. Refer to **WHEEL ALIGNMENT, SPECIFICATIONS**.

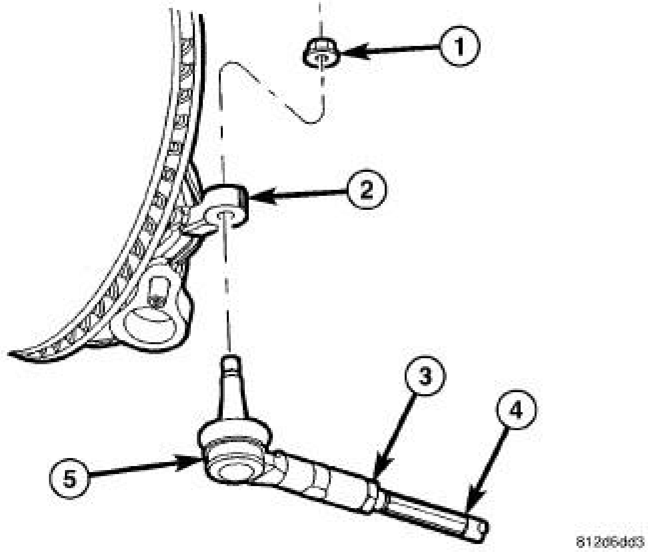

Fig. 98: Front Outer Tie Rod
Courtesy of CHRYSLER GROUP, LLC

3. Tighten the tie rod jam nut (3) to the proper specification using care not to lose adjustment. Refer to **SPECIFICATIONS** .
4. Make sure the inner tie rod-to-steering gear boot is not twisted, then reinstall the boot clamp at the inner tie rod.
5. Adjust front toe on opposite side of vehicle using the above procedure as necessary.

CURB HEIGHT MEASUREMENT

The wheel alignment is to be checked and all alignment adjustments made with the vehicle at its required curb height specification.

Vehicle height is to be checked with the vehicle on a flat, level surface, preferably a vehicle alignment rack. The tires are to be inflated to the recommended pressure. All tires are to be the same size as standard equipment. Vehicle height is checked with the fuel tank full, and no passenger or luggage compartment load.

Vehicle height is not adjustable. If the measurement is not within specifications, inspect the vehicle for bent or weak suspension components. Compare the parts tag on the suspect coil spring(s) to the parts book and the vehicle sales code, checking for a match. Once removed from the vehicle, compare the coil spring height to a correct new or known good coil spring. The heights should vary if the suspect spring is weak.

NOTE: **When measuring, the maximum left-to-right differential is not to exceed 12.5 mm (0.5 in.).**

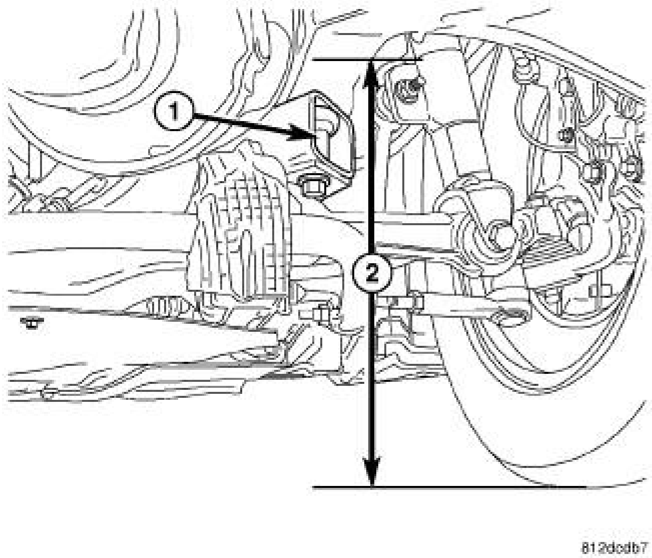

Fig. 99: Front Curb Height Measurement
Courtesy of CHRYSLER GROUP, LLC

1. Front - On each side of the vehicle, measure the distance (2) from the frame rail just behind the engine cradle rear mount (1) to the floor or alignment rack/lift runway surface. It may be necessary to measure to the bottom of a straight edge, placed from lift runway to runway, to get an accurate measurement.

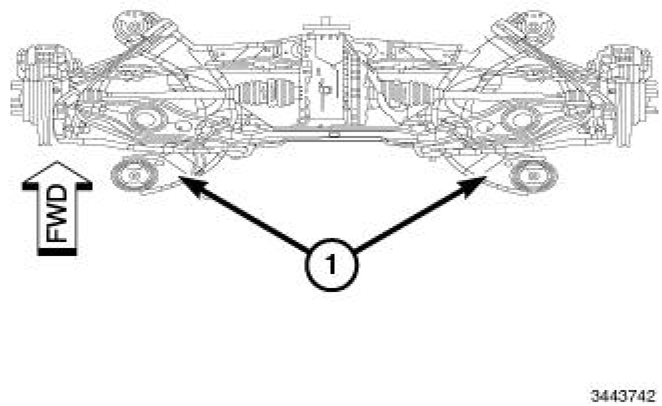

Fig. 100: Cradle Frame
Courtesy of CHRYSLER GROUP, LLC

2. Rear - On each side of the vehicle, measure the distance from the cradle frame (1) to the floor or alignment rack/lift runway surface. It may be necessary to measure to the bottom of a straight edge, placed from lift runway to runway, to get an accurate measurement.
3. Compare the measurements to the specifications listed in the following Curb Height Specifications chart.

CURB HEIGHT SPECIFICATIONS

MODEL	FRONT	REAR

MODEL	FRONT	REAR
Non-SRT and Non-Super Track Pak with 18 in. wheels	325 mm Â± 12 mm	352 mm Â± 12 mm
	12.80 in. Â± 0.47 in	13.86 in. Â± 0.47 in.
Non-SRT and Non-Super Track Pak with 20 in. wheels	331 mm Â± 12 mm	358 mm Â± 12 mm
	13.03 in. Â± 0.47 in	14.09 in. Â± 0.47 in.

FUEL DELIVERY, GAS

STANDARD PROCEDURE

FUEL SYSTEM PRESSURE RELEASE

WARNING: The fuel system is under constant high pressure even with engine off. Until the fuel pressure has been properly released from the system, do not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Wear protective clothing and eye protection. Make sure the area in which the vehicle is being serviced is in a well ventilated area and free of flames/sparks. Failure to comply may result in serious or fatal injury.

1. Remove the fuel pump relay from the Power Distribution Center (PDC). Refer to **FUSE - RELAY LOCATIONS AND TYPES, SPECIFICATIONS** . A relay location label can also be found on the underside of the PDC cover.
2. Start and run the engine until it stalls.
3. Attempt restarting engine until it will no longer run.
4. Turn the ignition to the OFF position.
5. Return fuel pump relay to the Power Distribution Center (PDC).

NOTE: After servicing the fuel system, one or more Diagnostic Trouble Codes (DTC's) may have been stored in the Powertrain Control Module (PCM) memory due to disconnecting the fuel pump module circuit. A diagnostic scan tool must be used to erase a DTC.

DRAINING FUEL TANK

CONVENTIONAL PROCEDURE

WARNING: The fuel system is under constant high pressure even with engine off. Until the fuel pressure has been properly released from the system, do not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Wear protective clothing and eye protection. Make sure the area in which the vehicle is being serviced is in a well ventilated area and free of flames/sparks. Failure to comply may result in serious or fatal injury.

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked OSHA approved containers. Wear protective clothing. Risk of injury to eyes and skin from contact with fuel.

CAUTION: If the electric fuel pump is not operating, and the fuel level is above 5/8 of a tank, the fuel tank must be removed prior to draining. If the fuel level is above

5/8 of a tank and the fuel pump module lock-ring is removed, fuel will spill into the interior of the vehicle.

CAUTION: **If the fuel level sending unit is not operating, and the fuel level cannot be determined the fuel tank must be removed prior to draining. If the fuel level is above 5/8 of a tank and the fuel pump module lock-ring is removed, fuel will spill into the interior of the vehicle.**

NOTE: **Due to a one-way check valve installed into the fuel fill fitting at the tank, the tank cannot be drained at the fuel filler tube.**

1. Perform the fuel system pressure release procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE**.
2. Disconnect the fuel supply line from the fuel rail. Refer to **FITTING, QUICK CONNECT, STANDARD PROCEDURE**.

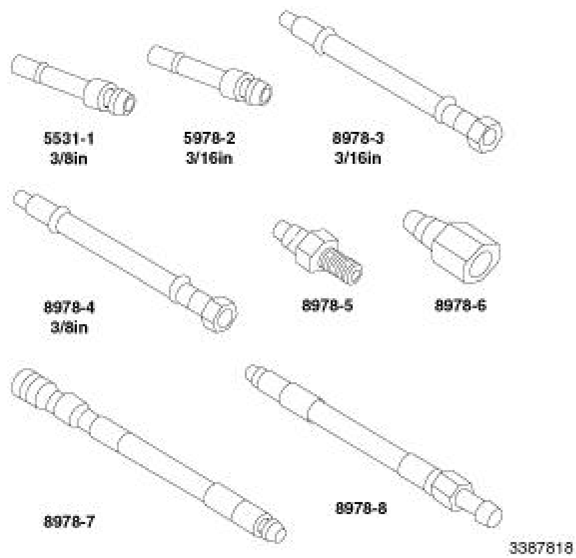

Fig. 1: Fuel Line Adapters
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Tool number 8978-2 is used on 5/16" fuel lines while tool number 8531-1 is used on 3/8" fuel lines.**

3. Install the appropriate fuel line adapter fitting from the (special tool #8978A, Decay Tool, Fuel) to the fuel supply line. Route the opposite end of this hose to an OSHA approved fuel storage tank such as the JohnDow Gas Caddy 320-FC-P30-A or equivalent.

NOTE: **Due to a built in time out feature of the diagnostic scan tool, the fuel pump may need to be reactivated several times before the fuel tank evacuation is complete.**

4. Using a diagnostic scan tool, activate the fuel pump until the fuel tank has been evacuated.

ALTERNATIVE PROCEDURE

WARNING: The fuel system is under constant high pressure even with engine off. Until the fuel pressure has been properly released from the system, do not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Wear protective clothing and eye protection. Make sure the area in which the vehicle is being serviced is in a well ventilated area and free of flames/sparks. Failure to comply may result in serious or fatal injury.

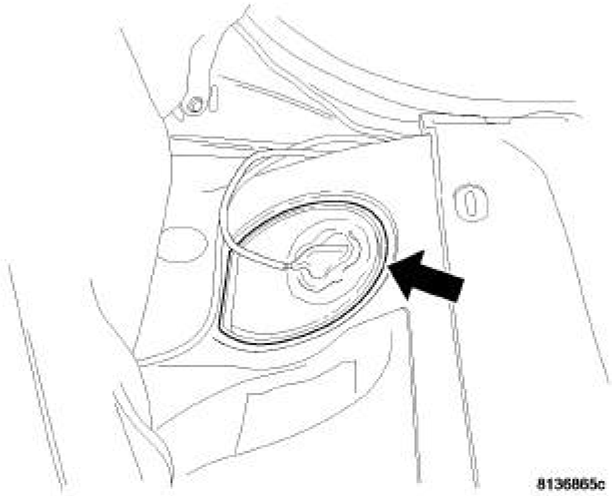
WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked OSHA approved containers. Wear protective clothing. Risk of injury to eyes and skin from contact with fuel.

CAUTION: The fuel level of the vehicle must be below 5/8 of a tank before using the "Alternative Procedure". If the fuel level is above 5/8 of a tank and the fuel pump module lock-ring is removed, fuel will spill into the interior of the vehicle.

CAUTION: If the electric fuel pump is not operating, and the fuel level is above 5/8 of a tank, the fuel tank must be removed prior to draining. If the fuel level is above 5/8 of a tank and the fuel pump module lock-ring is removed, fuel will spill into the interior of the vehicle.

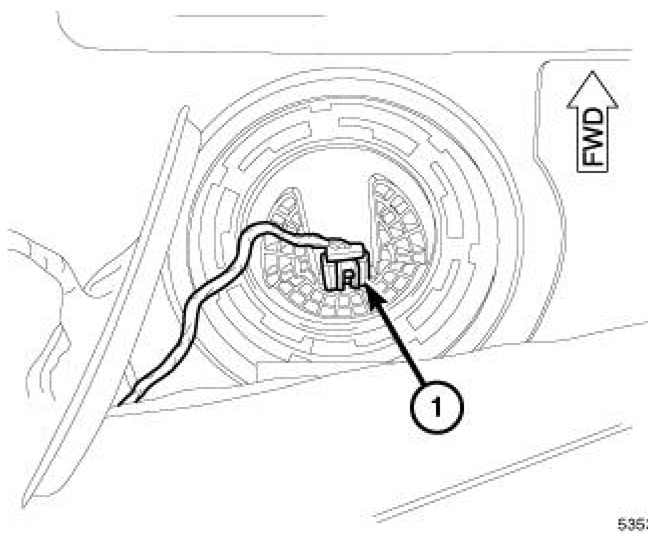
CAUTION: If the fuel level sending unit is not operating, and the fuel level cannot be determined the fuel tank must be removed prior to draining. If the fuel level is above 5/8 of a tank and the fuel pump module lock-ring is removed, fuel will spill into the interior of the vehicle.

1. Verify the fuel level is below 5/8 of a tank.
2. Perform the fuel system pressure release procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE**.
3. Disconnect the negative battery cable.
4. Push the rear lower seat cushion up and back and remove the seat cushion.
5. Fold back the foam pad covering the fuel pump module plastic access covers.



[Fig. 2: Locating Plastic Access Cover](#)
Courtesy of CHRYSLER GROUP, LLC

6. Remove the left side fuel pump module plastic access cover.



[Fig. 3: Left Side Module Orientation](#)
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect the electrical connector from the fuel pump module.

CAUTION: **An indexing arrow is located on top of the fuel pump module to clock its position into the fuel tank, note its location for reassembly.**

NOTE: **Prior to removing the fuel pump module, use compressed air to remove any accumulated dirt and debris from around fuel tank opening.**

8. Mark the fuel pump module orientation.
9. Position the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring

Wrench) into the notches on the outside edge of the lock ring.

10. Install a 1/2 inch drive breaker bar into the SAE Fuel Pump Lock Ring Wrench.
11. Rotate the breaker bar counterclockwise and remove the lock ring.

CAUTION: Do not spill fuel into the interior of the vehicle.

CAUTION: The lower reservoir of the fuel pump module must be drained before removal or fuel can spill into the interior of the vehicle.

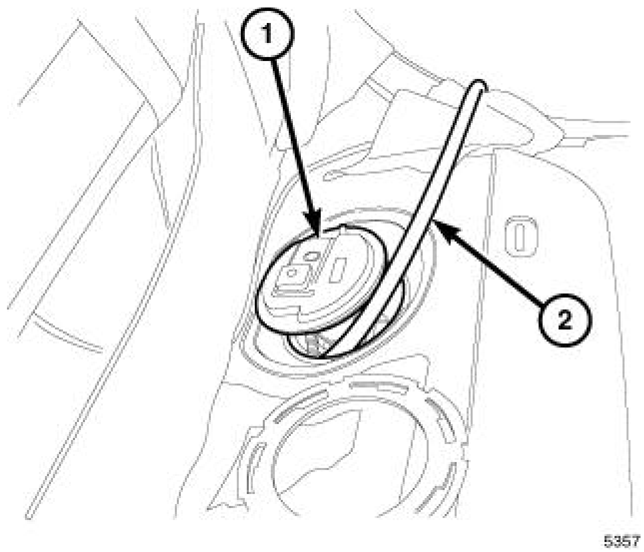


Fig. 4: Draining Left Side Fuel Tank
Courtesy of CHRYSLER GROUP, LLC

12. Lift the fuel pump module up enough to push a 3/8 inch hose into the fuel tank.
13. Attach the opposite end of this hose to an OSHA approved fuel storage tank such as the JohnDow Gas Caddy 320-FC-P30-A or equivalent.
14. Using the gas caddy, evacuate the left side of the fuel tank.
15. Remove the right side auxiliary fuel pump module plastic access cover.

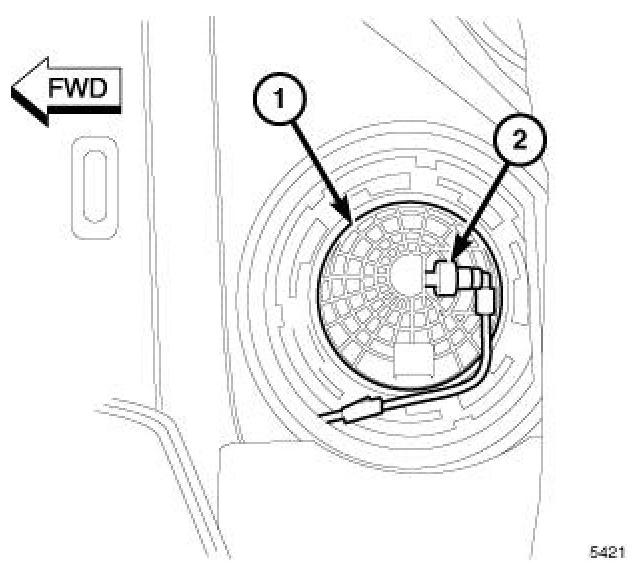

Fig. 5: Auxiliary Fuel Pump Module & Fuel Supply Line
Courtesy of CHRYSLER GROUP, LLC

16. Disconnect the fuel supply line (2) at the auxiliary fuel pump module (1).

CAUTION: An indexing arrow is located on top of the fuel pump module to clock its position into the fuel tank, note its location for reassembly.

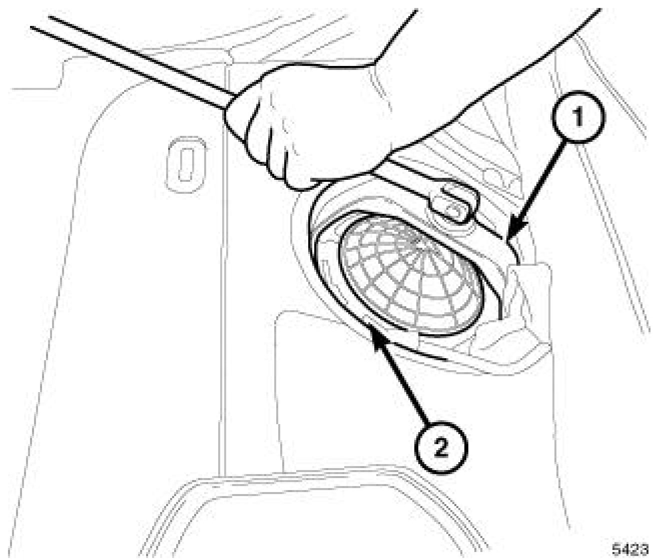

Fig. 6: Fuel Pump Lock Ring Wrench & Lock Ring
Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to removing the auxiliary fuel pump module, use compressed air to remove any accumulated dirt and debris from around fuel tank opening.

17. Mark the auxiliary fuel pump module orientation.
18. Position the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench) (1) into the notches on the outside edge of the lock ring (2).
19. Install a 1/2 inch drive breaker bar into the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench) (1).
20. Rotate the breaker bar counterclockwise and remove the lock ring.

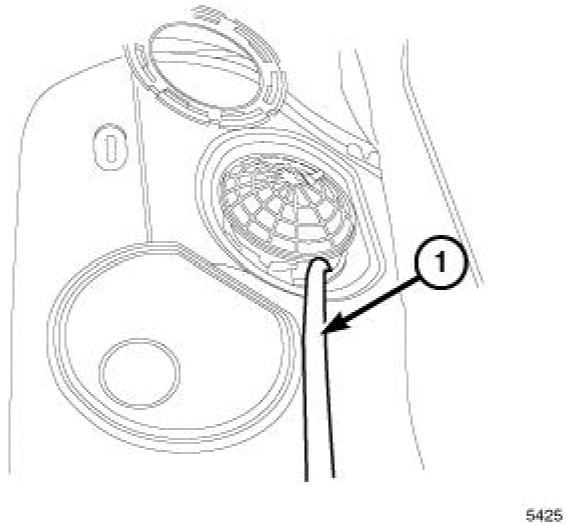

Fig. 7: Draining Right Side
Courtesy of CHRYSLER GROUP, LLC

21. Lift the auxiliary fuel pump module up enough to push a 3/8 inch hose (1) into the fuel tank.
22. Attach the opposite end of this hose to an OSHA approved fuel storage tank such as the JohnDow Gas Caddy 320-FC-P30-A or equivalent.
23. Using the gas caddy, evacuate the right side of the fuel tank.

FITTING, QUICK CONNECT

STANDARD PROCEDURE

QUICK-CONNECT FITTINGS

Different types of quick-connect fittings are used to attach the various fuel system components, lines and tubes. Some quick-connect fittings require the use of a special tool for disconnection and removal.

These are the quick-connect fittings:

- Redundant Latch Single Button Type Fitting

- Single Button Type Fitting
- Pinch Type Fitting
- Single Tab Type Fitting
- Two Tab Type Fitting
- Plastic Retainer Ring Type Fitting
- Latch Clip Type 1 Fitting
- Latch Clip Type 2 Fitting
- Wing Type Fitting

DISCONNECTING

WARNING: **The fuel system is under a constant pressure (even with engine off). Before servicing any fuel system hose, fitting or line, fuel system pressure must be released.**

CAUTION: **Before separating a Quick-Connect fitting, pay attention to what type of fitting is being used. This will prevent unnecessary fitting or fitting latch breakage.**

CAUTION: **The interior components (O-rings, clips) of quick-connect fittings are not serviced separately, but new plastic spacers and latches are available for some types. If service parts are not available, do not attempt to repair the damaged fitting or fuel line (tube). If repair is necessary, replace the complete fuel line (tube) assembly.**

REDUNDANT LATCH SINGLE BUTTON TYPE FITTING:

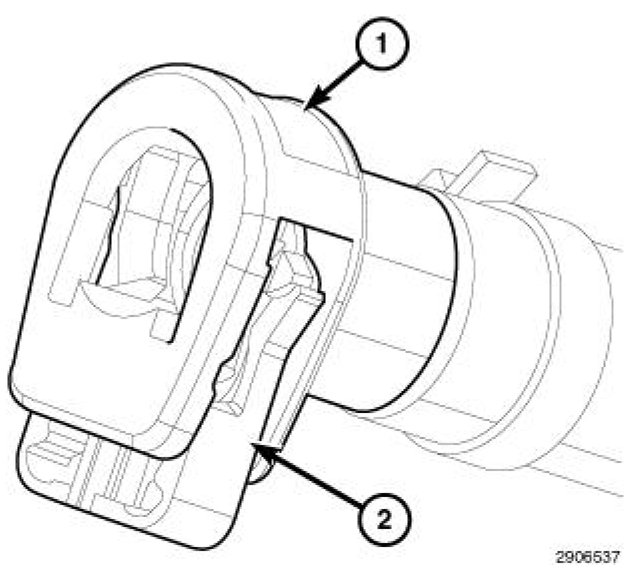

Fig. 8: Redundant Latch & Push Button
Courtesy of CHRYSLER GROUP, LLC

This type of quick-connect fitting is equipped with a redundant latch (2) and a single push button (1) that releases two internal latches located in the quick-connect fitting. Special tools are not required for removal.

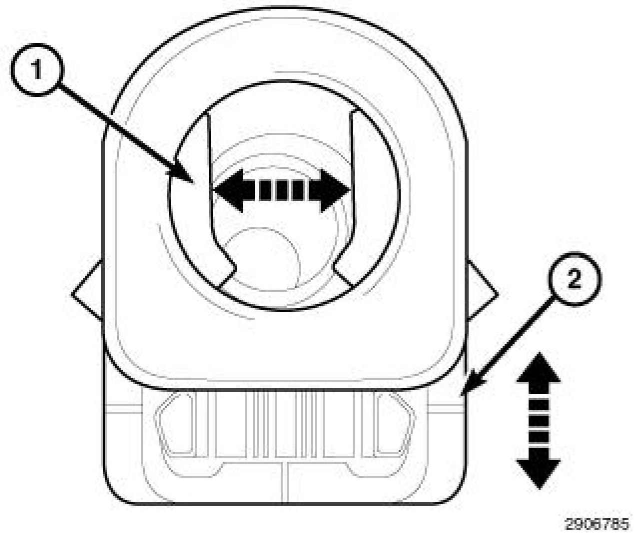

Fig. 9: Redundant Latch & Internal Latches
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not pry or pull up on the push button as damage to the latches of the quick-connect fitting will occur.

1. Pull the redundant latch (2) out, away from the quick-connect fitting.
2. Press on the push button with your thumb, which releases the internal latches (1) and remove the quick-connect fitting from the fuel system component.

SINGLE BUTTON TYPE FITTING:

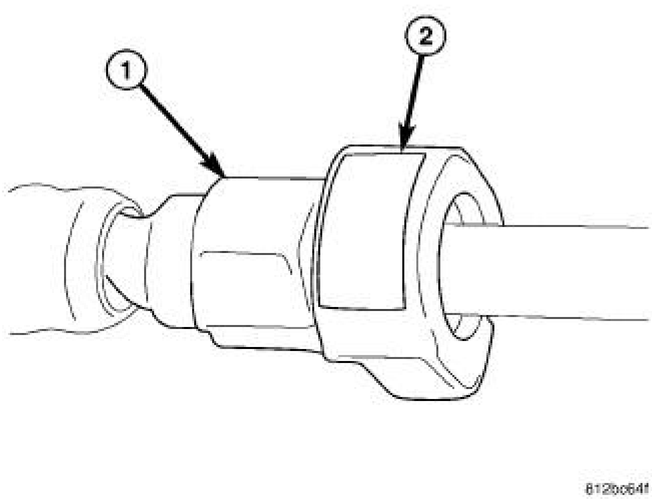

Fig. 10: Single Button Fitting
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not pry or pull up on the push button as damage to the latches of the quick-connect fitting will occur.

This type of quick-connect fitting is equipped with a single push button (2) that releases two internal latches located in the quick-connect fitting. Special tools are not required for removal.

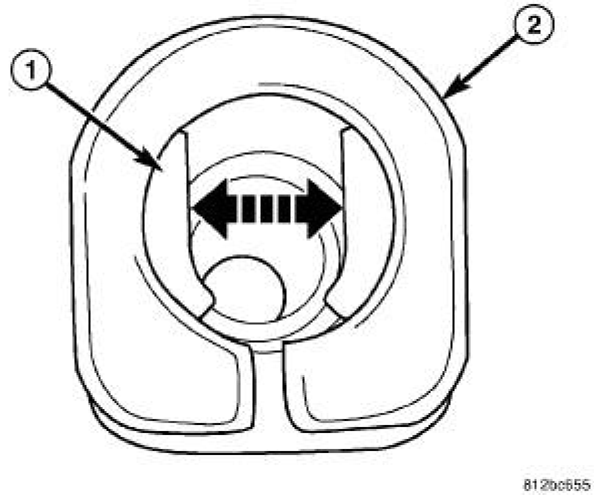

Fig. 11: Quick-Connect Fitting Latches
Courtesy of CHRYSLER GROUP, LLC

1. Press on the push button with your thumb, which releases the internal latches (1).
2. Remove the quick-connect fitting from the fuel system component.

2 BUTTON TYPE FITTING

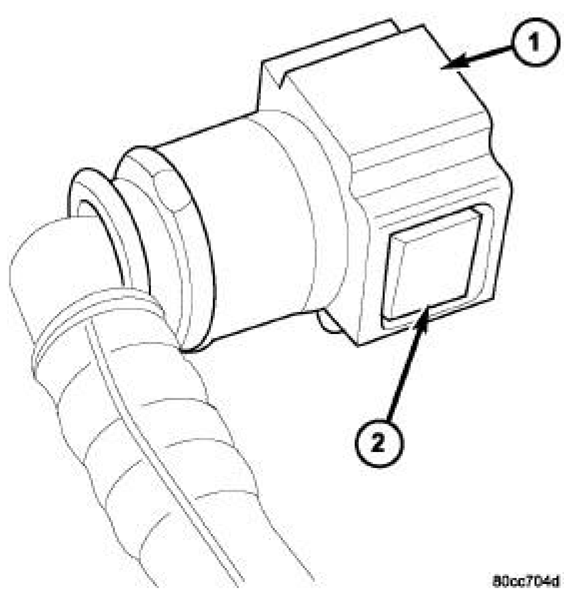

Fig. 12: 2-Button Type Fitting
Courtesy of CHRYSLER GROUP, LLC

This type of quick-connect fitting (1) is equipped with two push buttons (2) that releases two internal latches located in the quick-connect fitting. Special tools are not required for removal.

1. Press on both push buttons with your thumb, which releases the internal latches.
2. While holding the two push buttons simultaneously, remove the quick-connect fitting from the fuel system component.

PINCH TYPE FITTING

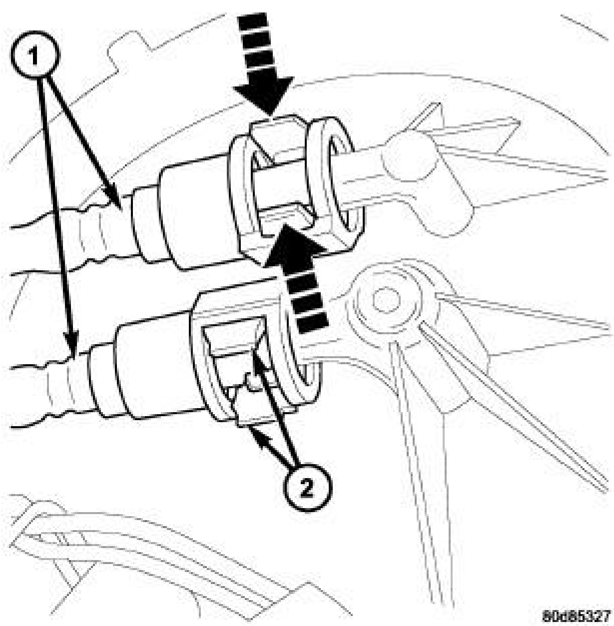

Fig. 13: View Of Pinch Type Quick-Connect Fitting
Courtesy of CHRYSLER GROUP, LLC

This type of quick-connect fitting (1) is equipped with two finger tabs (2). Special tools are not required for removal.

1. Pinch both tabs (2) together and release the quick-connect fitting.
2. Remove the quick-connect fitting from the fuel system component.

SINGLE TAB TYPE FITTING

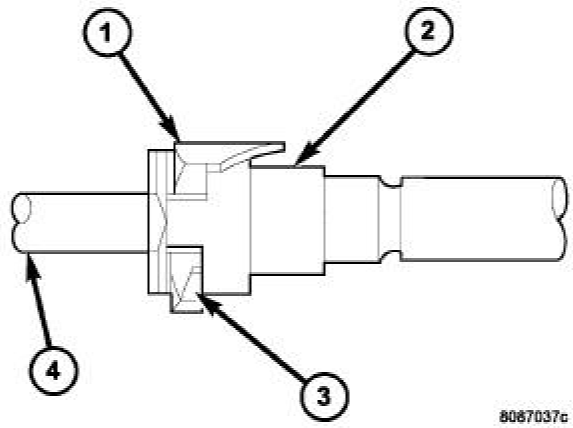

Fig. 14: View Of Single-Tab Type Fitting
Courtesy of CHRYSLER GROUP, LLC

This type of quick-connect fitting (2) is equipped with a single pull tab (1). The tab is removable. After the tab is removed the quick-connect fitting can be separated from the fuel system component. Special tools are not required for removal.

NOTE: **If the release tab (3) is not pressed prior to releasing pull tab, the pull tab will be damaged**

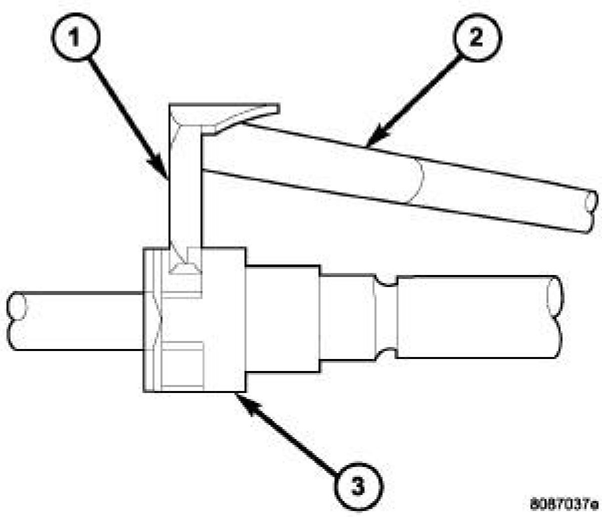

Fig. 15: Disconnecting Single-Tab Type Fitting
Courtesy of CHRYSLER GROUP, LLC

1. Press the release tab on the side of the fitting (3) to release the pull tab (1).
2. While pressing the release tab on the side of the quick-connect fitting use a screwdriver (2) to pry up the pull tab.
3. Raise the pull tab until it separates from the quick-connect fitting.
4. Remove the quick-connect fitting from the fuel system component.

TWO TAB TYPE FITTING

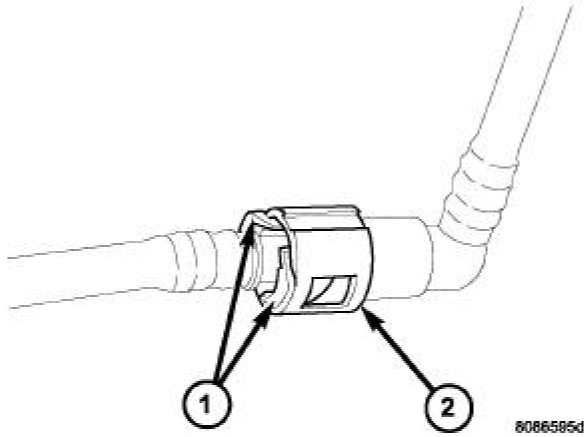

Fig. 16: Identifying Typical 2-Tab Type Fitting
Courtesy of CHRYSLER GROUP, LLC

This type of quick-connect fitting (2) is equipped with tabs (1) located on both sides of the fitting (2). These tabs are integral to the fuel system component. The plastic tabs will remain on the component being serviced after the quick-connect fitting is removed. The O-ring and spacer will remain in the quick-connect fitting. Special tools are not required for removal.

1. Squeeze the plastic tabs (1) against the sides of component being serviced with your fingers.
2. Remove the quick-connect fitting from the fuel system component.

PLASTIC RETAINER RING TYPE FITTING

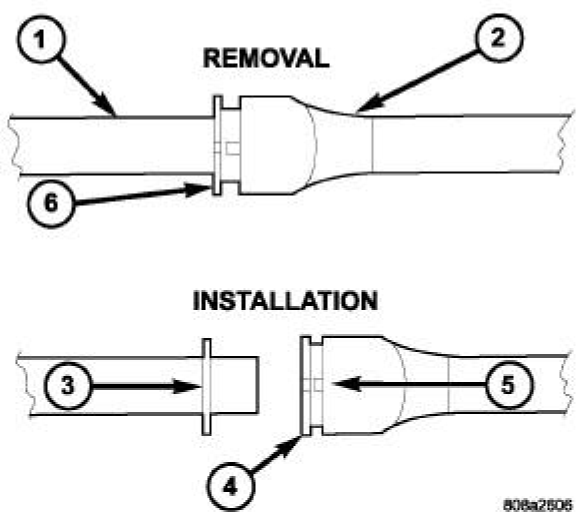

Fig. 17: Plastic Retainer Ring Type Fitting
Courtesy of CHRYSLER GROUP, LLC

This type of fitting can be identified by the use of a round plastic retainer ring (4, 6) usually black in color. Special tools are not required for removal.

NOTE: **The round plastic retainer ring must be pressed squarely into the quick-connect fitting body. If this retainer is cocked during removal it will be difficult to disconnect the quick-connect fitting. Use an open-end wrench on the shoulder of the plastic retainer ring to aid in disconnection.**

1. Firmly push the quick-connect fitting (5) towards the component being serviced while firmly pushing the round plastic retainer ring into the quick-connect fitting (6). With the round plastic ring depressed, remove the quick-connect fitting from the fuel system component.
2. After removal the plastic retainer ring will remain with the quick-connect fitting.

LATCH CLIP TYPE 1 FITTING

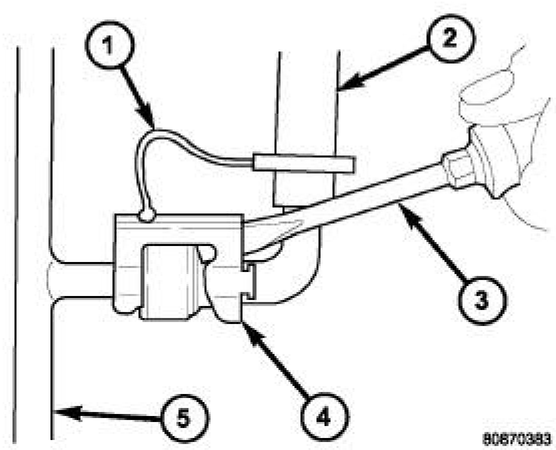

Fig. 18: Latch Clip Type 1 Fitting
Courtesy of CHRYSLER GROUP, LLC

Depending on vehicle model and engine, two different types of safety latch clips are used. One is tethered (1) to fuel line and the other is not. A special tool will be necessary to disconnect the fuel line after latch clip is removed. The latch clip may be used on certain fuel line and fuel rail connections or to join fuel lines together.

1. Pry up on the latch clip (4) with a screwdriver (3).
2. Slide the latch clip away from the quick-connect fitting while lifting the screwdriver and position aside.

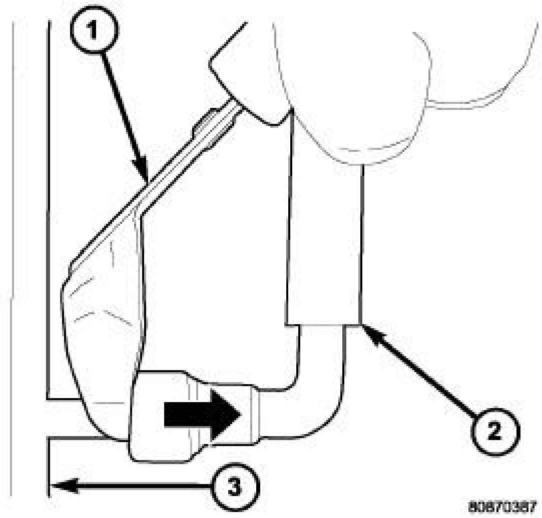

Fig. 19: Fuel Line Disconnection Using Special Tool
Courtesy of CHRYSLER GROUP, LLC

3. Insert an appropriate fuel line removal tool (1) into the quick-connect fitting and release the internal latches.

NOTE: **After removal the internal latches will remain in the quick-connect fitting.**

4. With the special tool still inserted, remove the quick-connect fitting from the fuel system component.

LATCH CLIP TYPE 2 FITTING

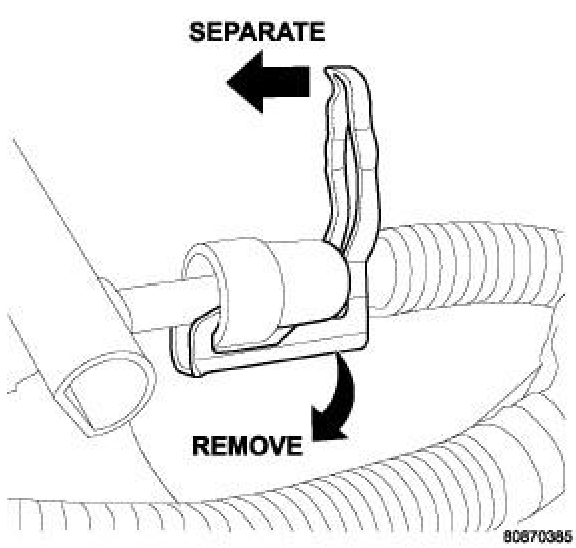

Fig. 20: Latch Clip Type 2 Fitting
Courtesy of CHRYSLER GROUP, LLC

Depending on vehicle model and engine, two different types of safety latch clips are used. One is tethered to the fuel line and the other is not. A special tool will be necessary to disconnect the fuel line after the latch clip is

removed. The latch clip may be used on certain fuel line and fuel rail connections or to join fuel lines together.

1. Unlatch the small arms on the end of clip, swing away and separate from the fuel system component.
2. Slide the latch clip away from the quick-connect fitting while lifting with a screwdriver and position aside.

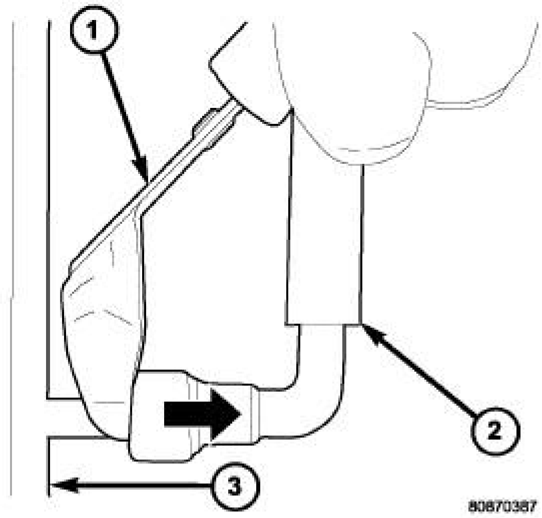

Fig. 21: Fuel Line Disconnection Using Special Tool
Courtesy of CHRYSLER GROUP, LLC

3. Insert an appropriate fuel line removal tool (1) into the quick-connect fitting and release the internal latches.

NOTE: **After removal the internal latches will remain in the quick-connect fitting.**

4. With the special tool still inserted, remove the quick-connect fitting from the fuel system component.

WING TYPE FITTING

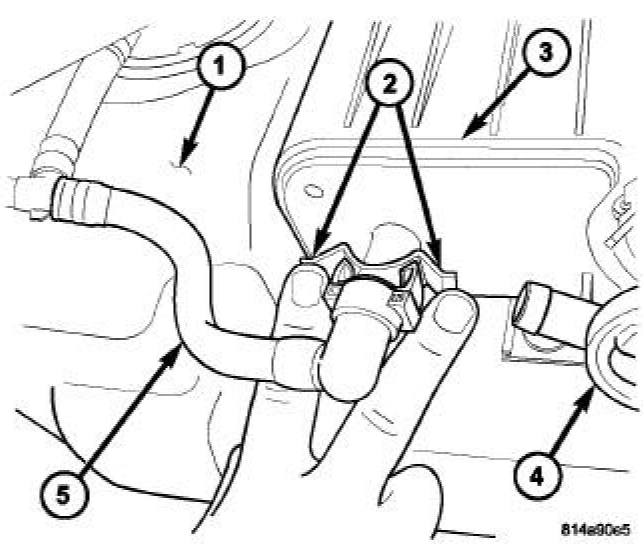

Fig. 22: EVAP Canister Vapor Hose
Courtesy of CHRYSLER GROUP, LLC

The wing type fitting is used on fuel system and emission components. The wing type fitting is most commonly used on the EVAP canister (3). Special tools are not required for removal.

1. Using two fingers, press both wings (2) and release the locking tabs.

NOTE: After removal the locking tabs will remain with the quick-connect fitting.

2. While holding the wings, remove the quick-connect fitting from the fuel system component.

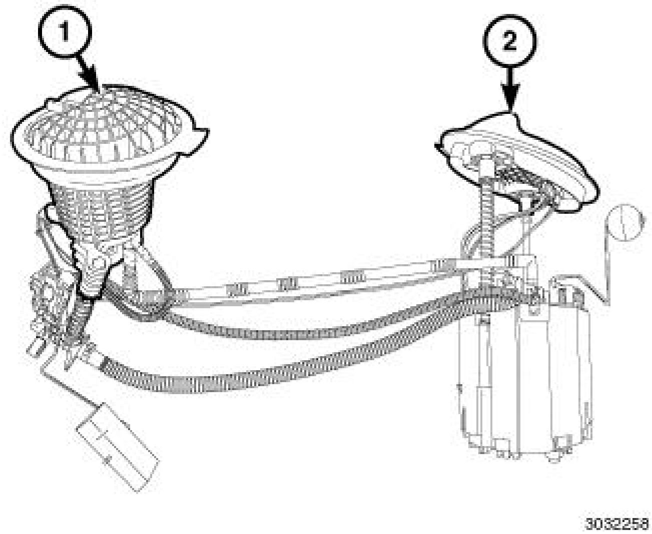
CONNECTING

1. Inspect the quick-connect fitting body and fuel system components for damage. Replace as necessary.
2. Prior to connecting any quick-connect fitting to components, check condition of fitting and components. Clean parts with a lint-free cloth. Lubricate with clean engine oil.
3. Insert the quick-connect fitting onto the fuel tube or fuel system component until the built-in stop on the fuel tube or component rests against the back of fitting.
4. Continue pushing until a click is felt.
5. If Equipped:
   - **Redundant Latch Single Button Type Fitting:** Push redundant latch until it locks into position in the quick-connect fitting.
   - **Single Tab Type Fitting:** Push new tab down until it locks into position in the quick-connect fitting.
   - **Latch Clip Type Fitting:** Install latch clip (snaps into position). **If latch clip will not snap into position, this indicates the quick-connect fitting is not properly installed onto fuel system component, recheck the connection.**
6. Verify a locked condition by firmly pulling on the quick-connect fitting connection of the fuel system component.

MODULE, FUEL PUMP

DESCRIPTION

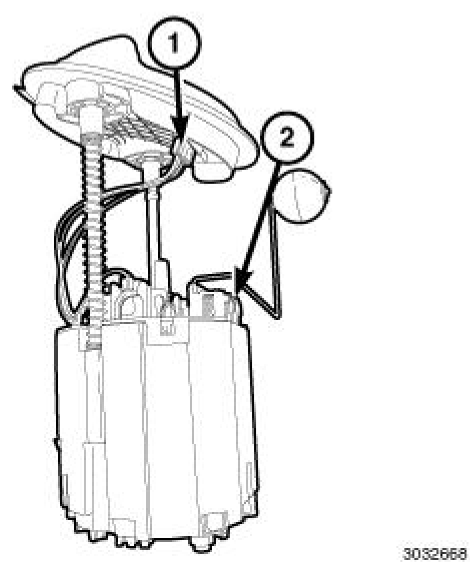
3.6L/5.7L/6.4L



[Fig. 23: Main Fuel Pump Module & Auxiliary Fuel Pump Module](#)
Courtesy of CHRYSLER GROUP, LLC

This vehicle uses a saddle type tank that has a reservoir on both sides of the rear drive shaft. The main fuel pump module (2) is located on the left side of the vehicle. The auxiliary fuel pump module (1) is located the right side of the vehicle. The fuel outlet or fuel supply line is on the auxiliary fuel pump module (right side) and supplies fuel to the engine. The electrical connector is on the main fuel pump module (left side) and controls both modules. The fuel pressure regulator is integrated into the auxiliary fuel pump module and is not a serviceable component.

Both modules have fuel level sending cards. The fuel level sending cards are not serviceable components. There are 3 hoses that connect the main and auxiliary fuel pump modules together, one is the fuel supply line the other two are fuel return lines. These lines are removed from the main fuel pump module when servicing either unit. One fuel filter is used and is located at the bottom of the main fuel pump module and is designed for extended life. A separate frame mounted fuel filter is not used with any engine. The fuel filter is not a serviceable component.



[Fig. 24: Electrical Connector And Fuel Level Sending Card](#)

Right side auxiliary fuel pump module with the fuel supply port (1), electrical connection (2), fuel transfer line (3), fuel supply line (4), fuel pressure relief (6) and fuel level sending unit (5).

OPERATION

3.6L/5.7L/6.4L

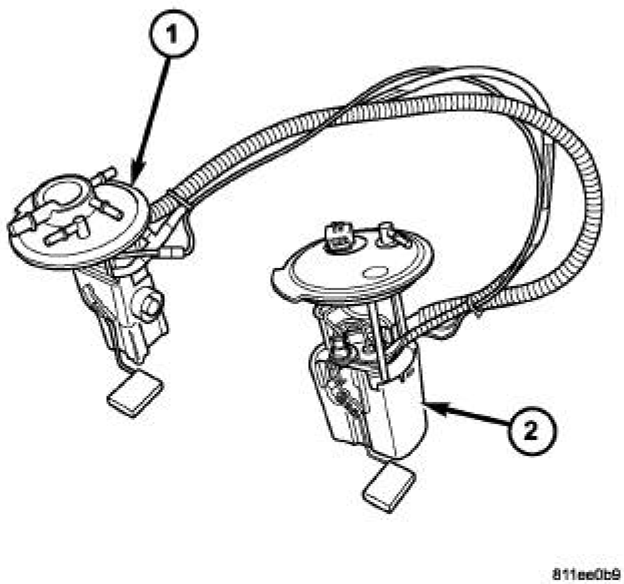

Fig. 29: Main Fuel Pump Module & Auxiliary Fuel Pump Module
Courtesy of CHRYSLER GROUP, LLC

Fuel enters the reservoir of the main fuel pump module (left side). The main fuel pump module (2) pumps the fuel through the filter to the auxiliary fuel pump module (1) (right side) through a supply line inside the fuel tank. The fuel pressure regulator inside the auxiliary fuel pump module regulates the pressure at 58 psi and sends fuel to the engine. All unused fuel that is not sent to the engine is fed through a venturi at the bottom of the auxiliary fuel pump module. This creates a low pressure siphoning effect and draws fuel from the passenger side of the tank and transfers it to the drivers side tank via a siphon hose inside the tank. While the vehicle is running the fuel in the right side of tank is continuously transferred to the left side. Fuel will continue to fill the left side tank till it reaches the bridge section and then starts to spill over to the right side.

Both main and auxiliary fuel pumps have fuel level sender cards and the reading of these senders are averaged out to give the fuel gauge reading. When diagnosing a fuel level sender concern, the right side reading should never be higher than the left side reading. However, it is possible, depending on fuel level and driving habit before diagnosing, to spill fuel over to the right side that might indeed show a lower resistance value than the left side.

The fuel gauge gives an indication to the vehicle operator the level of fuel in the fuel tank. This fuel gauge is controlled by the instrument cluster circuit board based upon cluster programming and hard wired inputs received by the cluster from the fuel level sending units integrated into the fuel pump modules.

The instrument cluster continually monitors both fuel pump sender cards to determine the level of fuel in the fuel tank. The cluster then sends the proper fuel level messages to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. For further diagnosis of the fuel gauge or the instrument cluster circuitry that controls the gauge. Refer to **DIAGNOSIS AND TESTING** . The fuel gauge is serviced as a unit with the instrument cluster.

6.2L

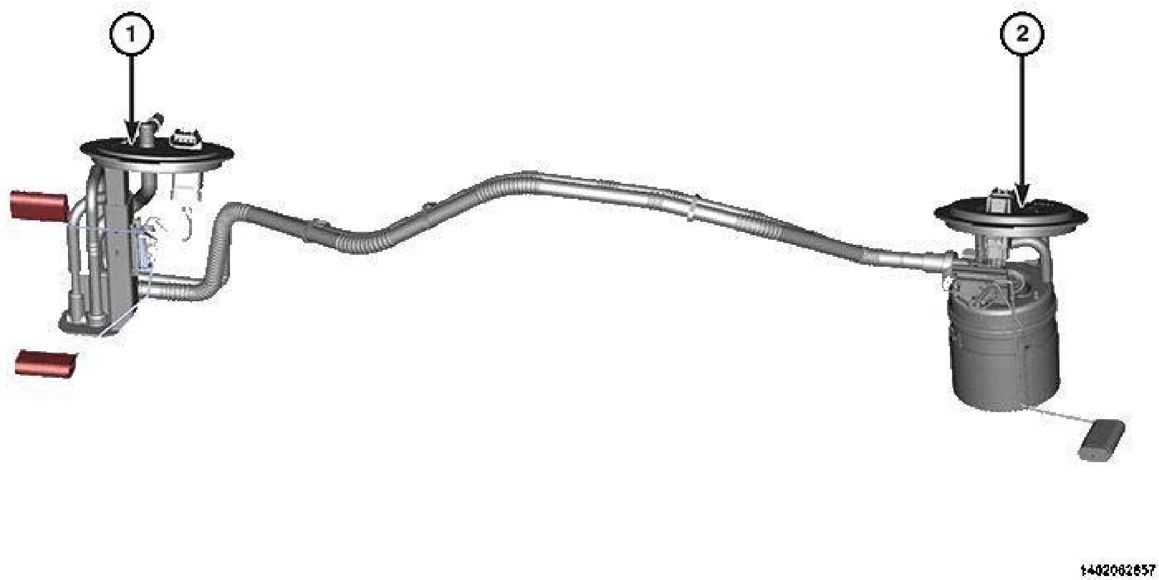

Fig. 30: Auxiliary Fuel Pump Module & Main Fuel Pump Module
Courtesy of CHRYSLER GROUP, LLC

Fuel enters the reservoir of the main fuel pump module (left side). The main fuel pump module (2) pumps the fuel through the filter to the auxiliary fuel pump module (1) (right side) through a supply line inside the fuel tank. The fuel pressure regulator inside the auxiliary fuel pump module regulates the pressure at 58 psi and sends fuel to the engine. All unused fuel that is not sent to the engine is fed through a venturi at the bottom of the auxiliary fuel pump module. This creates a low pressure siphoning effect and draws fuel from the passenger side of the tank and transfers it to the drivers side tank via a siphon hose inside the tank. While the vehicle is running the fuel in the right side of tank is continuously transferred to the left side. Fuel will continue to fill the left side tank till it reaches the bridge section and then starts to spill over to the right side.

Both main and auxiliary fuel pumps have fuel level sending units and the reading of these senders are averaged out to give the fuel gauge reading. When diagnosing a fuel level sender concern, the right side reading should never be higher than the left side reading. However, it is possible, depending on fuel level and driving habit before diagnosing, to spill fuel over to the right side that might indeed show a lower resistance value than the left side.

The fuel gauge gives an indication to the vehicle operator the level of fuel in the fuel tank. This fuel gauge is controlled by the instrument cluster circuit board based upon cluster programming and hard wired inputs received by the cluster from the fuel level sending units integrated into the fuel pump modules.

The instrument cluster continually monitors both fuel pump sending units to determine the level of fuel in the fuel tank. The cluster then sends the proper fuel level messages to other electronic modules in the vehicle over

the Controller Area Network (CAN) data bus. For further diagnosis of the fuel gauge or the instrument cluster circuitry that controls the gauge. Refer to **DIAGNOSIS AND TESTING** . The fuel gauge is serviced as a unit with the instrument cluster.

REMOVAL

3.6L/5.7L/6.4L

MAIN FUEL PUMP MODULE

WARNING: The fuel system is under constant high pressure even with engine off. Until the fuel pressure has been properly released from the system, do not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Wear protective clothing and eye protection. Make sure the area in which the vehicle is being serviced is in a well ventilated area and free of flames/sparks. Failure to comply may result in serious or fatal injury.

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked OSHA approved containers. Wear protective clothing. Risk of injury to eyes and skin from contact with fuel.

CAUTION: If the electric fuel pump module is not operating or the fuel level sending unit is not operating and the fuel level cannot be determined, the fuel tank must be removed prior to draining. If the fuel level is above 5/8 of a tank and the fuel pump module lock-ring is removed, fuel will spill into the interior of the vehicle

1. Verify the fuel level is below 5/8 of a tank.
2. Perform the fuel pressure release procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE**.
3. If required, perform the draining fuel tank procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE**.
4. Disconnect and isolate the negative battery cable.
5. Remove the rear seat cushion. Refer to **SEAT CUSHION, REMOVAL** .
6. Fold back the foam pad covering the fuel pump module plastic access covers.

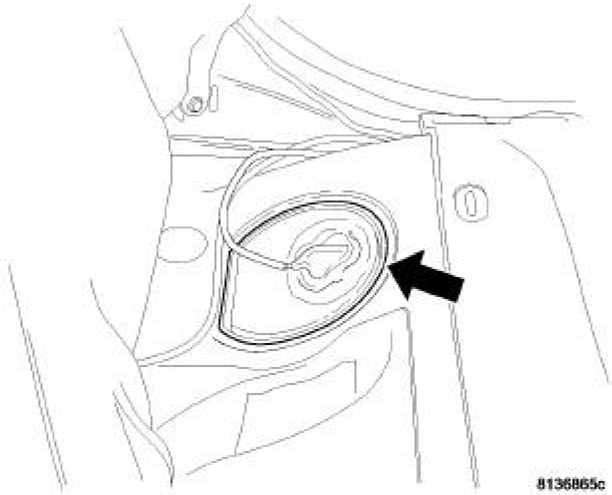

Fig. 31: Locating Plastic Access Cover
Courtesy of CHRYSLER GROUP, LLC

7. Remove the left side main fuel pump module plastic access cover.

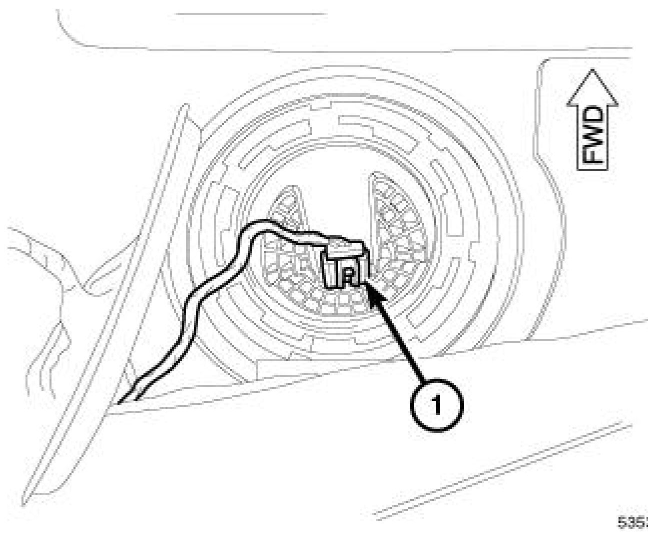

Fig. 32: Left Side Module Orientation
Courtesy of CHRYSLER GROUP, LLC

8. Disconnect the main fuel pump module wire harness connector.

CAUTION: **An indexing arrow is located on top of the fuel pump module to clock its position into the fuel tank, note its location for reassembly.**

NOTE: **Prior to removing the fuel pump module, use compressed air to remove any accumulated dirt and debris from around fuel tank opening.**

9. Mark the main fuel pump module orientation.
10. Position the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring

Wrench) into the notches on the outside edge of the lock ring.

11. Install a 1/2 inch drive breaker bar into the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench).

NOTE: **The main fuel pump module will spring up slightly when the lock ring is removed.**

12. Rotate the breaker bar counterclockwise and remove the lock ring.

CAUTION: **Do not allow the float arm of the main fuel pump module to come in contact with any part of the fuel tank during removal or installation, damage to the float arm and fuel level sending card may result.**

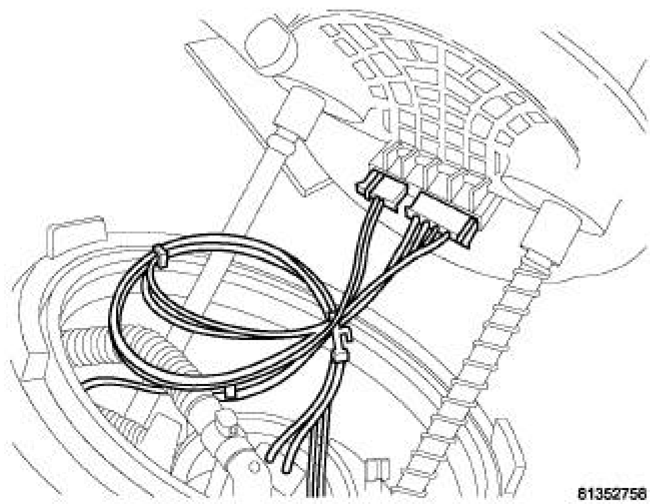

Fig. 33: Module Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

13. Raise and separate the top section from the bottom section of the main fuel pump module.
14. Disconnect the wire harness connectors from under the top section of the main fuel pump module.
15. Remove the top section of the main fuel pump module from the vehicle.

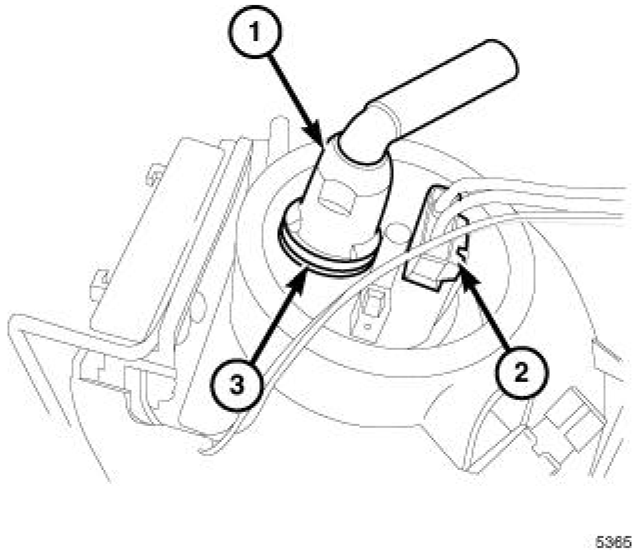

Fig. 34: Fuel Supply Line, Fuel Pump Module Electrical Connector & Quick Connect Release Tab
Courtesy of CHRYSLER GROUP, LLC

16. Press the quick connect release tab (3) and remove the fuel supply line (1) from the main fuel pump module.

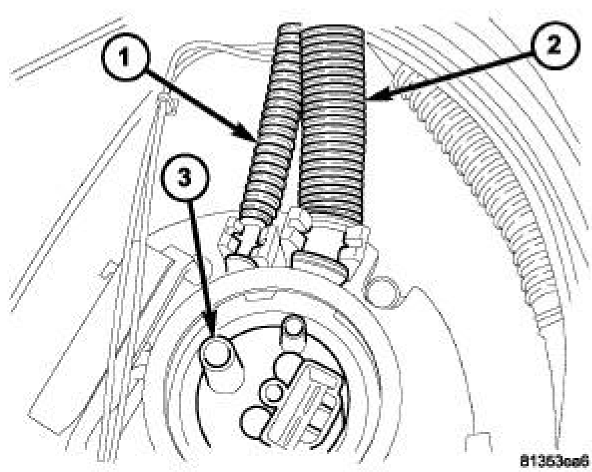

Fig. 35: Fuel Return Lines
Courtesy of CHRYSLER GROUP, LLC

17. Disconnect the fuel return lines (1, 2) from the main fuel pump module.

NOTE: **Do not spill fuel into the interior of the vehicle.**

18. Carefully lift the bottom section of the main fuel pump module out of the fuel tank, tip the bottom section on its side and drain the remaining fuel from the bottom reservoir into the fuel tank and remove from vehicle.

NOTE: **Whenever a fuel pump module is serviced, the rubber O-ring seal must be**

replaced.

19. Remove and discard the rubber O-ring seal.

AUXILIARY FUEL PUMP MODULE

NOTE: **The Main Fuel Pump Module must be removed for Auxiliary Fuel Pump Module removal.**

1. Remove the main fuel pump module, see **MAIN FUEL PUMP MODULE**. .
2. Remove the auxiliary fuel pump module plastic access cover from the floor pan.

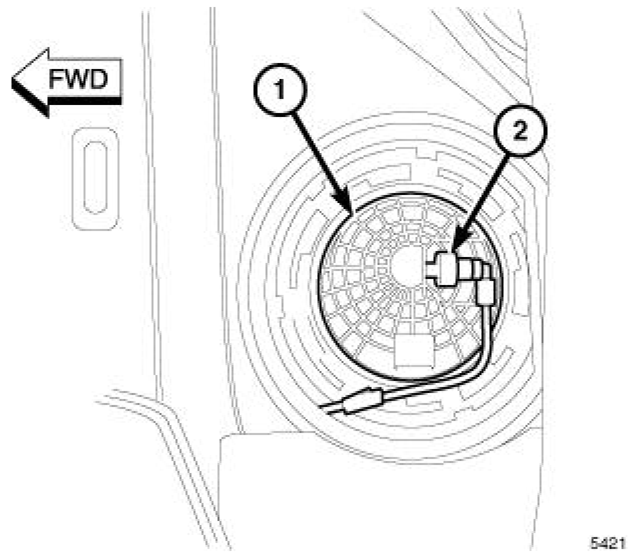

Fig. 36: Auxiliary Fuel Pump Module & Fuel Supply Line
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Prior to removing the fuel pump module, use compressed air to remove any accumulated dirt and debris from around fuel tank opening.**

3. Disconnect the fuel supply line (2) from the auxiliary fuel pump module (1).
4. Mark the auxiliary fuel pump module orientation.

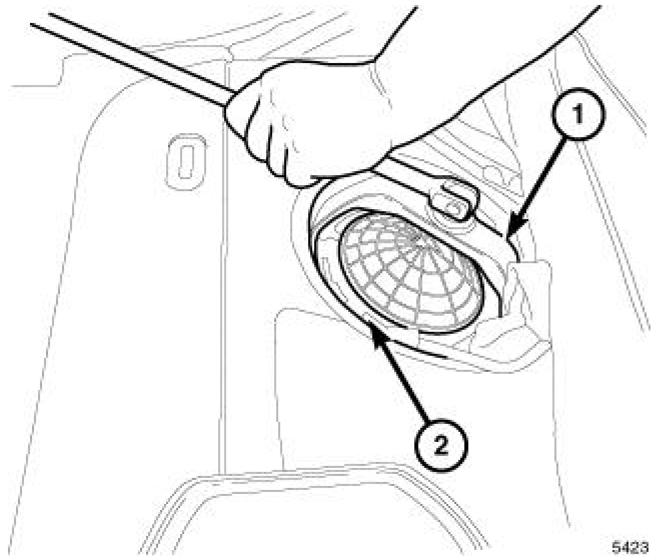

Fig. 37: Fuel Pump Lock Ring Wrench & Lock Ring
Courtesy of CHRYSLER GROUP, LLC

5. Position the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench) (1) into the notches on the outside edge of the lock ring (2).
6. Install a 1/2 inch drive breaker bar into the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench) (1).
7. Rotate the breaker bar counterclockwise and remove the lock ring (2).

CAUTION: Do not allow the float arm of the auxiliary fuel pump module to come in contact with any part of the fuel tank during removal or installation, damage to the float arm and fuel level sending card may result.

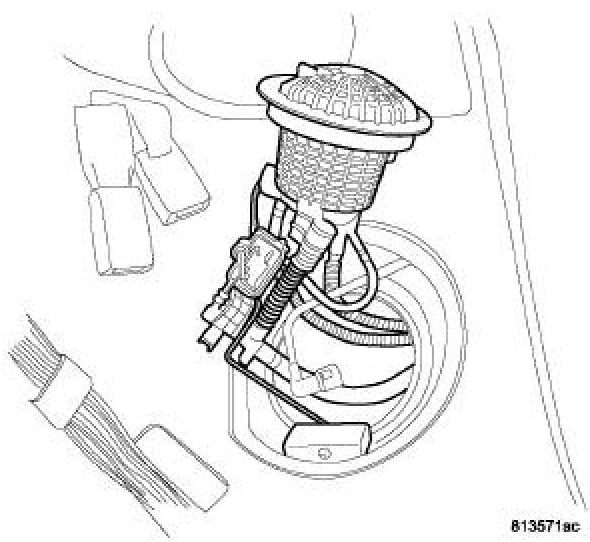

Fig. 38: Remove/Install Right Side Module
Courtesy of CHRYSLER GROUP, LLC

8. Lift the auxiliary fuel pump module up and out of fuel tank while guiding the fuel supply and return lines

out from the left side of the fuel tank.

NOTE: **Whenever a fuel pump module is serviced, the rubber O-ring seal must be replaced.**

9. Remove and discard the rubber O-ring seal.

6.2L

MAIN FUEL PUMP MODULE

WARNING: The fuel system is under constant high pressure even with engine off. Until the fuel pressure has been properly released from the system, do not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Wear protective clothing and eye protection. Make sure the area in which the vehicle is being serviced is in a well ventilated area and free of flames/sparks. Failure to comply may result in serious or fatal injury.

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked OSHA approved containers. Wear protective clothing. Risk of injury to eyes and skin from contact with fuel.

CAUTION: If the electric fuel pump module is not operating or the fuel level sending unit is not operating and the fuel level cannot be determined, the fuel tank must be removed prior to draining. If the fuel level is above 5/8 of a tank and the fuel pump module lock-ring is removed, fuel will spill into the interior of the vehicle

1. Verify the fuel level is below 5/8 of a tank.
2. Perform the fuel pressure release procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE**.
3. If required, perform the draining fuel tank procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE**.
4. Disconnect and isolate the negative battery cable.
5. Remove the rear seat cushion. Refer to **SEAT CUSHION, REMOVAL** .
6. Fold back the foam pad covering the fuel pump module plastic access covers.

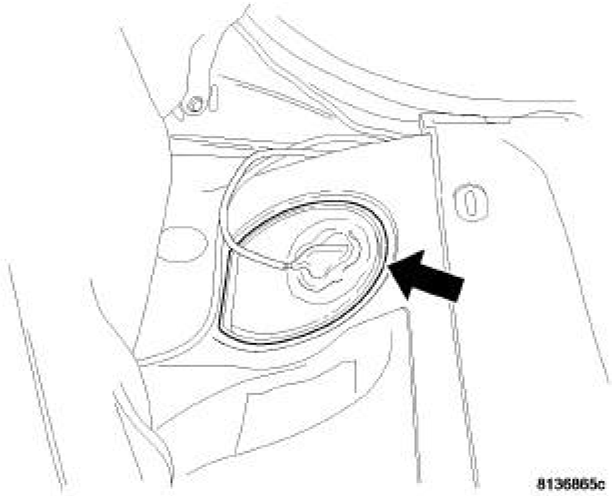

Fig. 39: Locating Plastic Access Cover
Courtesy of CHRYSLER GROUP, LLC

7. Remove the left side main fuel pump module plastic access cover.

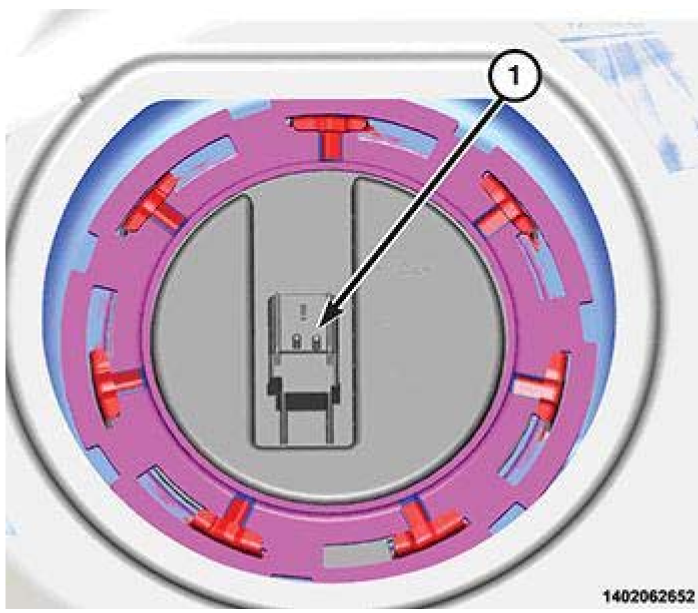

Fig. 40: Main Fuel Pump Module Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

8. Disconnect the main fuel pump module wire harness connector (1).

CAUTION: **An indexing arrow is located on top of the fuel pump module to clock its position into the fuel tank, note its location for reassembly.**

NOTE: **Prior to removing the fuel pump module, use compressed air to remove any accumulated dirt and debris from around fuel tank opening.**

9. Mark the main fuel pump module orientation.

10. Position the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench) into the notches on the outside edge of the lock ring.
11. Install a 1/2 inch drive breaker bar into the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench).

NOTE: **The main fuel pump module will spring up slightly when the lock ring is removed.**

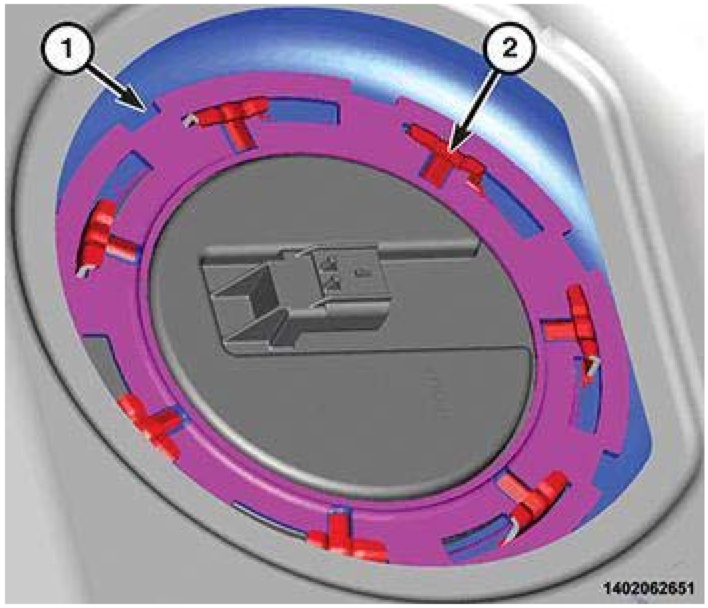

Fig. 41: Fuel Pump Module & Lock Ring
Courtesy of CHRYSLER GROUP, LLC

12. Rotate the breaker bar counterclockwise and remove the lock ring (1).

CAUTION: **Do not allow the float arm of the main fuel pump module to come in contact with any part of the fuel tank during removal or installation, damage to the float arm and fuel level sending card may result.**

Fig. 42: Wire Harness Connector & Main Fuel Pump Module Top Section
Courtesy of CHRYSLER GROUP, LLC

13. Raise and separate the top section (2) from the bottom section of the main fuel pump module.
14. Disconnect the wire harness connector (1) from under the top section of the main fuel pump module.
15. Remove the top section of the main fuel pump module from the vehicle.

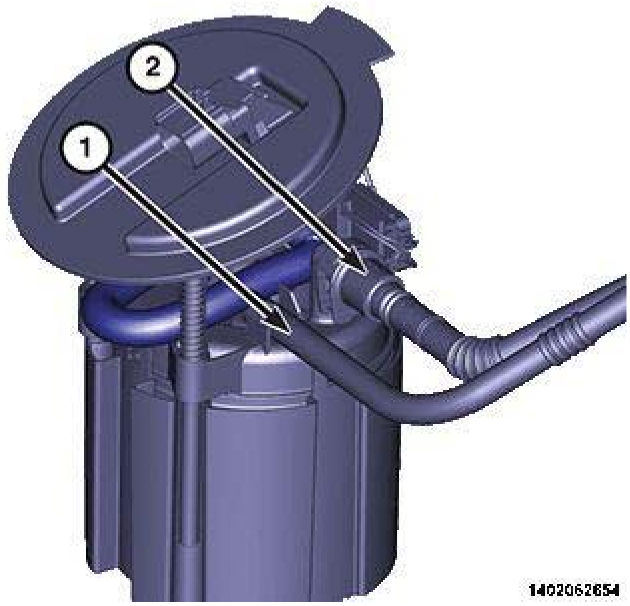

Fig. 43: Fuel Return Line & Quick Connect Release Tab
Courtesy of CHRYSLER GROUP, LLC

16. Press the quick connect release tab (2) and remove the fuel supply line from the main fuel pump module.
17. Disconnect the fuel return line (1) from the main fuel pump module.

NOTE: **Do not spill fuel into the interior of the vehicle.**

18. Carefully lift the bottom section of the main fuel pump module out of the fuel tank, tip the bottom section on its side and drain the remaining fuel from the bottom reservoir into the fuel tank and remove from vehicle.

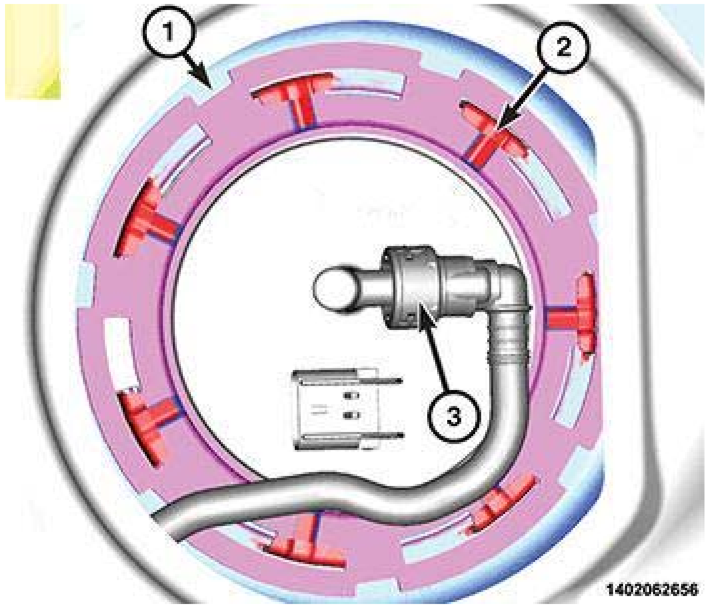
NOTE: **Whenever a fuel pump module is serviced, the rubber O-ring seal must be replaced.**

19. Remove and discard the rubber O-ring seal.

AUXILIARY FUEL PUMP MODULE

NOTE: **The Main Fuel Pump Module must be removed for Auxiliary Fuel Pump Module removal.**

1. Remove the main fuel pump module. Refer to **MODULE, FUEL PUMP, REMOVAL**.
2. Remove the auxiliary fuel pump module access cover from the floor pan.



[Fig. 44: Lock Ring, Fuel Pump & Fuel Supply Line](#)
Courtesy of CHRYSLER GROUP, LLC

NOTE:	**Prior to removing the fuel pump module, use compressed air to remove any accumulated dirt and debris from around fuel tank opening.**

3. Disconnect the fuel supply line (3) from the auxiliary fuel pump module.
4. Mark the auxiliary fuel pump module orientation.
5. Position the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench) into the notches on the outside edge of the lock ring (1).
6. Install a 1/2 inch drive breaker bar into the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench).
7. Rotate the breaker bar counterclockwise, disengaging the lock ring from the fuel pump (2).

CAUTION:	**Do not allow the float arm of the auxiliary fuel pump module to come in contact with any part of the fuel tank during removal or installation, damage to the float arm and fuel level sending card may result.**

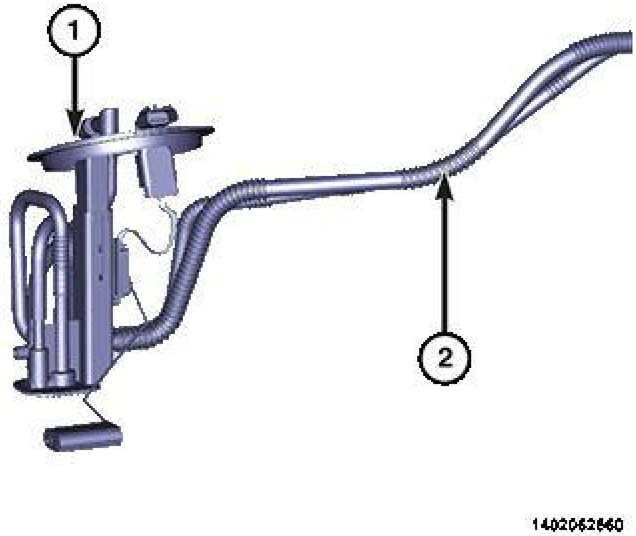


Fig. 45: Auxiliary Fuel Pump Module & Fuel Supply And Return Line
Courtesy of CHRYSLER GROUP, LLC

8. Lift the auxiliary fuel pump module (1) up and out of fuel tank while guiding the fuel supply and return lines (2) out from the left side of the fuel tank.

NOTE:	**Whenever a fuel pump module is serviced, the rubber O-ring seal must be replaced.**

9. Remove and discard the rubber O-ring seal.

INSTALLATION

3.6L/5.7L/6.4L

MAIN FUEL PUMP MODULE

WARNING:	**No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked OSHA approved containers. Wear protective clothing. Risk of injury to eyes and skin from contact with fuel.**
CAUTION:	**Do not allow the float arm of the main fuel pump module to come in contact with any part of the fuel tank during removal or installation, damage to the float arm and fuel level sending card may result.**

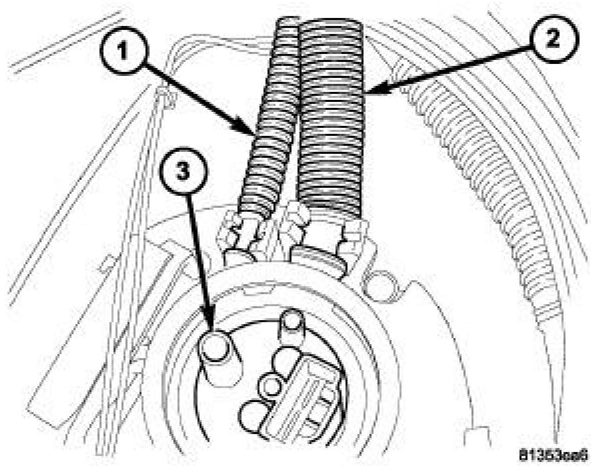

Fig. 46: Hose Connections Drivers Side
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The Auxiliary Fuel Pump Module must be installed before the Main Fuel Pump Module.**

1. If the auxiliary fuel pump module is removed, see **AUXILIARY FUEL PUMP MODULE**. .

   NOTE: **Whenever the fuel pump module is serviced, the rubber O-ring seal must be replaced.**

2. Install a new rubber O-ring seal.
3. Using caution not to bend the float arm, lower the bottom section of the main fuel pump module into the fuel tank.
4. Connect the fuel return lines (1, 2) to the main fuel pump module.

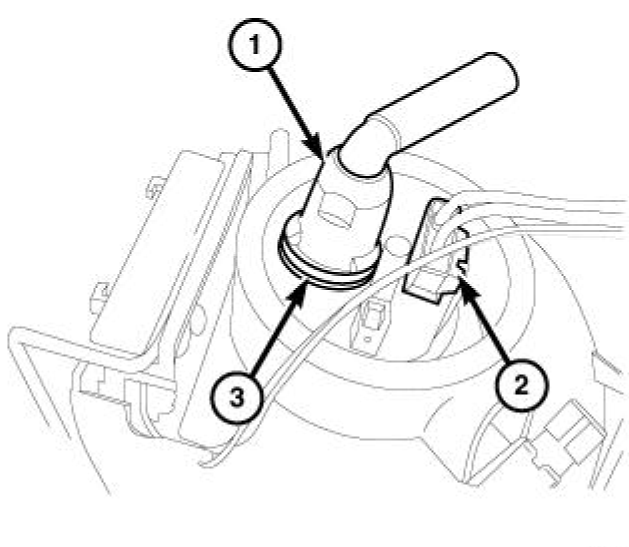

Fig. 47: Fuel Supply Line, Fuel Pump Module Electrical Connector & Quick Connect Release Tab

Courtesy of CHRYSLER GROUP, LLC

5. Connect the fuel supply line (1) to the main fuel pump module.

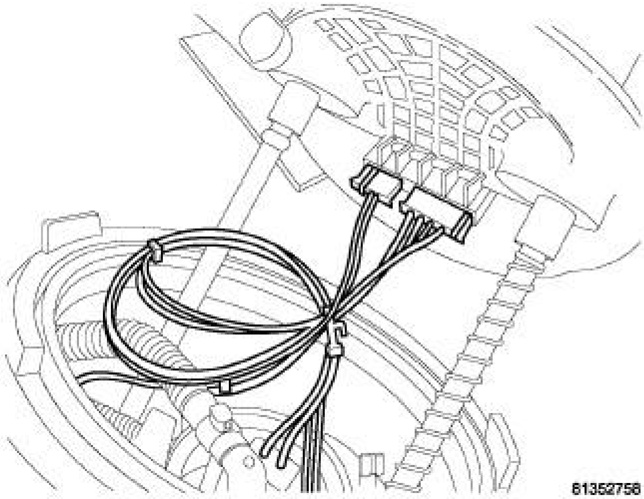

Fig. 48: Module Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

6. Connect the wire harness connectors at the top section of the main fuel pump module.
7. Join the upper section and lower section of the main fuel pump module together.
8. Position the main fuel pump module as noted during removal.

CAUTION: **Verify the electrical wires are tucked away into the fuel tank so they don't get pinched between the top of the fuel pump module and the rubber O-ring seal.**

CAUTION: **An indexing arrow is located on top of the fuel pump module to clock it's position into the fuel tank. The fuel pump module must be installed in the same position as removed.**

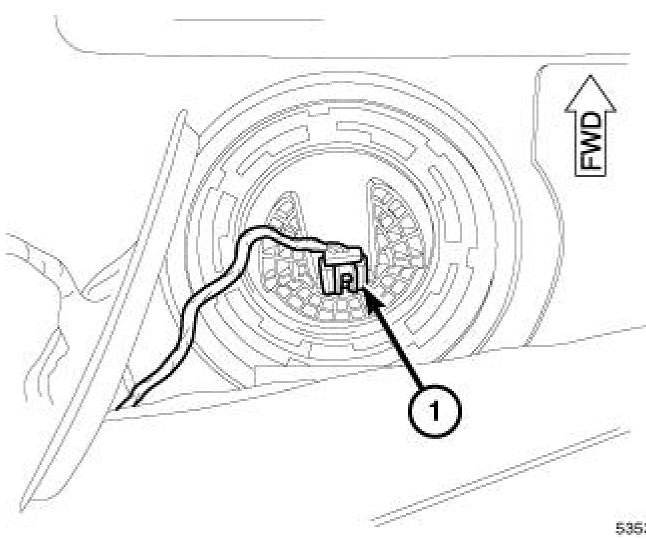

Fig. 49: Left Side Module Orientation
Courtesy of CHRYSLER GROUP, LLC

9. Align the rubber O-ring seal and lower the main fuel pump module into position.
10. Verify the main fuel pump module is in the same position as noted during removal. This step must be performed to prevent the float from contacting the side of the fuel tank.
11. Position the lock ring over top of the main fuel pump module.
12. Position the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench) into the notches on the outside edge of the lock ring.
13. Install a 1/2 inch drive breaker bar into the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench).
14. Rotate the breaker bar clockwise until all seven notches of the lock ring have engaged.

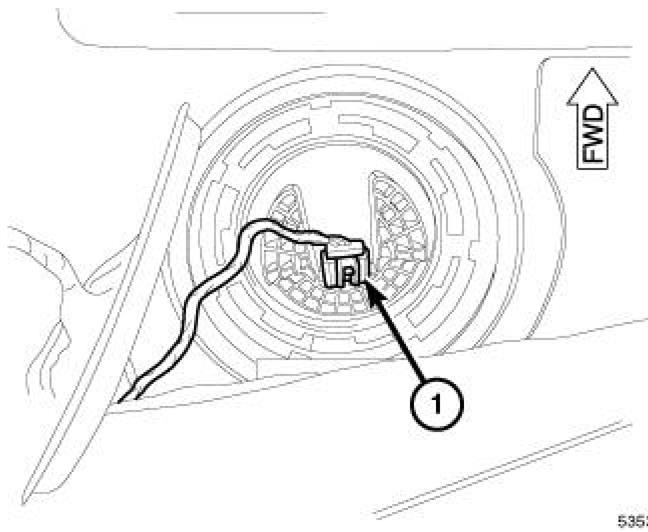

Fig. 50: Left Side Module Orientation
Courtesy of CHRYSLER GROUP, LLC

15. Connect the electrical connector (1) to the main fuel pump module.
16. Fill the fuel tank and check for leaks around the rubber O-ring seal.

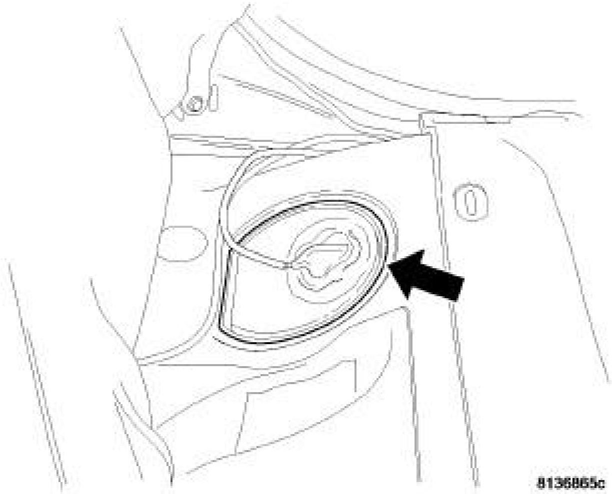

Fig. 51: Locating Plastic Access Cover
Courtesy of CHRYSLER GROUP, LLC

17. Install the main fuel pump module plastic access cover.
18. Lower the foam pad covering back into place.
19. Push the rear lower seat cushion back and down and install the seat cushion.
20. Connect the negative battery cable.

AUXILIARY FUEL PUMP MODULE

CAUTION: **An indexing arrow is located on top of the fuel pump module to clock it's position into the fuel tank. The fuel pump module must be installed in the same position as removed.**

CAUTION: **Do not allow the float arm of the auxiliary fuel pump module to come in contact with any part of the fuel tank during removal or installation, damage to the float arm and fuel level sending card may result.**

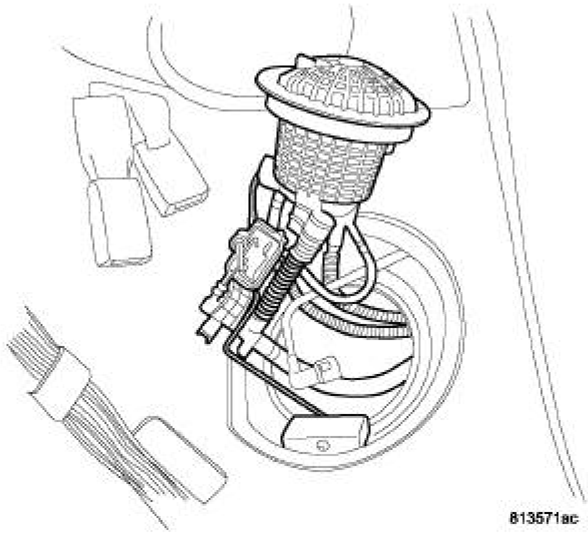

Fig. 52: Remove/Install Right Side Module
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Whenever the fuel pump module is serviced, the rubber O-ring seal must be replaced.**

1. Install a new rubber O-ring seal.
2. Using caution not to bend the float arm, lower the auxiliary fuel pump module into the fuel tank while guiding the fuel return lines, fuel supply line and electrical connector over to the left side of the fuel tank.
3. Align the rubber O-ring seal and lower the auxiliary fuel pump module into position as noted during removal.
4. Position the lock ring over top of the auxiliary fuel pump module.
5. Verify the auxiliary fuel pump module is in the same position as noted during removal. This step must be performed to prevent the float from contacting the side of the fuel tank.

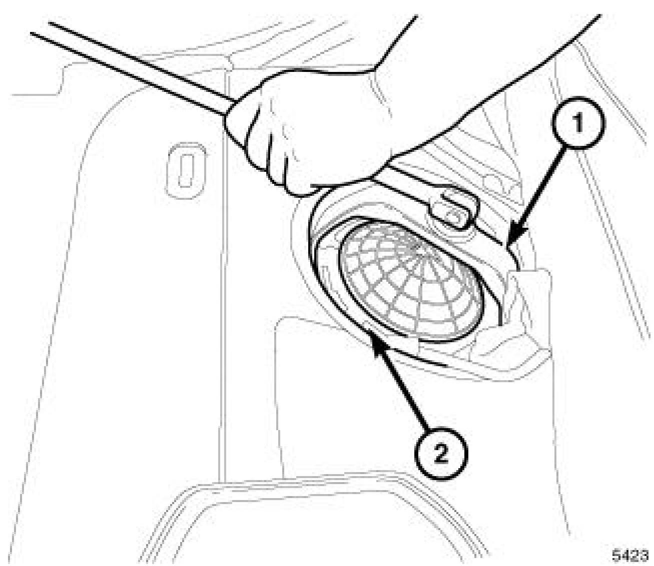

Fig. 53: Fuel Pump Lock Ring Wrench & Lock Ring
Courtesy of CHRYSLER GROUP, LLC

6. Position the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench) (1) into the notches on the outside edge of the lock ring (2).
7. Install a 1/2 inch drive breaker bar into the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench) (1).
8. Rotate the breaker bar clockwise until all seven notches of the lock ring have engaged.

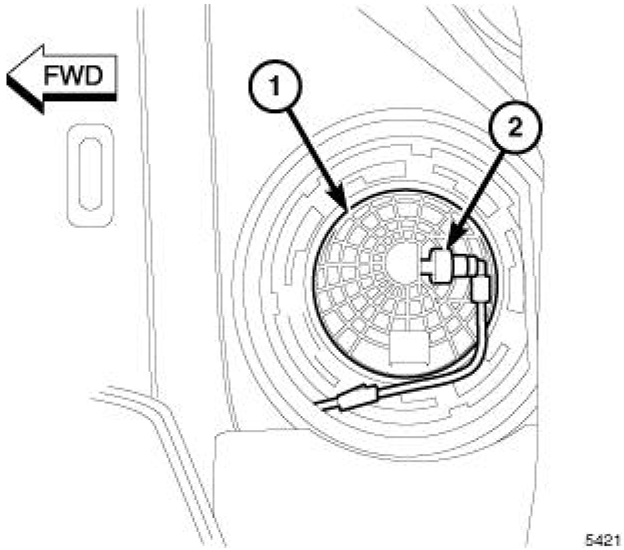

Fig. 54: Auxiliary Fuel Pump Module & Fuel Supply Line
Courtesy of CHRYSLER GROUP, LLC

9. Connect the fuel supply line (2) to auxiliary fuel pump module.
10. Install the auxiliary fuel pump module plastic access cover (1).
11. Install the main fuel pump module, see **MAIN FUEL PUMP MODULE**.

6.2L

MAIN FUEL PUMP MODULE

WARNING: **No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked OSHA approved containers. Wear protective clothing. Risk of injury to eyes and skin from contact with fuel.**

CAUTION: **Do not allow the float arm of the main fuel pump module to come in contact with any part of the fuel tank during removal or installation, damage to the float arm and fuel level sending card may result.**

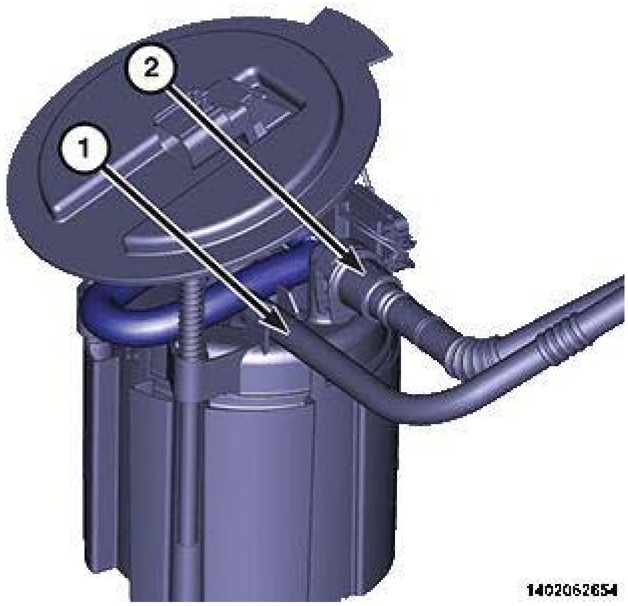

Fig. 55: Fuel Return Line & Quick Connect Release Tab
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The Auxiliary Fuel Pump Module must be installed before the Main Fuel Pump Module.**

1. If the auxiliary fuel pump module is removed, see **AUXILIARY FUEL PUMP MODULE**. .

   NOTE: **Whenever the fuel pump module is serviced, the rubber O-ring seal must be replaced.**

2. Install a new rubber O-ring seal.
3. Using caution not to bend the float arm, lower the bottom section of the main fuel pump module into the fuel tank.
4. Connect the fuel return line (1) to the main fuel pump module.
5. Connect the fuel supply line (2) to the main fuel pump module.

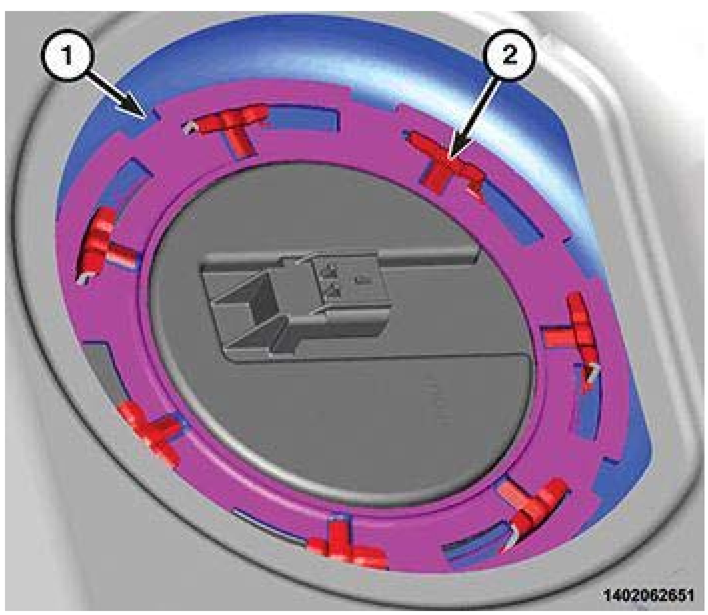
[Fig. 56: Wire Harness Connector & Main Fuel Pump Module Top Section]

Courtesy of CHRYSLER GROUP, LLC

6. Connect the wire harness connector (1) at the top section of the main fuel pump module.
7. Join the upper section (2) and lower section of the main fuel pump module together.
8. Position the main fuel pump module as noted during removal.

CAUTION: **Verify the electrical wires are tucked away into the fuel tank so they don't get pinched between the top of the fuel pump module and the rubber O-ring seal.**

CAUTION: **An indexing arrow is located on top of the fuel pump module to clock it's position into the fuel tank. The fuel pump module must be installed in the same position as removed.**



[Fig. 57: Fuel Pump Module & Lock Ring]

Courtesy of CHRYSLER GROUP, LLC

9. Align the rubber O-ring seal and lower the main fuel pump module into position.
10. Verify the main fuel pump module is in the same position as noted during removal. This step must be performed to prevent the float from contacting the side of the fuel tank.
11. Position the lock ring (1) over top of the main fuel pump module (2).
12. Position the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench) into the notches on the outside edge of the lock ring.
13. Install a 1/2 inch drive breaker bar into the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench).
14. Rotate the breaker bar clockwise until all seven notches of the lock ring have engaged.

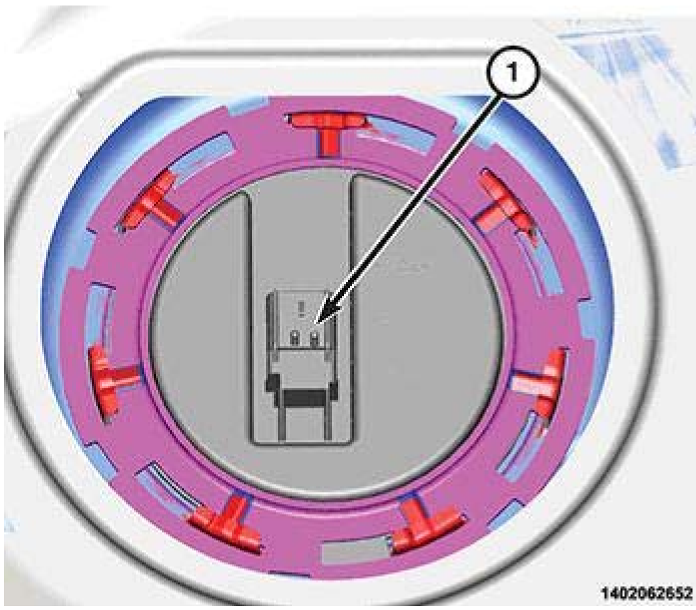


Fig. 58: Main Fuel Pump Module Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

15. Connect the electrical connector (1) to the main fuel pump module.
16. Fill the fuel tank and check for leaks around the rubber O-ring seal.

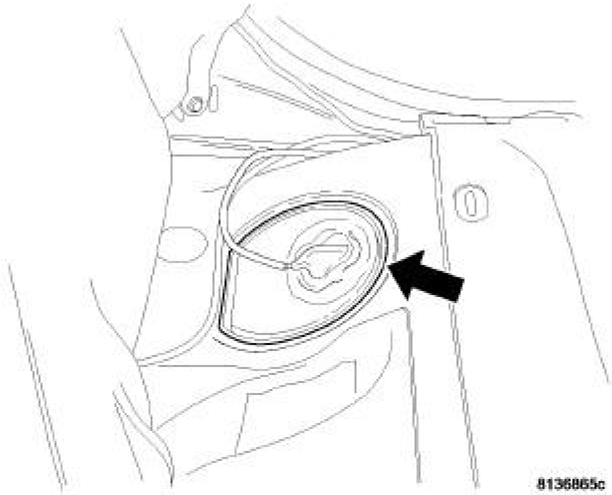

Fig. 59: Locating Plastic Access Cover
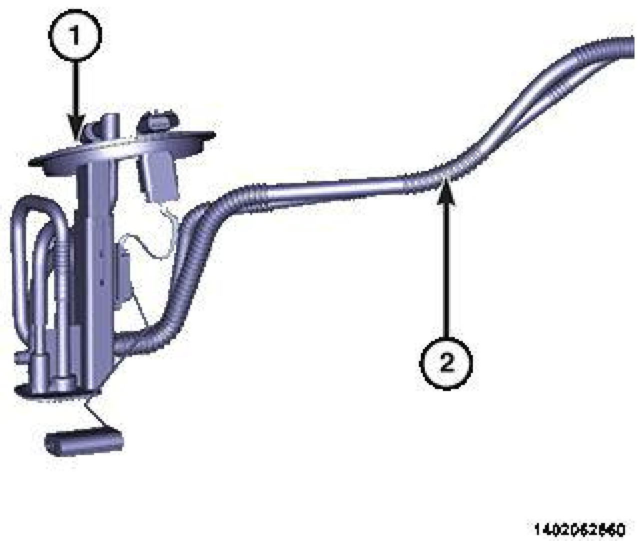
Courtesy of CHRYSLER GROUP, LLC

17. Install the main fuel pump module plastic access cover.
18. Lower the foam pad covering back into place.
19. Push the rear lower seat cushion back and down and install the seat cushion.
20. Connect the negative battery cable.

AUXILIARY FUEL PUMP MODULE

CAUTION: An indexing arrow is located on top of the fuel pump module to clock it's position into the fuel tank. The fuel pump module must be installed in the same position as removed.

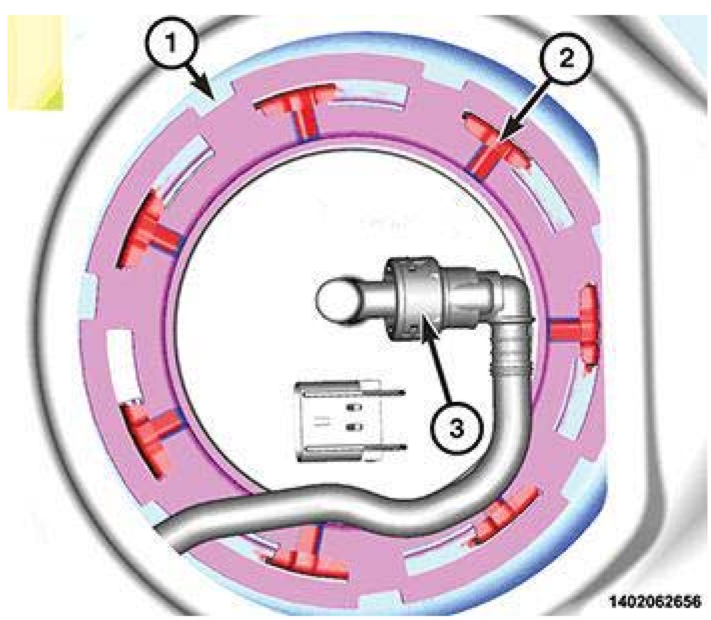
CAUTION: Do not allow the float arm of the auxiliary fuel pump module to come in contact with any part of the fuel tank during removal or installation, damage to the float arm and fuel level sending card may result.



[Fig. 60: Auxiliary Fuel Pump Module & Fuel Supply And Return Line](#)
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Whenever the fuel pump module is serviced, the rubber O-ring seal must be replaced.**

1. Install a new rubber O-ring seal.
2. Using caution not to bend the float arm, lower the auxiliary fuel pump module (1) into the fuel tank while guiding the fuel return line and supply lines (2) over to the left side of the fuel tank.
3. Align the rubber O-ring seal and lower the auxiliary fuel pump module into position as noted during removal.



[Fig. 61: Lock Ring, Fuel Pump & Fuel Supply Line](#)
Courtesy of CHRYSLER GROUP, LLC

4. Position the lock ring over top of the auxiliary fuel pump module.

5. Verify the auxiliary fuel pump module is in the same position as noted during removal. This step must be performed to prevent the float from contacting the side of the fuel tank.
6. Position the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench) into the notches (1) on the outside edge of the lock ring.
7. Install a 1/2 inch drive breaker bar into the SAE Fuel Pump Lock Ring Wrench (special tool #9340, SAE Fuel Pump Lock Ring Wrench).
8. Rotate the breaker bar clockwise until all seven notches of the lock ring have engaged (2).
9. Connect the fuel supply line (3) to auxiliary fuel pump module.
10. Install the auxiliary fuel pump module access cover.
11. Install the main fuel pump module. Refer to **MODULE, FUEL PUMP, INSTALLATION**.

RAIL, FUEL

REMOVAL

3.6L

WARNING: The fuel system is under constant pressure even with engine off. Before servicing the fuel rail, fuel system pressure must be released.

1. Perform the fuel pressure release procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE**.
2. Disconnect and isolate the negative battery cable.

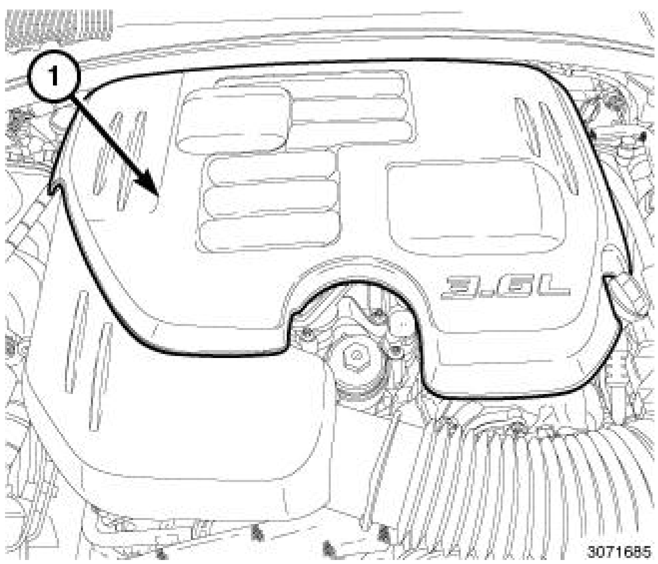


Fig. 62: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

3. Remove the engine cover (1).
4. Remove the upper intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL** .

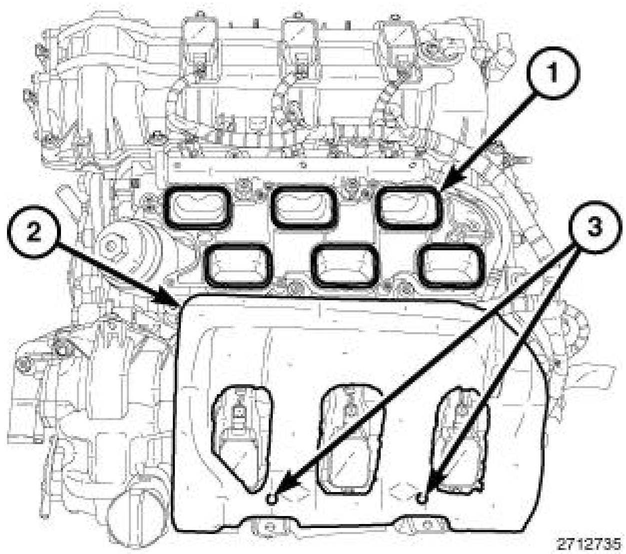

Fig. 63: Intake Ports, Insulator & Alignment Posts
Courtesy of CHRYSLER GROUP, LLC

5. Remove the insulator (2) from the left cylinder head cover.

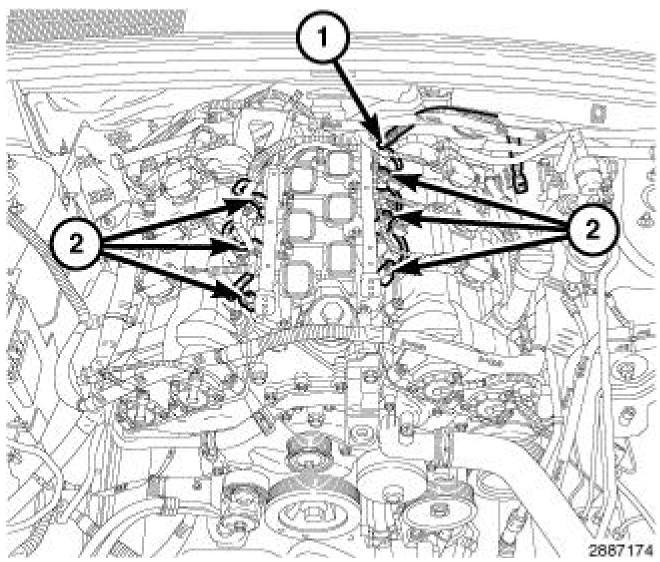

Fig. 64: Fuel Supply Hose & Fuel Injector Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

6. Disconnect the fuel injector wire harness connectors (2).
7. Disconnect the fuel supply hose (1) from the fuel rail. Refer to **FITTING, QUICK CONNECT, STANDARD PROCEDURE**.

CAUTION: The left and right fuel rails are replaced as an assembly. Do not attempt to separate the rail halves at the connector tube. Due to the design of this tube, it does not use any clamps. Never attempt to install a clamping device of any kind on the tube. When removing the fuel rail assembly for any reason, be careful not to bend or kink the tube.

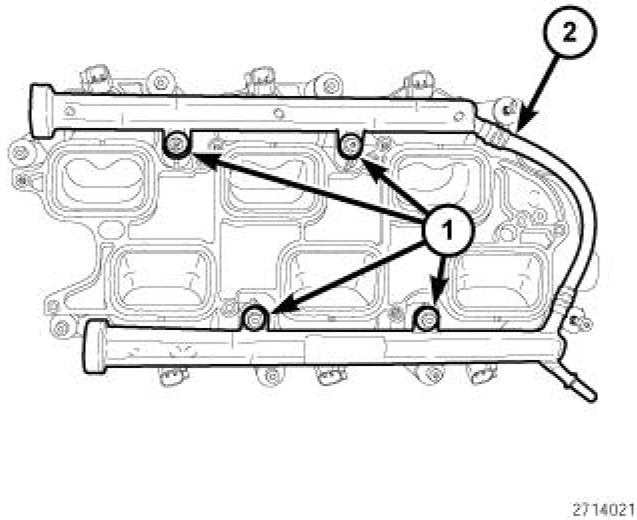

Fig. 65: Fuel Rail & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Remove bolts (1) and the fuel rail (2) with fuel injectors.

CAUTION: **When removing the fuel rail from the lower intake manifold, one or more fuel injectors may remain in the intake manifold resulting in residual fuel spilling onto the engine from the fuel rail.**

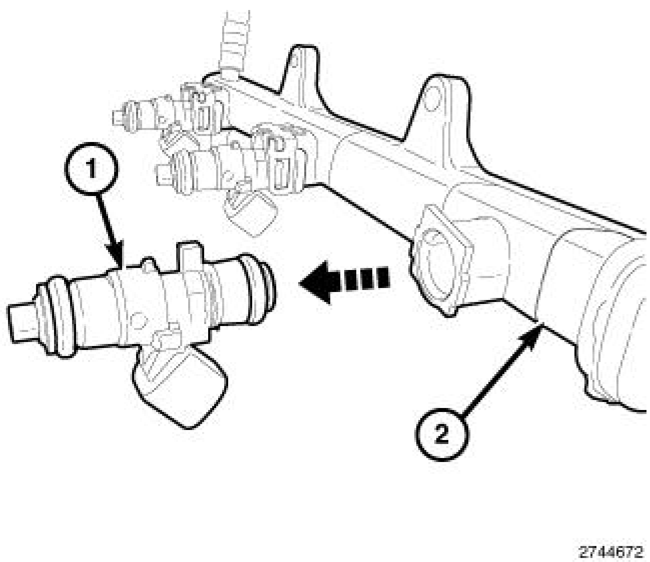

Fig. 66: Removing Fuel Injector From Fuel Rail
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Number 2 fuel injector removal shown in the illustration, all other fuel injectors similar.**

9. If required, remove safety clips and the fuel injectors (1) from fuel rail (2).

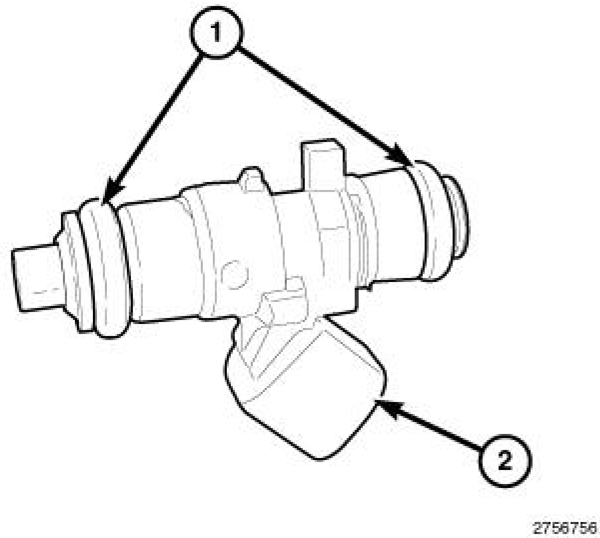

Fig. 67: O-Ring Seals
Courtesy of CHRYSLER GROUP, LLC

10. Remove and discard all fuel injector O-ring seals (1).

5.7L

WARNING: **The fuel system is under constant pressure even with engine off. Before servicing the fuel rail, fuel system pressure must be released.**

CAUTION: **The left and right fuel rails are replaced as an assembly. Do not attempt to separate fuel rail halves at connector tube. Due to design of the connector tube, it does not use any clamps. Never attempt to install a clamping device of any kind to the connector tube. When removing fuel rail assembly for any reason, be careful not to bend or kink the connector tube.**

1. Perform fuel system pressure release procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE**.
2. Disconnect and isolate the negative battery cable.

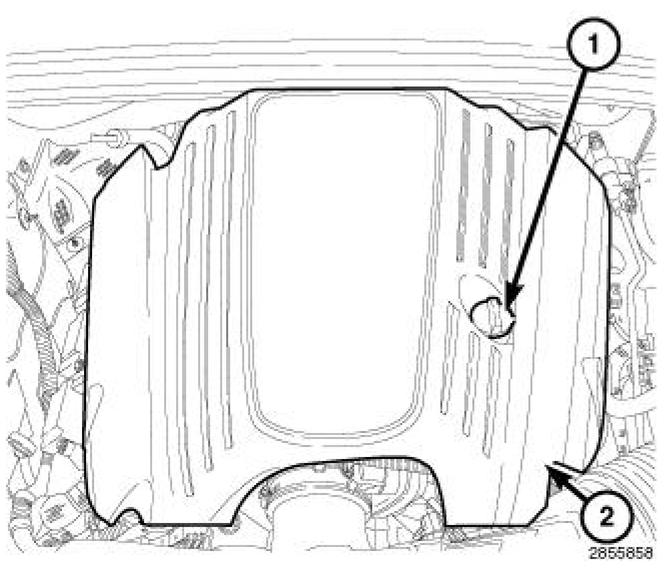

Fig. 68: Oil Fill Cap & Engine Cover
Courtesy of CHRYSLER GROUP, LLC

3. Remove the engine cover (2).
4. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** .
5. Disconnect the PCV hose.
6. Disconnect fuel injector wire harness connector from fuel injectors.

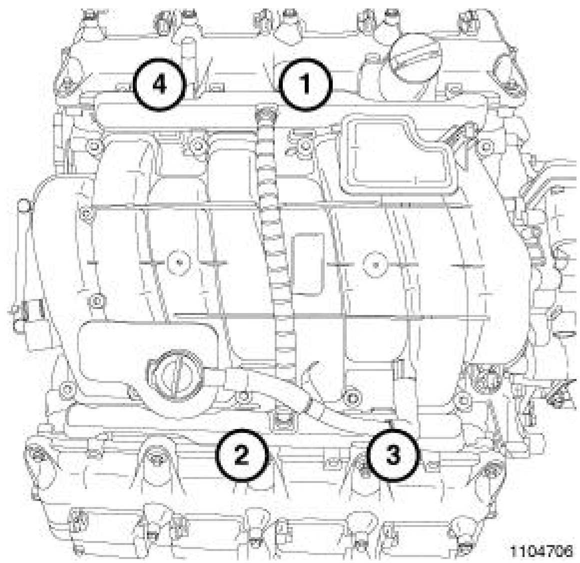

Fig. 69: Fuel Rail Mounting Bolts Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect the fuel supply line at the fuel rail. Refer to **FITTING, QUICK CONNECT, STANDARD PROCEDURE**.
8. Using the sequence shown in the illustration, remove the four fuel rail bolts.
9. Gently rock and lift the left side fuel rail until the fuel injectors just start to clear the machined holes in the intake manifold.
10. Gently rock and lift the right side fuel rail until the fuel injectors just start to clear the machined holes in the intake manifold. Repeat this procedure (left/right) until all injectors have cleared the machined holes.
11. Remove the fuel rail with fuel injectors.
12. If required, removed safety clips and the fuel injectors from fuel rail.

6.2L

WARNING: The fuel system is under constant pressure even with engine off. Before servicing fuel rail, fuel system pressure must be released. Failure to follow this warning may result in serious or fatal injury.

CAUTION: The left and right fuel rails are replaced as an assembly. Do not attempt to separate fuel rail halves at connector tube. Due to design of the connector tube, it does not use any clamps. Never attempt to install a clamping device of any kind to the connector tube. When removing fuel rail assembly for any reason, be careful not to bend or kink the connector tube.

1. Perform Fuel System Pressure Release Procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE**.
2. Disconnect and isolate the negative battery cable.

Fig. 70: Engine Covers
Courtesy of CHRYSLER GROUP, LLC

3. Remove the engine covers (1).

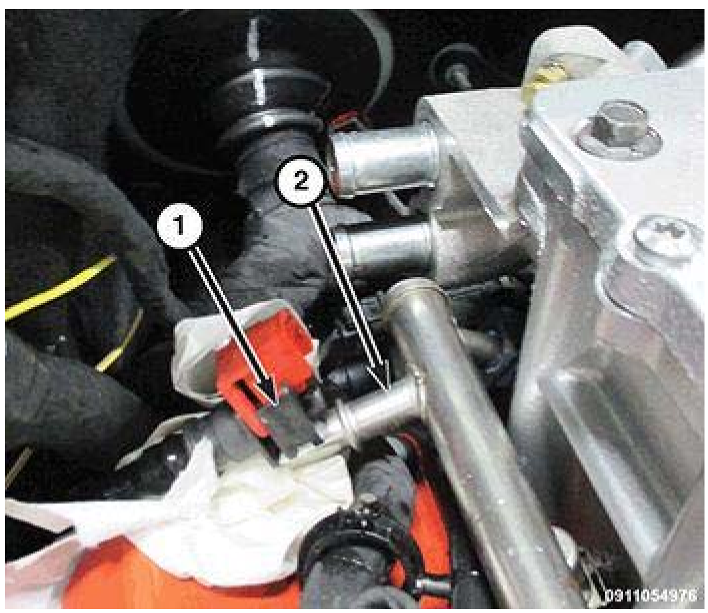

Fig. 71: Fuel Supply Line & Fuel Rail
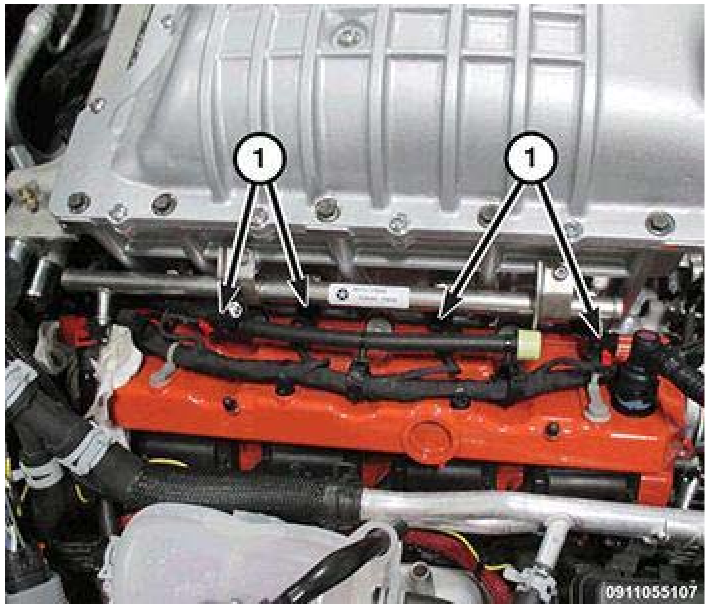
Courtesy of CHRYSLER GROUP, LLC

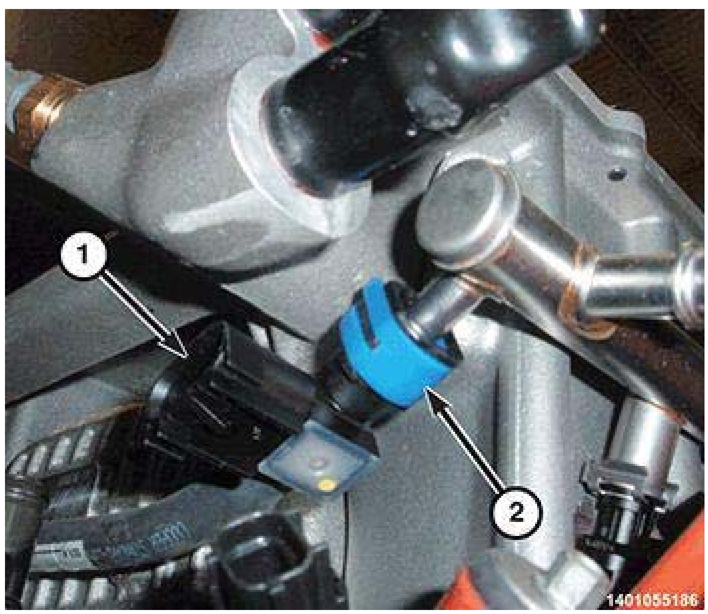
4. Disconnect the fuel supply line (1) from fuel rail (2). Refer to **FITTING, QUICK CONNECT, STANDARD PROCEDURE**.



[Fig. 72: Fuel Injector Wire Harness Connectors](#)
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Right side shown in the illustration, left side similar.**

5. Disconnect the left side fuel injector wire harness connectors (1) and position harness aside



[Fig. 73: Fuel Pressure Sensor Wire Harness Connector & Fuel Rail Supply Line](#)
Courtesy of CHRYSLER GROUP, LLC

6. Disconnect the fuel pressure sensor (1) wire harness connector.
7. Disconnect the left fuel rail supply line (2) from right fuel rail. Refer to **FITTING, QUICK CONNECT, STANDARD PROCEDURE**.

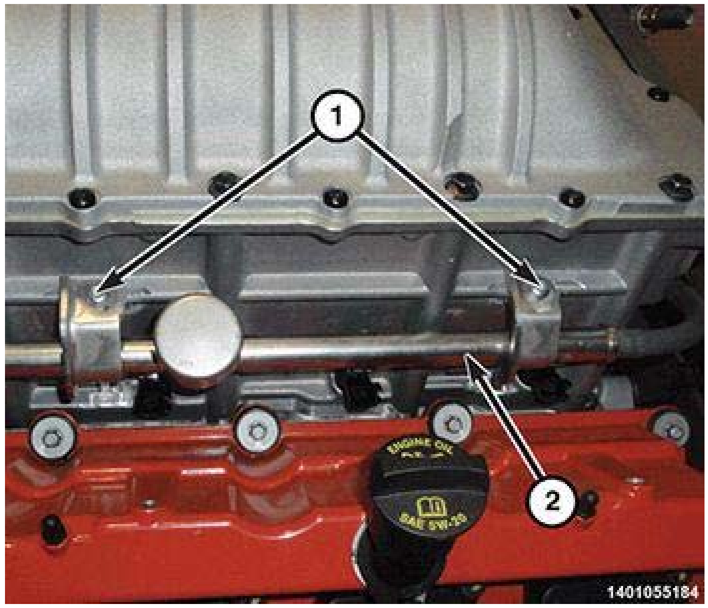


Fig. 74: Fuel Rail Bolts & Fuel Rail
Courtesy of CHRYSLER GROUP, LLC

8. Remove the left fuel rail bolts (1).
9. Gently rock and lift the left fuel rail until the fuel injectors just start to clear machined holes in the supercharger.
10. Remove the left fuel rail (2), with injectors attached, from the engine.

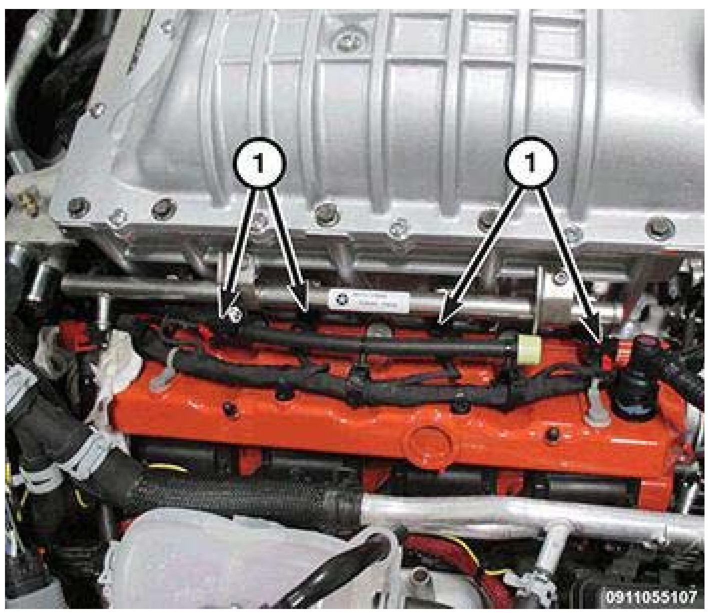

Fig. 75: Fuel Injector Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

11. Disconnect the right side fuel injector wire connectors (1) and position harness aside.

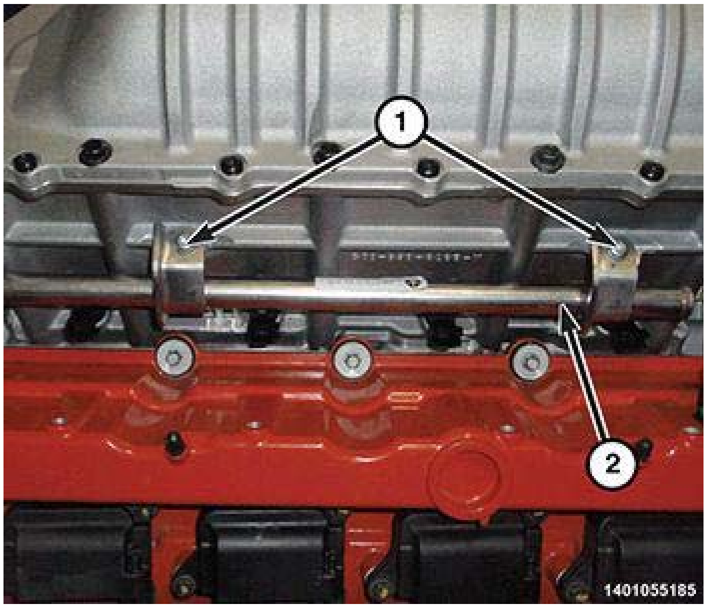

Fig. 76: Fuel Rail Bolts & Fuel Rail
Courtesy of CHRYSLER GROUP, LLC

12. Remove the right fuel rail bolts (1).
13. Gently rock and lift the right fuel rail until the fuel injectors just start to clear machined holes in the supercharger.
14. Remove the right fuel rail (2), with injectors attached, from the engine.

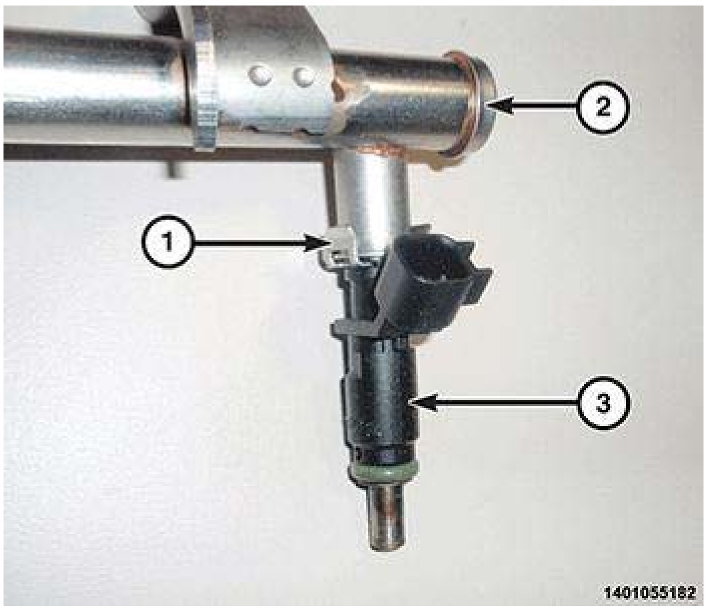

Fig. 77: Safety Clips, Fuel Rail & Fuel Injector
Courtesy of CHRYSLER GROUP, LLC

15. If required, remove safety clips (1) and the fuel injectors (3).

6.4L

WARNING: The fuel system is under constant pressure even with engine off. Before

servicing fuel rail, fuel system pressure must be released. Failure to follow this warning may result in serious or fatal injury.

CAUTION: **The left and right fuel rails are replaced as an assembly. Do not attempt to separate fuel rail halves at connector tube. Due to design of the connector tube, it does not use any clamps. Never attempt to install a clamping device of any kind to the connector tube. When removing fuel rail assembly for any reason, be careful not to bend or kink the connector tube.**

1. Perform Fuel System Pressure Release Procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE**.
2. Disconnect and isolate the negative battery cable.

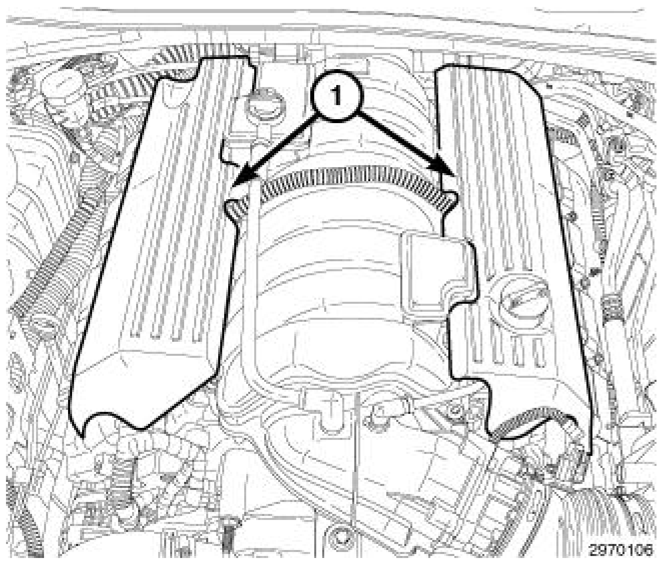

Fig. 78: Installing Engine Covers
Courtesy of CHRYSLER GROUP, LLC

3. Remove the engine covers (1).

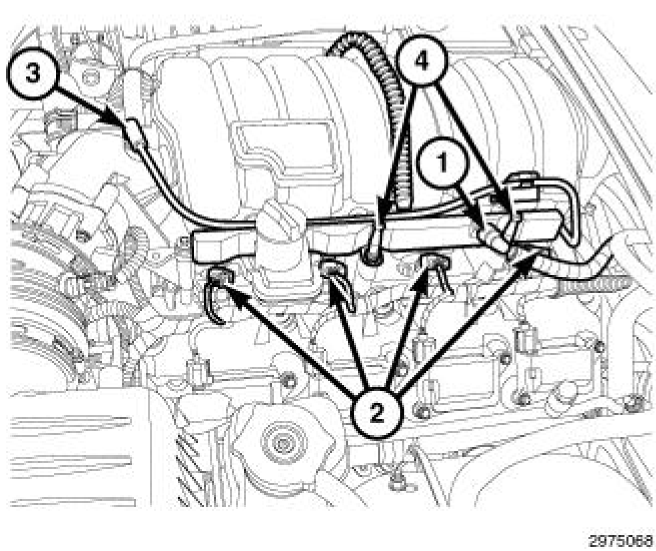

Fig. 79: Fuel Supply Line, Left Side Fuel Injector Electrical Connectors, EVAP Vacuum Line &

Left Fuel Rail Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the fuel supply line (1) from fuel rail. Refer to **FITTING, QUICK CONNECT, STANDARD PROCEDURE**.
5. Disconnect the left side fuel injector wire harness connectors (2) and position harness aside
6. Disconnect the EVAP vacuum line (3) and position aside.
7. Remove the left fuel rail bolts (4).

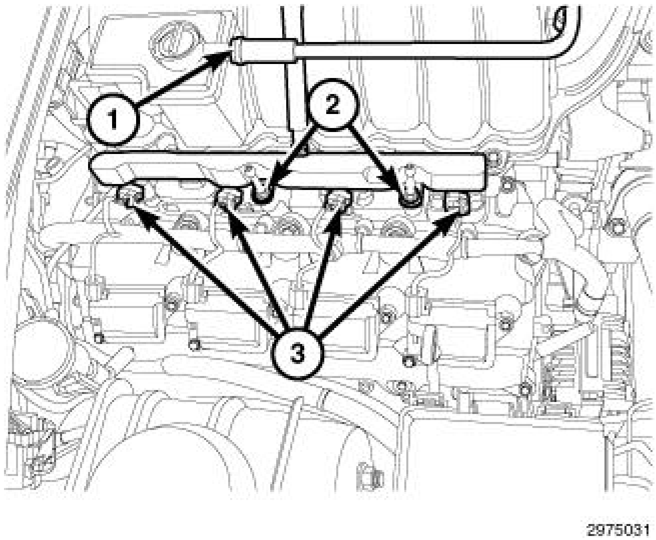

Fig. 80: PCV Hose, Right Fuel Rail Retaining Bolts & Right Side Fuel Injector Electrical Connectors
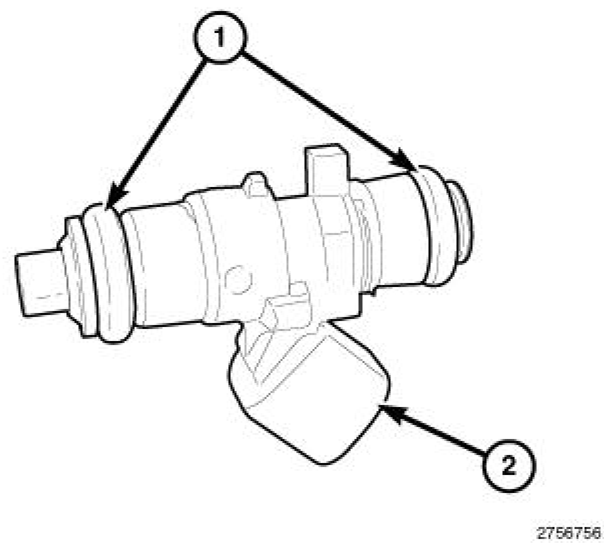
Courtesy of CHRYSLER GROUP, LLC

8. Disconnect the PCV hose (1) and position aside.
9. Remove the right fuel rail bolts (2).
10. Remove the right side fuel injector wire connectors (3) and position harness aside.
11. Gently rock and lift the right fuel rail until the fuel injectors just start to clear machined holes in intake manifold.
12. Gently rock and lift the left fuel rail until the fuel injectors just start to clear machined holes in intake manifold.
13. Repeat this procedure (left/right) until all fuel injectors have cleared the machined holes.
14. Remove both fuel rails (with injectors attached) from the engine.
15. If required, remove safety clips and the fuel injectors.

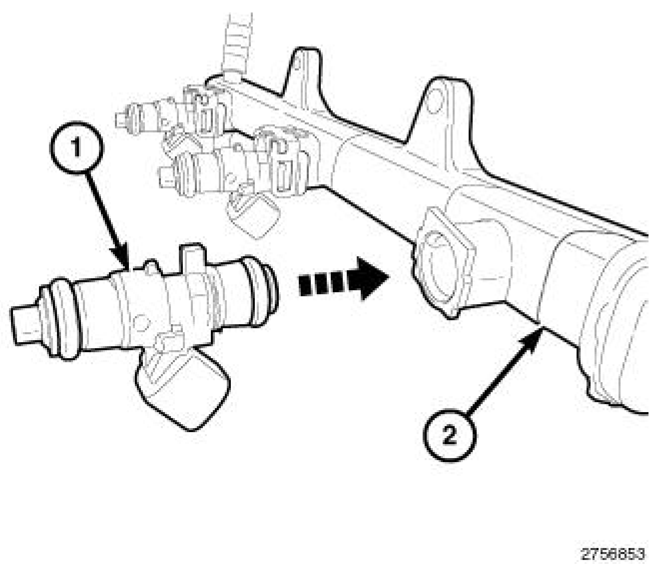
INSTALLATION

3.6L



[Fig. 81: O-Ring Seals]
Courtesy of CHRYSLER GROUP, LLC

1. Lightly lubricate the new O-ring seals (1) with clean engine oil and instal the O-ring seals onto the fuel injector (2).



[Fig. 82: Installing Fuel Injector To Fuel Rail]
Courtesy of CHRYSLER GROUP, LLC

2. If required, install the fuel injectors (1) into the fuel rail (2) and safety clips.

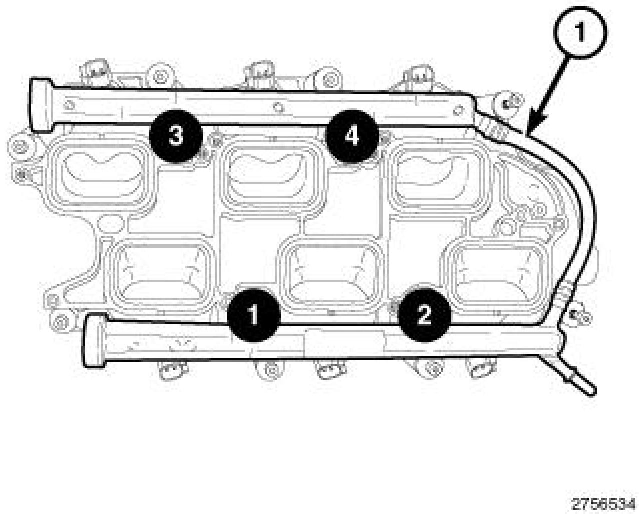


Fig. 83: Fuel Rail Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

3. Clean out the fuel injector bores in the lower intake manifold.
4. Install the fuel rail (1) onto the lower intake manifold. Using the sequence shown in the illustration, tighten bolts to the proper torque specification. Refer to **FUEL DELIVERY, GAS, SPECIFICATIONS**.

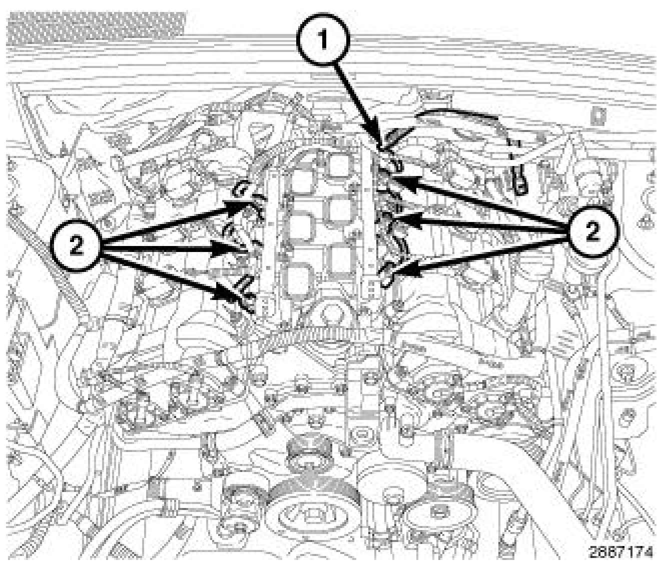

Fig. 84: Fuel Supply Hose & Fuel Injector Electrical Connectors
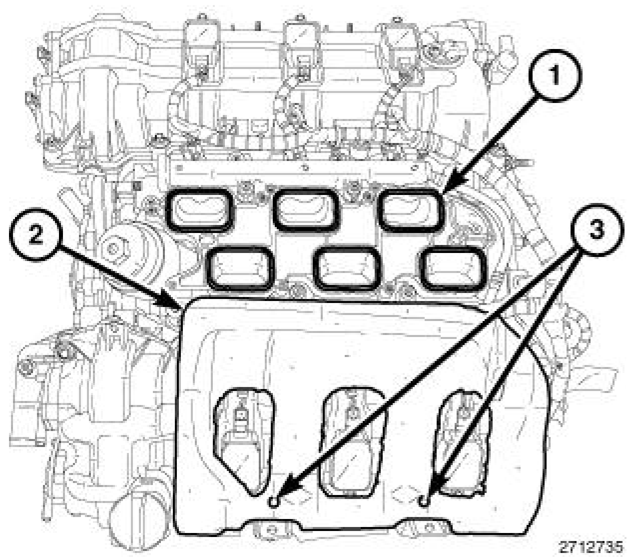
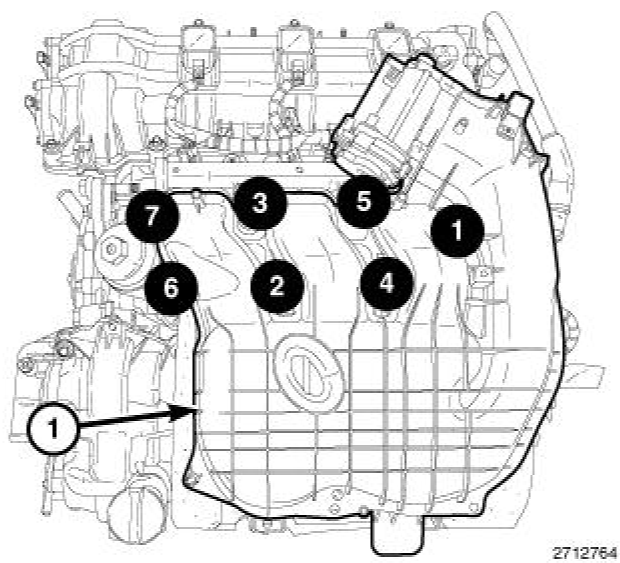
Courtesy of CHRYSLER GROUP, LLC

5. Connect the fuel injector wire harness connectors (2).
6. Connect the fuel supply hose to the fuel rail (1). Refer to **FITTING, QUICK CONNECT, STANDARD PROCEDURE**.



[Fig. 85: Intake Ports, Insulator & Alignment Posts](#)
Courtesy of CHRYSLER GROUP, LLC

7. Install the insulator (2) to the two alignment posts (3) on top of the left cylinder head cover.



[Fig. 86: Upper Intake Manifold Bolt Tightening Sequence](#)
Courtesy of CHRYSLER GROUP, LLC

8. Install the upper intake manifold (1) and support brackets. Refer to **MANIFOLD, INTAKE, INSTALLATION** .

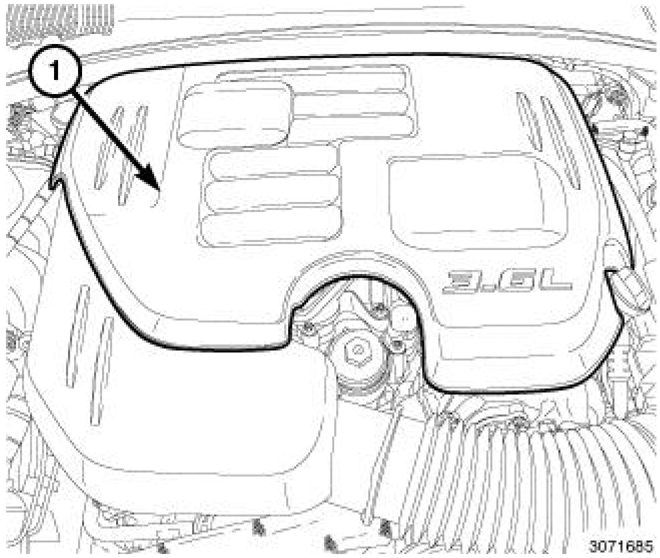


Fig. 87: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

9. Install the engine cover (1).
10. Connect the negative battery cable.
11. Start the engine and check for leaks.

5.7L

CAUTION: The left and right fuel rails are replaced as an assembly. Do not attempt to separate fuel rail halves at connector tube. Due to design of the connector tube, it does not use any clamps. Never attempt to install a clamping device of any kind to the connector tube. When removing fuel rail assembly for any reason, be careful not to bend or kink the connector tube.

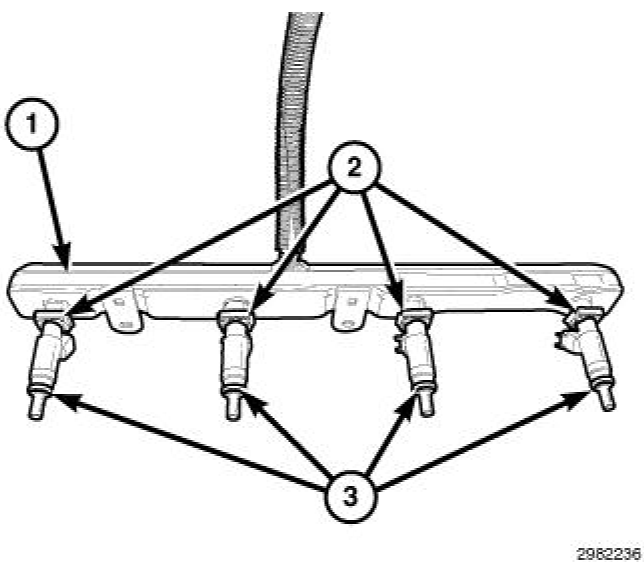

Fig. 88: Fuel Injector O-Rings, Fuel Rail/Fuel Injector Assembly & Four Fuel Rail Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

1. If required, inspect and lubricate the fuel injector O-rings.

2. If removed, install the fuel injectors into fuel rail.
3. Inspect the fuel injector O-rings (3) and replace if necessary.
4. Clean out the fuel injector machined bores in the intake manifold.
5. Apply a small amount of engine oil to each fuel injector O-ring (3).

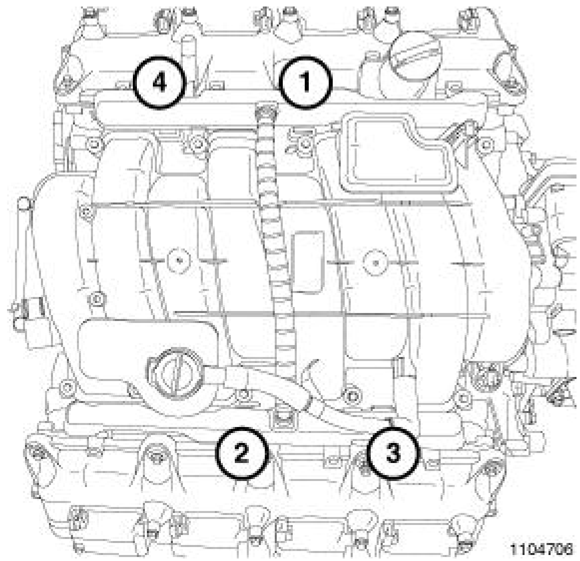

Fig. 89: Fuel Rail Mounting Bolts Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

6. Install the fuel rail/fuel injector assembly by guide each fuel injector into the intake manifold using care not to tear the O-ring seal.
7. Push the right fuel rail down until the fuel injectors have bottomed on shoulders.
8. Push the left fuel rail down until the injectors have bottomed on shoulders.
9. Using the sequence shown in the illustration, install the four fuel rail bolts and tighten to the proper torque specification. Refer to **FUEL DELIVERY, GAS, SPECIFICATIONS**.
10. Connect the fuel line to the fuel rail. Refer to **FITTING, QUICK CONNECT, STANDARD PROCEDURE**.
11. Connect the fuel injector wire harness connectors.
12. Connect the PCV hose.
13. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION** .

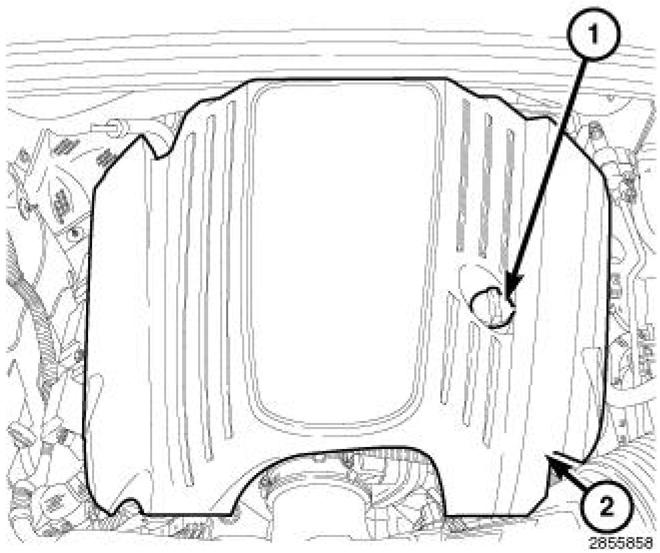

Fig. 90: Oil Fill Cap & Engine Cover

REGULATOR, FUEL PRESSURE

DESCRIPTION

DESCRIPTION

The fuel pressure regulator is integrated with the auxiliary fuel pump module and is not serviced separately. The auxiliary fuel pump module must be replace if the fuel pressure regulator is to be replaced.

For auxiliary fuel pump module removal. Refer to **MODULE, FUEL PUMP, REMOVAL**.

SENDING UNIT AND SENSOR, FUEL LEVEL

DESCRIPTION

DESCRIPTION

The fuel level sending units and sensors are integrated with both the main fuel pump module and the auxiliary fuel pump module and are not serviced separately. The appropriate fuel pump module must be replace if either fuel level sending unit is to be replaced.

For fuel pump module removal. Refer to **MODULE, FUEL PUMP, REMOVAL**.

TANK, FUEL

REMOVAL

REMOVAL

WARNING: The fuel system is under constant high pressure even with engine off. Until the fuel pressure has been properly released from the system, do not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Wear protective clothing and eye protection. Make sure the area in which the vehicle is being serviced is in a well ventilated area and free of flames/sparks. Failure to comply may result in serious or fatal injury.

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked OSHA approved containers. Wear protective clothing. Risk of injury to eyes and skin from contact with fuel.

1. Perform the draining fuel tank procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE**.
2. Disconnect and isolate the negative battery cable.
3. Remove the left rear wheelhouse splash shield. Refer to **SHIELD, SPLASH, REAR WHEELHOUSE, REMOVAL** .

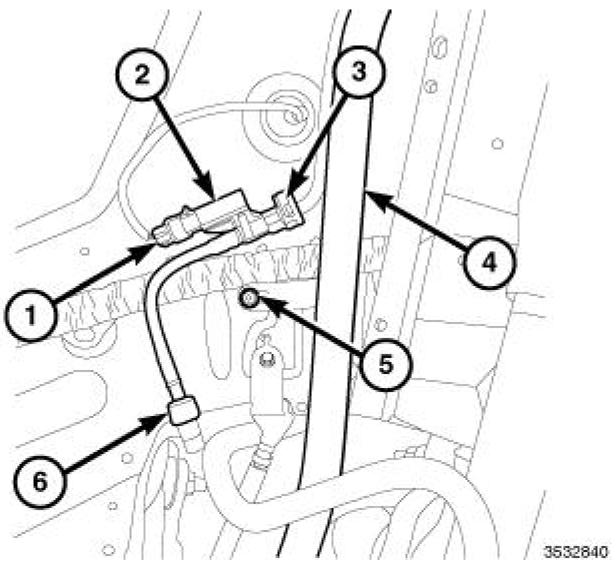

Fig. 105: Fuel Tank Pressure Sensor Electrical Connector, Filler Tube & Fuel Tank Vent Steel Line

14. Disconnect the vapor line. Refer to **FITTING, QUICK CONNECT, STANDARD PROCEDURE**.

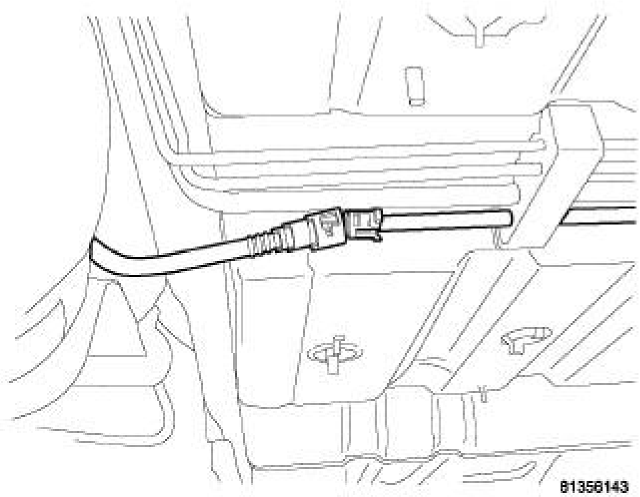

Fig. 114: Fuel Line Disconnected
Courtesy of CHRYSLER GROUP, LLC

15. Disconnect the fuel supply line. Refer to **FITTING, QUICK CONNECT, STANDARD PROCEDURE**.
16. Using a suitable hydraulic jack with a fuel tank adapter, support the fuel tank.

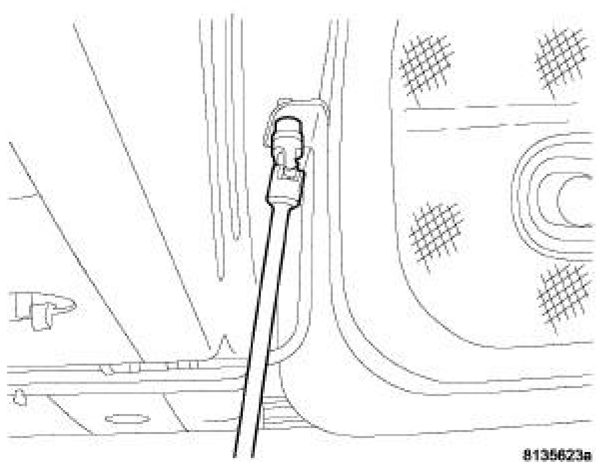

Fig. 115: Tank Strap Bolts
Courtesy of CHRYSLER GROUP, LLC

17. Remove the fuel tank support strap retaining bolts.

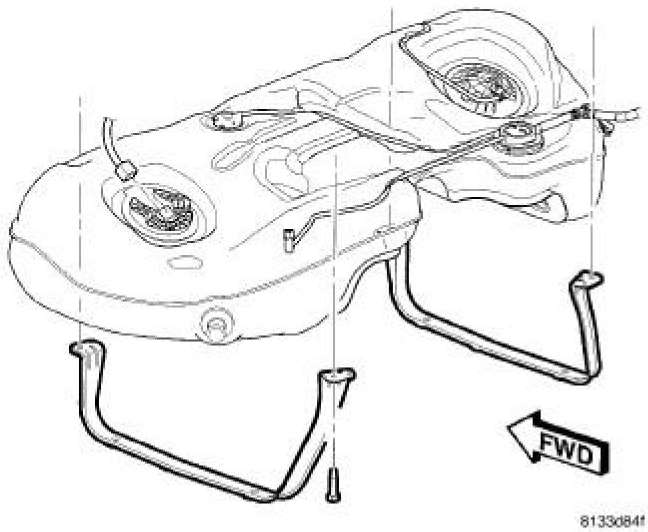

Fig. 116: Tank Straps
Courtesy of CHRYSLER GROUP, LLC

18. Remove the fuel tank support straps.

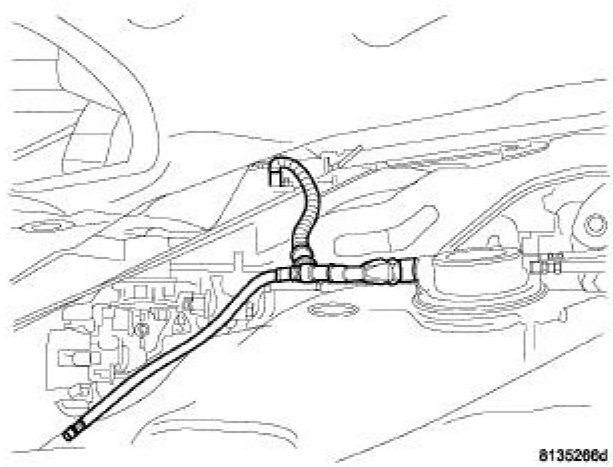

Fig. 117: Tank Vent Line Routing
Courtesy of CHRYSLER GROUP, LLC

19. Carefully lower the fuel tank and pull the ORVR vent line through bracket.
20. Lower and remove the fuel tank from the vehicle.

INSTALLATION

INSTALLATION

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked OSHA approved

containers. Wear protective clothing. Risk of injury to eyes and skin from contact with fuel.

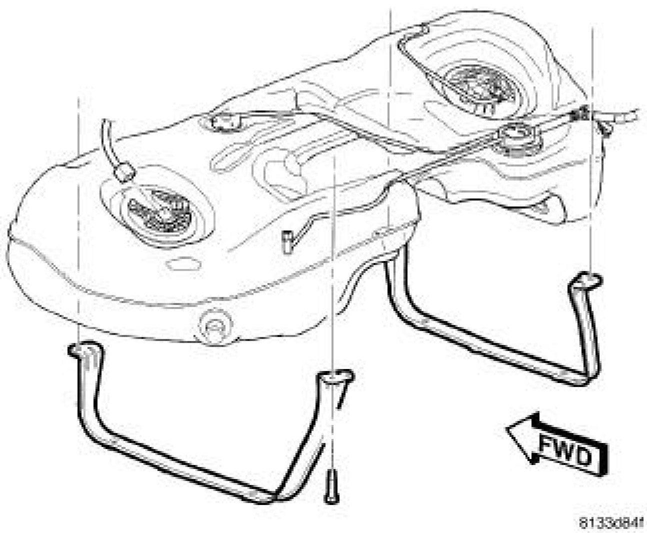

Fig. 118: Tank Straps
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the fuel pump modules. Refer to **MODULE, FUEL PUMP, INSTALLATION**.
2. Using a suitable hydraulic jack with a fuel tank adapter, support the fuel tank.
3. Carefully raise the fuel tank into position while guiding the Onboard Refueling Vapor Recovery (ORVR) vent line through bracket.
4. Install the fuel tank straps. Tighten bolts to the proper torque specification. Refer to **FUEL DELIVERY, GAS, SPECIFICATIONS**.

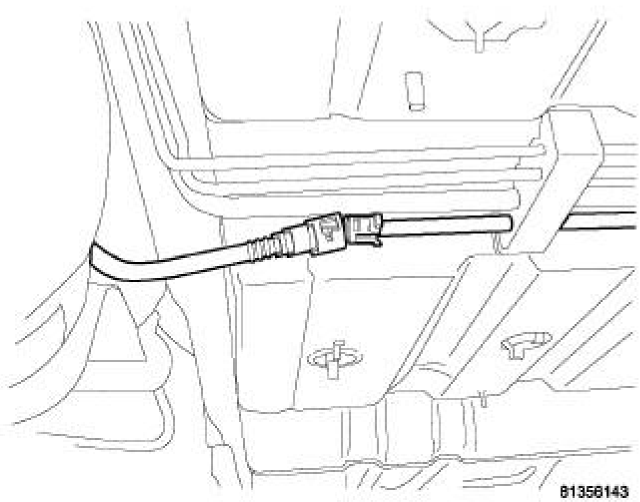

Fig. 119: Fuel Line Disconnected
Courtesy of CHRYSLER GROUP, LLC

5. Connect the fuel supply line.

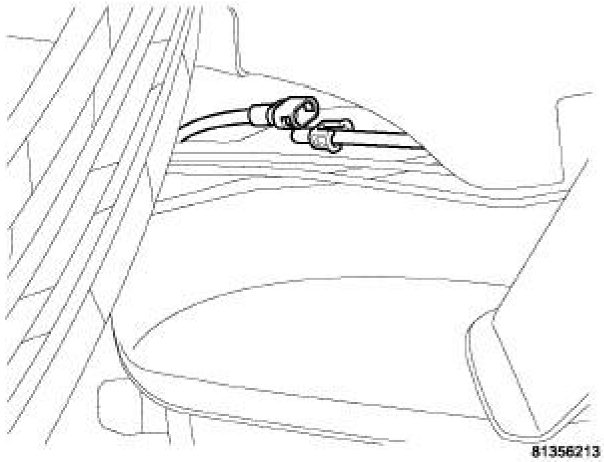

Fig. 120: Vapor Connection On Tank
Courtesy of CHRYSLER GROUP, LLC

6. Connect the vapor line.

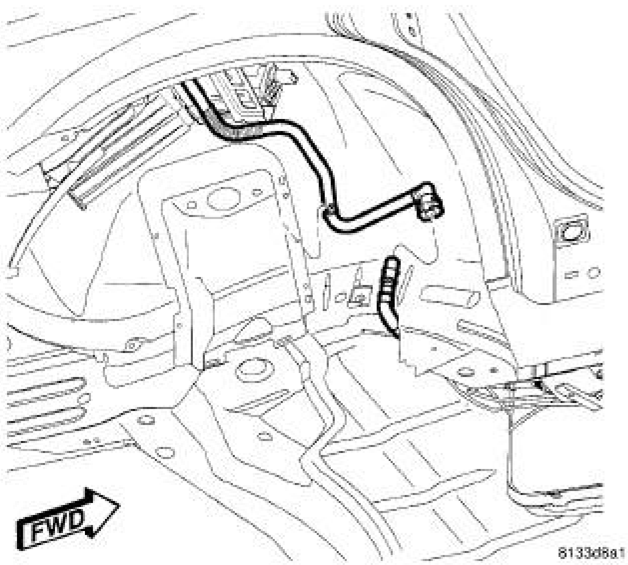

Fig. 121: EVAP Line
Courtesy of CHRYSLER GROUP, LLC

7. Connect the EVAP line in the right rear wheel well.

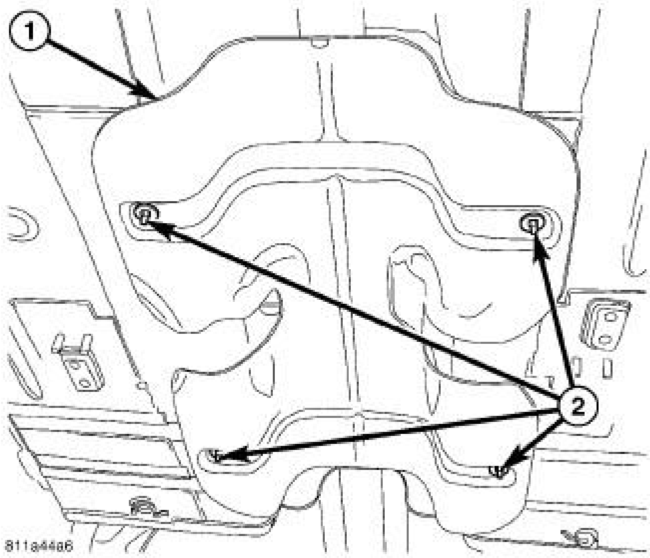

Fig. 122: Heat Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

8. Install the heat shield (1) and fasteners (2).
9. Install the propeller shaft. Refer to **INSTALLATION** .

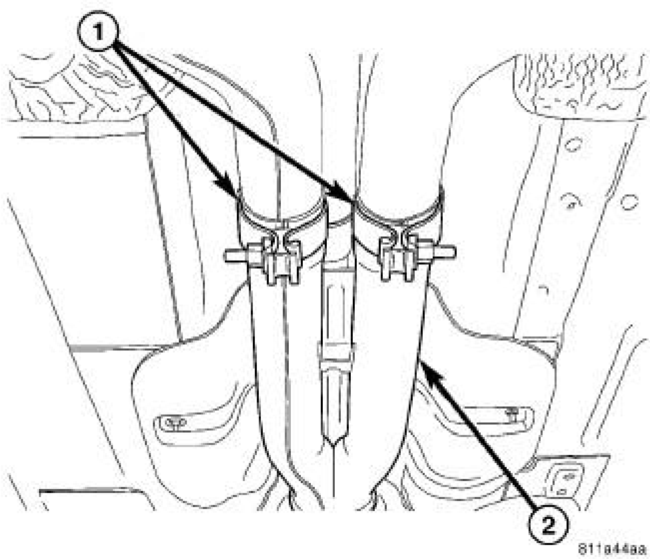

Fig. 123: Identifying Clamps & Rear Exhaust System

10. Install the muffler and tailpipe assembly (2). Refer to **MUFFLER, EXHAUST, INSTALLATION** .

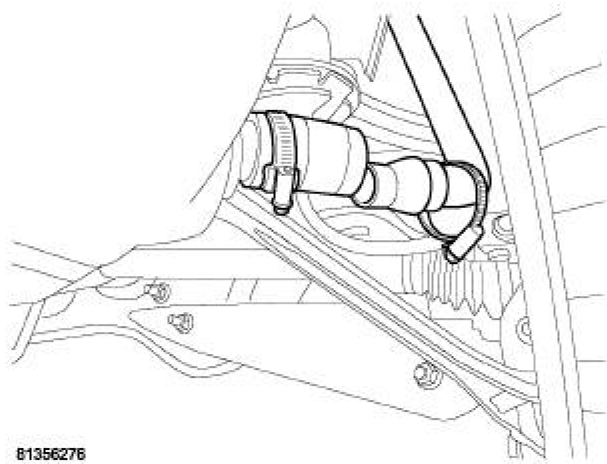

Fig. 124: Remove/Install Filler Tube
Courtesy of CHRYSLER GROUP, LLC

11. Connect the fuel filler tube to the rubber hose on the fuel tank.

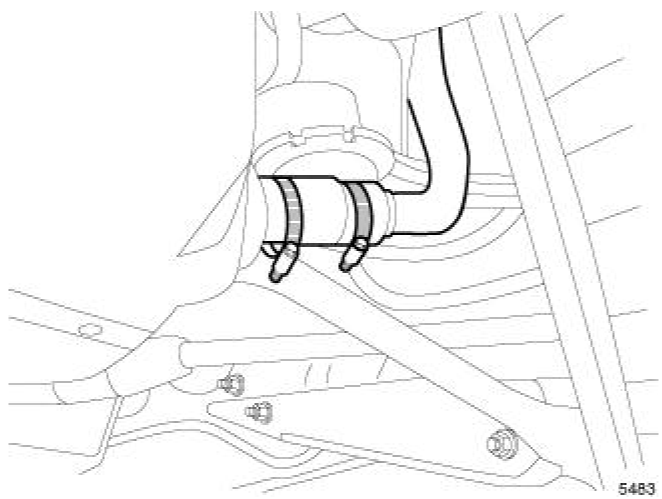

Fig. 125: Filler Tube Clamp Removed
Courtesy of CHRYSLER GROUP, LLC

12. Install the fuel filler tube hose clamp and securely tighten.

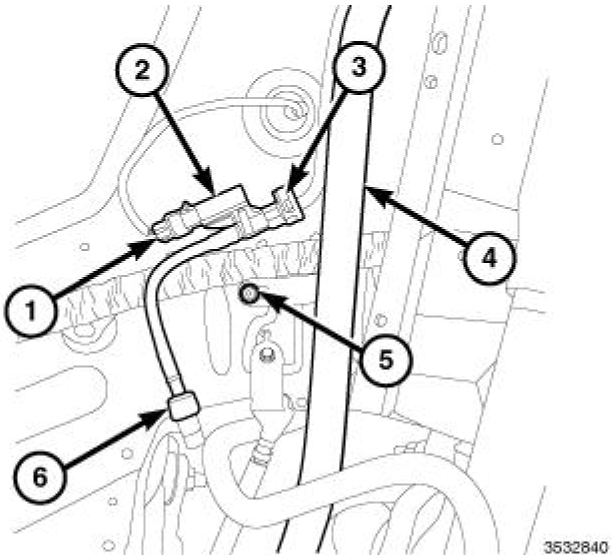

Fig. 126: Fuel Tank Pressure Sensor Electrical Connector, Filler Tube & Fuel Tank Vent Steel Line
Courtesy of CHRYSLER GROUP, LLC

13. Connect the ORVR vent line (3).
14. Install the fuel filler tube retaining nut (5) and tighten to the proper torque specification. Refer to **FUEL DELIVERY, GAS, SPECIFICATIONS**.
15. Install the left rear wheelhouse splash shield. Refer to **SHIELD, SPLASH, REAR WHEELHOUSE, INSTALLATION** .
16. Install the left rear tire.

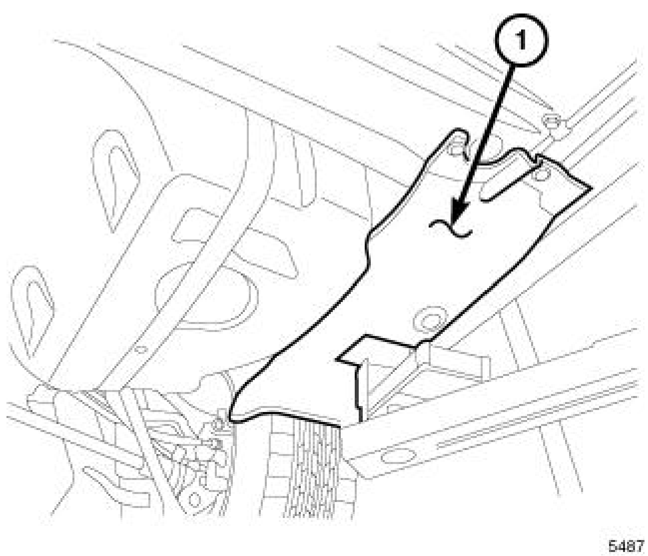

Fig. 127: Left Underbody Splash Shield
Courtesy of CHRYSLER GROUP, LLC

17. Install the left underbody splash shield (1).

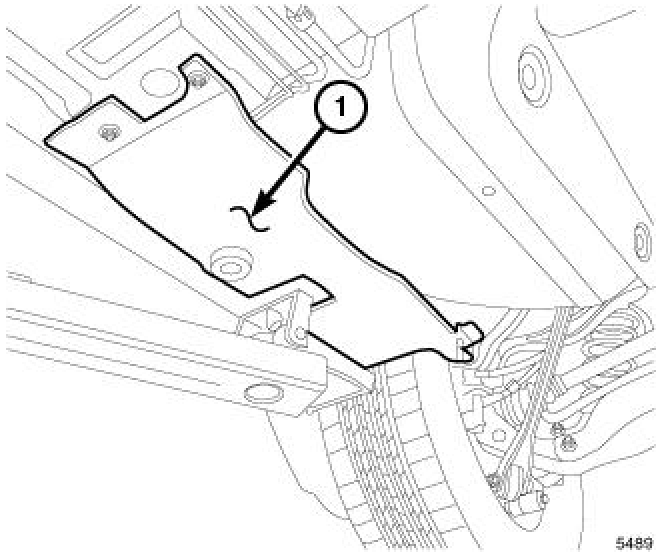

Fig. 128: Right Underbody Splash Shield
Courtesy of CHRYSLER GROUP, LLC

18. Install the right underbody splash shield (1).
19. Remove support and lower the vehicle.
20. Fill the fuel tank.
21. Connect the negative battery cable.
22. Use the scan tool to pressurize the fuel system and check for leaks.

TUBE, FUEL TANK FILLER

REMOVAL

REMOVAL

1. Perform the fuel tank draining procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE**.
2. Disconnect the negative battery cable.

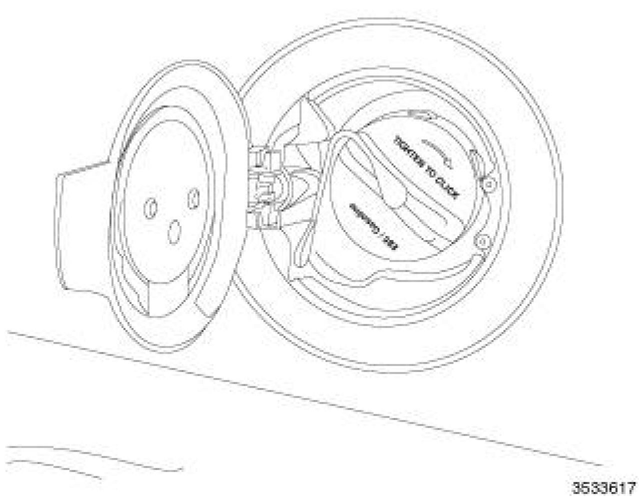

Fig. 129: Fuel Filler Door & Cap
Courtesy of CHRYSLER GROUP, LLC

3. Open the fuel filler door.
4. Remove the fuel filler cap.
5. Remove the left rear wheelhouse splash shield. Refer to **SHIELD, SPLASH, REAR WHEELHOUSE, REMOVAL** .

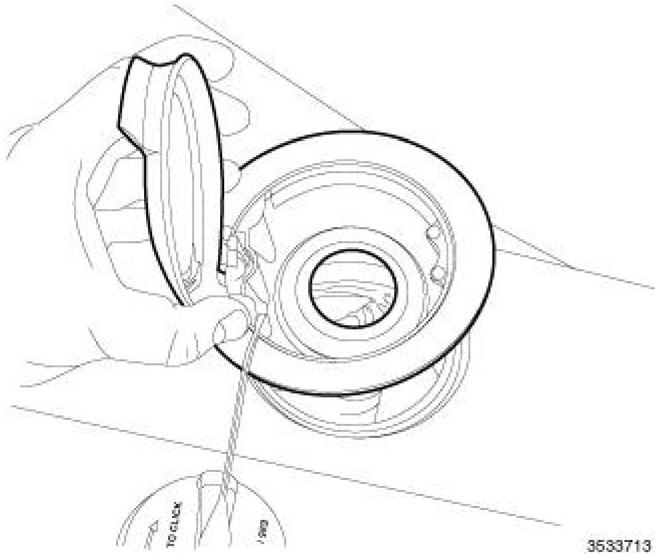

Fig. 130: Fuel Filler Tube Housing
Courtesy of CHRYSLER GROUP, LLC

6. Using your hand. Remove the fuel filler tube housing by squeezing the locking tabs located on the backside of the fender.
7. Remove the housing away from the fender allowing the filler tube to release from the rubber grommet.

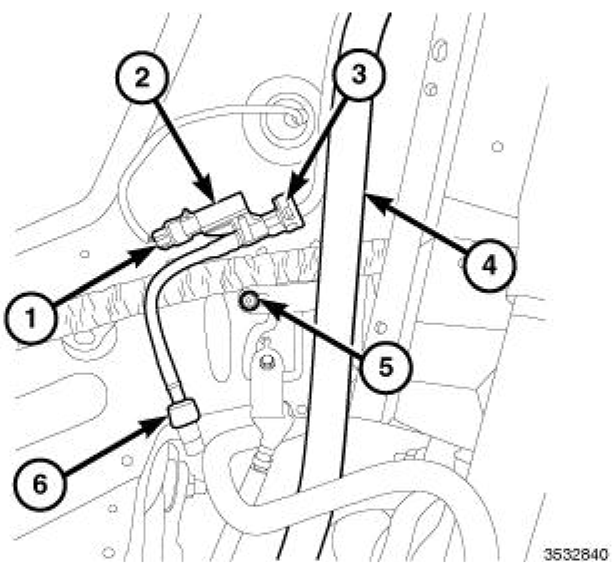

Fig. 131: Fuel Tank Pressure Sensor Electrical Connector, Filler Tube & Fuel Tank Vent Steel Line
Courtesy of CHRYSLER GROUP, LLC

8. Disconnect the Onboard Refueling Vapor Recovery (ORVR) line (3) at the filler tube. Refer to **FITTING,**

QUICK CONNECT, STANDARD PROCEDURE.

9. Remove the fuel filler tube retaining nut (5).

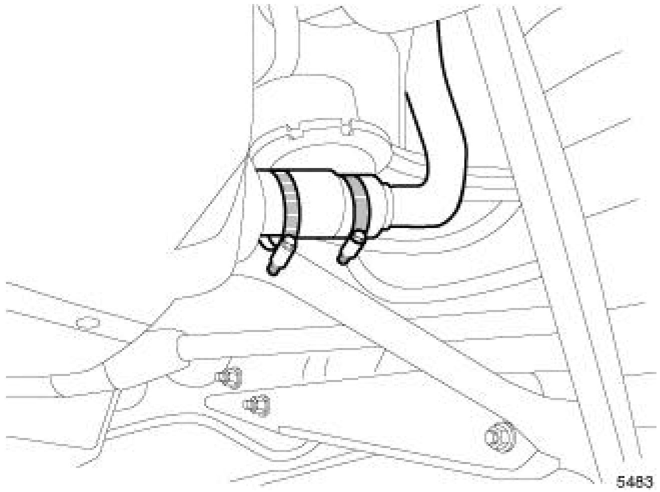

Fig. 132: Filler Tube Clamp Removed
Courtesy of CHRYSLER GROUP, LLC

NOTE: The filler tube connecting hose to the fuel tank is pressure fitted to the filler tube. To remove the hose. It must be removed from the fuel tank side.

10. Loosen the fuel filler tube hose clamp from the fuel tank.

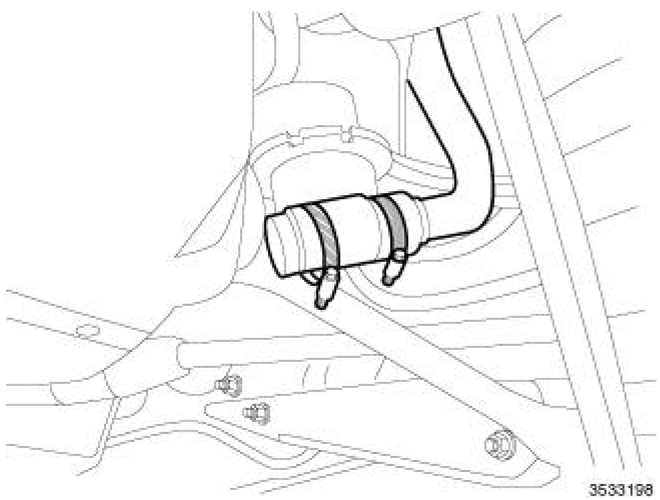

Fig. 133: Remove/Install Fuel Filler Tube Rubber Hose
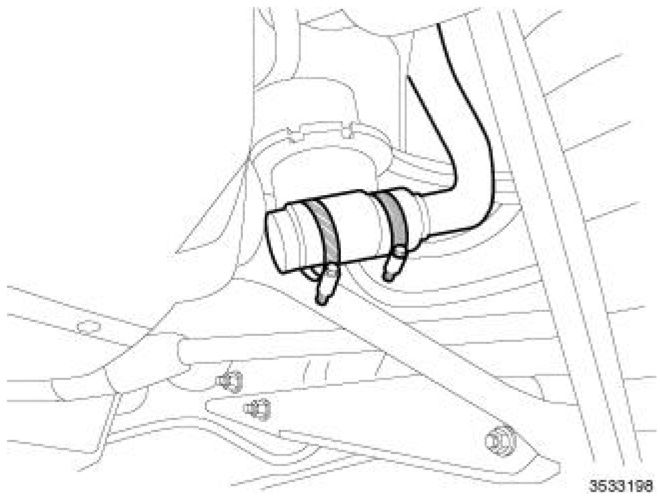
Courtesy of CHRYSLER GROUP, LLC

11. Remove the fuel filler tube rubber hose from the fuel tank and remove the fuel filler tube from the vehicle.

INSTALLATION

INSTALLATION



[**Fig. 134: Remove/Install Fuel Filler Tube Rubber Hose**]
Courtesy of CHRYSLER GROUP, LLC

1. Position the fuel filler tube into the vehicle.
2. Insert the fuel filler tube rubber hose into the fuel tank filler neck.

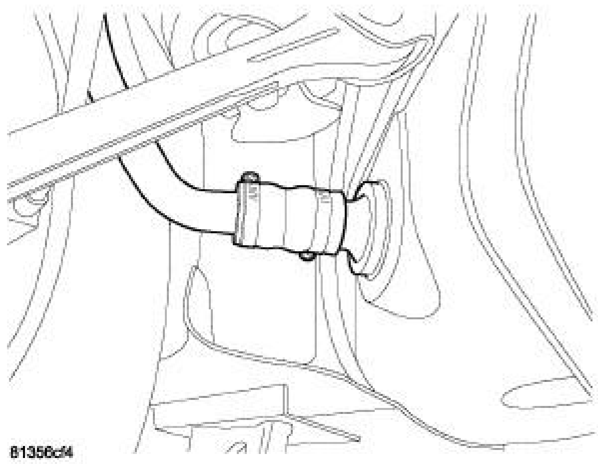


Fig. 135: Filler Tube Hose Clamp
Courtesy of CHRYSLER GROUP, LLC

3. Slide the fuel filler tube hose clamp into position and securely tighten.

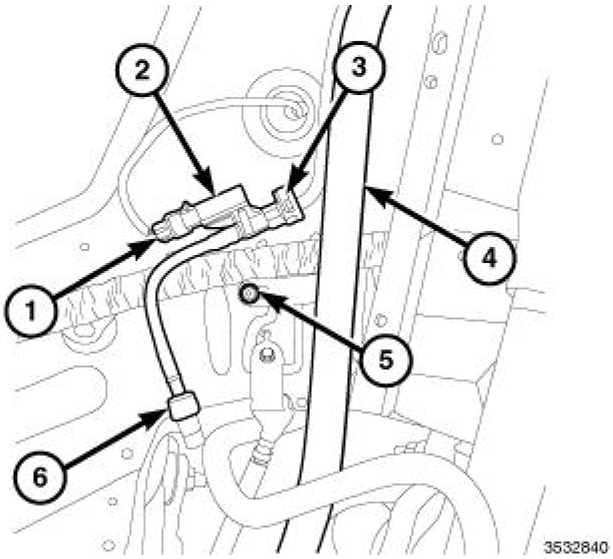

Fig. 136: Fuel Tank Pressure Sensor Electrical Connector, Filler Tube & Fuel Tank Vent Steel Line
Courtesy of CHRYSLER GROUP, LLC

4. Install the fuel filler tube retaining nut (5) and tighten to the proper torque specification. Refer to **TORQUE SPECIFICATIONS**.
5. Connect the fuel filler tube ORVR vent line (3) at the filler tube (4).

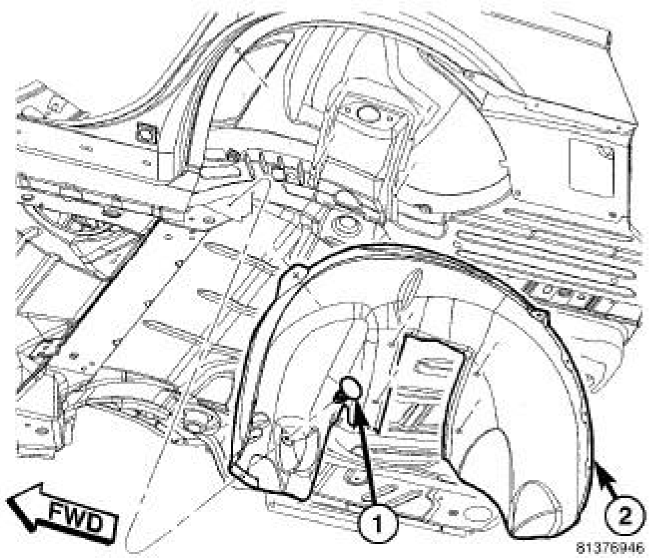

Fig. 137: Removing/Installing Rear Wheelhouse Shield
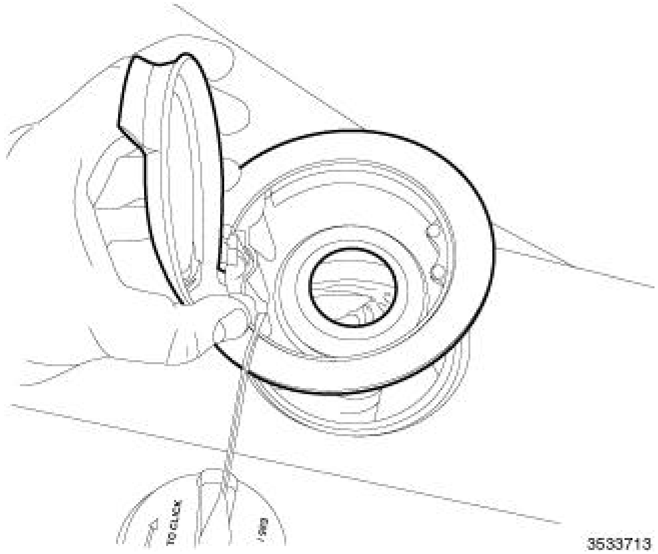
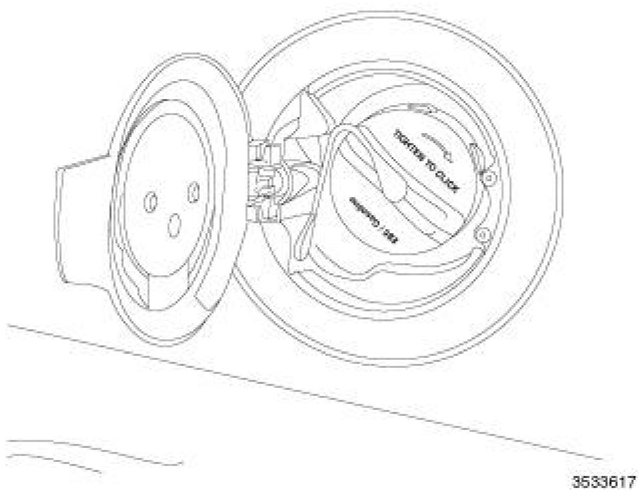
Courtesy of CHRYSLER GROUP, LLC

6. Install the rear wheelhouse splash shield (2) to the body and the push-pins (1).
7. Install the left rear tire.
8. Remove support and lower the vehicle.



[Fig. 138: Fuel Filler Tube Housing](#)
Courtesy of CHRYSLER GROUP, LLC

9. Align the fuel filler tube to the fuel filler housing rubber seal.
10. Firmly press the fuel filler housing into the fender till housing locks into place.



[Fig. 139: Fuel Filler Door & Cap](#)
Courtesy of CHRYSLER GROUP, LLC

11. Check the fuel filler tube housing for flushness to fender.
12. Install the fuel cap.
13. Connect the negative battery cable.
14. Fill the fuel tank and check for leaks.

FUEL INJECTION, GAS

OPERATION

INJECTION SYSTEM

All engines used in this service information have a sequential Multi-Port Electronic Fuel Injection system. The MPI system is computer regulated and provides precise air/fuel ratios for all driving conditions. The Powertrain Control Module (PCM) operates the fuel injection system.

The PCM regulates:

- Ignition timing
- Air/fuel ratio
- Emission control devices
- Cooling fan
- Charging system
- Idle speed
- Vehicle speed control

Various sensors provide the inputs necessary for the PCM to correctly operate these systems. In addition to the sensors, various switches also provide inputs to the PCM.

The PCM can adapt its programming to meet changing operating conditions.

Fuel is injected into the intake port above the intake valve in precise, metered amounts through electronically operated injectors. The PCM cycles the fuel injectors in a specific sequence. Under most operating conditions, the PCM maintains an air fuel ratio of 14.7 parts air to 1 part fuel by constantly adjusting injector pulse width. Injector pulse width is the length of time the injector is open.

The PCM adjusts injector pulse width by opening and closing the ground path to the injector. Engine RPM (speed) and manifold absolute pressure (air density) are the **primary** inputs that determine injector pulse width.

MODES OF OPERATION

As input signals to the PCM change, the PCM adjusts its response to output devices. For example, the PCM must calculate a different injector pulse width and ignition timing for idle than it does for Wide Open Throttle (WOT). There are several different modes of operation that determine how the PCM responds to the various input signals.

The multi-port fuel injection systems has the following modes of operation:

- Ignition switch ON (Zero RPM)
- Engine start-up
- Engine warm-up
- Cruise
- Idle
- Acceleration
- Deceleration
- Wide-Open-Throttle
- Ignition switch OFF

Within these modes of operation are two different functions, OPEN LOOP and CLOSED LOOP.

During OPEN LOOP operation the PCM receives input signals and responds according to preset PCM programming. Inputs from the upstream and downstream heated oxygen (O2) sensors are not monitored during OPEN LOOP operation, except for heated O2 sensor diagnostics (they are checked for shorted conditions at all times).

During CLOSED LOOP operation the PCM monitors the inputs from the upstream and downstream heated O2 sensors. The upstream heated oxygen sensor input tells the PCM if the calculated injector pulse width resulted in the ideal air-fuel ratio of 14.7 to one. By monitoring the exhaust oxygen content through the upstream heated oxygen sensor, the PCM can fine tune the injector pulse width. Fine tuning the injector pulse width allows the PCM to achieve optimum fuel economy combined with low emissions.

For the PCM to enter CLOSED LOOP operation, the following must occur:

1. Engine coolant temperature must be over 35Ā°F (1.7Ā°C).
    - If the coolant is over 35Ā°F (1.7Ā°C) the PCM will wait 38 seconds.
    - If the coolant is over 50Ā°F (10Ā°C) the PCM will wait 15 seconds.
    - If the coolant is over 167Ā°F (75Ā°C) the PCM will wait 3 seconds.
    - For other temperatures the PCM will interpolate the correct waiting time.
2. The O2 sensor must read either greater than 0.745 volts or less than 0.29 volt.

OPEN LOOP operation is used for engine start-up (crank), engine warm-up, deceleration with fuel shutoff and wide open throttle. Under most conditions, acceleration, deceleration (with A/C on), idle and cruise modes, **with the engine at operating temperature,** occur in CLOSED LOOP operation.

IGNITION SWITCH ON (ZERO RPM) MODE

When the ignition switch activates the fuel injection system, the following actions occur:

- The PCM monitors the engine coolant temperature sensor and throttle position sensor input. The PCM determines basic fuel injector pulse width from this input.
- The PCM determines atmospheric air pressure from the MAP sensor input to modify injector pulse width.

When the key is in the ON position and the engine is not running (zero rpm), the Auto Shutdown (ASD) and fuel pump relays de-energize after approximately 1 second. Therefore, battery voltage is not supplied to the fuel pump, ignition coil, fuel injectors and heated oxygen sensors.

ENGINE WARM-UP MODE

This is an OPEN LOOP mode. The following inputs are received by the PCM:

- Manifold Absolute Pressure (MAP)
- Crankshaft position (engine speed)
- Engine coolant temperature
- Inlet/Intake air temperature (IAT)
- Camshaft position
- Knock sensor

- Throttle position
- A/C switch status
- Battery voltage
- Vehicle speed
- Speed control
- O2 sensors

The PCM adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.

The PCM adjusts ignition timing and engine idle speed.

CRUISE OR IDLE MODE

When the engine is at operating temperature this is a CLOSED LOOP mode. During cruising or idle the following inputs are received by the PCM:

- Manifold absolute pressure
- Crankshaft position (engine speed)
- Inlet/Intake air temperature
- Engine coolant temperature
- Camshaft position
- Knock sensor
- Throttle position
- Exhaust gas oxygen content (O2 sensors)
- A/C switch status
- Battery voltage
- Vehicle speed

The PCM adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.

The PCM adjusts engine idle speed and ignition timing. The PCM adjusts the air/fuel ratio according to the oxygen content in the exhaust gas (measured by the upstream and downstream heated oxygen sensors).

The PCM monitors for engine misfire. During active misfire and depending on the severity, the PCM either continuously illuminates or flashes the malfunction indicator lamp (Check Engine light on instrument panel). Also, the PCM stores an engine misfire DTC in memory, during the 2nd trip with the fault.

The PCM performs several diagnostic routines. They include:

- Oxygen sensor monitor
- Downstream heated oxygen sensor diagnostics during open loop operation (except for shorted)
- Fuel system monitor
- EGR monitor (if equipped)

- Purge system monitor
- Catalyst efficiency monitor
- All inputs monitored for proper voltage range (rationality)
- All monitored components (refer to **ON-BOARD DIAGNOSTICS**).

The PCM compares the upstream and downstream heated oxygen sensor inputs to measure catalytic convertor efficiency. If the catalyst efficiency drops below the minimum acceptable percentage, the PCM stores a diagnostic trouble code in memory, after 2 trips.

During certain idle conditions, the PCM may enter a variable idle speed strategy. During variable idle speed strategy the PCM adjusts engine speed based on the following inputs.

- A/C status
- Battery voltage
- Battery temperature or Calculated Battery Temperature
- Engine coolant temperature
- Engine run time
- Inlet/Intake air temperature
- Vehicle mileage

ACCELERATION MODE

This is a CLOSED LOOP mode. The PCM recognizes an abrupt increase in Throttle Position sensor output voltage or MAP sensor output voltage as a demand for increased engine output and vehicle acceleration. The PCM increases injector pulse width in response to increased fuel demand.

DECELERATION MODE

This is a CLOSED LOOP mode. During deceleration the following inputs are received by the PCM:

- A/C status
- Battery voltage
- Inlet/Intake air temperature
- Engine coolant temperature
- Crankshaft position (engine speed)
- Exhaust gas oxygen content (upstream heated oxygen sensor)
- Knock sensor
- Manifold absolute pressure
- Throttle position sensor

The PCM may receive a closed throttle input from the Throttle Position Sensor (TPS) when it senses an abrupt decrease in manifold pressure. This indicates a hard deceleration (Open Loop). In response, the PCM may momentarily turn off the injectors. This helps improve fuel economy, emissions and engine braking.

WIDE-OPEN-THROTTLE MODE

This is an OPEN LOOP mode. During wide-open-throttle operation, the following inputs are used by the PCM:

- Inlet/Intake air temperature
- Engine coolant temperature
- Engine speed
- Knock sensor
- Manifold absolute pressure
- Throttle position

When the PCM senses a wide-open-throttle condition through the Throttle Position Sensor (TPS) it de-energizes the A/C compressor clutch relay. This disables the air conditioning system and disables EGR (if equipped).

The PCM adjusts injector pulse width to supply a predetermined amount of additional fuel, based on MAP and RPM.

IGNITION SWITCH OFF MODE

When the operator turns the ignition switch to the OFF position, the following occurs:

- All outputs are turned off unless the oxygen sensor heater monitor test is being run. Refer to ON-BOARD DIAGNOSTICS .
- No inputs are monitored except for the heated oxygen sensors. The PCM monitors the heating elements in the oxygen sensors and then shuts down.

FUEL ECONOMY AND MAINTENANCE

A vehicle that is not properly tuned and maintained cannot be expected to perform at its maximum efficiency and can have an adverse effect on fuel economy. The following recommendations will ensure that the vehicle is performing at its maximum efficiency:

- **Use the recommended motor oil grade.** Using the manufacturer's recommended grade of MoparĀ® motor oil can improve fuel mileage by 1-2%. MoparĀ® motor oil labeled "Energy Conserving" contains friction-reducing additives.
- **Check and replace air filters.** Replacing a clogged air filter with a new MoparĀ® air filter can improve fuel mileage.
- **Keep the engine tuned.** Repairing a vehicle that is noticeably out of tune can improve fuel mileage by an average of 4%. Maintaining a vehicle and repairing problems, such as a faulty oxygen sensor, can improve mileage by as much as 40%.
- **Keep tires properly inflated.** Under-inflated tires can lower fuel mileage by 0.4% for every 1 psi drop in pressure of all four tires.

FUEL CORRECTION OR ADAPTIVE MEMORIES

OPERATION

SHORT TERM

Short Term Adaptive or Short Term Fuel Trim (STFT) is an immediate correction to fuel injector pulse width. During Closed Loop operation, Short Term Adaptive makes immediate adjustments to fuel delivery in direct

response to the signal from the upstream oxygen sensor. The PCM infers air/fuel ratio by monitoring oxygen content measured by the upstream oxygen sensor.

This is an immediate response to the oxygen sensor signal that is consistently high or low. The PCM knows that the base pulse width calculation needs to be modified by adjusting the injector pulse width until the correct oxygen sensor voltage is achieved. The need to adjust the injector pulse width may be a result of vehicle operating conditions, engine wear, fuel quality, etc. The maximum range of authority for Short Term Adaptive is Ā±33%. Short Term Adaptive values are not stored when the ignition is off.

LONG TERM

The main function of Long Term Adaptive is to make fuel corrections that permit Short Term Adaptive to hover around zero. In order to maintain correct emissions throughout all operating ranges of the engines, a cell structure based on engine RPM and load (MAP) is used.

There are 26 cells used for the NGC. Two of the cells are used only during idle, as determined by throttle position and park/neutral switch input. The other cells each represent a given off-idle manifold pressure and RPM range.

After the vehicle has reached full operating temperature, short term correction factors will update Long Term Adaptive Memory cells based on vehicle load (RPM/MAP) to allow the Short Term Adaptive value to be brought back to near zero. Once this correction factor is updated in the memory, it will be used by the PCM under all operating conditions, open loop and closed loop. However, the values stored in the Long-term are updated only after the vehicle has entered long-term closed loop at full operating temperature. This is done to prevent any transition temperature or start-up compensation from corrupting long term fuel correction.

Long Term and Short Term Adaptive can each change the pulse width by as much as Ā±33% for a maximum total correction of Ā±66% from base pulse width calculation. Long Term Adaptive values are used during both Open Loop and Closed Loop operation.

SYSTEM DIAGNOSIS

OPERATION

The Powertrain Control Module (PCM) can test many of its own input and output circuits. If the PCM senses a fault in a major system, the PCM stores a Diagnostic Trouble Code (DTC) in memory.

For DTC information see On-Board Diagnostics. Refer to the **DTC INDEX** article. .

INJECTOR(S), FUEL

REMOVAL

3.6L

WARNING: The fuel system is under constant pressure even with engine off. Before servicing the fuel rail, fuel system pressure must be released.

1. Perform the fuel pressure release procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE**.
2. Disconnect and isolate the negative battery cable.

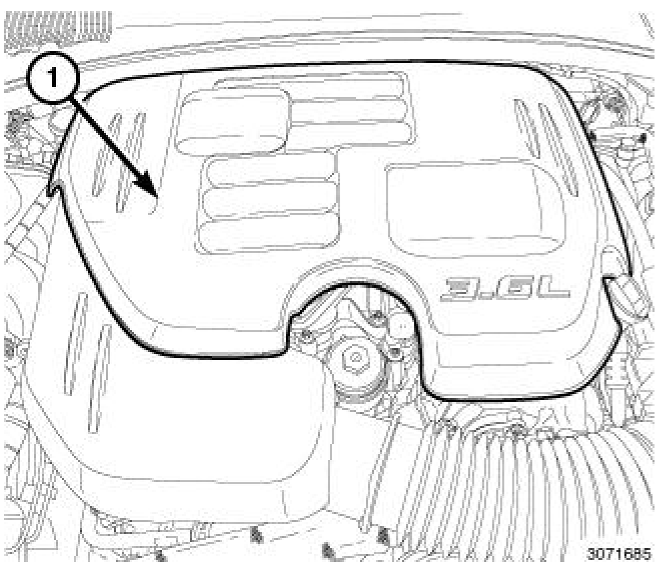

Fig. 140: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

3. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).

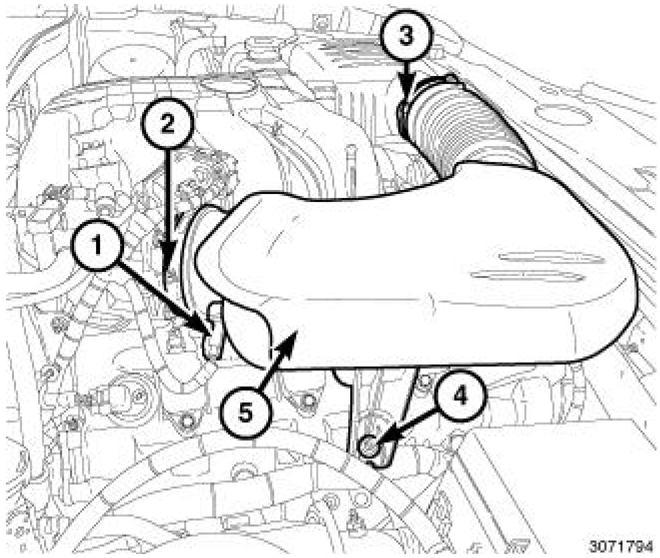

Fig. 141: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the electrical connector (1) from the Inlet Air Temperature (IAT) sensor.
5. Loosen the clamp (2) at the throttle body.
6. Loosen the clamp (3) at the air cleaner housing.
7. Lift the air inlet hose assembly retaining grommet off the ball stud (4).
8. Remove the air inlet hose assembly (5).

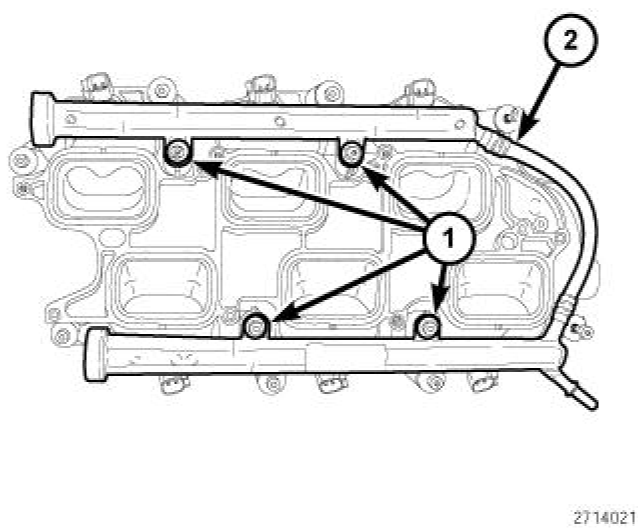

Fig. 142: Fuel Rail & Retaining Bolts
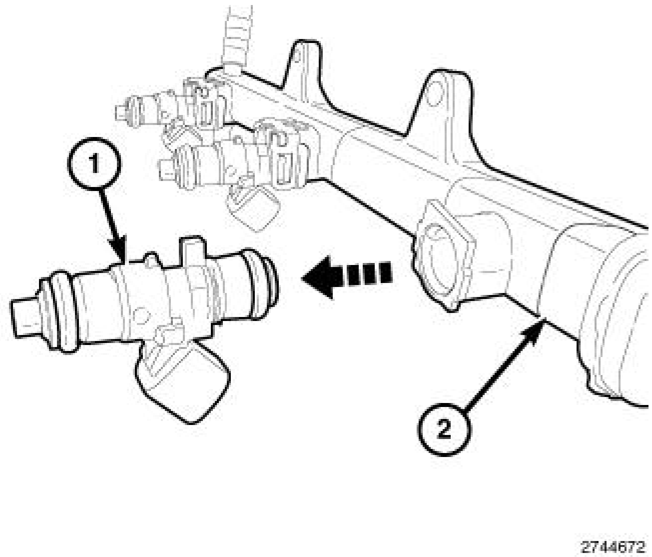
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When removing the fuel rail from the lower intake manifold, one or more fuel injectors may remain in the intake manifold resulting in residual fuel spilling onto the engine from the fuel rail.

9. Remove the upper intake manifold and fuel rail (2). Refer to **RAIL, FUEL, REMOVAL**.



[Fig. 143: Removing Fuel Injector From Fuel Rail]
Courtesy of CHRYSLER GROUP, LLC

NOTE:	**Number 2 fuel injector removal shown in the illustration, all other fuel injectors similar.**

10. Remove the fuel injectors (1) from the fuel rail (2).

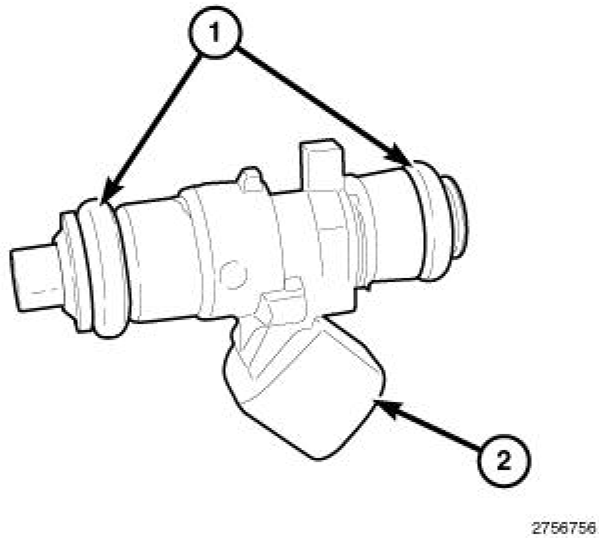
NOTE:	**Right side shown in the illustration, left side similar.**
WARNING:	**The fuel system is under constant pressure even with engine off. Before servicing fuel injector(s), fuel system pressure must be released.**
NOTE:	**To remove one or more fuel injectors, the fuel rail assembly must be removed from engine.**

1. Perform the fuel system pressure release procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE**.
2. Remove the fuel rail assembly (1). Refer to **RAIL, FUEL, REMOVAL**.
3. Remove the fuel injector retaining clip(s) (2) from the fuel rail (1).
4. Remove the injector(s) from the fuel rail assembly.

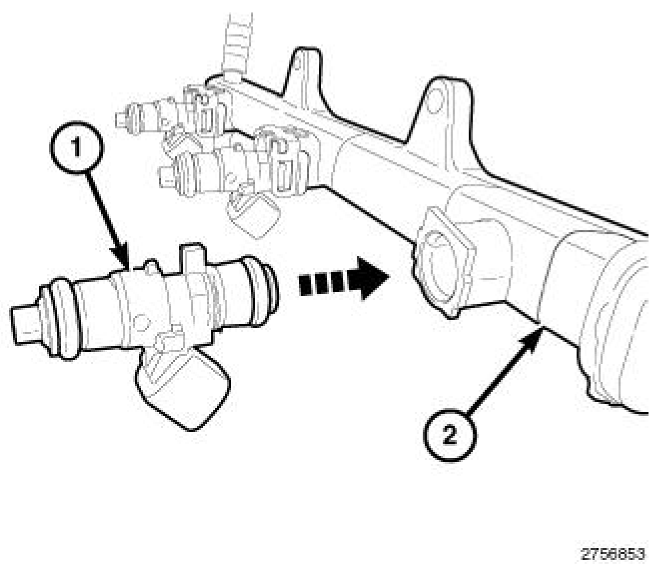
INSTALLATION

3.6L



[Fig. 148: O-Ring Seals](#)
Courtesy of CHRYSLER GROUP, LLC

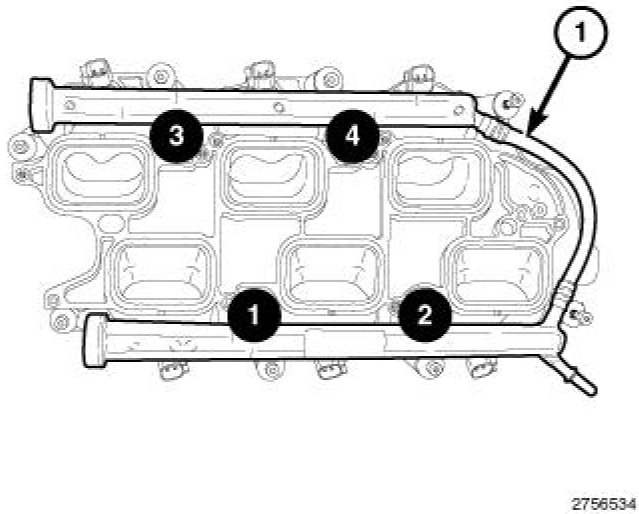
1. Lightly lubricate the new O-ring seals (1) with clean engine oil and position the seals onto the fuel injector (2).



[Fig. 149: Installing Fuel Injector To Fuel Rail](#)
Courtesy of CHRYSLER GROUP, LLC

NOTE:	**Number 2 fuel injector installation shown in the illustration, all other fuel injectors similar.**

2. Install the fuel injectors (1) into the fuel rail (2).



[Fig. 150: Fuel Rail Bolt Tightening Sequence](#)
Courtesy of CHRYSLER GROUP, LLC

3. Install the fuel rail and upper intake manifold. Refer to **RAIL, FUEL, INSTALLATION**.

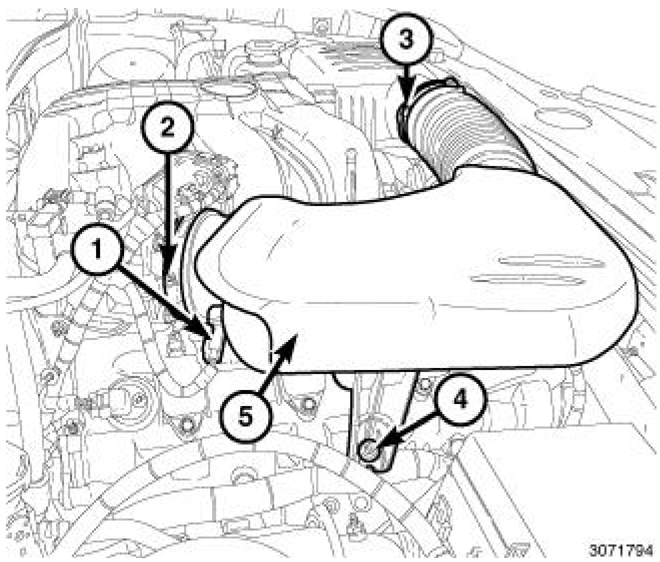


Fig. 151: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners
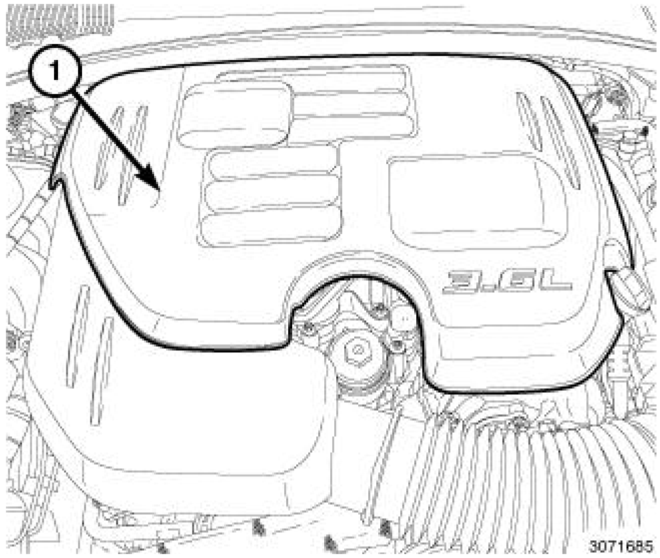
Courtesy of CHRYSLER GROUP, LLC

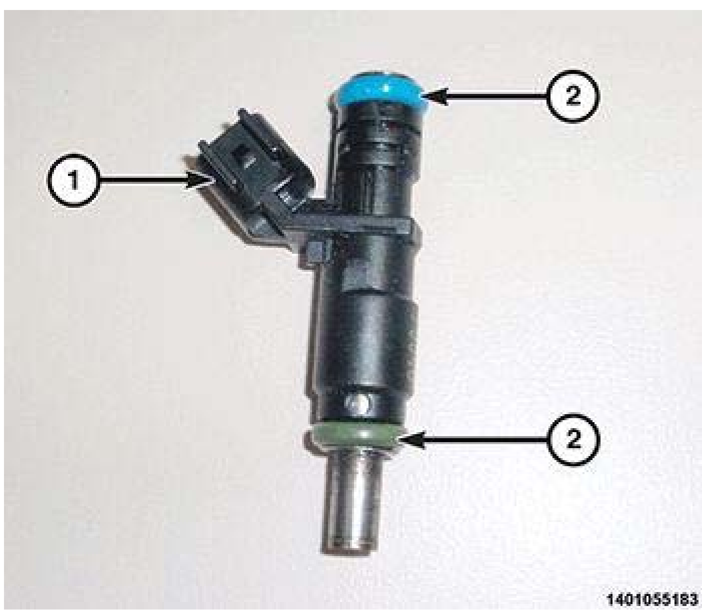
4. Position the air inlet hose assembly (5) onto the throttle body and the air cleaner housing.
5. Secure the air inlet hose assembly retaining grommet onto the ball stud (4).
6. Securely tighten the clamp at the air cleaner housing (3).
7. Securely tighten the clamp (2) at the throttle body.
8. Connect the Inlet Air Temperature (IAT) sensor wire harness connector (1).



[Fig. 152: Engine Cover](#)
Courtesy of CHRYSLER GROUP, LLC

9. Install the engine cover (1).
10. Connect the negative battery cable.
11. Start the engine and check for leaks.

INSTALLATION - 6.2L



[Fig. 153: Fuel Injector & O-Rings](#)
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The fuel injector O-rings (2) may be used again, provided no cuts, tears, or deformation have occurred.**

1. Inspect the fuel injector O-rings (2) and replace if necessary.
2. Apply a small amount of clean engine oil to each fuel injector O-rings (2).

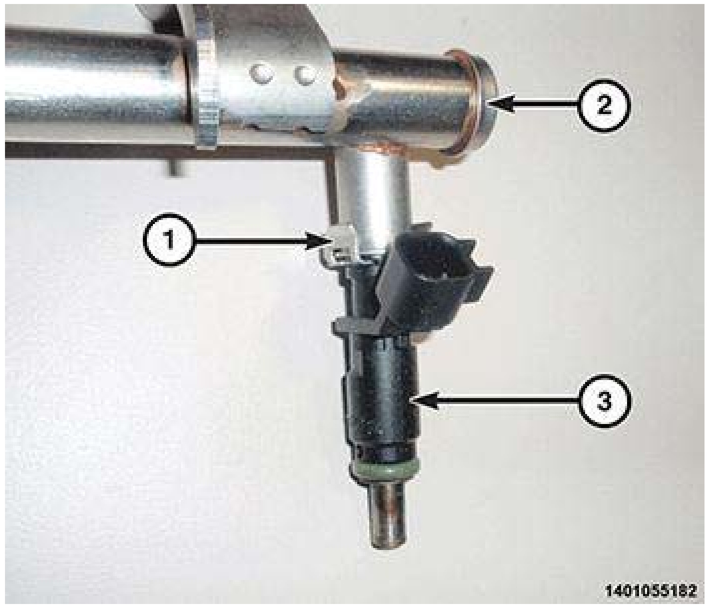


Fig. 154: Safety Clips, Fuel Rail & Fuel Injector
Courtesy of CHRYSLER GROUP, LLC

3. Install the fuel injector(s) (3) into the fuel rail (2) and install the retaining clip(s) (1).
4. Install the fuel rail assembly. Refer to **RAIL, FUEL, INSTALLATION**.
5. Start the engine and check for leaks.

INSTALLATION - 5.7L/6.4L

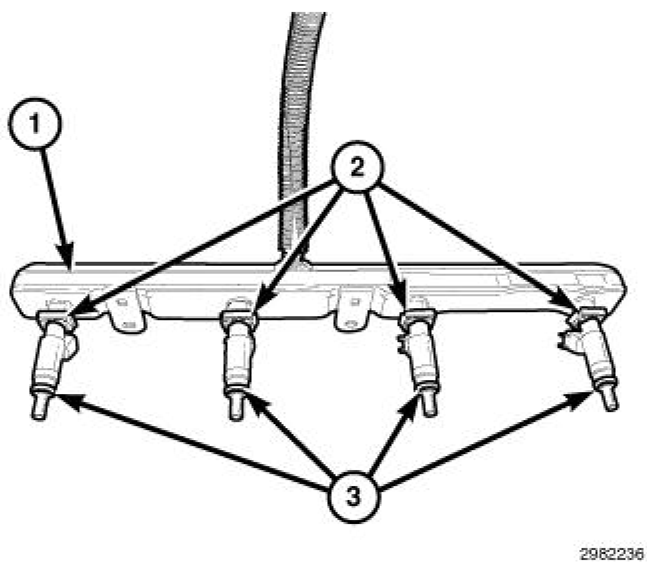

Fig. 155: Fuel Injector O-Rings, Fuel Rail/Fuel Injector Assembly & Four Fuel Rail Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Right side shown in the illustration, left side similar.**

NOTE: **The fuel injector O-rings may be used again, provided no cuts, tears, or deformation have occurred.**

1. Inspect the fuel injector O-rings (3) and replace if necessary.

2. Apply a small amount of engine oil to each fuel injector O-rings.
3. Install the fuel injector(s) into the fuel rail and install the retaining clip(s) (2).
4. Install the fuel rail assembly (1). Refer to **RAIL, FUEL, INSTALLATION**.
5. Start the engine and check for leaks.

PEDAL, ACCELERATOR

REMOVAL

REMOVAL

The Accelerator Pedal Position Sensor (APPS) and the accelerator pedal is serviced as a complete assembly including the bracket.

1. Disconnect and isolate the negative battery cable.

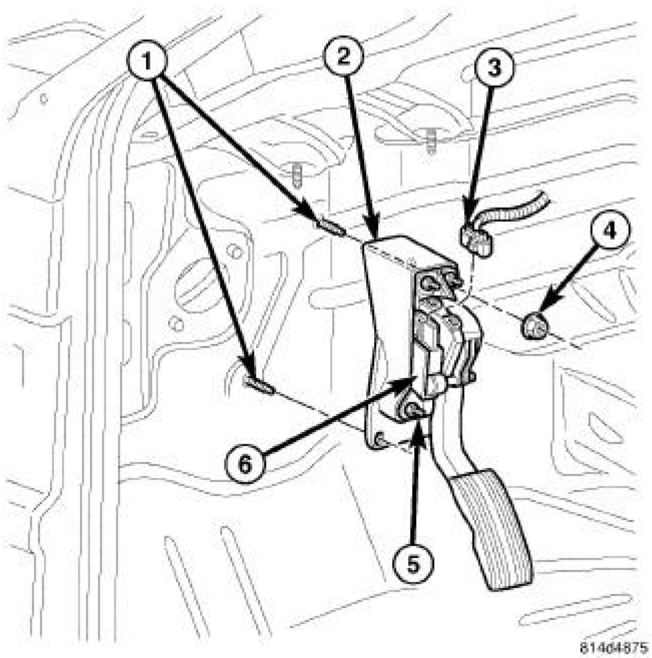

Fig. 156: Removal & Installation Of Accelerator Pedal W/Apps
Courtesy of CHRYSLER GROUP, LLC

2. Disconnect the APPS (6) wire harness connector (3).
3. Remove nuts (4) and the accelerator pedal assembly (2).

INSTALLATION

INSTALLATION

The Accelerator Pedal Position Sensor (APPS) and the accelerator pedal is serviced as a complete assembly including the bracket.

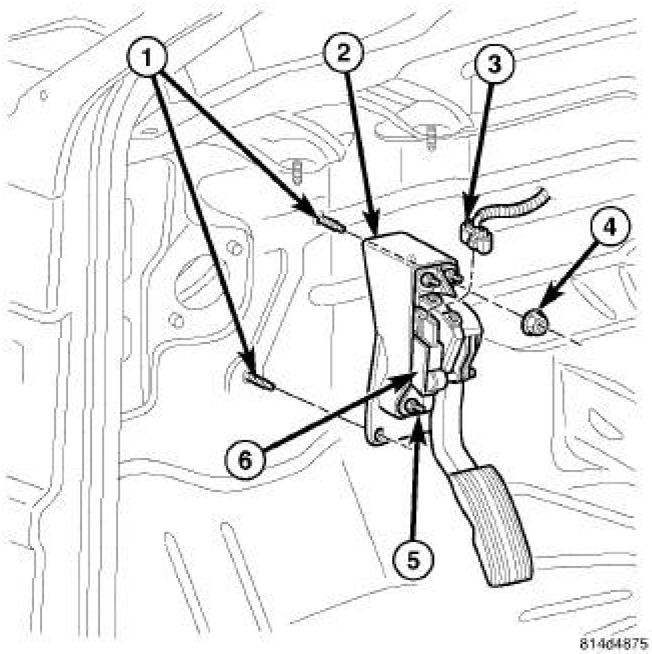

Fig. 157: Removal & Installation Of Accelerator Pedal W/Apps
Courtesy of CHRYSLER GROUP, LLC

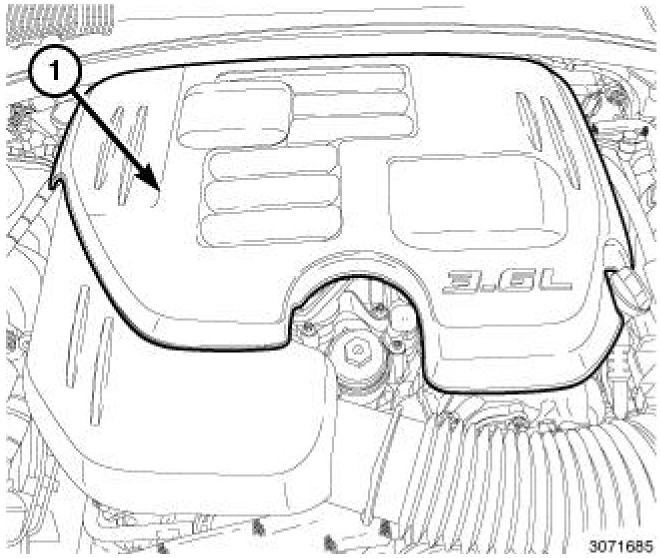
1. Install the accelerator pedal assembly on the two mounting studs (1). Tighten nuts (4) to the proper torque specification. Refer to **FUEL INJECTION, GAS, SPECIFICATIONS**.
2. Connect the APPS (6) wire harness connector (3).
3. Install the steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
4. Connect the negative battery cable.
5. Use a scan tool to learn electrical parameters. Go to the Miscellaneous menu, and then select ETC Learn.
6. If the previous step is not performed, a Diagnostic Trouble Code (DTC) will be set.
7. If necessary, also use a scan tool to erase any Diagnostic Trouble Codes (DTC's) from the PCM.
8. Before starting the engine, operate the accelerator pedal to check for any binding.

SENSOR, AIR TEMPERATURE, INLET

REMOVAL

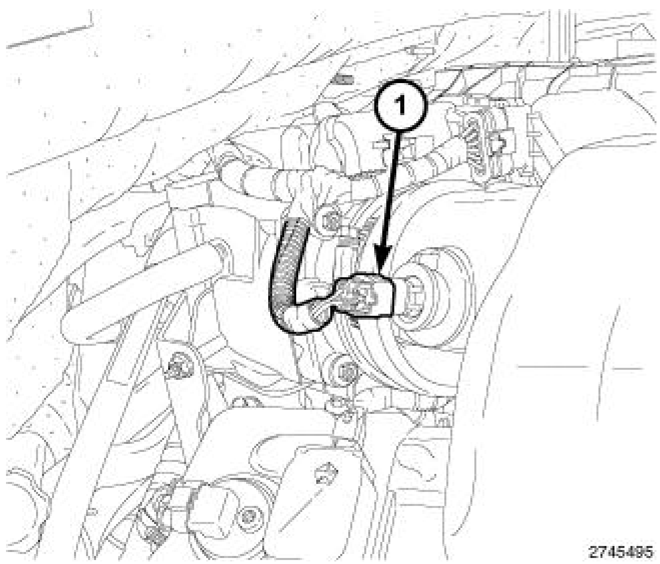
3.6L

1. Disconnect and isolate the negative battery cable.



[Fig. 158: Engine Cover](#)
Courtesy of CHRYSLER GROUP, LLC

2. Remove the engine cover (1).



[Fig. 159: Inlet Air Temperature Sensor Electrical Connector](#)
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the Inlet Air Temperature (IAT) sensor wire harness connector (1).

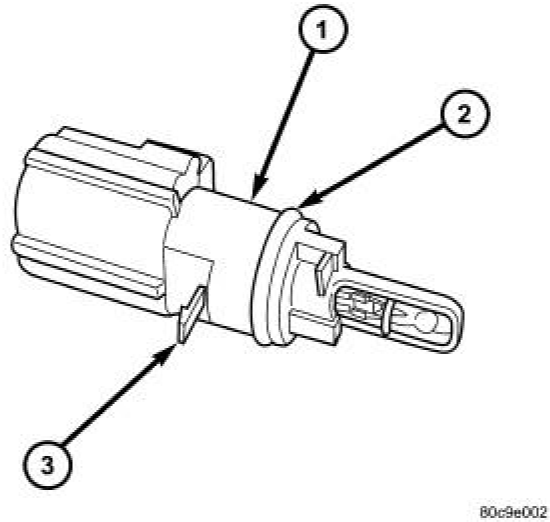


Fig. 160: IAT Sensor, O-Ring Seal & Release Tab
Courtesy of CHRYSLER GROUP, LLC

4. Clean any dirt from the air inlet tube at the IAT sensor base.
5. Gently lift the small plastic release tab (3), rotate the sensor about 1/4 turn counterclockwise and remove the sensor from the inlet air hose.
6. The IAT sensor O-ring (2) can be reused if not damaged.

5.7L

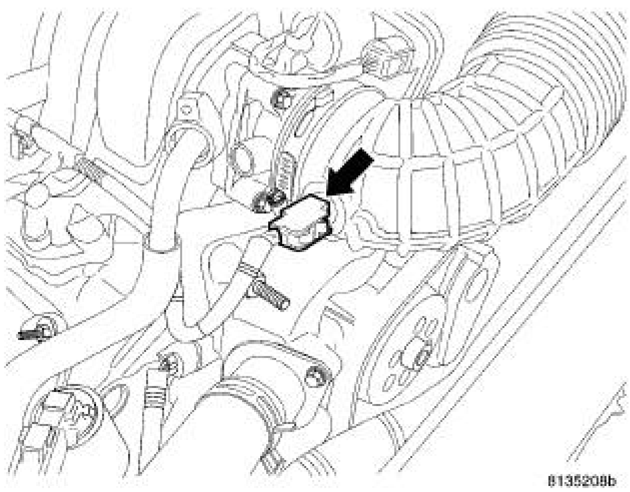

Fig. 161: Sensor Location
Courtesy of CHRYSLER GROUP, LLC

The Inlet Air Temperature (IAT) sensor is installed into the rubber air intake hose near front of throttle body.

1. Disconnect and isolate the negative battery cable.

2. Remove the engine cover
3. Disconnect IAT sensor wire harness connector.
4. Clean dirt from sensor base.
5. Pull sensor from rubber air hose.

6.4L

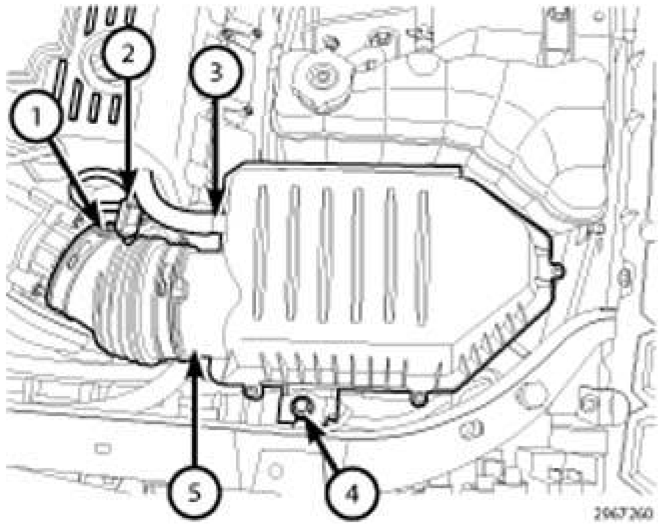

Fig. 162: Air Duct Retaining Clamp, Intake Air Temperature Sensor Electrical Connector, Makeup Air Hose, Bolt & Air Cleaner Housing
Courtesy of CHRYSLER GROUP, LLC

The Inlet Air Temperature (IAT) sensor (2) is installed into the rubber air intake hose near the front of the throttle body.

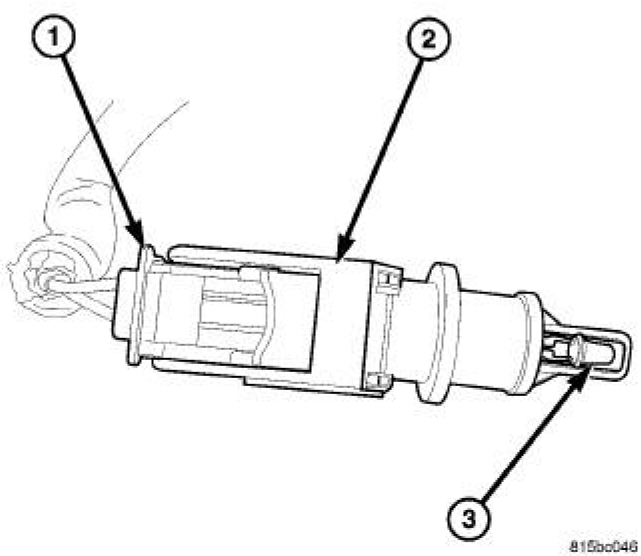

Fig. 163: IAT Sensor, Electrical Connector & Sensor Probe
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.

2. Disconnect the IAT sensor (2) wire harness connector (1).
3. Turn the IAT sensor 1/4 turn counterclockwise and remove the IAT sensor from the rubber air intake hose.
4. Inspect the sensor probe (3) for any damage.
5. Clean any dirt or debris from sensor base.

INSTALLATION

3.6L

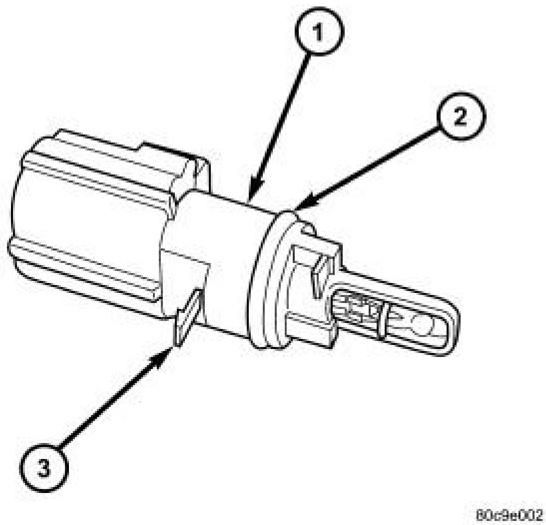

Fig. 164: IAT Sensor, O-Ring Seal & Release Tab
Courtesy of CHRYSLER GROUP, LLC

1. The Inlet Air Temperature (IAT) sensor O-ring seal (2) can be reused if not damaged.
2. Clean the IAT sensor mounting hole in the air inlet hose.
3. Install the IAT sensor into the air inlet hose and rotate clockwise until the release tab (3) engages.

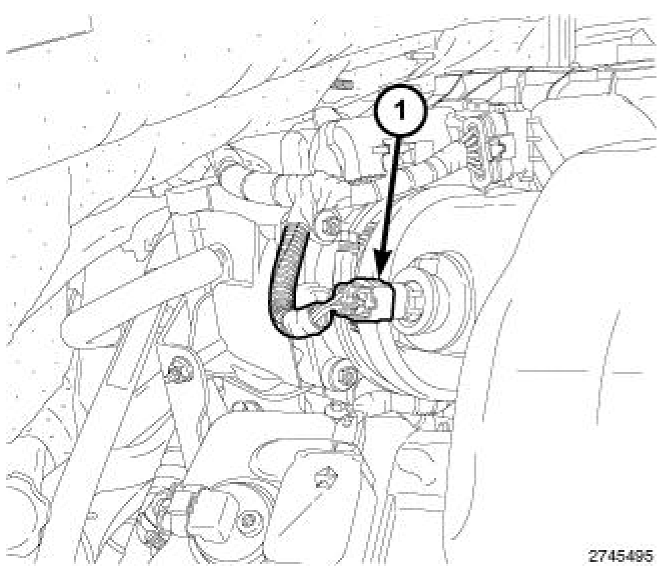

Fig. 165: Inlet Air Temperature Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

4. Install the IAT sensor wire harness connector (1).

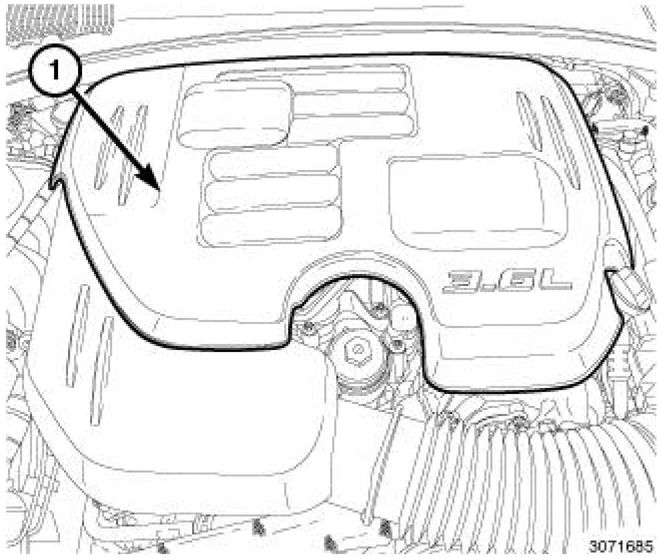

Fig. 166: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

5. Install the engine cover (1).
6. Connect the negative battery cable.

5.7L

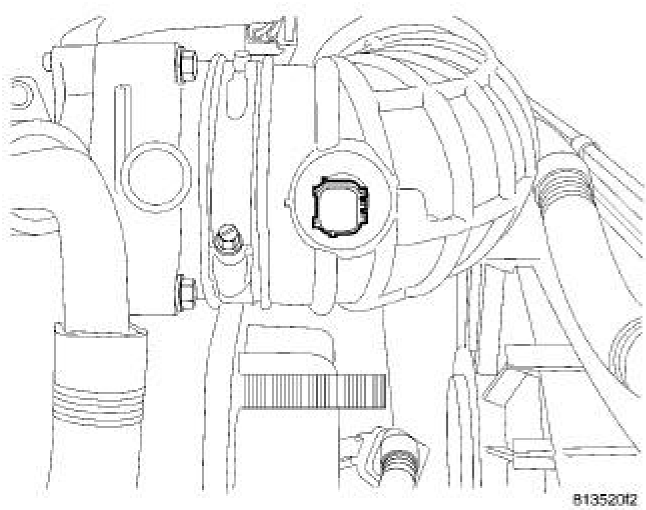

Fig. 167: Sensor Orientation
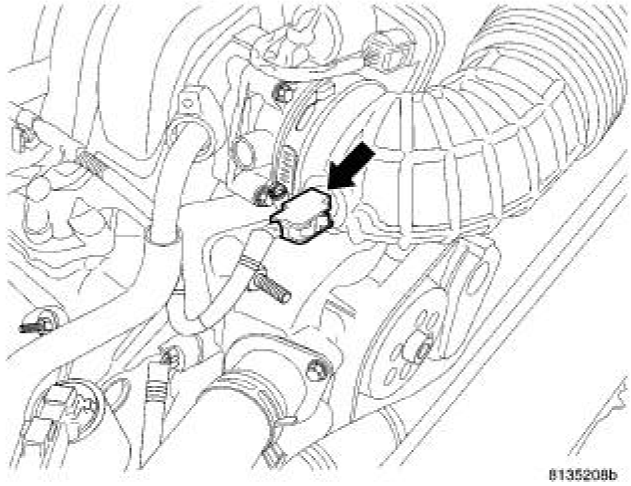
Courtesy of CHRYSLER GROUP, LLC

1. Install Inlet Air Temperature (IAT) sensor into rubber air hose.
2. Rotate sensor into position as shown. **For proper system operation, sensor must be positioned as**

shown in illustration.



[**Fig. 168: Sensor Location**]()
Courtesy of CHRYSLER GROUP, LLC

3. Connect IAT sensor wire harness connector.
4. Install the engine cover.
5. Connect the negative battery cable.

6.4L

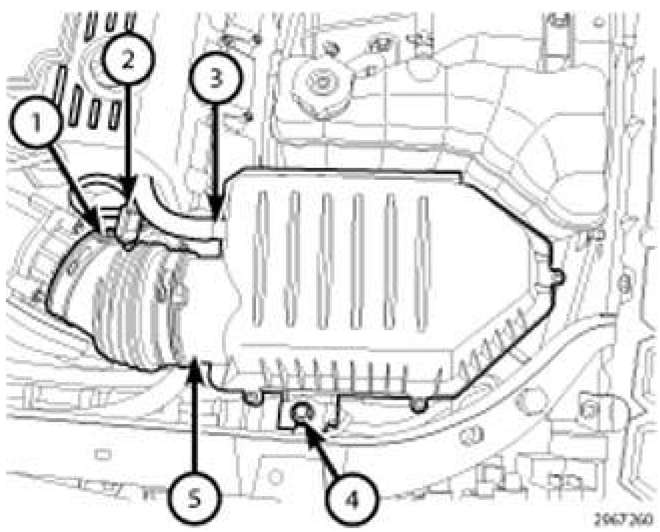


Fig. 169: Air Duct Retaining Clamp, Intake Air Temperature Sensor Electrical Connector, Makeup Air Hose, Bolt & Air Cleaner Housing
Courtesy of CHRYSLER GROUP, LLC

NOTE:	**Use care not to bend or damage the Inlet Air Temperature (IAT) sensor probe while installing.**

1. Install the IAT sensor (2) into the rubber air intake hose, turn the IAT sensor 1/4 turn clockwise and lock

into position.

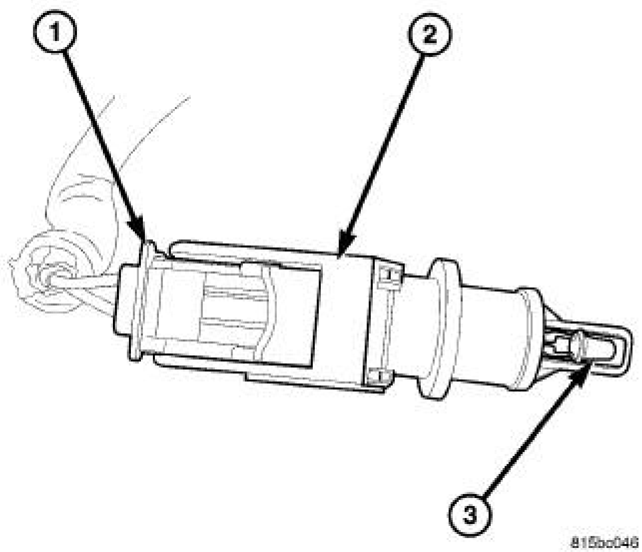

Fig. 170: IAT Sensor, Electrical Connector & Sensor Probe
Courtesy of CHRYSLER GROUP, LLC

2. Connect the IAT sensor (2) wire harness connector (1).

SENSOR, CRANKSHAFT POSITION

REMOVAL

3.6L

1. Disconnect and isolate the negative battery cable.

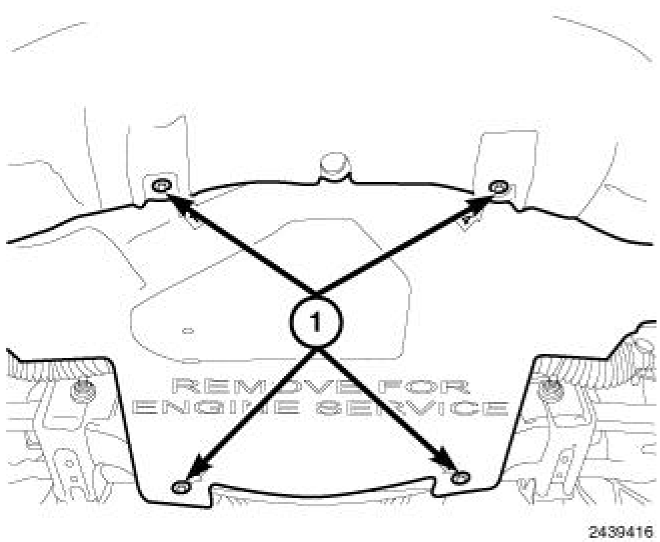

Fig. 171: Belly Pan & Fasteners
Courtesy of CHRYSLER GROUP, LLC

2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

3. Remove bolts (1) and the belly pan.

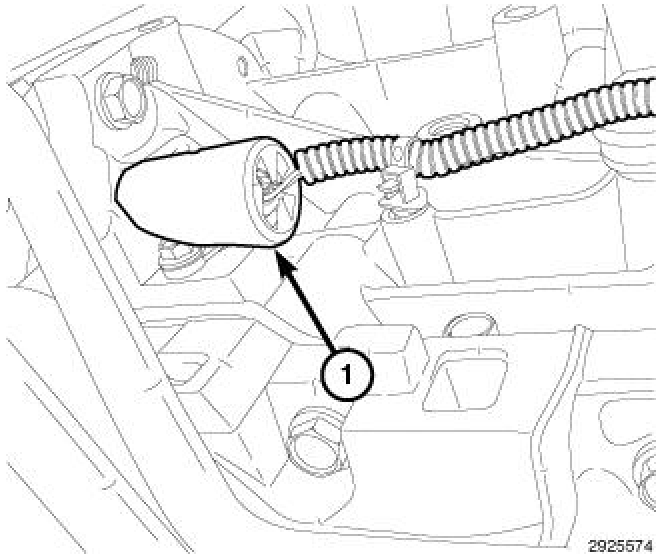

Fig. 172: Heat Shield
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The Crankshaft Position (CKP) sensor is mounted into the right rear side of the cylinder block.**

4. Push back the heat shield (1) from the crankshaft CKP sensor.

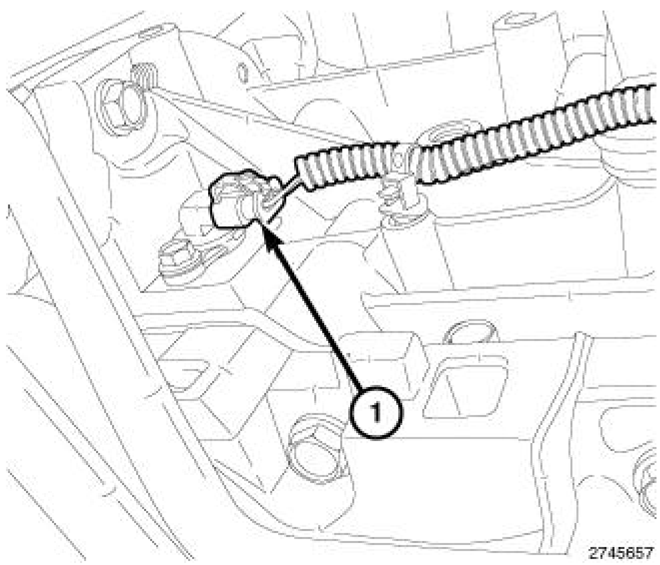

Fig. 173: Crankshaft Position Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the CKP sensor wire harness connector (1).

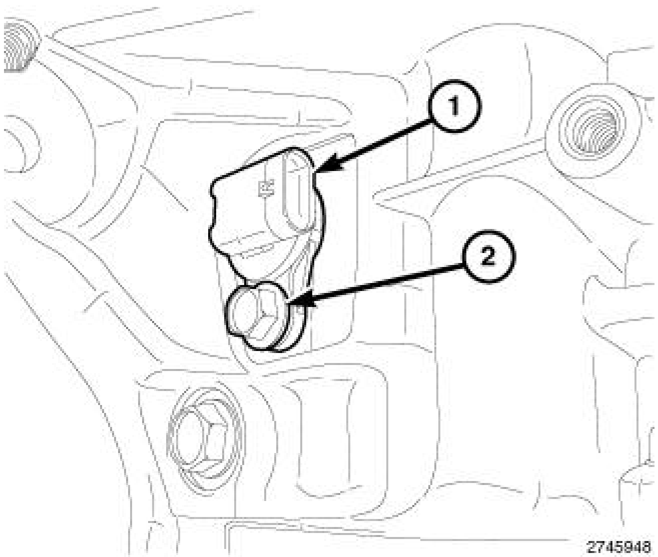

Fig. 174: CKP Sensor & Bolt
Courtesy of CHRYSLER GROUP, LLC

6. Remove bolt (2) the CKP sensor (1) from the cylinder block.

6.2L

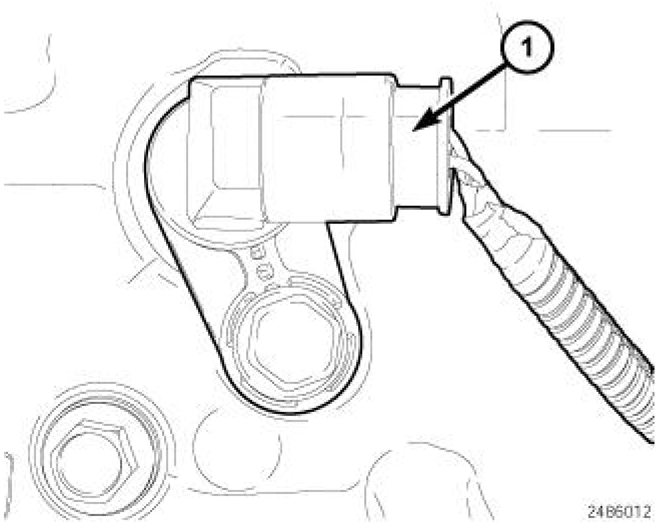

Fig. 175: Crankshaft Position Sensor Electrical Connector
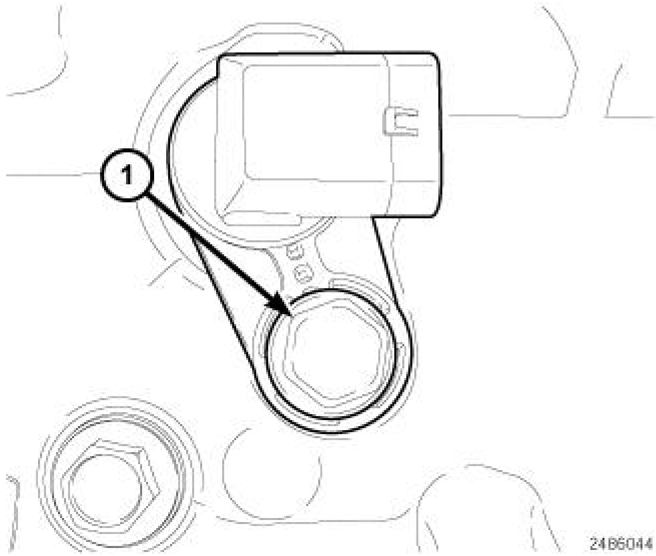
Courtesy of CHRYSLER GROUP, LLC

The Crankshaft Position (CKP) sensor is located at the right-rear side of the engine block (1). It is positioned and bolted into a machined hole in the engine block.

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the starter. Refer to **STARTER, REMOVAL** .
4. Disconnect the CKP sensor wire harness connector (1).



[Fig. 176: Crankshaft Position Sensor Mounting Bolt](#)
Courtesy of CHRYSLER GROUP, LLC

5. Remove bolt (1) and the CKP sensor from the engine block.

5.7L/6.4L

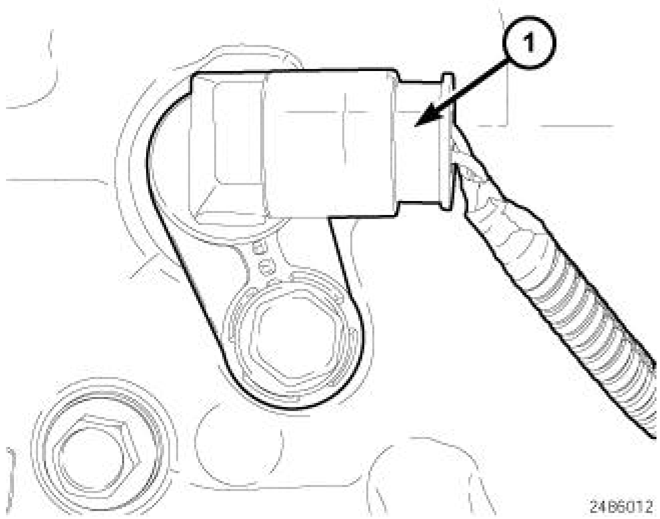


Fig. 177: Crankshaft Position Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

The Crankshaft Position (CKP) sensor is located at the right-rear side of the engine block (1). It is positioned and bolted into a machined hole in the engine block.

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the starter. Refer to **STARTER, REMOVAL** .
4. Disconnect the CKP sensor wire harness connector (1).

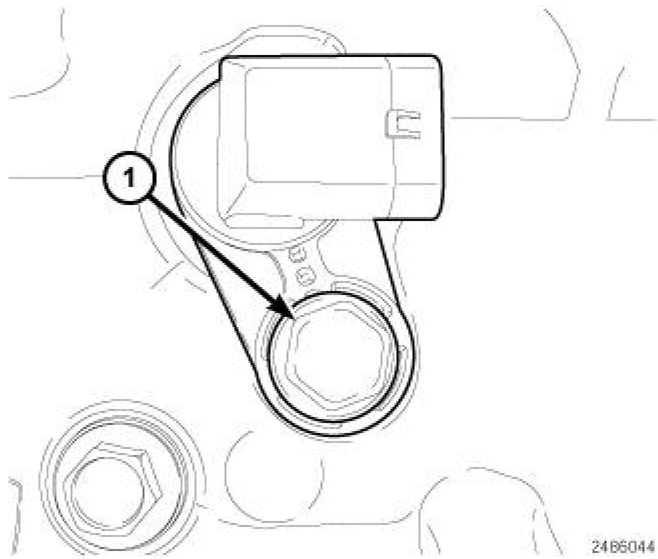

Fig. 178: Crankshaft Position Sensor Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

5. Remove bolt (1) and the CKP sensor from the engine block.

INSTALLATION

3.6L

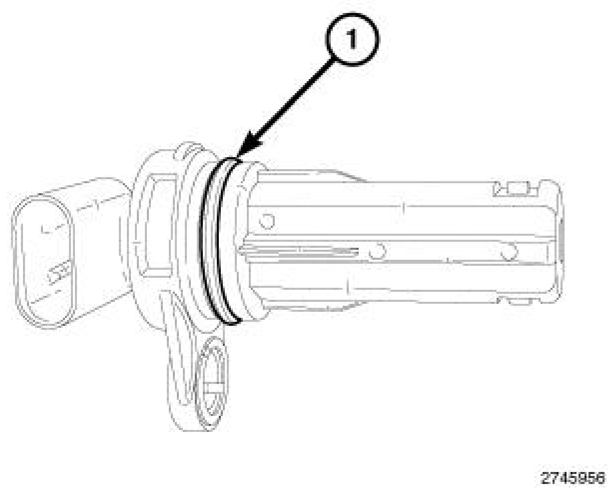

Fig. 179: CKP Sensor O-Ring
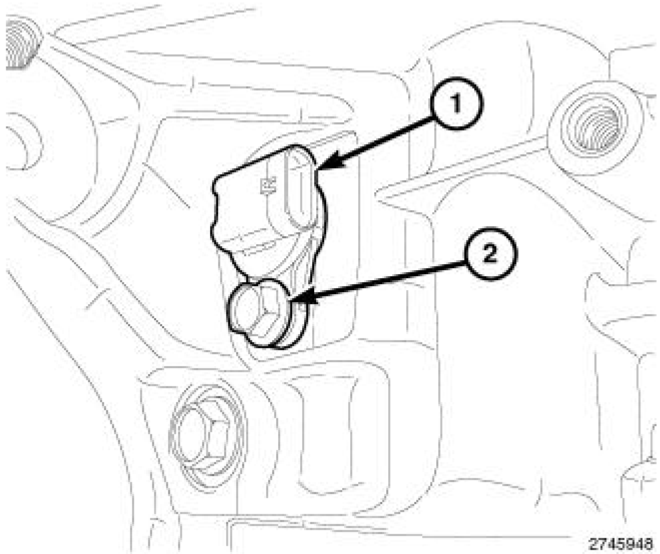
Courtesy of CHRYSLER GROUP, LLC

1. The Crankshaft Position (CKP) sensor O-ring (1) can be reused if not damaged.
2. Apply a small amount of engine oil to the CKP sensor O-ring (1).

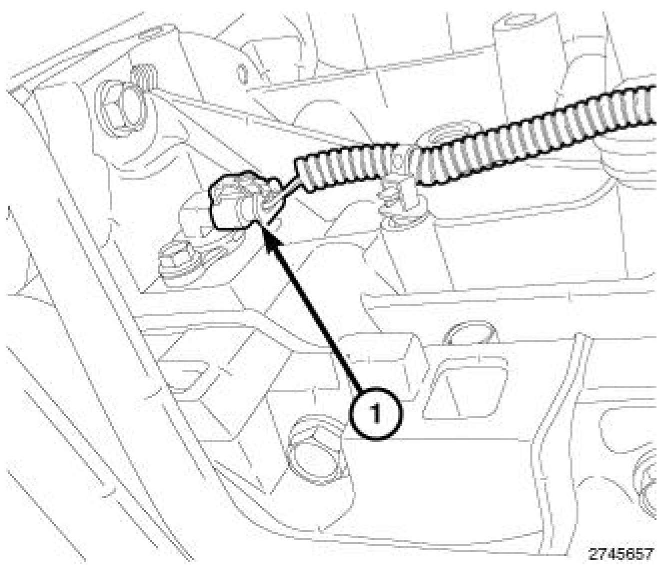


[Fig. 180: CKP Sensor & Bolt]
Courtesy of CHRYSLER GROUP, LLC

3. Clean out the CKP sensor mounting bolt hole in the engine block.

CAUTION: **Before tightening the CKP sensor mounting bolt, be sure the sensor is completely flush to the cylinder block. If the CKP sensor is not flush, damage to the sensor mounting tang may result.**

4. Install the CKP sensor (1) into the engine block. Tighten bolt (2) to the proper torque specification. Refer to **FUEL INJECTION, GAS, SPECIFICATIONS**.



[Fig. 181: Crankshaft Position Sensor Electrical Connector]
Courtesy of CHRYSLER GROUP, LLC

5. Connect the CKP sensor wire harness connector (1).

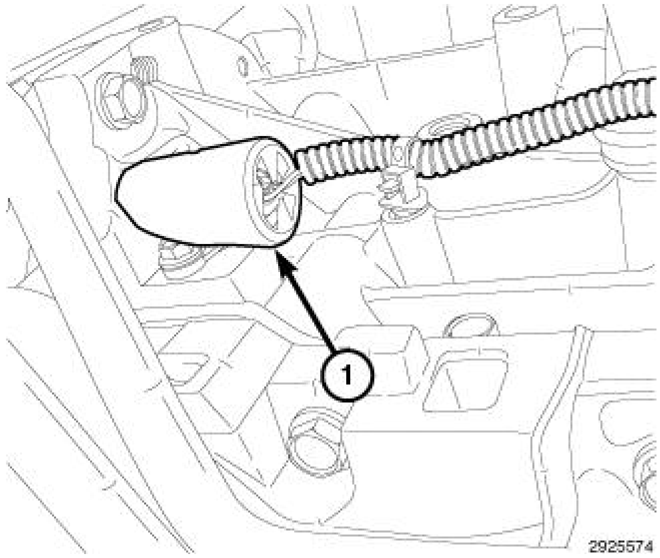


Fig. 182: Heat Shield
Courtesy of CHRYSLER GROUP, LLC

6. Install the heat shield (1) over the CKP sensor.

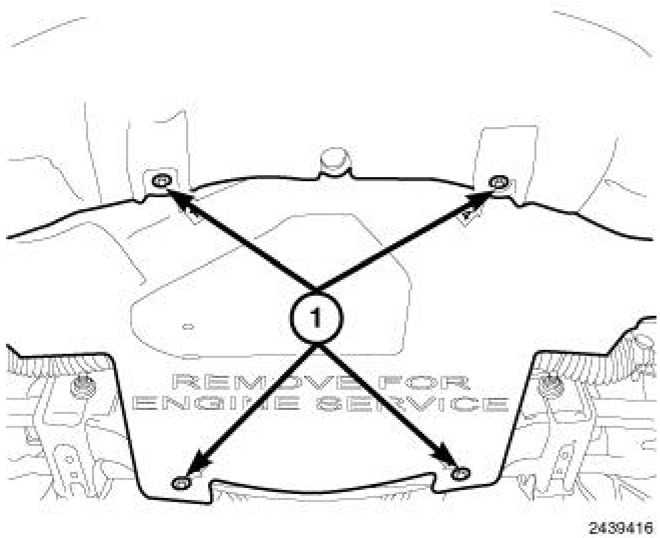

Fig. 183: Belly Pan & Fasteners
Courtesy of CHRYSLER GROUP, LLC

7. Install the belly pan and securely tighten bolts (1).
8. Remove support and lower the vehicle.
9. Connect the negative battery cable.

NOTE: **The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.**

6.2L

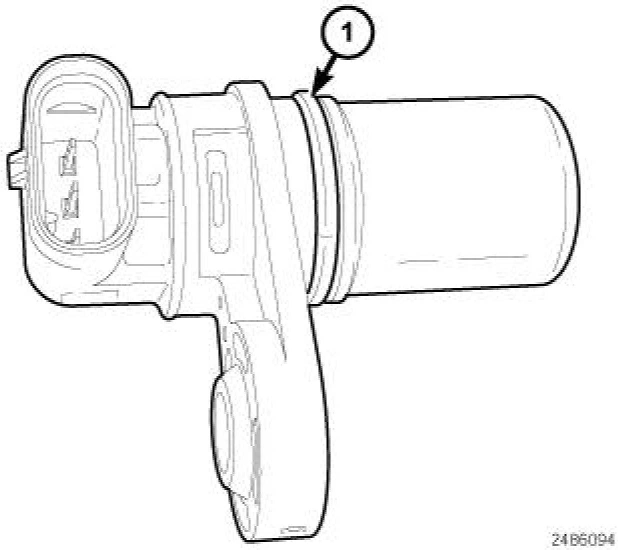

Fig. 184: Crankshaft Position Sensor O-Ring
Courtesy of CHRYSLER GROUP, LLC

1. Check the condition of the Crankshaft Position (CKP) sensor O-ring (1), and replace if necessary.
2. Clean the machined hole in the engine block.
3. Apply a small amount of engine oil to the CKP sensor O-ring (1).

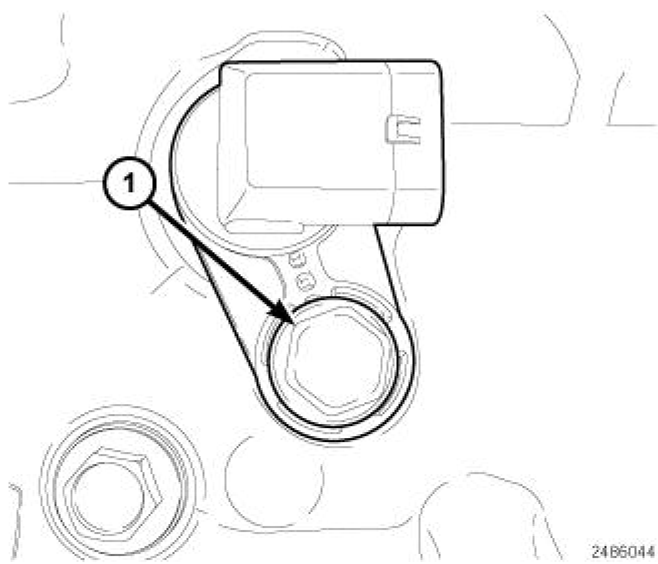

Fig. 185: Crankshaft Position Sensor Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

CAUTION: **Before tightening the CKP sensor mounting bolt (1), be sure the sensor is completely flush to the cylinder block. If sensor is not flush, damage to the sensor mounting tang may result.**

4. Install the CKP sensor into the engine block. Tighten bolt (1) to the proper torque specification. Refer to FUEL INJECTION, GAS, SPECIFICATIONS.

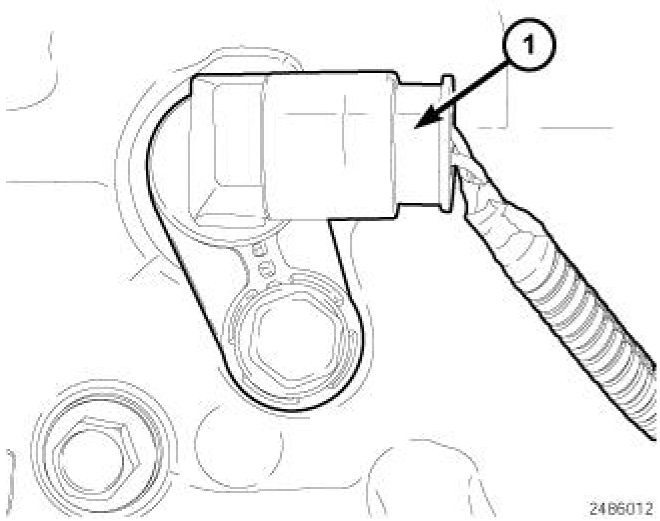

Fig. 186: Crankshaft Position Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

5. Connect the CKP sensor wire harness connector (1).
6. Install the starter. Refer to **STARTER, INSTALLATION** .
7. Remove support and lower the vehicle.
8. Install the negative battery cable.

NOTE: **The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.**

5.7L/6.4L

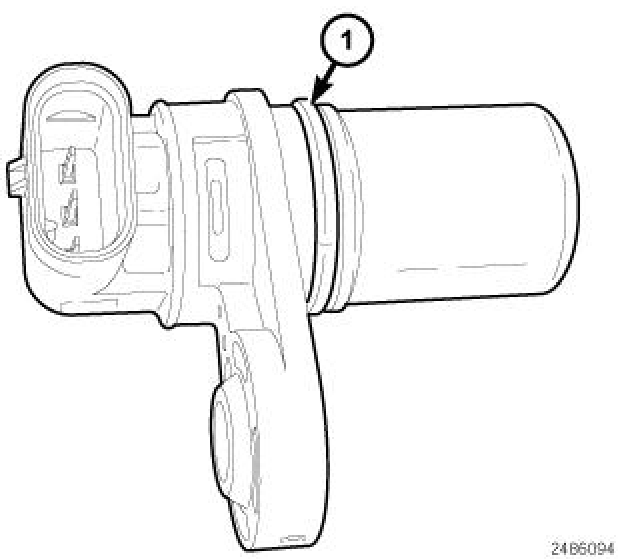

Fig. 187: Crankshaft Position Sensor O-Ring
Courtesy of CHRYSLER GROUP, LLC

1. Check the condition of the Crankshaft Position (CKP) sensor O-ring (1), and replace if necessary.

2. Clean the machined hole in the engine block.
3. Apply a small amount of engine oil to the CKP sensor O-ring (1).

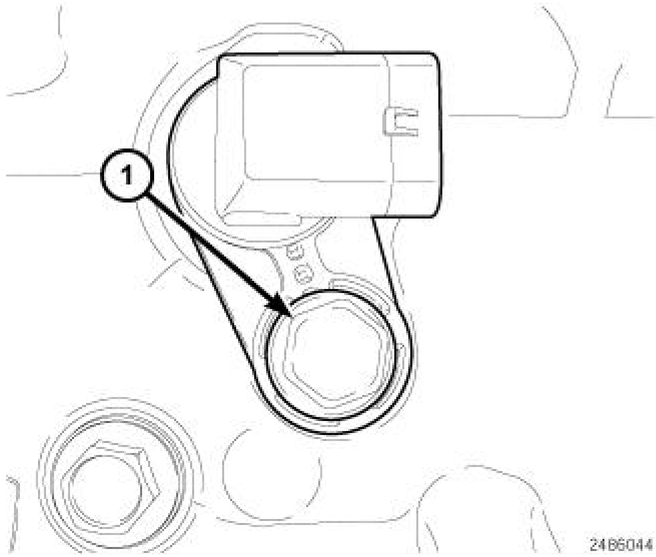

Fig. 188: Crankshaft Position Sensor Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Before tightening the CKP sensor mounting bolt (1), be sure the sensor is completely flush to the cylinder block. If sensor is not flush, damage to the sensor mounting tang may result.

4. Install the CKP sensor into the engine block. Tighten bolt (1) to the proper torque specification. Refer to **FUEL INJECTION, GAS, SPECIFICATIONS**.

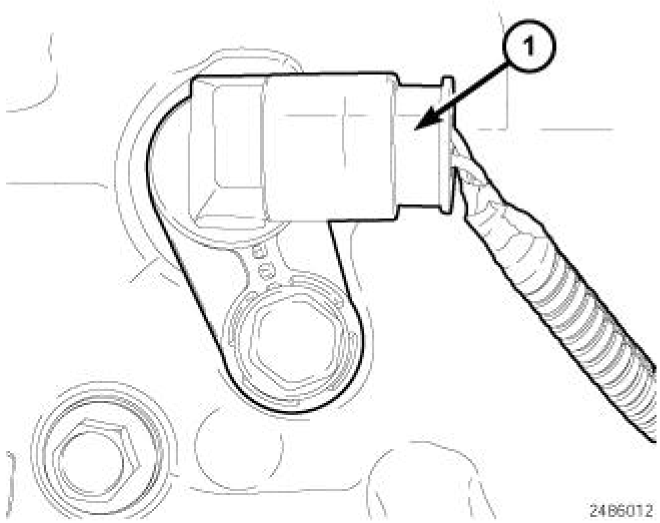

Fig. 189: Crankshaft Position Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

5. Connect the CKP sensor wire harness connector (1).
6. Install the starter. Refer to **STARTER, INSTALLATION** .

7. Remove support and lower the vehicle.
8. Install the negative battery cable.

NOTE: **The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.**

SENSOR, MASS AIRFLOW (MAF)

REMOVAL

6.2L

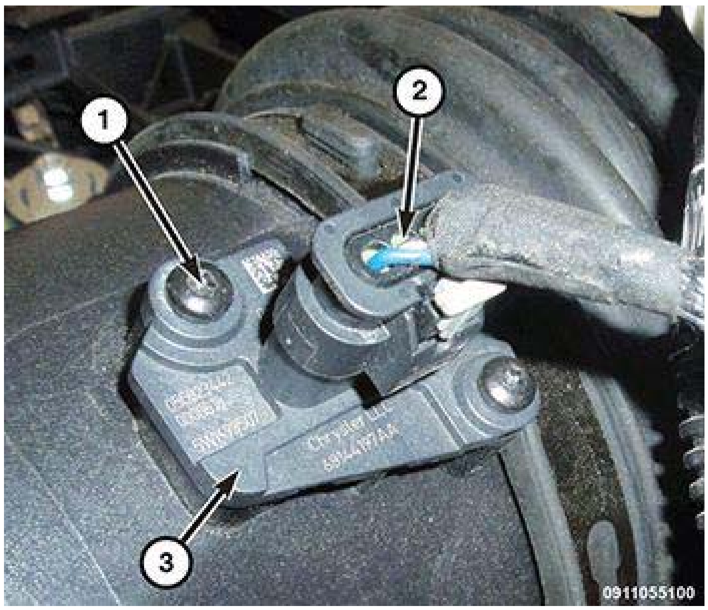

Fig. 190: MAF Sensor, Connector & Screw
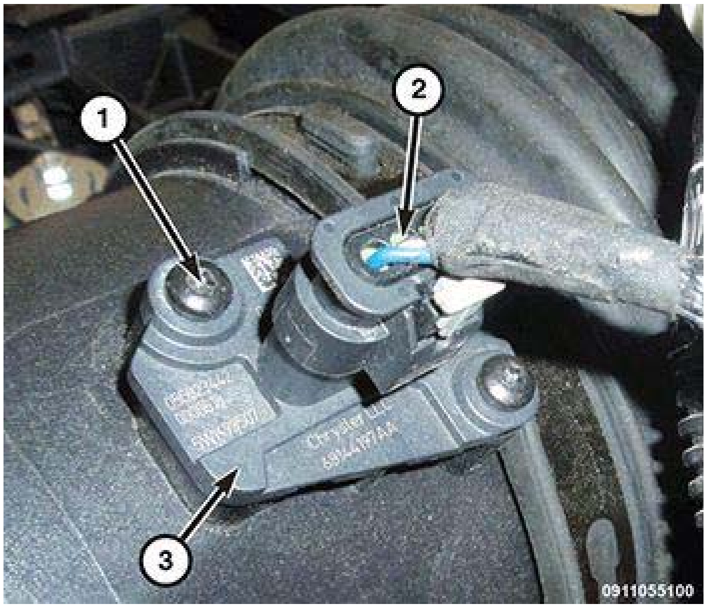
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Disconnect the Mass Air Flow (MAF) sensor wire harness connector (2).
3. Remove the screws (1) and the MAF sensor (3).

INSTALLATION

6.2L



[Fig. 191: MAF Sensor, Connector & Screw]
Courtesy of CHRYSLER GROUP, LLC

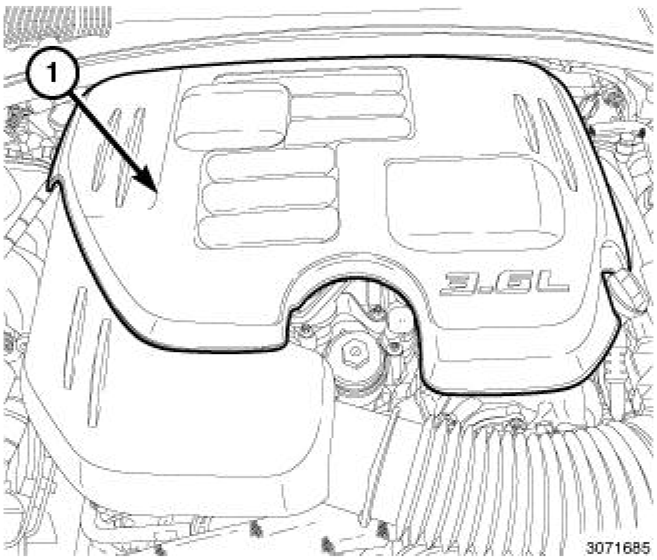
1. Install the Mass Air Flow (MAF) sensor (3) and securely tighten the screws (1).
2. Connect the MAF sensor wire harness connector (2).
3. Connect the negative battery cable.

SENSOR, MANIFOLD AIR PRESSURE (MAP)

REMOVAL

3.6L

1. Disconnect and isolate the negative battery cable.



[Fig. 192: Engine Cover]
Courtesy of CHRYSLER GROUP, LLC

2. Remove the engine cover (1).

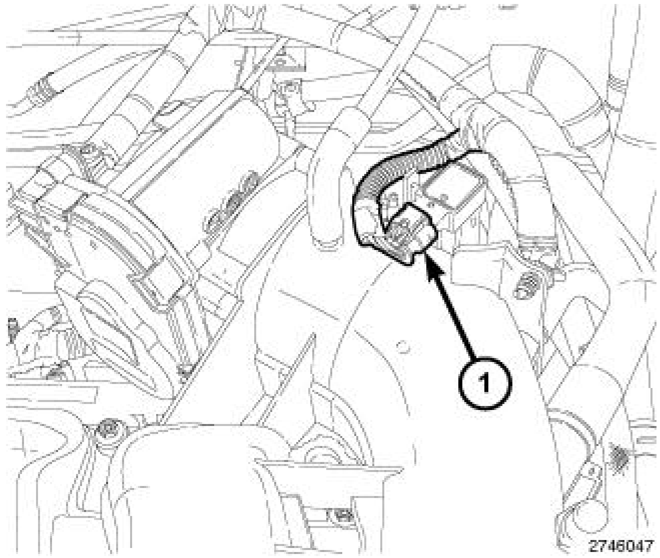


Fig. 193: MAP Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

3. Unlock and disconnect the MAP sensor wire harness connector (1).

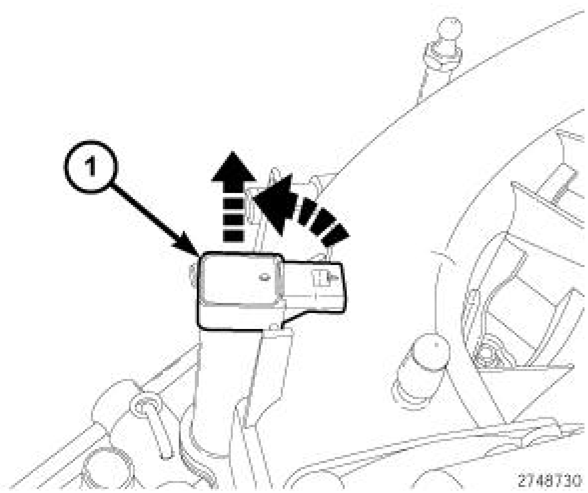

Fig. 194: Removing MAP Sensor
Courtesy of CHRYSLER GROUP, LLC

4. Rotate the MAP sensor 1/4 turn counterclockwise and pull the sensor straight up and out of the upper intake manifold.

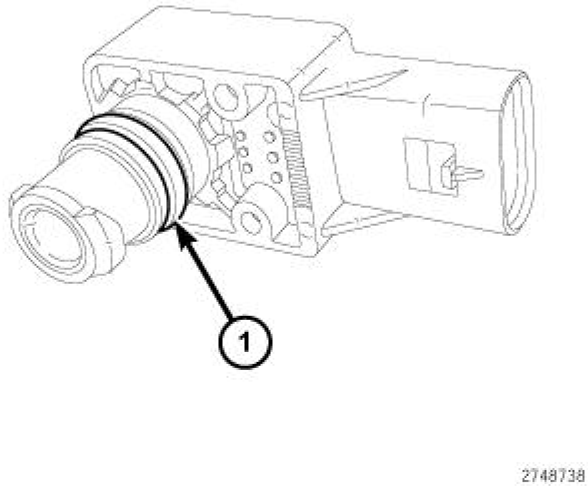

Fig. 195: O-Ring
Courtesy of CHRYSLER GROUP, LLC

5. The MAP sensor O-ring (1) can be reused if not damaged.

5.7L

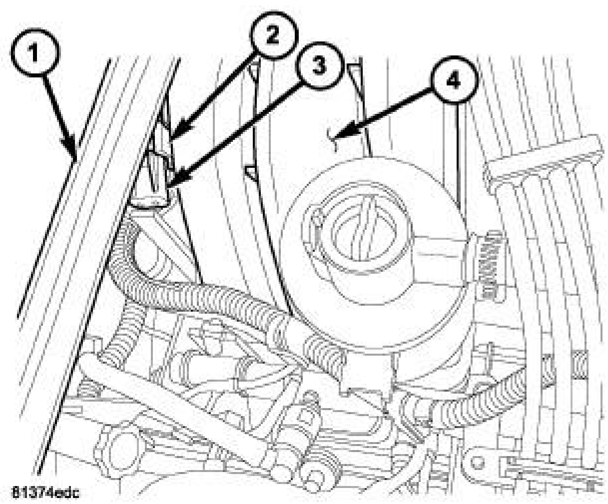

Fig. 196: Electrical Connector, Cowl/Hood Seal, Manifold Absolute Pressure (MAP) Sensor & Intake Manifold

2. Remove bolt (2) and the MAP sensor (1).

INSTALLATION

3.6L

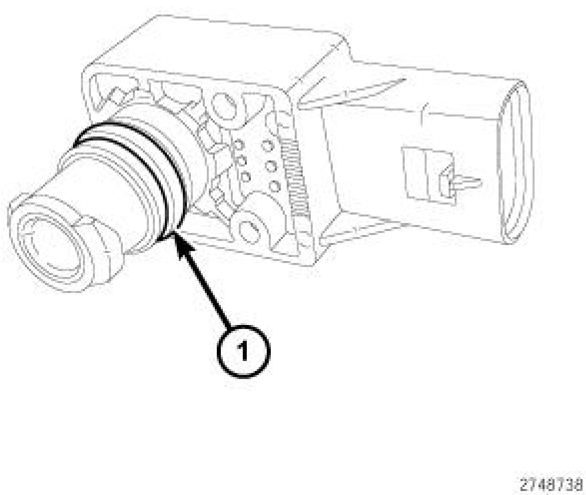

Fig. 200: O-Ring
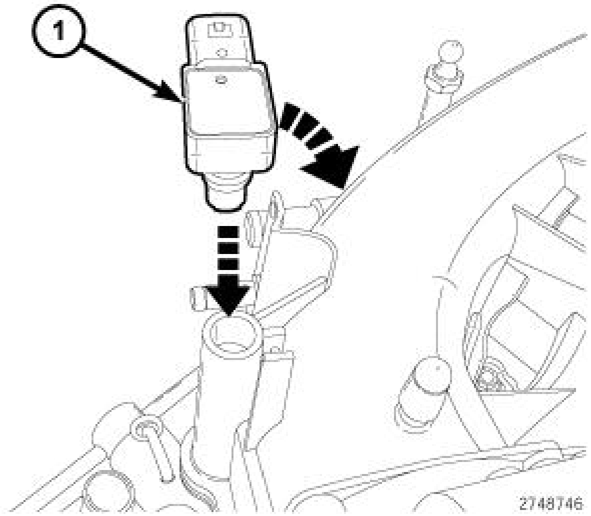
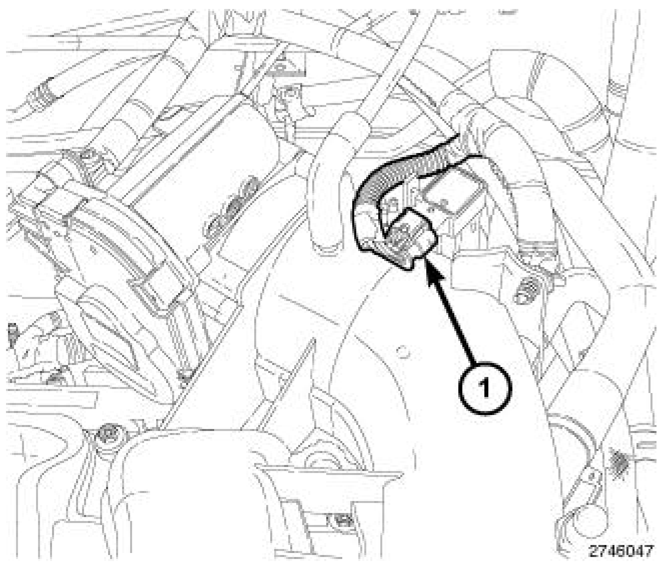
Courtesy of CHRYSLER GROUP, LLC

1. The Manifold Air Pressure (MAP) sensor O-ring (1) can be reused if not damaged.
2. Apply a small amount of engine oil to the MAP sensor O-ring (1).



[Fig. 201: Installing MAP Sensor](#)
Courtesy of CHRYSLER GROUP, LLC

3. Install the MAP sensor (1) into the upper intake manifold and rotate 1/4 turn clockwise.



[Fig. 202: MAP Sensor Electrical Connector](#)
Courtesy of CHRYSLER GROUP, LLC

4. Connect and lock the MAP sensor wire harness connector (1).

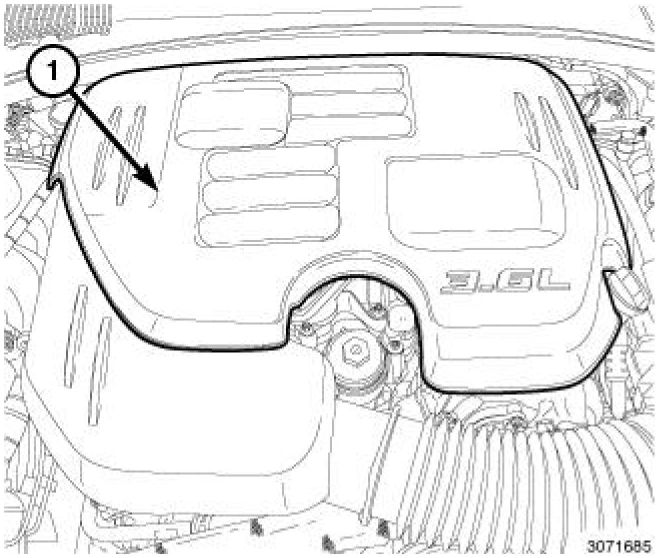


Fig. 203: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

5. Install the engine cover (1).
6. Connect the negative battery cable.

5.7L

1. Clean MAP sensor mounting hole at intake manifold.
2. Check MAP sensor O-ring seal for cuts or tears.
3. Install and rotate the MAP sensor 1/4 turn clockwise.

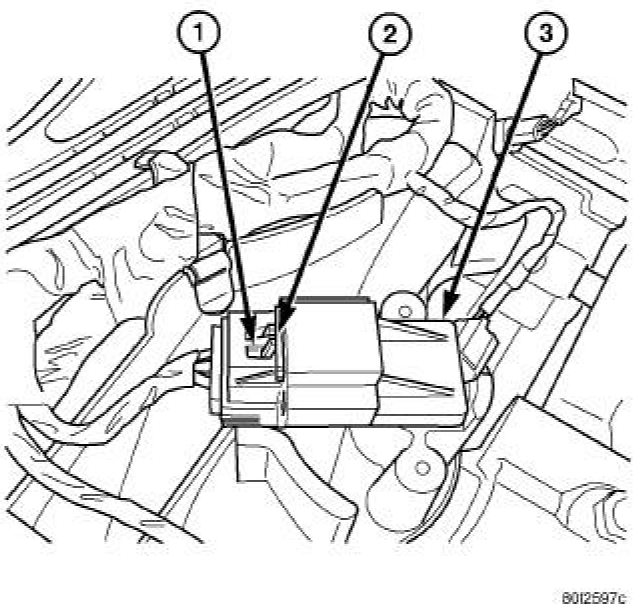

Fig. 204: Removing/Installing MAP Sensor
Courtesy of CHRYSLER GROUP, LLC

4. Connect and lock the MAP sensor wire harness connector (1).

6.4L

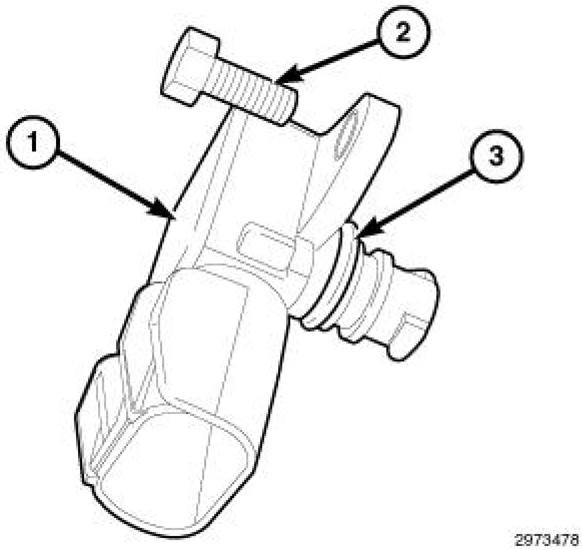

Fig. 205: MAP Sensor, Retaining Bolt & MAP Sensor O-Ring
Courtesy of CHRYSLER GROUP, LLC

1. Clean the Manifold Absolute Pressure (MAP) sensor mounting hole at rear of intake manifold.
2. Check the condition of the MAP sensor O-ring seal (3) and replace if necessary.
3. Install the MAP sensor (1) and securely tighten bolt (2).

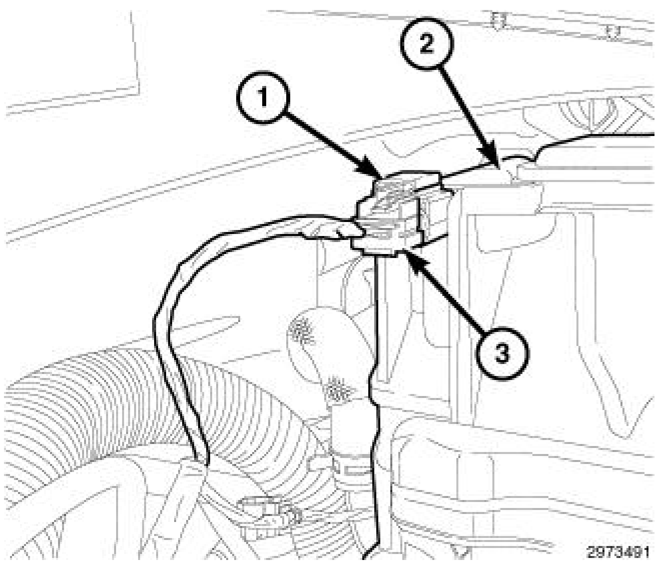

Fig. 206: Manifold Absolute Pressure (MAP) Sensor, Intake Manifold & Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

4. Connect the MAP sensor (1) wire harness connector (3).

SENSOR, OXYGEN

DESCRIPTION

DESCRIPTION

3.6L

The engine is equipped with four heated oxygen sensors:

- The right upstream oxygen sensor is referred to as the 1/1 sensor.
- The right downstream oxygen sensor is referred to as the 1/2 sensor.
- The left upstream oxygen sensor is referred to as the 2/1 sensor.
- The left downstream oxygen sensor is referred to as the 2/2 sensor.

5.7L/6.2L/6.4L

The engine is equipped with four heated oxygen sensors:

- The left upstream oxygen sensor is referred to as the 1/1 sensor.
- The left downstream oxygen sensor is referred to as the 1/2 sensor.
- The right upstream oxygen sensor is referred to as the 2/1 sensor.
- The right downstream oxygen sensor is referred to as the 2/2 sensor.

REMOVAL

3.6L

UPSTREAM

WARNING: The exhaust pipes and catalytic converter become very hot during engine operation. Allow the engine to cool before removing the oxygen sensor.

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

   CAUTION: When disconnecting the oxygen sensor electrical connector, do not pull directly on the wire going into the sensor. The sensor wiring can be damaged resulting in sensor failure.

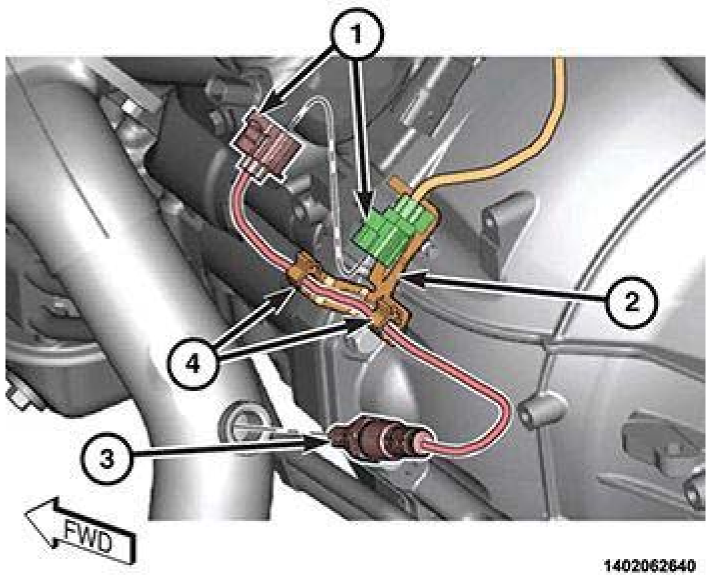

Fig. 207: Oxygen Sensor Wire Harness Connector, Retainer, Oxygen Sensor & Oxygen Sensor Wire Harness
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the oxygen sensor wire harness connector (1).
4. Disengage the oxygen sensor wire harness (4) from the retainer (2).
5. Remove the oxygen sensor (3).
6. Clean the exhaust pipe threads using an appropriate tap.

DOWNSTREAM

WARNING: The exhaust pipes and catalytic converter become very hot during engine operation. Allow the engine to cool before removing the oxygen sensor.

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

CAUTION: When disconnecting the oxygen sensor electrical connector, do not pull directly on the wire going into the sensor. The sensor wiring can be damaged resulting in sensor failure.

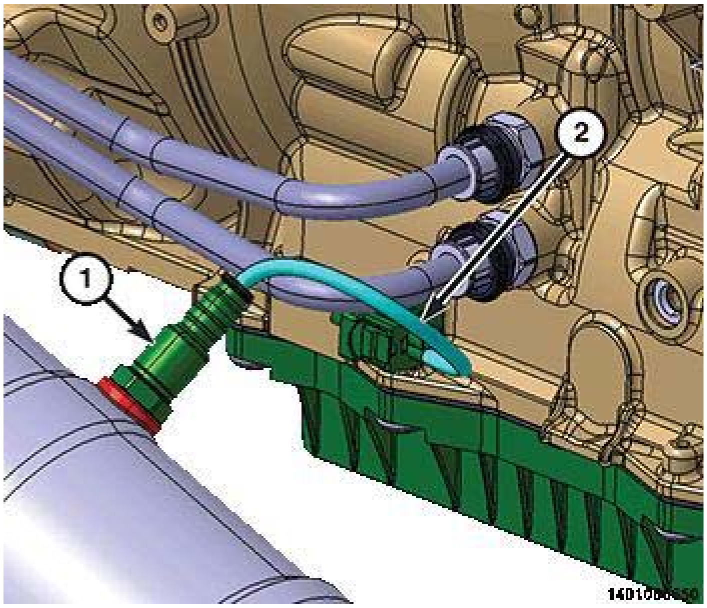

Fig. 208: Oxygen Sensor & Oxygen Sensor Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the oxygen sensor wire harness connector (2).
4. Remove the oxygen sensor (1).
5. Clean the exhaust pipe threads using an appropriate tap.

5.7L

UPSTREAM

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

WARNING: **The exhaust pipes and catalytic converter become very hot during engine operation. Allow the engine to cool before removing the oxygen sensor.**

CAUTION: **When disconnecting the oxygen sensor electrical connector, do not pull directly on the wire going into the sensor. The sensor wiring can be damaged resulting in sensor failure.**

Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the oxygen sensor wire harness connector (2) and remove the harness from the retainer (3).
4. Remove the oxygen sensor (1) from the exhaust manifold.
5. Clean the threads in the exhaust pipes using an appropriate tap.

DOWNSTREAM

1. Disconnect and Isolate the negative battery cable
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

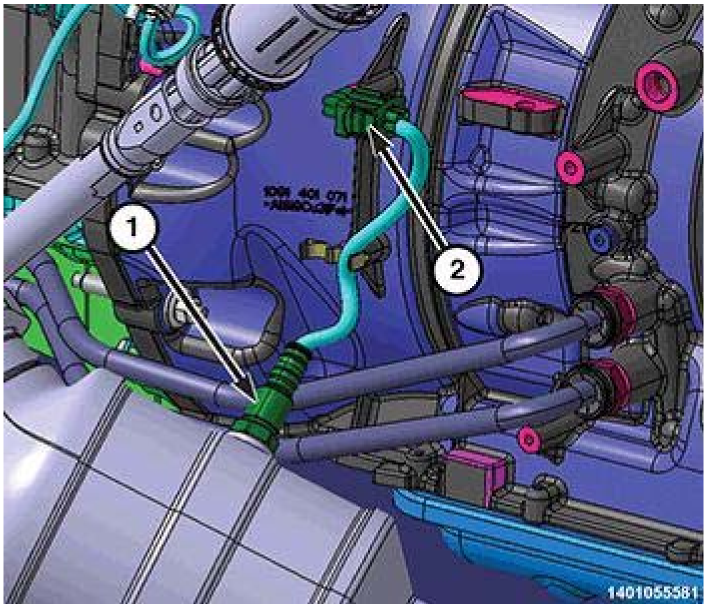

Fig. 214: Removing/Installing Oxygen Sensor
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the oxygen sensor wire harness connector (2).

CAUTION: When disconnecting the oxygen sensor electrical connector, do not pull directly on the wire going into the sensor. The sensor wiring can be damaged resulting in sensor failure.

4. Remove the wire harness from the retainer.
5. Remove the oxygen sensor (1).
6. Clean the threads in the catalytic converters using an appropriate tap.

INSTALLATION

3.6L

UPSTREAM

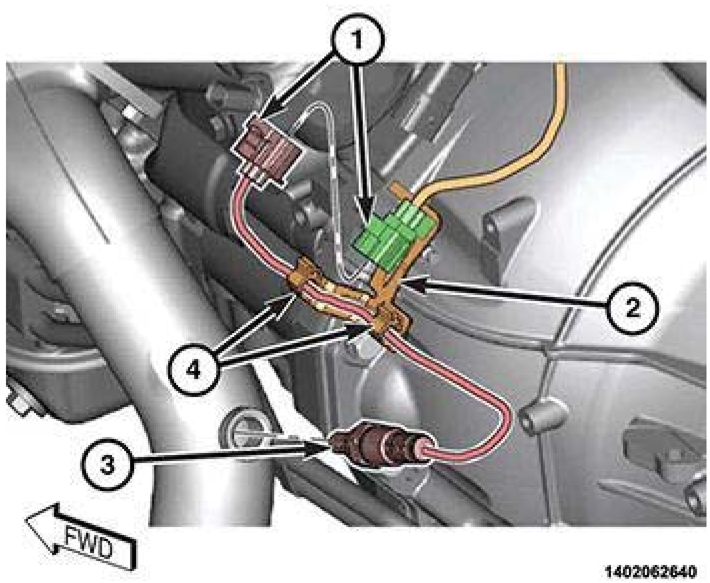

Fig. 215: Oxygen Sensor Wire Harness Connector, Retainer, Oxygen Sensor & Oxygen Sensor Wire Harness
Courtesy of CHRYSLER GROUP, LLC

1. If reinstalling the original oxygen sensor, coat the sensor threads with an anti-seize compound such as Loctite 771- 64 or equivalent. New sensors have compound on the threads and do not require an additional coating. **Do Not add any additional anti-seize compound to the threads of a new oxygen sensor.**
2. Install the oxygen sensor (3) and tighten to the proper torque specification. Refer to FUEL INJECTION, GAS, SPECIFICATIONS.

CAUTION: Never apply any type of grease to the oxygen sensor electrical connector, or attempt any repair of the sensor wiring harness.

3. Connect the oxygen sensor wire harness connector (1).
4. Position the oxygen sensor wire harness (4) into the retainer (2) and engage the retainer.
5. Remove support and lower the vehicle.
6. Connect the negative battery cable.

DOWNSTREAM

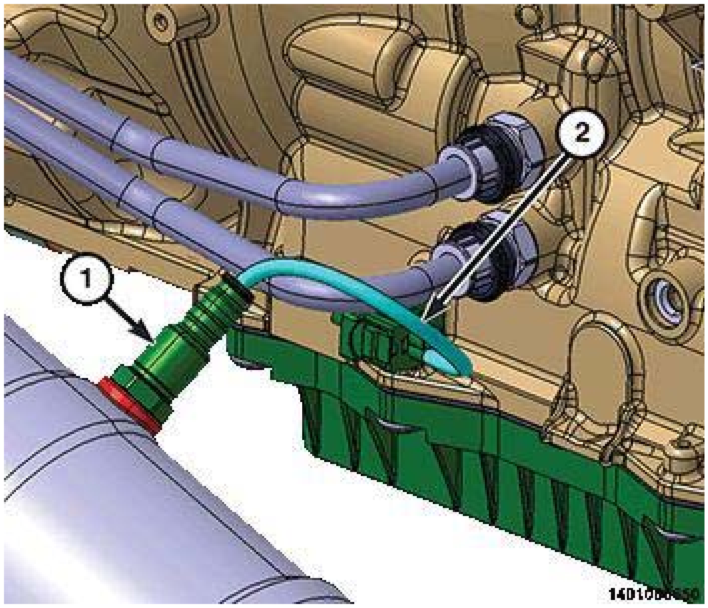

Fig. 216: Oxygen Sensor & Oxygen Sensor Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. If reinstalling the original oxygen sensor, coat the sensor threads with an anti-seize compound such as Loctite 771- 64 or equivalent. New sensors have compound on the threads and do not require an additional coating. **Do Not add any additional anti-seize compound to the threads of a new oxygen sensor.**
2. Install the oxygen sensor (1) and tighten to the proper torque specification. Refer to **FUEL INJECTION, GAS, SPECIFICATIONS**.

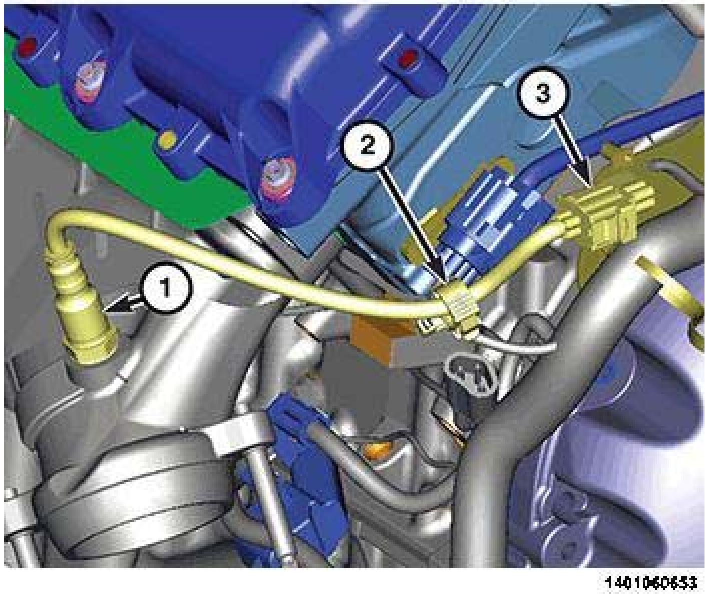
CAUTION: Never apply any type of grease to the oxygen sensor electrical connector, or attempt any repair of the sensor wiring harness.

3. Connect the oxygen sensor wire harness connector (2).
4. Remove support and lower the vehicle.
5. Connect the negative battery cable.

5.7L

UPSTREAM

Threads of new oxygen sensors are factory coated with anti-seize compound to aid in removal. **Do not add any additional anti-seize compound to threads of a new oxygen sensor.**



[Fig. 217: Oxygen Sensor, Retainer & Oxygen Sensor Wire Harness Connector](#)
Courtesy of CHRYSLER GROUP, LLC

1. Install the oxygen sensor (1) and tighten to the proper torque specification. Refer to **FUEL INJECTION, GAS, SPECIFICATIONS**.
2. Position the oxygen sensor wire harness into the retainer and engage the retainer.
3. Connect the oxygen sensor wire harness connector.
4. Remove support and lower the vehicle.
5. Connect the negative battery cable.

DOWNSTREAM

Threads of new oxygen sensors are factory coated with anti-seize compound to aid in removal. **Do not add any additional anti-seize compound to threads of a new oxygen sensor.**

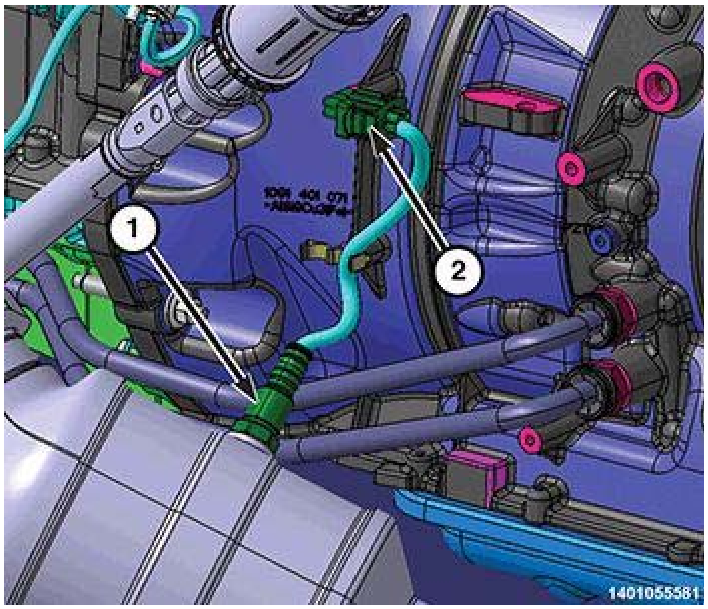

Fig. 222: Removing/Installing Oxygen Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Install the oxygen sensor (1) and tighten to the proper torque specification. Refer to **FUEL INJECTION, GAS, SPECIFICATIONS**.
2. Connect the oxygen sensors wire harness connector (2) and secure the wire harness in the retainer.
3. Remove support and lower the vehicle.
4. Connect the negative battery cable.

THROTTLE BODY

REMOVAL

3.6L

1. Disconnect and isolate the negative battery cable.

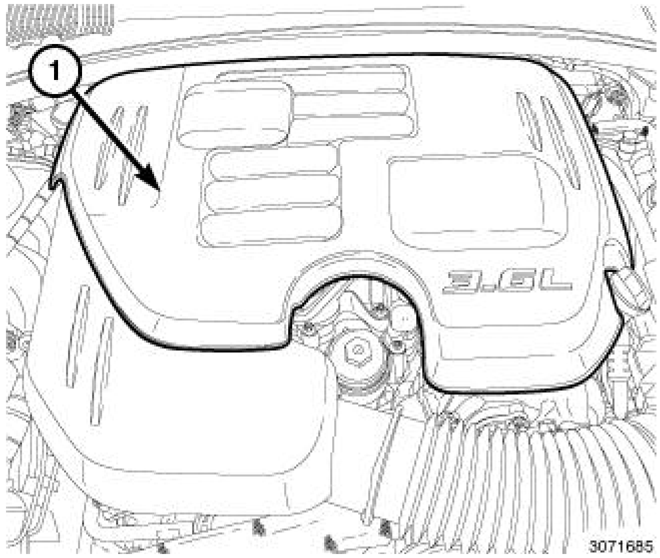

Fig. 223: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

2. Remove the engine cover (1).

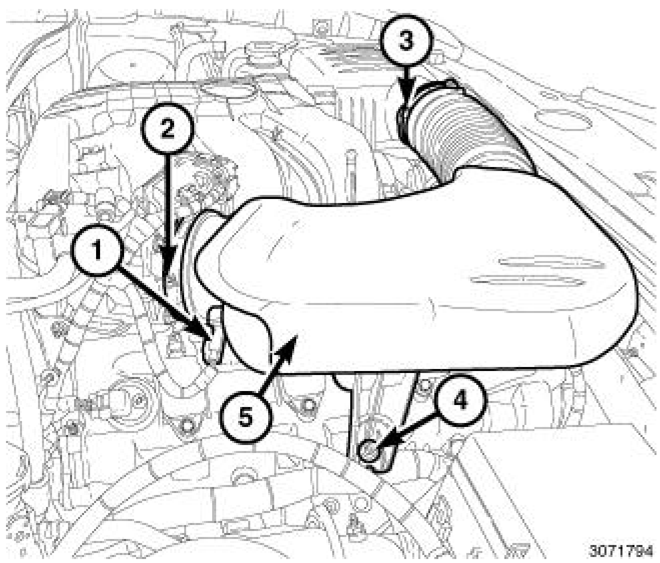

Fig. 224: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the Inlet Air Temperature (IAT) sensor wire harness connector (1).
4. Loosen the air inlet hose assembly clamp (2) and remove from throttle body.
5. Loosen the air inlet hose assembly clamp (3) and lift the air inlet hose assembly (5) retaining grommet off the ball stud (4) and remove from air cleaner body.

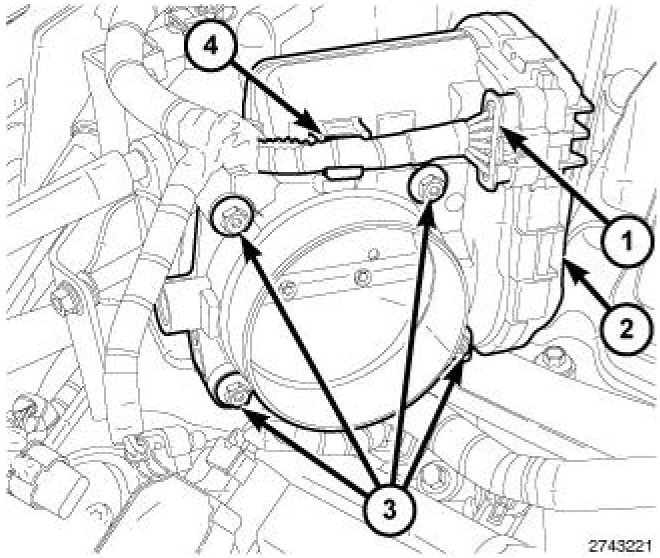

Fig. 225: Electrical Connector, Electronic Throttle Control, Clip & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Detach the Electronic Throttle Control (ETC) wire harness clip from the housing (4) and disconnect the ETC wire harness connector (1).
7. Remove bolts (3) and the ECT (2).

5.7L

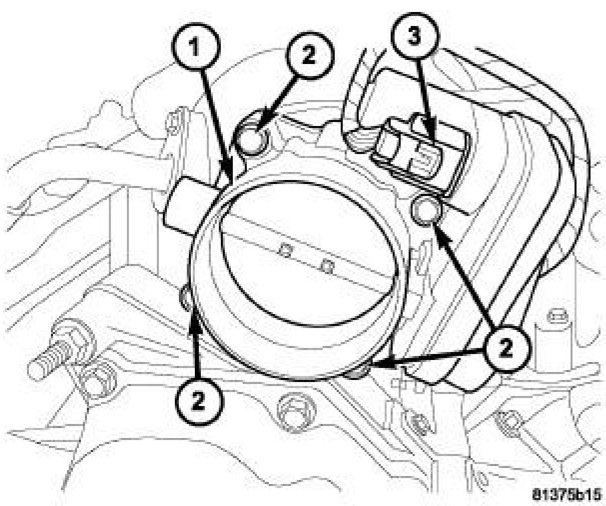

Fig. 226: Throttle Body, Throttle Body Mounting Bolts & Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use spray (carb) cleaners on any part of the throttle body. Do not apply silicone lubricants to any part of the throttle body.

1. Disconnect and isolate the negative battery cable.
2. Loosen clamp and remove the air inlet hose from throttle body.

3. Disconnect throttle body (1) wire harness connector (3).
4. Remove bolts (2) and the throttle body (1).

6.2L

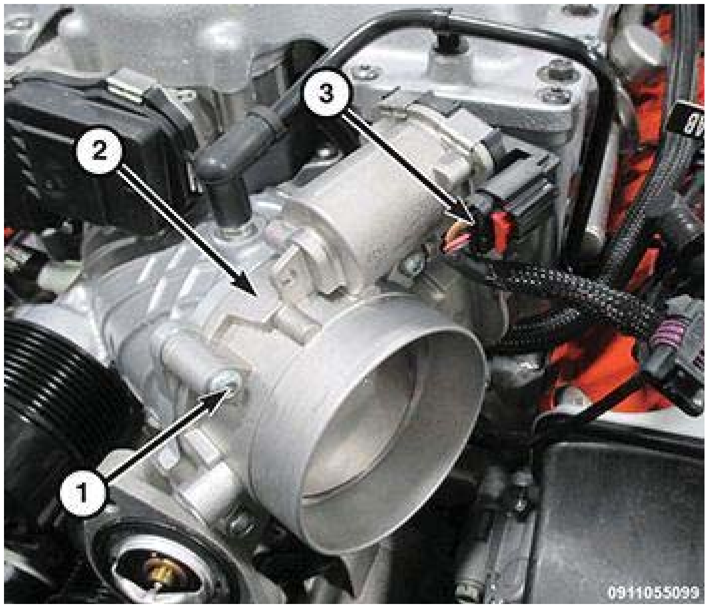

Fig. 227: Throttle Body, Throttle Body Mounting Bolts & Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

CAUTION: **Do not use spray (carb) cleaners on any part of the throttle body. Do not apply silicone lubricants to any part of the throttle body.**

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** .
3. Disconnect the throttle body (2) wire harness connector (3).
4. Remove bolts (1) the throttle body (2) from the supercharger.

6.4L

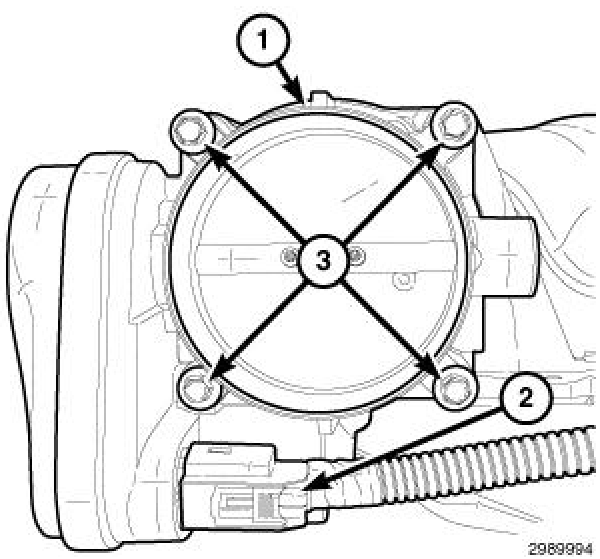

Fig. 228: Throttle Body, Throttle Body Mounting Bolts & Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use spray (carb) cleaners on any part of the throttle body. Do not apply silicone lubricants to any part of the throttle body.

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner housing. Refer to **BODY, AIR CLEANER, REMOVAL** .
3. Disconnect the electrical connector (2) at the throttle body (1).
4. Remove bolts (3) the throttle body from the intake manifold.

INSTALLATION

3.6L

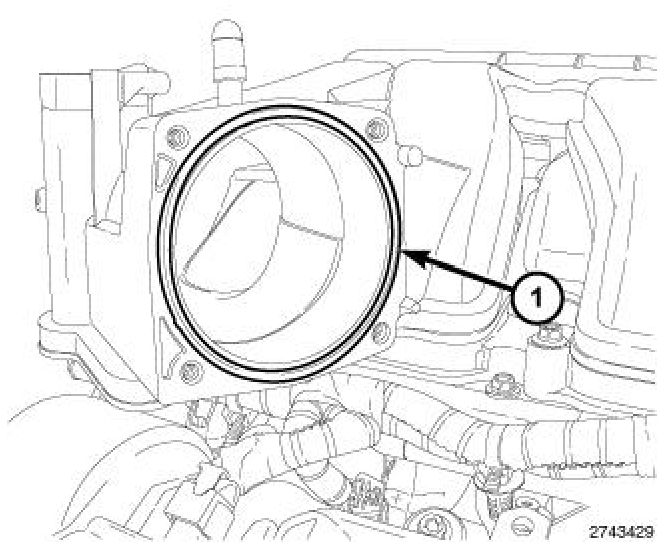

Fig. 229: Throttle Body-To-Intake Manifold Seal
Courtesy of CHRYSLER GROUP, LLC

1. Check the condition of the throttle body-to-intake manifold seal (1). The seal can be reused if not damaged.
2. Clean the mating surfaces of the throttle body and intake manifold.

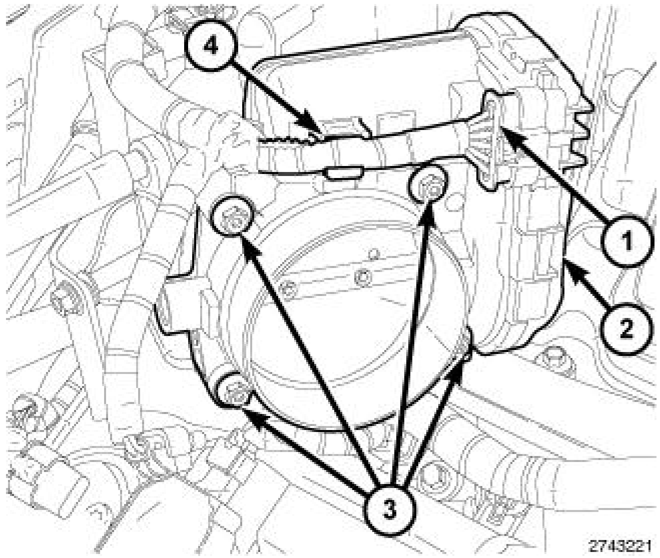

Fig. 230: Electrical Connector, Electronic Throttle Control, Clip & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Install the Electronic Throttle Control (ETC) (2). Tighten bolts (3) in a crisscross pattern sequence to the proper torque specification. Refer to **FUEL INJECTION, GAS, SPECIFICATIONS**.
4. Connect the ETC wire harness connector (1) and attach the ETC wire harness clip to the housing (4).

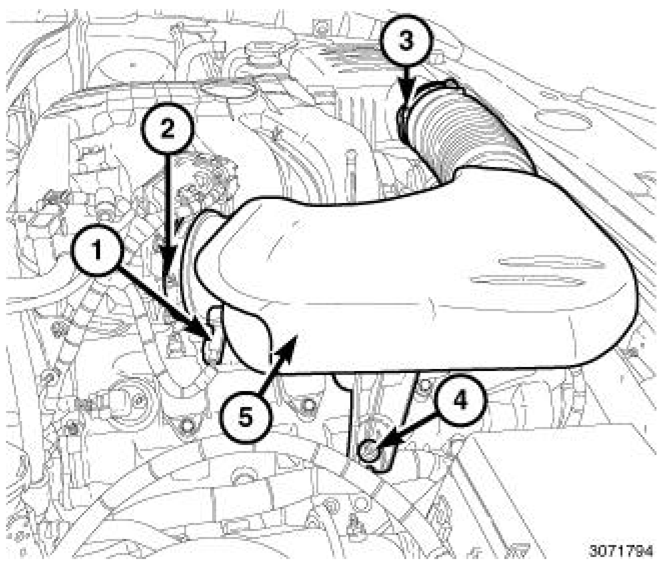

Fig. 231: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners
Courtesy of CHRYSLER GROUP, LLC

5. Install the air inlet hose assembly (5) onto the ECT (2) and securely tighten clamp.
6. Install the air inlet hose assembly (5) onto air cleaner housing (3). and seat retaining grommet onto the ball stud (4) then securely tighten clamp.
7. Connect the Inlet Air Temperature (IAT) sensor wire harness connector (1).

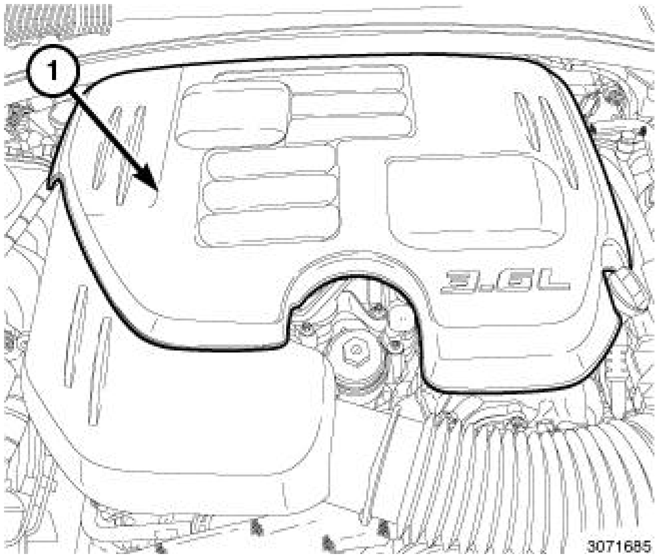

Fig. 232: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

8. Install the engine cover (1).
9. Connect the negative battery cable.

5.7L

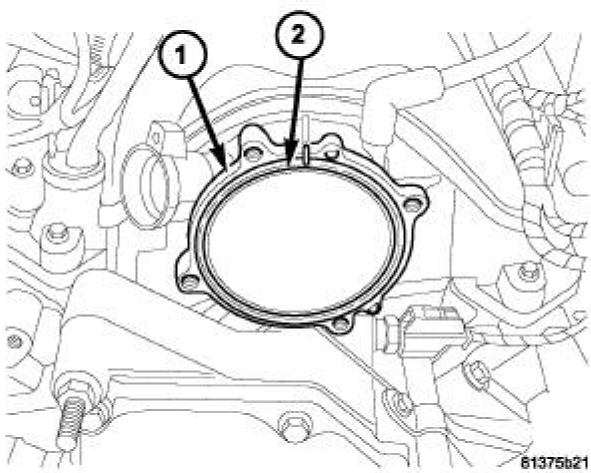

Fig. 233: Intake Manifold & Throttle Body O-Ring
Courtesy of CHRYSLER GROUP, LLC

1. Clean and check condition of throttle body-to-intake manifold O-ring (2).
2. Clean mating surfaces of throttle body and intake manifold (1).

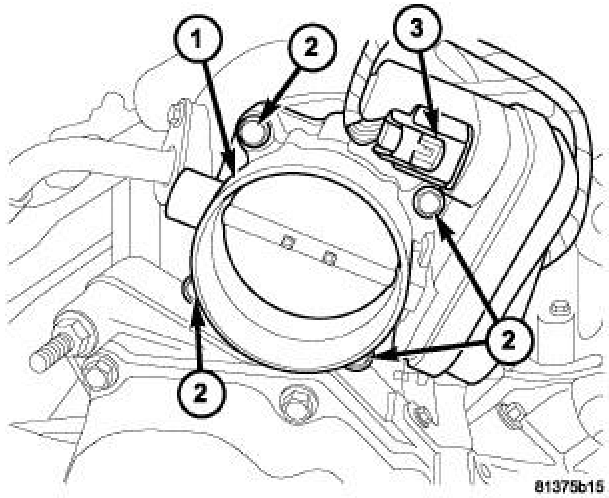

Fig. 234: Throttle Body, Throttle Body Mounting Bolts & Electrical Connector
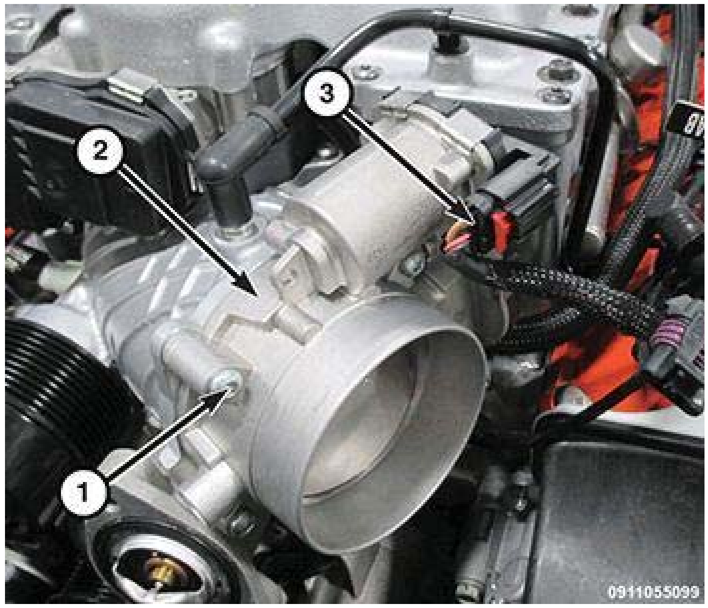
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use spray (carb) cleaners on any part of the throttle body. Do not apply silicone lubricants to any part of the throttle body.

3. Install the throttle body. Tighten bolts (2) to the proper torque specification. Refer to **FUEL INJECTION, GAS, SPECIFICATIONS**.
4. Install the throttle body wire harness connector (3).
5. Install the air inlet hose to throttle body and securely tighten clamp.
6. A Scan Tool may be used to learn electrical parameters. Go to the Miscellaneous menu, and then select ETC Relearn. If the relearn is not performed, a Diagnostic Trouble Code (DTC) will be set. If necessary, use a scan tool to erase any Diagnostic Trouble Codes (DTC's) from PCM.

6.2L

1. Clean and inspect the throttle body-to-intake manifold rubber O-ring seal and replace if necessary.
2. Clean the sealing surface of throttle body and supercharger.



[**Fig. 235: Throttle Body, Throttle Body Mounting Bolts & Electrical Connector**]()
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use spray (carb) cleaners on any part of the throttle body. Do not apply silicone lubricants to any part of the throttle body.

3. Install the throttle body (2). Tighten bolts (1) to the proper torque specification. Refer to **FUEL INJECTION, GAS, SPECIFICATIONS**.
4. Connect the throttle body wire harness connector (3).
5. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION** .
6. Connect the negative battery cable.
7. A scan tool may be used to learn electrical parameters. Go to the Miscellaneous menu and then select ETC Relearn. If the relearn is not performed, a Diagnostic Trouble Code (DTC) will be set. If necessary, use a scan tool to erase any DTC's from the PCM.

6.4L

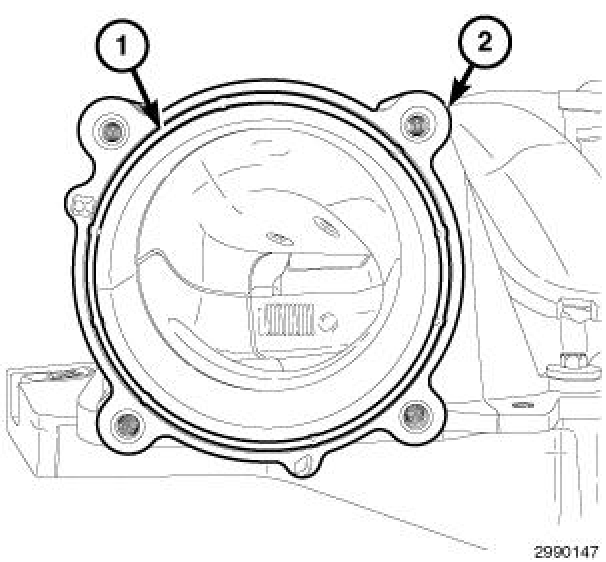


Fig. 236: Throttle Body O-Ring
Courtesy of CHRYSLER GROUP, LLC

1. Clean and inspect the throttle body-to-intake manifold rubber O-ring seal (1) and replace if necessary.
2. Clean the sealing surface of throttle body and intake manifold (2).

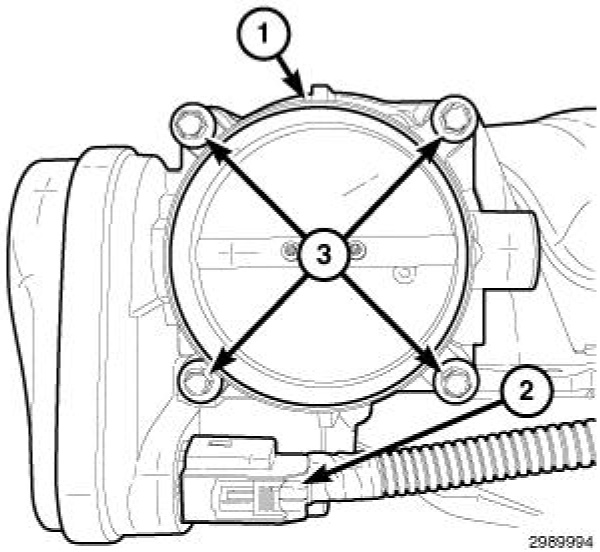

Fig. 237: Throttle Body, Throttle Body Mounting Bolts & Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use spray (carb) cleaners on any part of the throttle body. Do not apply silicone lubricants to any part of the throttle body.

3. Install the throttle body (1). Tighten bolts (3) to the proper torque specification. Refer to **FUEL INJECTION, GAS, SPECIFICATIONS**.
4. Connect the throttle body wire harness connector (2).
5. Install the air cleaner housing. Refer to **BODY, AIR CLEANER, INSTALLATION** .
6. Connect the negative battery cable.
7. A scan tool may be used to learn electrical parameters. Go to the Miscellaneous menu and then select ETC Relearn. If the relearn is not performed, a Diagnostic Trouble Code (DTC) will be set. If necessary, use a scan tool to erase any DTC's from the PCM.

VALVE, SHORT RUNNER

DESCRIPTION

DESCRIPTION

The intake manifold features a dual shaft Short Runner Valve (SRV) system to maximize both low end torque and peak power. The SRV is bolted to the rear of the intake manifold and can be service separately from the manifold.

The SRV system operates under Wide Open Throttle conditions to maximize engine performance. When activated by the PCM, the SRV actuates a mechanical linkage to redirect the intake air flow to eight short runners. The PCM looks for a signal feedback when the actuator is activated. If the signal feedback is not

present, the PCM sets the DTC.

REMOVAL

REMOVAL

1. Disconnect the negative battery cable.
2. Remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL** for 3.6L, **MANIFOLD, INTAKE, REMOVAL, 5.7L** for 5.7L or **MANIFOLD, INTAKE, REMOVAL** for 6.4L.

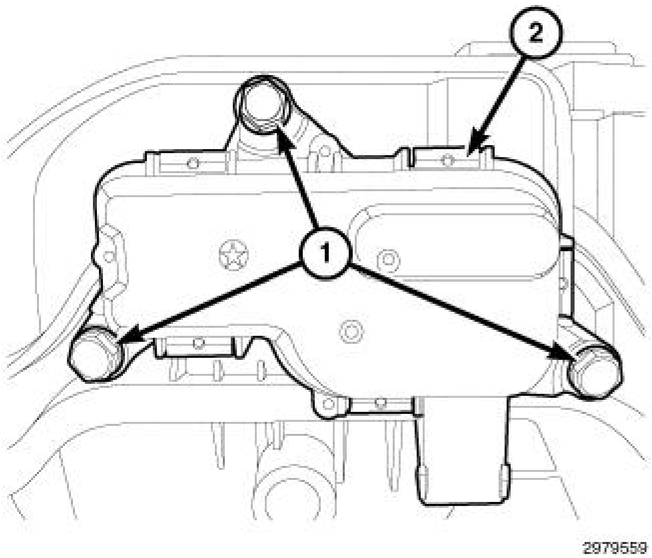

Fig. 238: Short Runner Valve (SRV) Actuator Retaining Bolts & SRV Actuator
Courtesy of CHRYSLER GROUP, LLC

3. Remove bolts (1) and the Short Runner Valve (SRV) actuator (2).

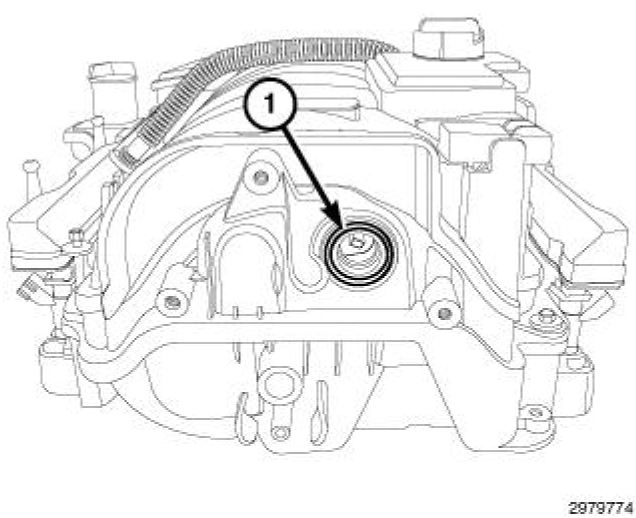

Fig. 239: Rubber O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

4. Remove and discard the SRV actuator rubber O-ring seal (1).

INSTALLATION

INSTALLATION

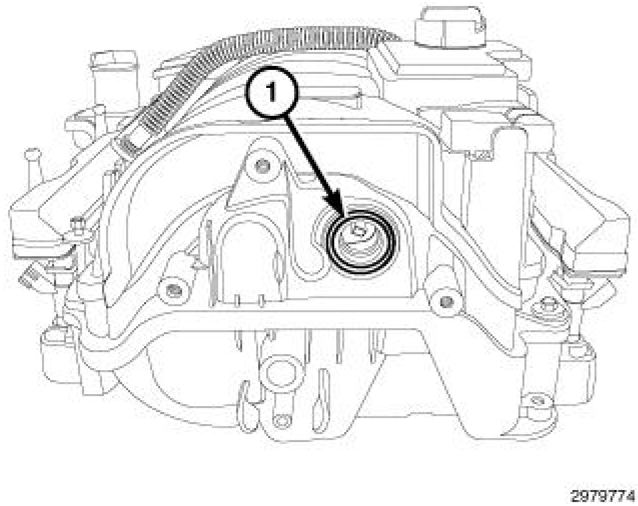

Fig. 240: Rubber O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not reuse the old Short Runner Valve (SRV) actuator O-ring seal (1).

1. Install a **new** SRV actuator rubber O-ring seal (1).

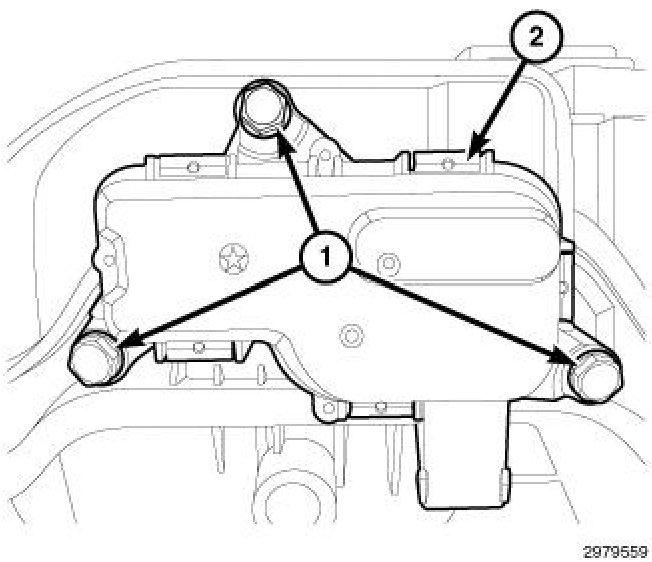

Fig. 241: Short Runner Valve (SRV) Actuator Retaining Bolts & SRV Actuator
Courtesy of CHRYSLER GROUP, LLC

2. Install the SRV actuator (2). tighten bolts (1) to the proper torque specification. Refer to **FUEL INJECTION, GAS, SPECIFICATIONS**.
3. Install the intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION** for 3.6L, **MANIFOLD, INTAKE, INSTALLATION** for 5.7L or **MANIFOLD, INTAKE, INSTALLATION** for 6.4L.
4. Connect the negative battery cable.

SENSOR, TMAP-INTAKE MANIFOLD

DESCRIPTION

DESCRIPTION

The 6.2L engine uses four Temperature and Manifold Absolute Pressure (TMAP) sensors.

- Bank 1 TMAP sensor is located on the right front bottom of the supercharger.
- Bank 2 TMAP sensor is located on the left rear bottom of the supercharger.
- The intermediate TMAP sensor is located on the upper left side of the supercharger.
- The throttle outlet TMAP sensor is located on the right front of the supercharger by the throttle body.

OPERATION

OPERATION

The air temperature portion of the sensor, provides an input voltage to the Powertrain Control Module (PCM) indicating air temperature at each of the four sensors. The Manifold Absolute Pressure (MAP) portion of the sensor provides an input voltage to the PCM indicating pressures from the four sensor locations.

REMOVAL

BANK 1

1. Disconnect and isolate the negative battery cable.

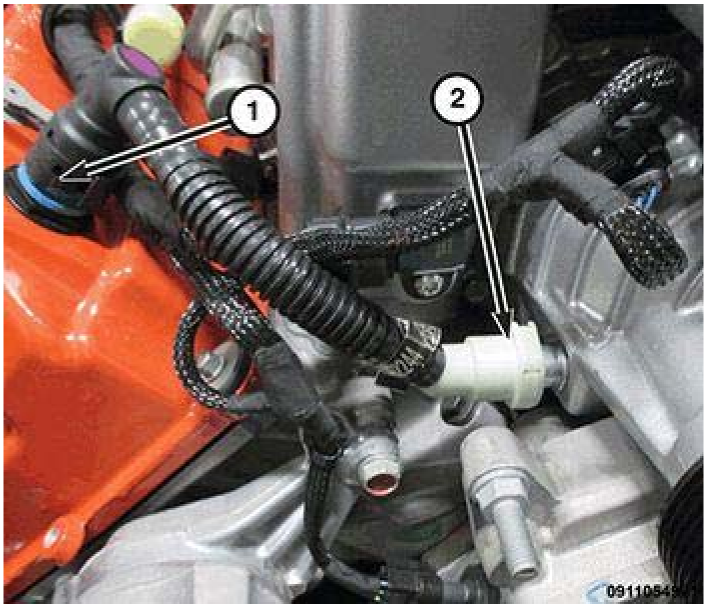

Fig. 242: Disconnecting/Connecting PCV Hose
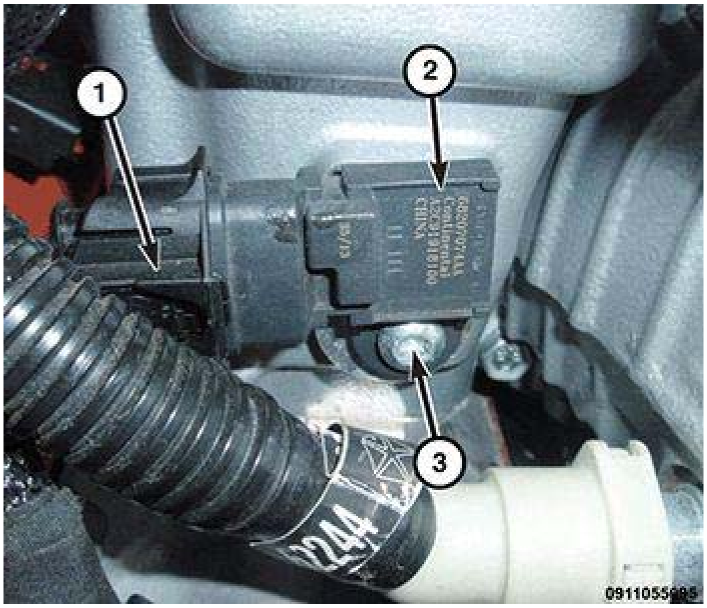
Courtesy of CHRYSLER GROUP, LLC

2. Disconnect the right side PCV hose (2) from the supercharger and position aside.



[Fig. 243: TMAP Sensor, Connector & Screw]
Courtesy of CHRYSLER GROUP, LLC

3. Clean the area around Temperature and Manifold Absolute Pressure (TMAP) sensor (2).
4. Disconnect the TMAP sensor wire harness connector (1).
5. Remove screw (3) and the TMAP sensor (2) from supercharger.

BANK 2

[Fig. 244: Engine Covers]
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the left side engine cover (1).

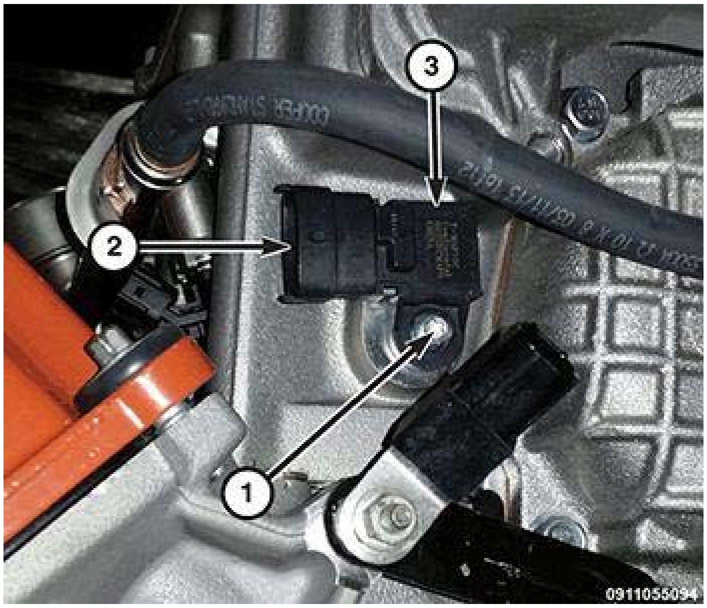


Fig. 245: TMAP Sensor, Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

3. Clean the area around the Temperature and Manifold Absolute Pressure (TMAP) sensor (3).
4. Disconnect the TMAP sensor wire harness connector (2).
5. Remove the screw (1) and the TMAP sensor (3).

INTERMEDIATE

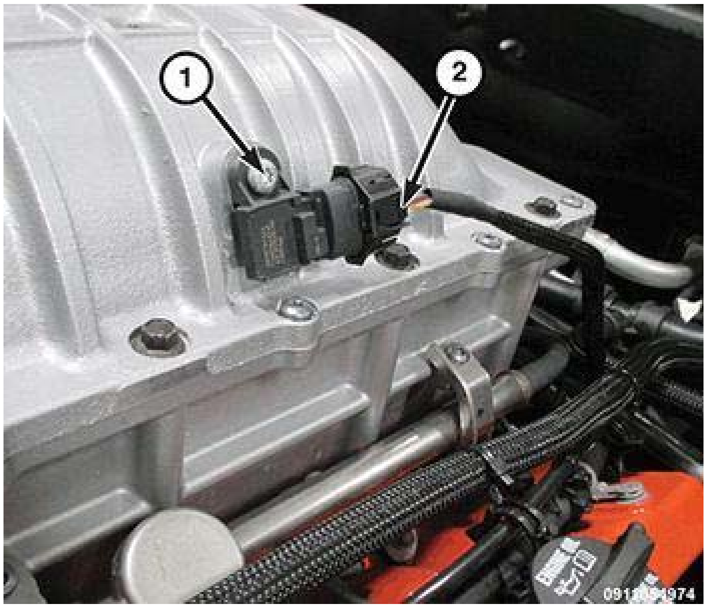

Fig. 246: TMAP Sensor, Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Clean the area around the Temperature and Manifold Absolute Pressure (TMAP) sensor.
3. Disconnect the TMAP sensor wire harness connector (2).
4. Remove the screw (1) and the TMAP sensor.

THROTTLE OUTLET

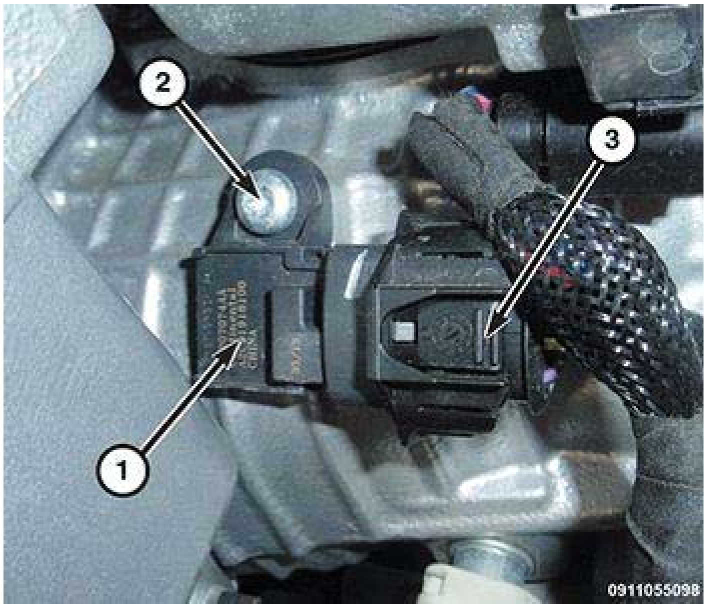

Fig. 247: TMAP Sensor, Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Clean the area around Temperature and Manifold Absolute Pressure (TMAP) sensor (1).
3. Disconnect the TMAP sensor wire harness connector (3).
4. Remove the screw (2) and the TMAP sensor (1) from supercharger.

INSTALLATION

BANK 1

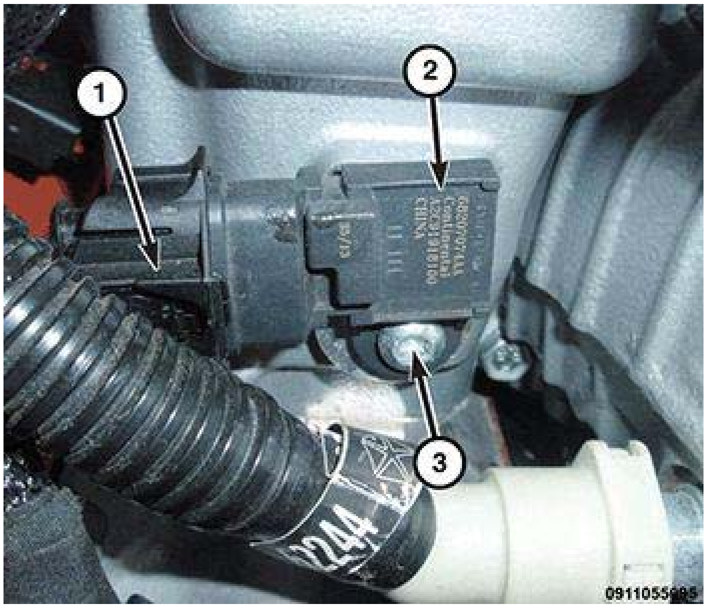

Fig. 248: TMAP Sensor, Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Check condition of Temperature and Manifold Absolute Pressure (TMAP) sensor O-ring seal.
2. Clean the sealing area on the supercharger.
3. Lubricate the TMAP sensor O-ring seal with clean engine oil.
4. Install the TMAP sensor (2) into the supercharger. Tighten the screw (3) to the proper torque specification. Refer to **FUEL INJECTION, GAS, SPECIFICATIONS**.
5. Connect the TMAP sensor wire harness connector (1).

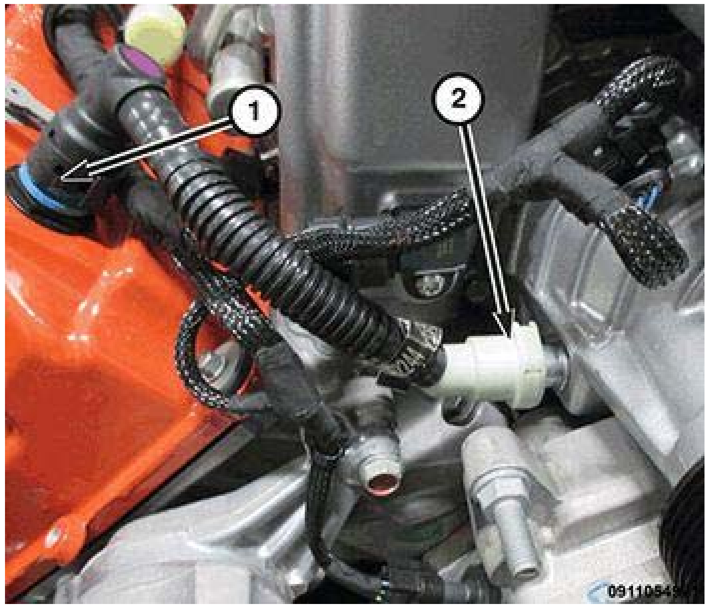

Fig. 249: Disconnecting/Connecting PCV Hose
Courtesy of CHRYSLER GROUP, LLC

6. Position the PCV hose (2) and connect it to the supercharger.
7. Connect the negative battery cable.

BANK 2

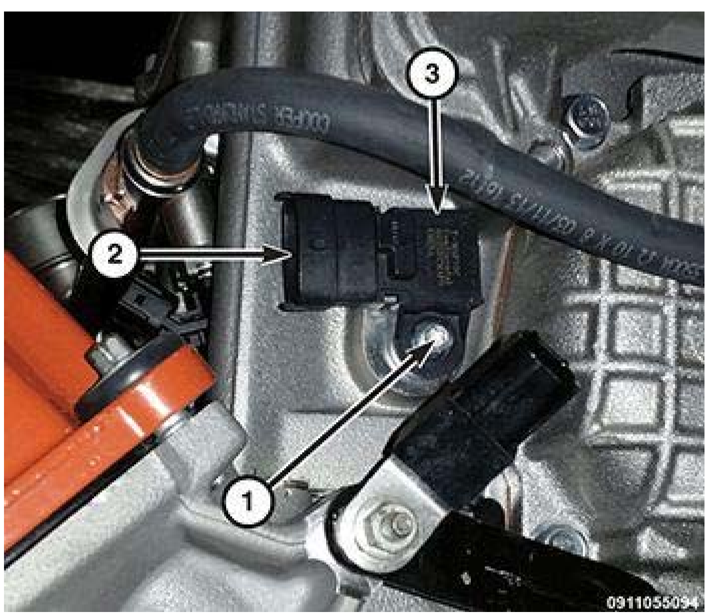

Fig. 250: TMAP Sensor, Connector & Screw

Courtesy of CHRYSLER GROUP, LLC

1. Check condition of Temperature and Manifold Absolute Pressure (TMAP) sensor O-ring seal.
2. Clean the sensor sealing area on the supercharger.
3. Lubricate the TMAP sensor O-ring seal with clean engine oil.
4. Install the TMAP sensor (3) into the supercharger. Tighten the screw (1) to the proper torque specification. Refer to **FUEL INJECTION, GAS, SPECIFICATIONS**.
5. Connect the TMAP sensor wire harness connector (2).

Fig. 251: Engine Covers
Courtesy of CHRYSLER GROUP, LLC

6. Install the left side engine cover (1).
7. Connect the negative battery cable.

INTERMEDIATE

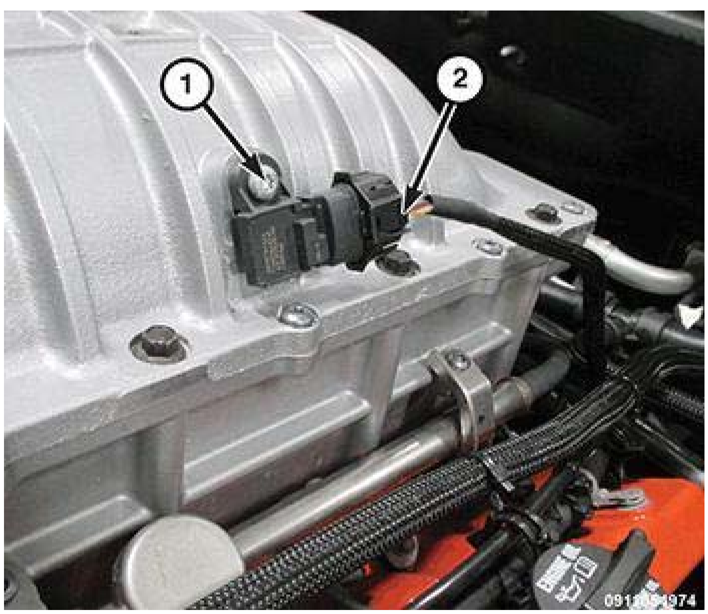

Fig. 252: TMAP Sensor, Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Check the condition of Temperature and Manifold Absolute Pressure (TMAP) sensor O-ring.
2. Clean the sealing area on the supercharger.
3. Lubricate the TMAP sensor O-ring seal with clean engine oil.
4. Install the TMAP sensor into the supercharger. Tighten the screw (1) to the proper torque specification. Refer to **FUEL INJECTION, GAS, SPECIFICATIONS**.
5. Connect the TMAP sensor wire harness connector (2).
6. Connect the negative battery cable.

THROTTLE OUTLET

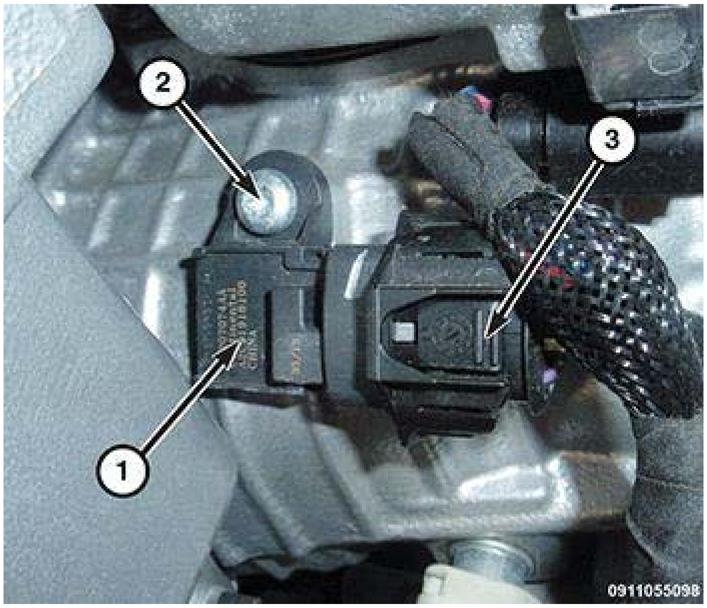

Fig. 253: TMAP Sensor, Connector & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Check condition of the Temperature and Manifold Absolute Pressure (TMAP) sensor O-ring seal.
2. Clean the sealing area on the supercharger.
3. Lubricate the TMAP sensor O-ring seal with clean engine oil.
4. Install the TMAP sensor (1) into the supercharger. Tighten the screw (2) to the proper torque specification. Refer to **FUEL INJECTION, GAS, SPECIFICATIONS**.
5. Connect the TMAP sensor wire harness connector (3).
6. Connect the negative battery cable.

Article GUID: A00735866

2015-16 DRIVELINE/AXLES

Half Shaft - Challenger

DESCRIPTION

DESCRIPTION

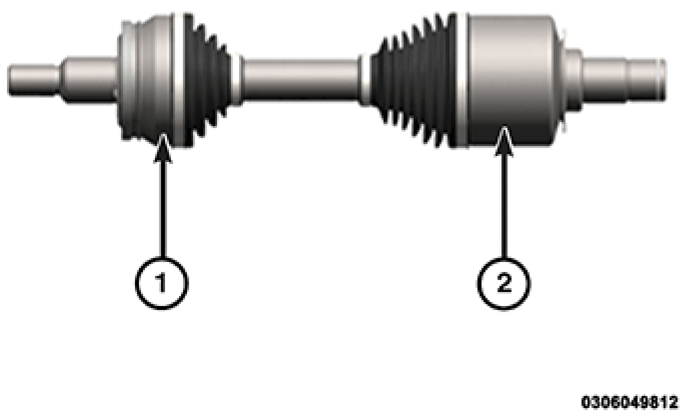

Fig. 1: Inner And Outer Half Shaft Joints
Courtesy of CHRYSLER GROUP, LLC

The inner joints of both halfshaft assemblies are inboard Double-Offset (DO) joints (2) and are splined to the differential side gears. The outer joints of both assemblies are Rzeppa joints (1).

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HALF SHAFT

VEHICLE INSPECTION

Check for grease in the vicinity of both the inboard and outboard joints. This is a sign of inner or outer joint seal boot or seal boot clamp damage.

NOISE AND/OR VIBRATION IN TURNS

A clicking noise and/or a vibration in turns could be caused by one of the following conditions:

- Damaged inner or outer boot or boot clamps. This will result in the loss and/or contamination of the joint grease, resulting in inadequate lubrication of the joint.
- Noise may also be caused by another component of the vehicle coming in contact with the half shafts.

CLUNKING NOISE DURING ACCELERATION

This noise may be a result of one of the following conditions:

- A torn boot on the inner or outer joint of the half shaft assembly.
- A loose or missing clamp on the inner or outer joint of the half shaft assembly.
- A damaged or worn half shaft joint.

SHUDDER OR VIBRATION DURING ACCELERATION

This problem could be a result of:

- A worn or damaged half shaft inner joint.
- Improper wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

VIBRATION AT HIGHWAY SPEEDS

This problem could be a result of:

- Foreign material (mud, etc.) packed on the backside of the wheel(s).
- Out of balance tires or wheels. Refer to **STANDARD PROCEDURE** .
- Improper tire and/or wheel runout. Refer to **DIAGNOSIS AND TESTING** .

REMOVAL

HALF SHAFT

NOTE: **This procedure requires the compression of the rear suspension to ride height. A drive-on hoist should be used. If a drive-on hoist is not used, screw-style under-hoist jack stands are required to compress the rear suspension, facilitating rear halfshaft removal.**

NOTE: **The halfshaft inner and outer boots are not serviceable separately. Boot replacement requires entire halfshaft assembly replacement.**

CAUTION: **Never grasp halfshaft assembly by the inner or outer boots. Doing so may cause the boot to pucker or crease, reducing the service life of the boot and joint. Avoid over angulating or stroking the C/V joints when handling the halfshaft.**

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the rear exhaust system. Refer to **MUFFLER, EXHAUST, REMOVAL** .
3. Remove the tire and wheel assembly. Refer to **REMOVAL** .

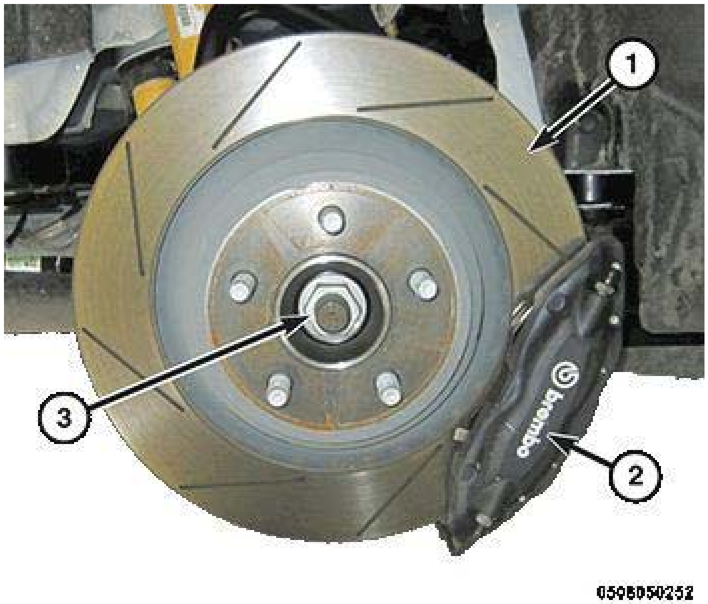

Fig. 2: Brake Rotor, Caliper & Hub Nut
Courtesy of CHRYSLER GROUP, LLC

4. Remove the hub nut (3) and discard.

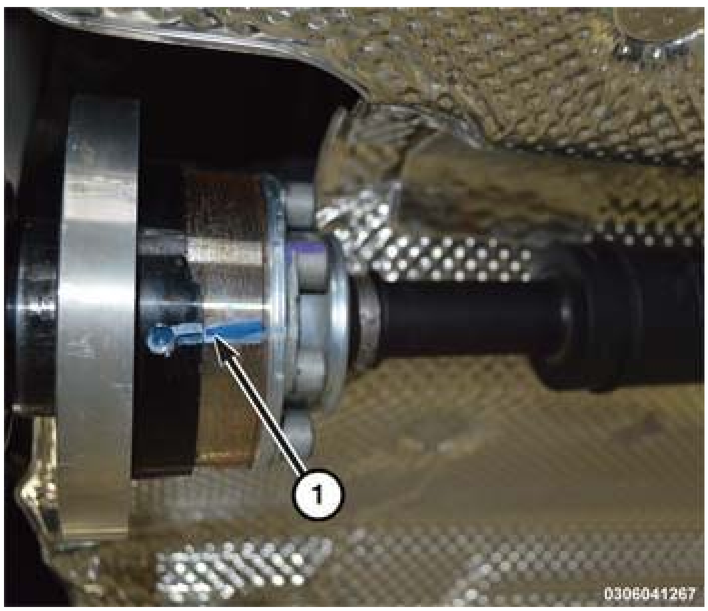

Fig. 3: Alignment Index Marks
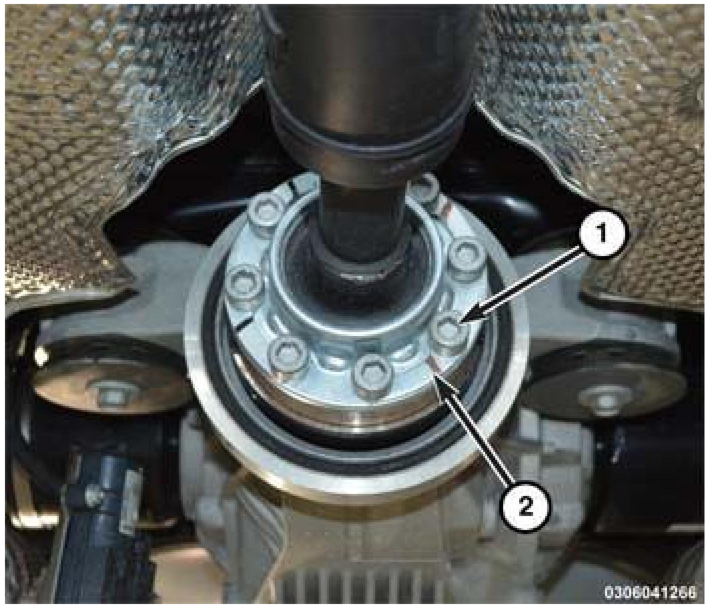
Courtesy of CHRYSLER GROUP, LLC

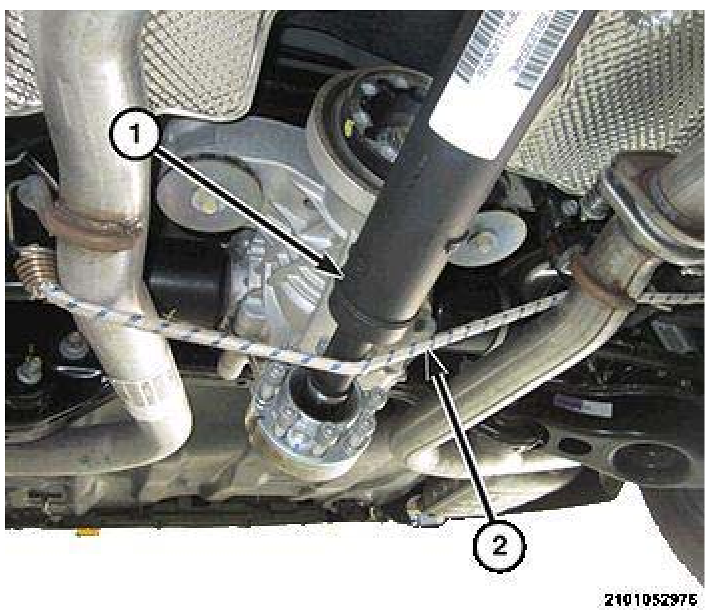
5. Apply alignment index marks (1) to the drive shaft and axle flanges (1).



[Fig. 4: Drive Shaft To Axle Flange Bolts & Washers](#)
Courtesy of CHRYSLER GROUP, LLC

NOTE:	**The use of soft/blunt tools is recommend for removal of joints from the companion flanges. Use of sharp pry tools, such as a screwdriver, will damage the joint housing and could result in driveline imbalance.**

6. Remove and discard the drive shaft to axle flange bolts (1) and washers (2). Separate the drive shaft from the rear axle.



[Fig. 5: Supporting Drive Shaft With Strap](#)
Courtesy of CHRYSLER GROUP, LLC

NOTE:	**Do not let the drive shaft hang unsupported, damage may occur to the shaft.**

7. Support the drive shaft (1) with a strap (2) or equivalent.

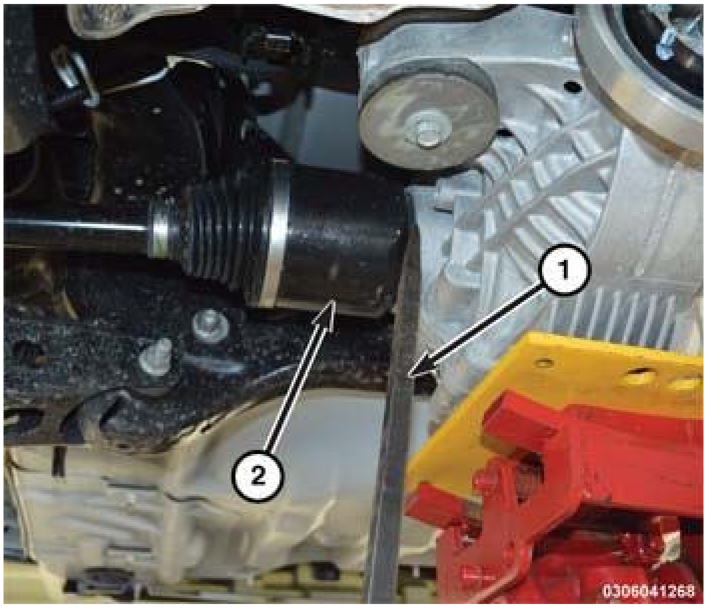


Fig. 6: Removing Halfshaft
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Do not damage the axle seal, axle seal dust cover, and halfshaft boot.**

NOTE: **Left Hand (LH) side shown in illustration, Right Hand (RH) side similar.**

8. Using a suitable screwdriver (1), partially disengage the halfshaft (2) from the rear axle assembly.

Fig. 7: Screw-Style Under-Hoist Jack Stand & Rear Suspension
Courtesy of CHRYSLER GROUP, LLC

9. If a drive-on hoist is not used, compress the rear suspension (2) using a screw-style under-hoist jack stand (1).

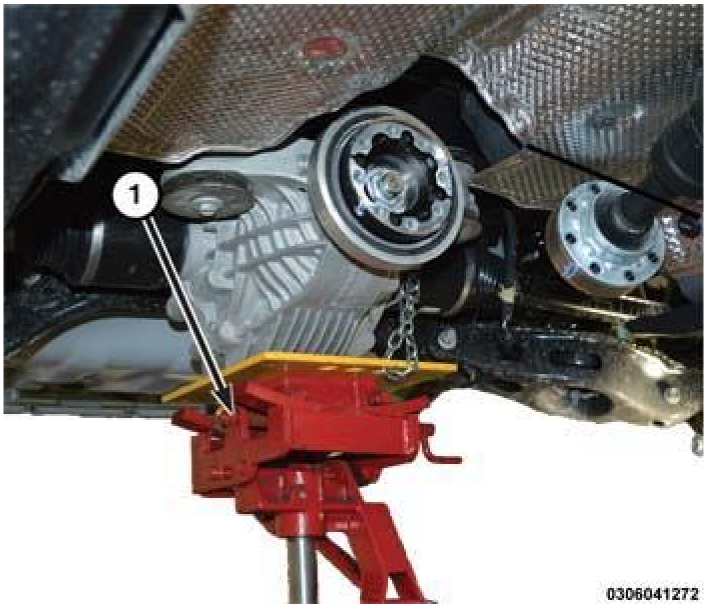

Fig. 8: Rear Axle Assembly On Transmission Jack
Courtesy of CHRYSLER GROUP, LLC

10. Position the transmission jack (1) under the rear axle assembly.

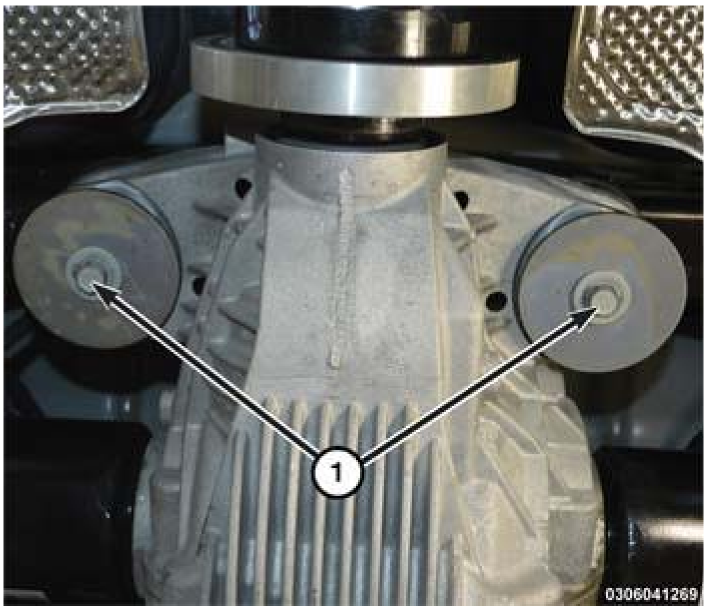

Fig. 9: Rear Axle Forward Mount Isolator Bolts
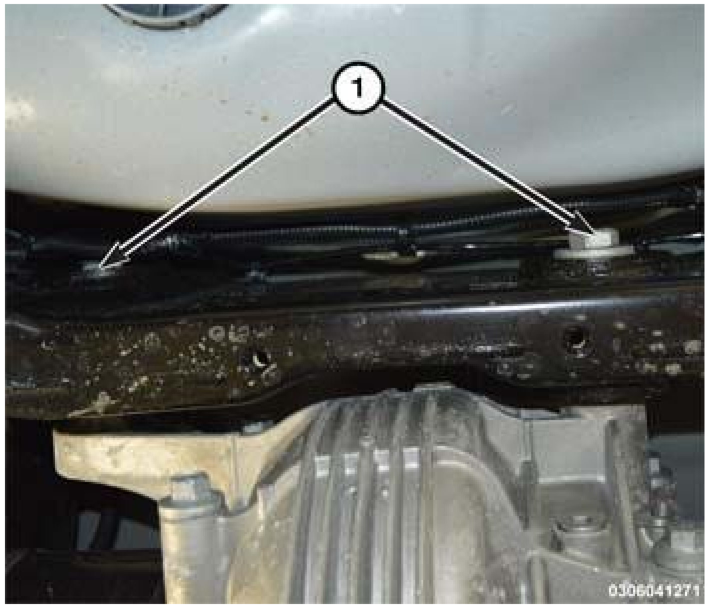
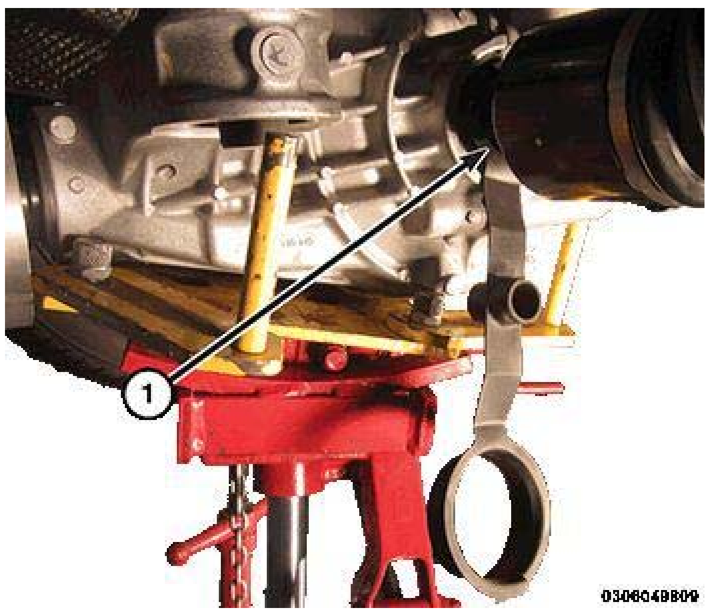
Courtesy of CHRYSLER GROUP, LLC

11. Remove and discard the rear axle forward mount isolator bolts (1).



[Fig. 10: Rear Axle To Crossmember Bolts](#)
Courtesy of CHRYSLER GROUP, LLC

12. Remove the two rear axle to crossmember bolts (1) from the rear axle.



[Fig. 11: Half Shaft Protector](#)
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left Hand (LH) side shown in illustration, Right Hand (RH) side similar.

13. Install the Protector, Half Shaft, Drive (special tool #10270, Protector, Half Shaft, Drive) (1).

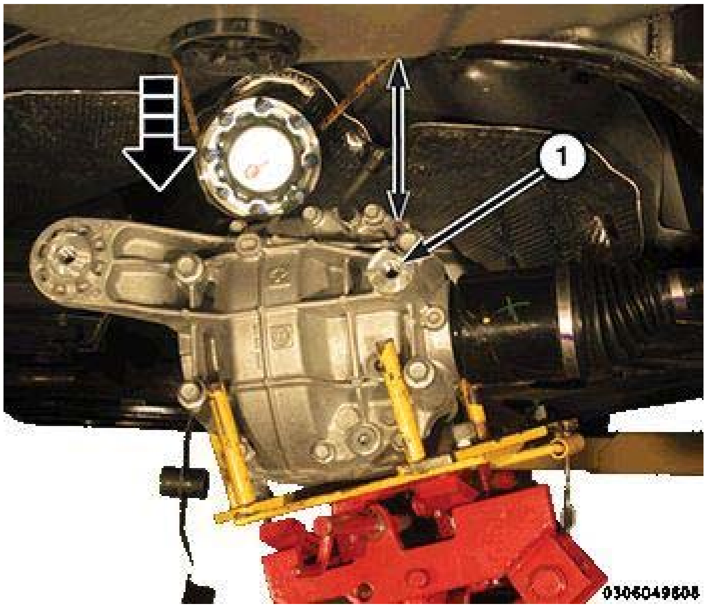


Fig. 12: Lowering Rear Axle
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Left Hand (LH) side shown in illustration, Right Hand (RH) side similar.**

14. Lower the rear axle (1) approximately six inches and push the rear axle assembly towards the front of the vehicle.

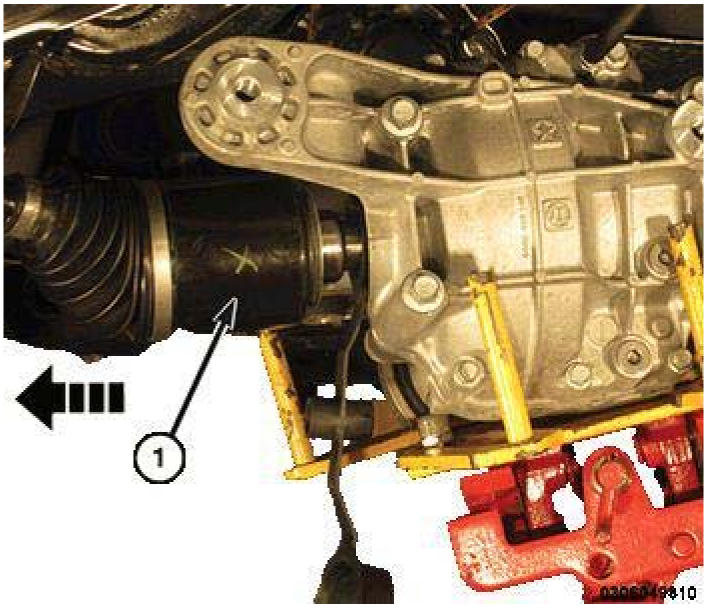

Fig. 13: Removing Halfshaft
Courtesy of CHRYSLER GROUP, LLC

CAUTION: **Never grasp halfshaft assembly by the inner or outer boots. Doing so may cause the boot to pucker or crease, reducing the service life of the boot and joint. Avoid over angulating or stroking the C/V joints when handling the halfshaft.**

CAUTION: **Use care while handling/storing halfshaft assembly. Damage to the slinger can result from improper handling. If slinger gets bent or damaged, straighten slinger to avoid contact with axle seal assembly.**

NOTE: **Do not allow the halfshaft splines to come in contact with the axle seal.**

15. With the aid of an assistant, shift the rear axle assembly in one direction and compress one halfshaft inner joint as far as possible while removing the other halfshaft (1).
16. Remove the halfshaft from the hub and the vehicle.

INSTALLATION

HALF SHAFT

CAUTION: **Never grasp halfshaft assembly by the inner or outer boots. Doing so may cause the boot to pucker or crease, reducing the service life of the boot and joint. Avoid over angulating or stroking the C/V joints when handling the halfshaft.**

NOTE: **The halfshaft inner and outer boots are not serviced separately. Boot replacement requires entire halfshaft assembly replacement.**

NOTE: **Always install a NEW hub nut. The original hub nut is one-time use only and should be discarded when removed.**

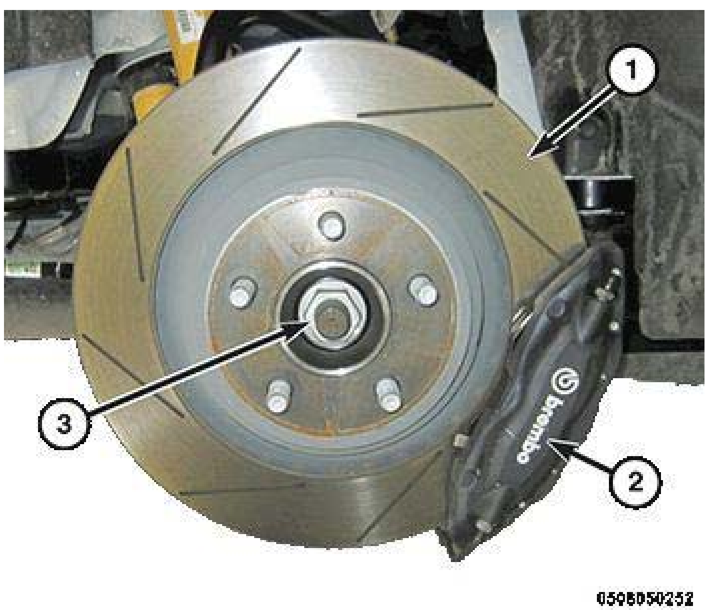

Fig. 14: Brake Rotor, Caliper & Hub Nut
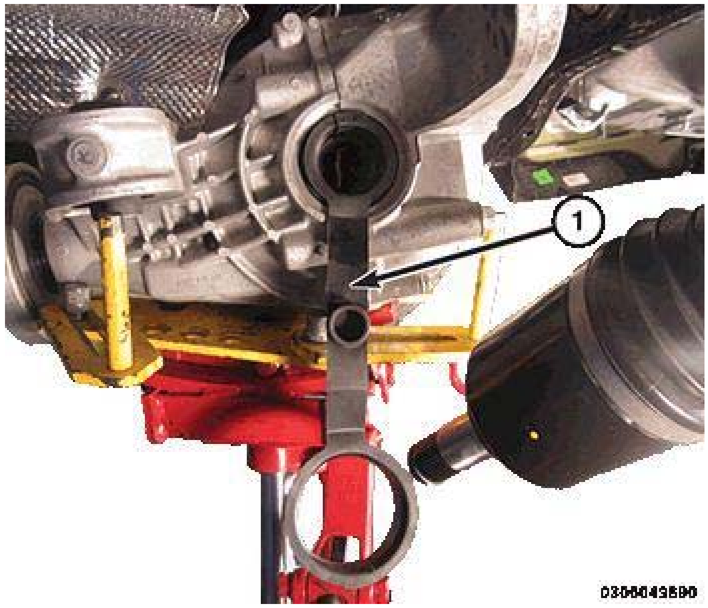
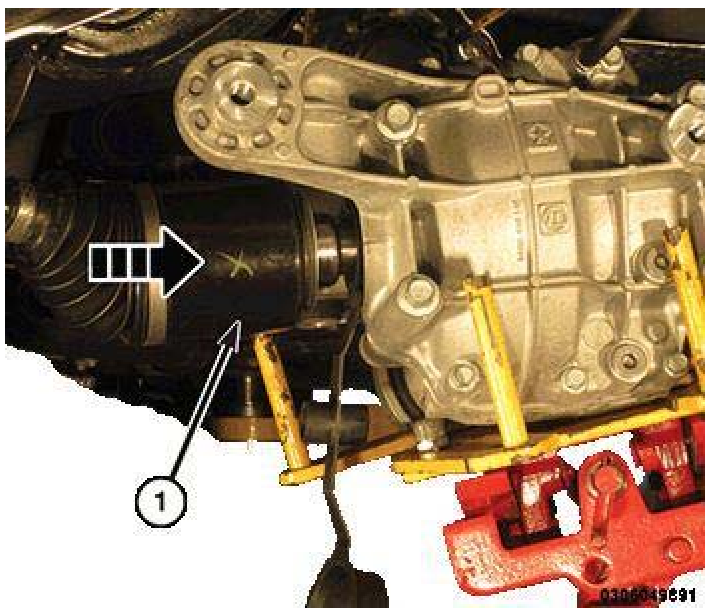
Courtesy of CHRYSLER GROUP, LLC

1. Install the half shaft in the hub and install a **NEW** hub nut (3) hand tight.
2. Install **NEW** circlip(s), on the halfshaft(s).



[Fig. 15: Protector Installed In Rear Axle]
Courtesy of CHRYSLER GROUP, LLC

3. Install the Protector, Half Shaft, Drive (special tool #10270, Protector, Half Shaft, Drive) (1) in the rear axle.



[Fig. 16: Installing Halfshaft]
Courtesy of CHRYSLER GROUP, LLC

NOTE:	**Use care when installing halfshaft to axle assembly. The halfshaft installation angle should be minimized to avoid damage to seal upon installation.**

4. Apply a light film of axle lubricant to all of the machined halfshaft surfaces that go into the rear axle. With the Protector, Half Shaft, Drive (special tool #10270, Protector, Half Shaft, Drive) (1) installed and the aid of an assistant, shift the rear axle assembly in one direction and compress one halfshaft inner joint as much as possible while installing the other halfshaft (1).

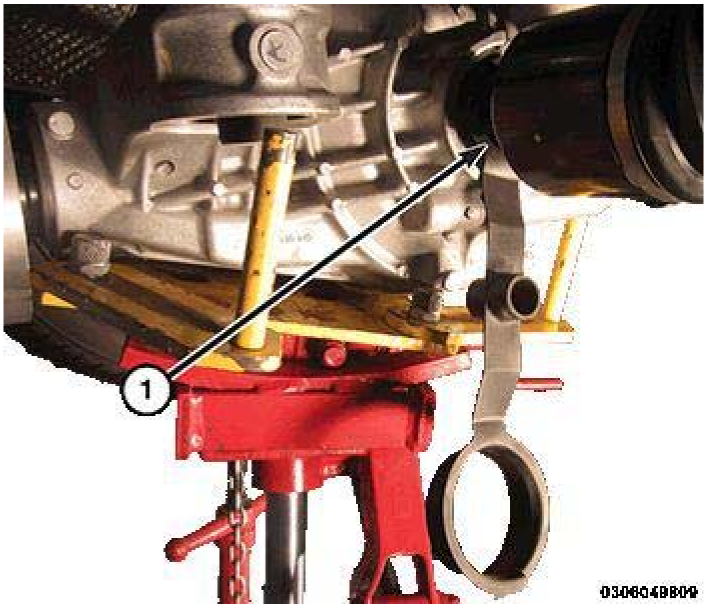


Fig. 17: Half Shaft Protector
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Use care not to damage the axle seal or the seal dust cover.**

5. Remove the Protector, Half Shaft, Drive (special tool #10270, Protector, Half Shaft, Drive) (1) and fully install the halfshaft in the rear axle. Verify proper installation by pulling outward on the joint by hand.
6. Raise the rear axle into position.

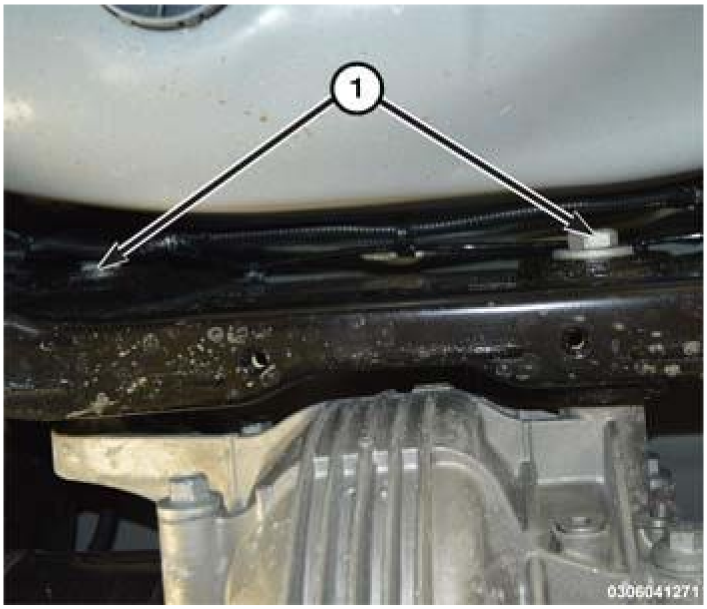

Fig. 18: Rear Axle To Crossmember Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Install the rear axle to crossmember bolts (1) hand tight into the rear axle.

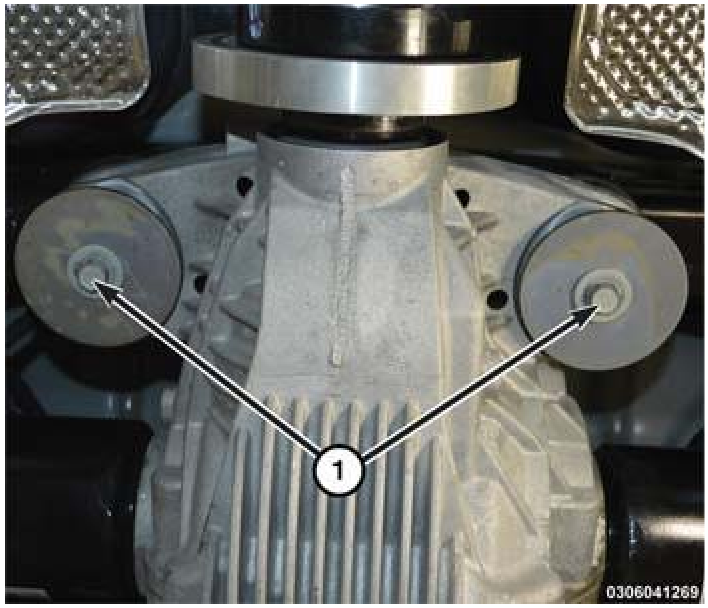

Fig. 19: Rear Axle Forward Mount Isolator Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Install the **NEW** rear axle forward mount isolator bolts (1) hand tight.
9. Tighten the **NEW** rear axle forward mount isolator bolts and the rear axle to crossmember bolts to the proper specification. Refer to **SPECIFICATIONS** .
10. Verify halfshafts are fully engaged in the axle assembly.

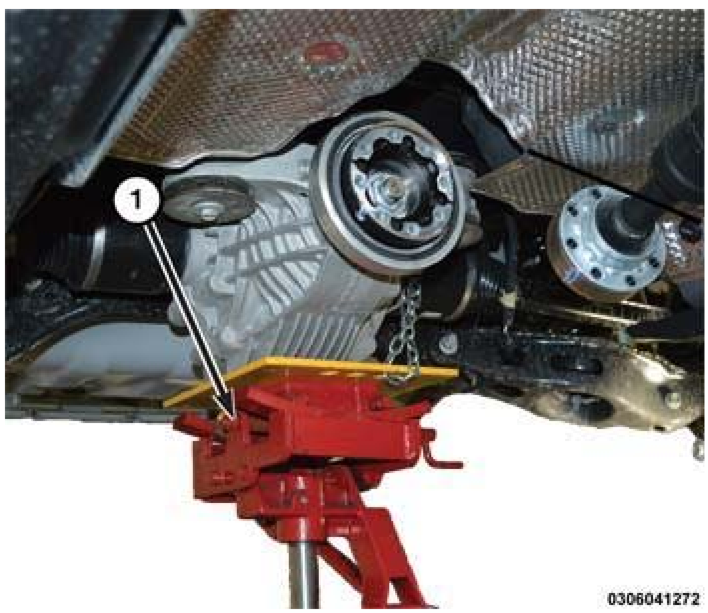

Fig. 20: Rear Axle Assembly On Transmission Jack
Courtesy of CHRYSLER GROUP, LLC

11. Remove the transmission jack (1).

Fig. 21: Screw-Style Under-Hoist Jack Stand & Rear Suspension
Courtesy of CHRYSLER GROUP, LLC

12. If used, remove screw-type under-hoist jack stand (1).

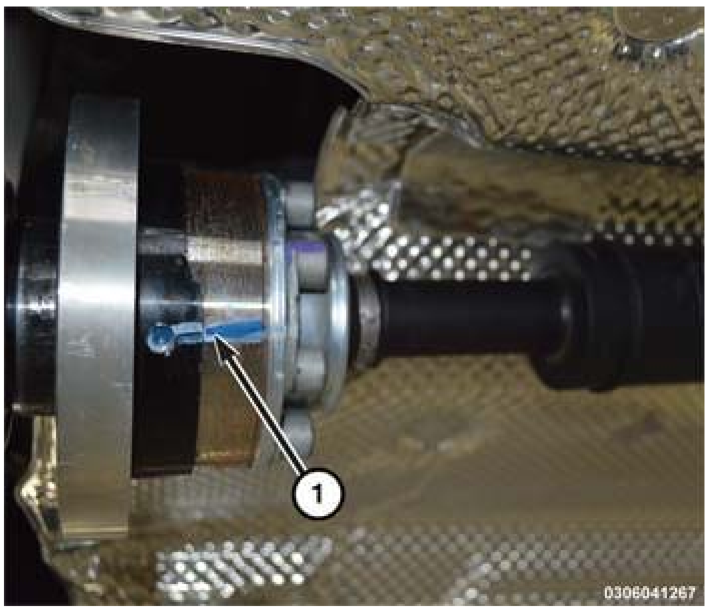

Fig. 22: Alignment Index Marks
Courtesy of CHRYSLER GROUP, LLC

13. Align the index marks (1) made during removal.

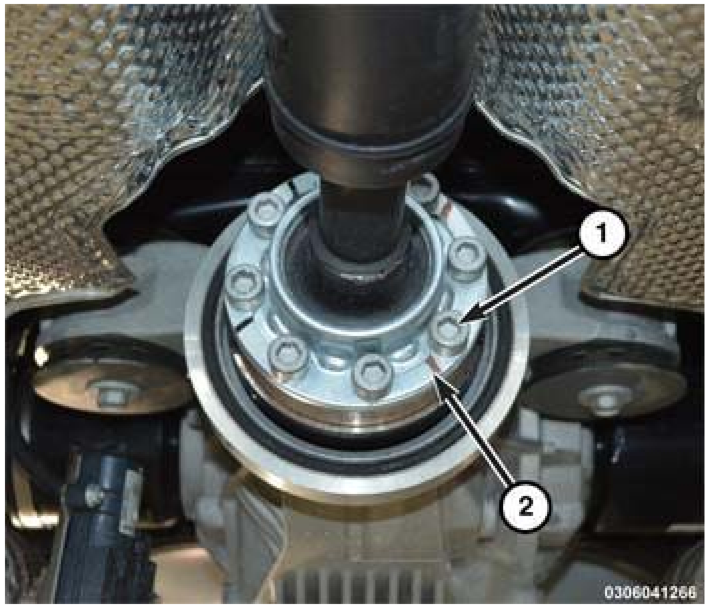

Fig. 23: Drive Shaft To Axle Flange Bolts & Washers
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Drive shaft bolts must be replaced with NEW . If NEW bolts are not available clean the old bolts and apply MoparÃ® Lock and Seal Adhesive or equivalent.**

14. Install the **NEW** drive shaft washers (2) and bolts (1) and tighten in a star pattern to 66 Nm (49 ft.-lbs.).
15. Check and fill the rear axle as needed. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .

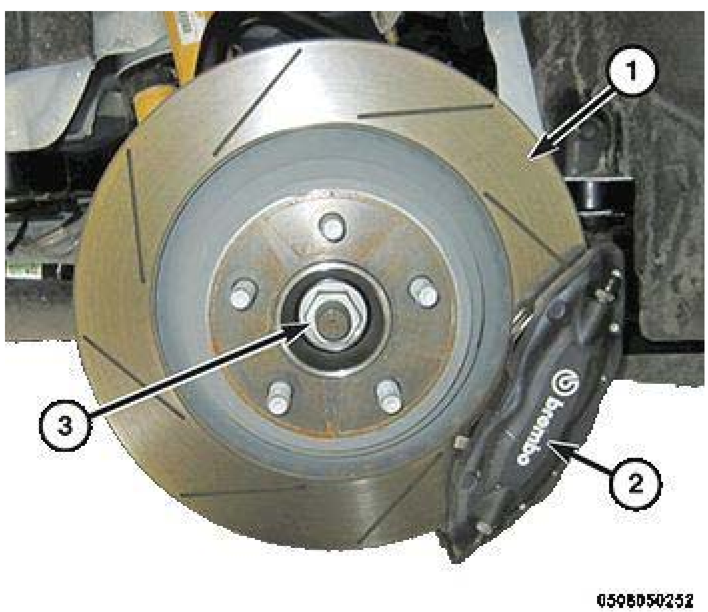

Fig. 24: Brake Rotor, Caliper & Hub Nut
Courtesy of CHRYSLER GROUP, LLC

16. Tighten the **NEW** hub nut (1) to the proper specification. Refer to **SPECIFICATIONS** .
17. Install the tire and wheel assembly. Refer to **INSTALLATION** .

2015-16 ACCESSORIES AND EQUIPMENT

Heated Glass - Service Information - Challenger

DESCRIPTION

DESCRIPTION

CAUTION: Grid lines can be damaged or scraped off with sharp instruments. Care should be taken in cleaning glass or removing foreign materials, decals or stickers. Normal glass cleaning solvents or hot water used with rags or toweling is recommended.

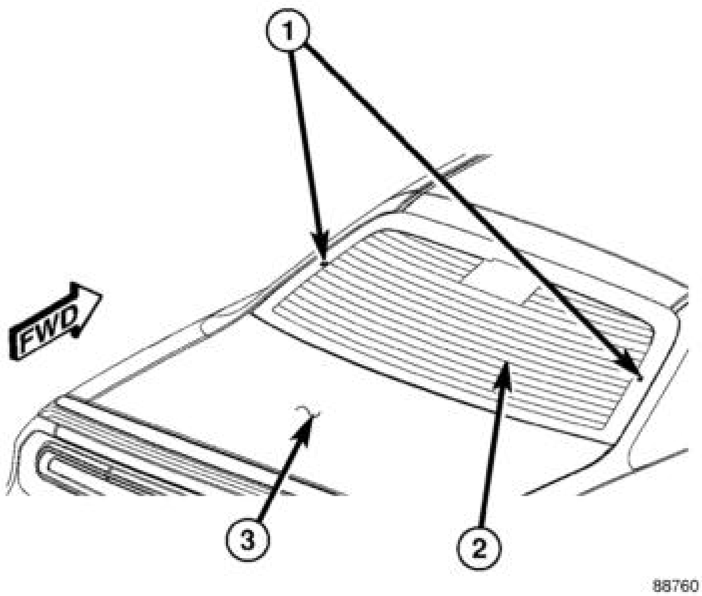

Fig. 1: Vertical Bus Bars, Grid Lines & Rear Window
Courtesy of CHRYSLER GROUP, LLC

- The rear window defogger system consists of two vertical bus bars and a series of grid lines fired onto the inside surface of the rear window.
- The defrost system is turned On or Off by push-button switches. The soft switch button is located in the U-Connect™ touch screen menu. The hard switch button is located on the center of the instrument panel center bezel.
- Circuit protection is provided by fuses located in the Power Distribution Center (PDC).

OPERATION

OPERATION

The rear window defogger (Electric Back Light) (EBL) system is actuated by a momentary switch located in the switchbank, or by using the control located in the U-Connect Touch ™ screen module. When a rear window defogger switch is pressed to on, the A/C heater module energizes the EBL relay in the Power Distribution Center (PDC), fused battery current is directed to the rear window defogger grid lines and to the heated outside

rear view mirrors, when equipped. The grid lines heat the glass to help clear the rear window and outside mirror surfaces of fog or frost.

An indicator lamp in the switchbank illuminates when the EBL system is on. The Heater, Ventilation and Air Conditioning Module (HVAC) contains the EBL system control circuitry, including the timer logic.

NOTE: **The EBL system turns off automatically after ten minutes of initial operation. Each following activation cycle of the EBL system will last five minutes.**

The EBL system automatically turns off after an initial programmed time interval of about ten minutes, as long as the ignition is left in the Run position. If a rear window defogger switch is pressed to on again after the initial time interval has expired, the EBL system will automatically turn off after about five minutes. The EBL system will also turn off if the ignition is set to any position other than Run, or by manually pressing the rear window defogger switch a second time.

Repair of the rear window defogger grid lines, bus bars, terminals or pigtail wires can be accomplished using the MoparÃ® Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent. Refer to **GRID, DEFOGGER, STANDARD PROCEDURE**.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ELECTRIC BACKLIGHT (EBL) SYSTEM

NOTE: **Illumination of the defogger switch indicator lamp does not necessarily mean that electrical current is reaching the rear glass heating grid lines.**

NOTE: **See appropriate Wiring Information for circuit descriptions and diagrams of the rear window defogger system.**

Operation of the rear window defogger (Electric Back Light (EBL)) system can be confirmed by the following:

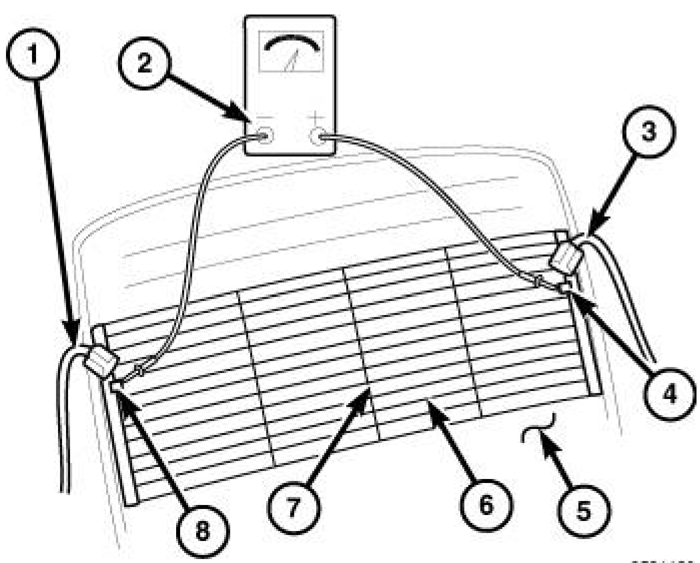

Fig. 2: Rear Window Glass Grid Test
Courtesy of CHRYSLER GROUP, LLC

1. Use the diagnostic scan tool to check for relevant codes to the EBL system. If no DTCs are found, go to 2. If any DTCs are found, repair as required, then proceed to step 2.
2. With the ignition in the Run position, press a rear window defogger switch to on.
3. Rear window defogger operation can be checked by feeling the rear window glass (5), or the heated outside rear view mirror glass, when equipped with heated mirrors. After three to four minutes of operation, a distinct difference in temperature should be detected between the clear glass area and the heated glass area, or the heated mirror glass.
4. If a temperature difference is not detected, use a 12 volt Direct Current (DC) voltmeter and contact the rear glass heating grid terminal A (8) with the negative lead, and terminal B (4) with the positive lead. The voltmeter should read battery voltage. If the voltmeter does not read battery voltage, check the following:
   - Confirm the ignition is in the Run position.
   - Confirm the rear window defogger switch is on.
   - Check the EBL fuse in the Power Distribution Center (PDC). The fuse must be tight in its receptacle and its electrical connections must be secure.
   - Confirm the EBL feed wire (3) is connected to the heating grid positive terminal and that there is continuity between the heating grid and the EBL relay in the PDC.
   - Confirm the EBL ground wire (1) is connected to the heating grid negative terminal and that there is continuity to ground.
5. Visually inspect the bus bars, horizontal defogger grid lines (6) and vertical defogger grid lines (7) for damage which could cause an open circuit condition. If a broken grid line or bus bar is found, repair as required. Refer to **GRID, DEFOGGER, STANDARD PROCEDURE**.
6. If the EBL system operation has been verified but the rear window defogger indicator lamp in the switchbank does not illuminate, replace the switchbank pod. Refer to **POD, SWITCH BANK, REMOVAL** .

GRID, DEFOGGER

STANDARD PROCEDURE

STANDARD PROCEDURE - GRID LINE AND TERMINAL REPAIR

WARNING: Materials contained in the Repair Kit (Part Number 04549275) may cause skin or eye irritation. The kit contains epoxy resin and amine type hardener, which are harmful if swallowed. Avoid contact with the skin and eyes. For skin contact, wash the affected areas with soap and water. For contact with the eyes, flush with plenty of water. Do not take internally. If taken internally, induce vomiting and call a physician immediately. Use with adequate ventilation. Do not use near fire or flame. Contains flammable solvents. Keep out of the reach of children. Failure to follow these instructions may result in serious or fatal injury.

Repair of the rear glass heating grid lines, bus bars, terminals or pigtail wires can be accomplished using the MoparÂ® Rear Window Defogger Repair Kit.

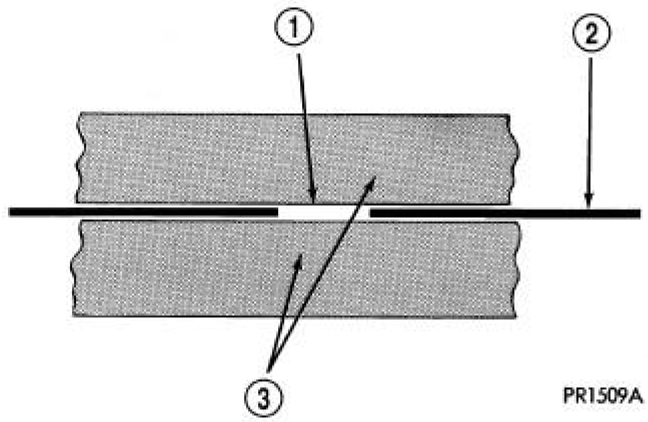

Fig. 3: Masking Tape, Grid Line & Break
Courtesy of CHRYSLER GROUP, LLC

1. Mask the repair area with masking tape (3) so that the conductive epoxy can be applied neatly. Extend the epoxy application onto the grid line (2) or the bus bar on each side of the break (1).
2. Follow the instructions in the repair kit for preparing the damaged area.
3. Remove the package separator clamp and mix the two conductive epoxy components thoroughly within the packaging. Fold the package in half and cut the center corner to dispense the epoxy.
4. Apply the epoxy through the slit in the masking tape or template. Overlap both ends of the break by at least 19 millimeters (0.75 inch).
5. For a terminal or pigtail wire replacement, mask the adjacent areas so the epoxy can be extended onto the adjacent grid line as well as the bus bar. Apply a thin layer of epoxy to the area where the terminal or pigtail wire was fastened and onto the adjacent grid line.
6. Apply a thin layer of conductive epoxy to the terminal or bare wire end of the pigtail and place it in the proper location on the bus bar. To prevent the terminal or pigtail wire from moving while the epoxy is curing, it must be wedged or clamped.
7. Carefully remove the masking tape or template.

CAUTION: Do not allow the glass surface to exceed 204Ā° C (400Ā° F) when using a heat gun, or the glass may fracture.

8. Allow the epoxy to cure 24 hours at room temperature, or carefully use a heat gun for 15 minutes. When using a heat gun, hold it approximately 25.4 centimeters (10 inches) from the repair and do not allow the glass surface to exceed 204Ā° C (400Ā° F).
9. After the conductive epoxy is properly cured, remove the wedge or clamp from the terminal or pigtail wire.
10. Connect the wire harness leads to the grid terminals or pigtail wires and verify EBL operation.

SWITCH, DEFOGGER

DESCRIPTION

DESCRIPTION

NOTE: Automatic Temperature Control (ATC) shown in illustration. Manual

Temperature Control (MTC) similar.

Fig. 4: Rear Window Defogger Controls
Courtesy of CHRYSLER GROUP, LLC

The controls (1) for the rear window defogger, also know as the Electric Back Light (EBL) system, are located in the switchbank and in the U-Connect Touch ™ screen module, at the center of the instrument panel. An amber indicator lamp in the switchbank illuminates when the EBL system is on.

OPERATION

OPERATION

The rear window defogger (Electric Back Light) (EBL) system is actuated by a momentary switch located in the switchbank, or by using the control located in the U-Connect Touch ™ screen module. When a rear window defogger switch is pressed to on, the HVAC module energizes the EBL relay in the Power Distribution Center (PDC) and fused battery current is directed to the rear window defogger grid lines and the heated outside rear view mirrors, when equipped. The grid lines heat the glass to help clear the rear window and outside mirror surfaces of fog or frost.

An amber indicator lamp in the switchbank illuminates when the EBL system is on. The Heater, Ventilation and Air Conditioning Module (HVAC) contains the EBL system control circuitry, including the timer logic.

NOTE: **The EBL system turns off automatically after ten minutes of initial operation. Each following activation cycle of the EBL system will last five minutes.**

The EBL system automatically turns off after an initial programmed time interval of about ten minutes, as long as the ignition is left in the Run position. If a rear window defogger switch is pressed to on again after the initial time interval has expired, the EBL system will automatically turn off after about five minutes. The EBL system will also turn off if the ignition is turned to any position other than run, or by manually pressing the rear window defogger switch a second time.

The individual rear window defogger switch located in the switchbank cannot be adjusted or repaired. If a rear

window defogger switch or indicator lamp is inoperative or damaged, the entire switchbank must be replaced.

The individual rear window defogger switch located in the U-Connect Touch ™ screen module cannot be adjusted or repaired. If a rear window defogger switch is inoperative or damaged, the entire U-Connect Touch ™ screen module must be replaced.

.

Article GUID: A00735938

DESCRIPTION

DESCRIPTION

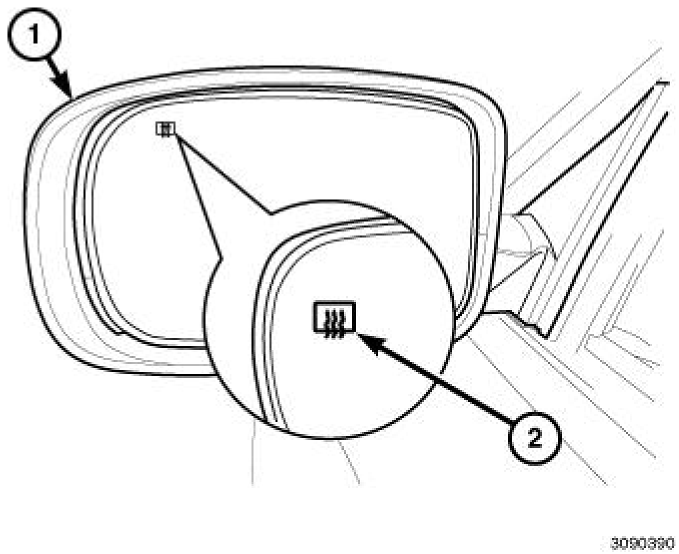

Fig. 1: Heated Outside Rear View Mirrors Defogger Symbol
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with electrically heated outside rear view mirrors (1) can be visually identified by the International Standards Organization (ISO) symbol for rear window defogger (2) on the mirror glass.

The heated mirror system operates in concert with the rear window defogger system, also known as the Electric Back Light (EBL) system, and is actuated by a momentary switch located in the switchbank, or by using the control located in the U-Connect Touch ™ screen module. When a rear window defogger switch is pressed to on, the Heater, Ventilation and Air Conditioning Module (HVAC) energizes the EBL relay in the Power Distribution Center (PDC), and fused battery current is directed to the rear window defogger grid lines and to the heated outside rear view mirrors. Heating the outside mirror glass helps clear the mirror surfaces of fog or frost.

An amber indicator lamp in the switchbank illuminates when the EBL system is on. The HVAC module contains the EBL system control circuitry, including the timer logic.

NOTE: **The EBL system turns off automatically after ten minutes of initial operation. Each following activation cycle of the EBL system will last five minutes.**

The EBL system automatically turns off after an initial programmed time interval of about ten minutes, as long as the ignition is left in the Run position. If a rear window defogger switch is pressed to on again after the initial time interval has expired, the EBL system will automatically turn off after about five minutes. The EBL system will also turn off if the ignition is set to any position other than Run, or by manually pressing the rear window defogger switch a second time.

Circuit protection for the heated mirror system is provided by a fuse in the Body Control Module (BCM).

OPERATION

OPERATION

When the rear window defogger switch is pressed, the rear window defogger (Electric Back Light) (EBL) system becomes activated and an electric heater grid located behind the glass of each of the outside rear view mirrors is energized. When energized, each of these heater grids produce heat to help clear the outside rear view mirrors of ice, snow, or fog.

If the outside mirror heating grids are both inoperative, refer to **DIAGNOSIS AND TESTING** . If only one of the outside mirror heating grids is inoperative, refer to **DIAGNOSIS AND TESTING** .

The heating grid behind each outside mirror glass cannot be repaired and the mirror glass must be replaced if inoperative or damaged. Refer to **MIRROR, OUTSIDE REARVIEW, GLASS, REMOVAL** .

2015-16 ACCESSORIES AND EQUIPMENT

Heated Seats - Service Information - Challenger

DESCRIPTION

DESCRIPTION

Vehicles with the optional heated seat system can be visually identified by the two heated seat switches located in the Radio Receiver Module (RRM), in the center of the instrument panel. The heated seat system allows the driver and front seat passenger to select from two different levels of electrical seat heating (HI and LO).

The heated seat system includes the following major components:

- **Heated Seat Switches** - Two heated seat switches are used, one for each front heated seat. Both switches are integral to the radio. Refer to **SWITCH, HEATED SEAT, DESCRIPTION**.
- **Heated Seat Module** - One Heated Seat Module (HSM) is used per vehicle. The HSM is mounted under the front passenger seat and contains the control logic and software for the heated seat system. The HSM communicates over the CAN data bus.
- **Heated Seat Elements** - Each front seat contains two heated seat elements, one on the seat back cushion and the other on the seat bottom cushion. The heated seat elements are hard-wired to the CSWM. Refer to **PAD, HEATER, DESCRIPTION**.

OPERATION

OPERATION

The Heated Seat Module (HSM) controls the heated seat system and the Heated Steering Wheel (HSW), when equipped. The HSM is secured to a mounting bracket located under the front passenger seat. The HSM responds to heated seat and steering wheel switch messages and ignition status inputs by controlling the 12 volt Direct Current (DC) output to the seat and steering wheel heating elements through high side drivers.

When either of the front heated seat switches in the U-Connect Touch™ screen module are pressed, the module sends a message over the Controller Area Network (CAN) data bus to the HSM, signaling the HSM to energize the heating elements for the front seat.

When the HSW switch in the U-Connect Touch™ screen module is pressed, the module sends a message over the Controller Area Network (CAN) data bus to the HSM, signaling the HSM to energize the heating element for the steering wheel.

The HSM energizes a high side driver to pulse width modulate the output to the heating elements. Heated seats turn off after approximately 45 minutes of continuous operation. If high-level heating is selected, the control system will remain at the high level for approximately 20 minutes and then drop to the low level. Normal heating cycle for the heated steering wheel is 52 minutes.

The heated seat and steering wheel system only operate when the engine is running. The heated seat and steering wheel system will turn off automatically whenever the ignition is set to any position other than Run.

The HSM is diagnosed using a scan tool and will automatically turn off the heating elements if it detects an open or low short in a heating element circuit. Refer to **DIAGNOSIS AND TESTING** .

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HEATED SEAT SYSTEM

NOTE:	**Vehicles equipped with the heated seat option utilize a low voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 9.0 volts or above 16.0 volts. Be certain to check the vehicle electrical system for proper voltage anytime the heated seat system appears inoperative.**

NOTE:	**If a Diagnostic Trouble Code (DTC) can not be verified, it is a good indication that an intermittent fault condition may be present. To help find an intermittent problem, sit in the seat in question and move around the heating elements within the seat while testing continuity. Wiggle the heated seat wire harness and electrical connectors while testing continuity.**

NOTE:	**For complete circuit diagrams, refer to appropriate SYSTEM WIRING DIAGRAMS article . Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.**

Before testing any individual components in the heated seat system, check the following:

- Check to see if the concern is isolated to only one seat. Operate the other heated seat.
- Check the ignition fuse in the Power Distribution Center (PDC) and repair if necessary.
- Using a scan tool, check for any Diagnostic Trouble Codes (DTCs) related to the Heated Seat Module (HSM) and the U-Connect Touch ™ screen module. If any DTCs are found, repair as necessary.
- Check the vehicles battery open-circuit voltage and charging system performance. If the vehicle's electrical system is defective or weak it may not be suppling sufficient energy to operate the heated seat system.
- If there are no DTCs and the front heated seat system functions properly, but a heated seat switch indicator does not illuminate, the entire U-Connect Touch ™ screen module must be replaced.

PAD, HEATER

DESCRIPTION

DESCRIPTION

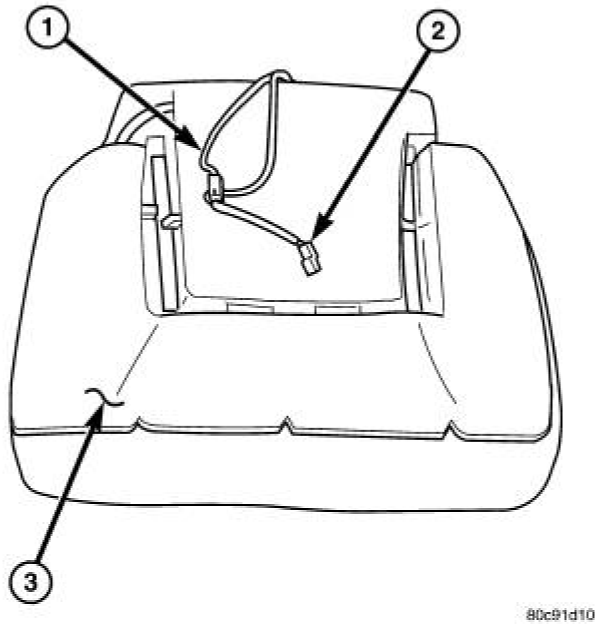

Fig. 1: Heated Seat Element, Seat Cushion & Connector
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional heated seat system have two heated seats. One heating element (1) is used for each seat bottom cushion and another heating element is used for each seat back cushion.

All of the heated seat elements consist of multiple heating circuits operating in parallel throughout the carbon fiber element and a wire lead and connector (2). The heated seat elements are captured between the seat cover and the seat cushion (3).

OPERATION

OPERATION

Battery current is directed to the heated seat elements by the Comfort Seat and Wheel Module (CSWM). The CSWM will energize the heated seat elements when a heated seat switch is pressed on.

As a Pulse Width Modulated (PWM) current passes through each heated seat element, the resistance of the wire used in the element disperse some of the electrical current in the form of heat. The heat produced by the heated seat element then radiates through the seat bottom and seat back covers, warming the seat covers and its occupant. The seat temperature is controlled/monitored by a signal to the CSWM from a Temperature Sensor thermistor which is part of the seat cushions. There is a thermistor in each heated seat.

The heated seat elements cannot be repaired and must be replaced if inoperative or damaged.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HEATED SEAT ELEMENT

NOTE:	**For a complete wiring diagram, refer to appropriate SYSTEM WIRING DIAGRAMS article . Wiring Information includes wiring diagrams, connector pin-out, and location views, details of wire harness routing and retention, splice**

and ground locations.

NOTE: **When checking heated seat elements for continuity, be certain to move the heating element being checked. Moving the element, such as sitting in the seat will eliminate the possibility of an intermittent open or short in the element which would only be evident if the element was in a certain position. Actual seat position can cause the wiring to stretch, pinch or short. Also not the proper routing of the wiring harness.**

1. Locate and disconnect the seat heating element electrical connectors as necessary.
2. Check the resistance between the circuits leading in and out of the suspect heated seat element. The resistance should be between the specifications listed in the following Heated Seat Element Resistance chart. If OK, refer to **DIAGNOSIS AND TESTING**. If not OK, replace the inoperative heated seat element. Refer to **PAD, HEATER, REMOVAL**.

HEATED SEAT ELEMENT RESISTANCE

Element Location	Acceptable Resistance Value
Driver Seat Bottom Cushion	7.8 - 9.6 ohms
Passenger Seat Bottom Cushion	8.4 - 10.4 ohms
Driver and Passenger Seat Back Cushion	8.5 - 10.6 ohms

REMOVAL

FRONT SEAT BACK

WARNING: **Disable the airbag system before attempting any front seat diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury. Refer to WARNING .**

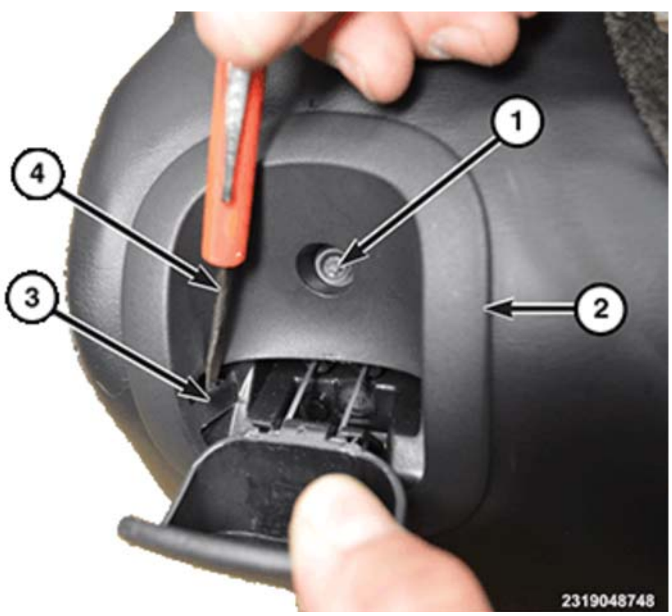

Fig. 2: Seat Back Release Cable Bezel, Tabs, Tool & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **SEATS, FRONT, WARNING** .
2. Remove the front seat back. Refer to **SEAT BACK, FRONT, REMOVAL** .
3. Remove the front seat back panel. Refer to **PANEL, SEAT BACK, FRONT, REMOVAL** .
4. Remove the screw (1) from the seat back release cable bezel (2).
5. Using a small bladed tool (4), release the tabs (3) and remove the seat back release cable bezel.

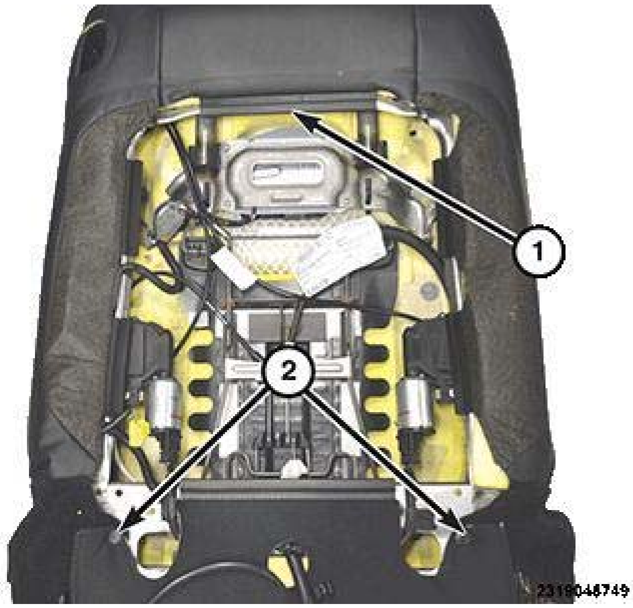

Fig. 3: J-Clip Retainers & Push Fasteners
Courtesy of CHRYSLER GROUP, LLC

6. Remove the two push fasteners (2).
7. Release all the J-clip retainers (1).

Fig. 4: Headrest Sleeve & Tab
Courtesy of CHRYSLER GROUP, LLC

8. Reach up behind the seat back cover and push the tab (1) of the headrest sleeve (2) and pull out to remove.

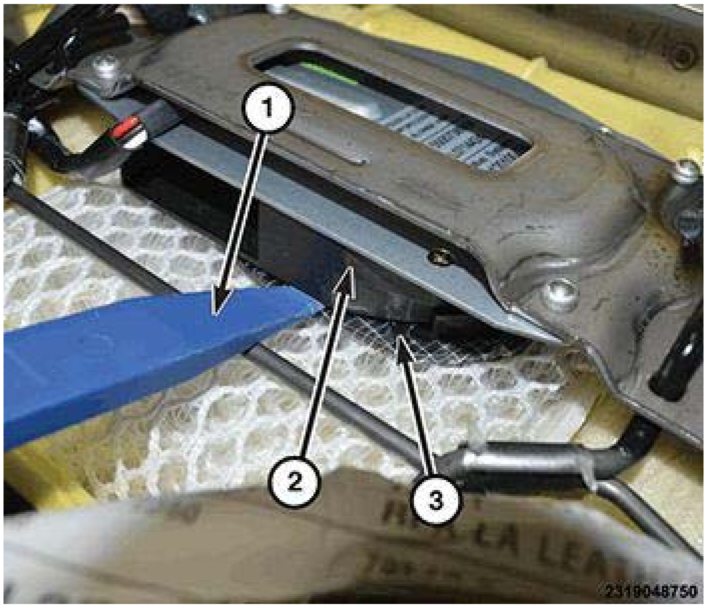

Fig. 5: Prying Seat Back Ventilation Plenum
Courtesy of CHRYSLER GROUP, LLC

9. Using a trim stick (1) or equivalent, pry the seat back ventilation plenum (3) from the seat back blower (2), if equipped.
10. Remove the seat back foam and seat back cover as an assembly, from the seat back frame.

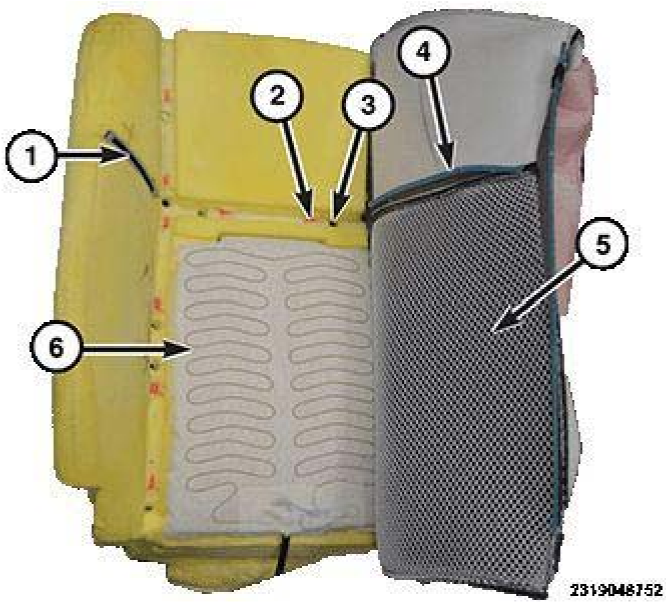

Fig. 6: Seat Back Cover, Fastener & Clips
Courtesy of CHRYSLER GROUP, LLC

11. Pull at the sides of the seat back cover (5) to release the hook and loop fastener (1).

12. Pull the seat back cover away from the foam and carefully release the clip strips (4) from the molded clips (2).
13. Remove the heated seat pad (6) from the foam.

FRONT SEAT BOTTOM

WARNING: **Disable the airbag system before attempting any front seat diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury. Refer to WARNING ..**

NOTE: **On all models, the front passenger seat contains an Occupant Detection Sensor (ODS) to provide information to the Occupant Restraint Controller (ORC). When servicing the front passenger seat, if required, remove the ODS from the seat bottom cushion and discard the sensor. Refer to SENSOR, OCCUPANT DETECTION, REMOVAL .**

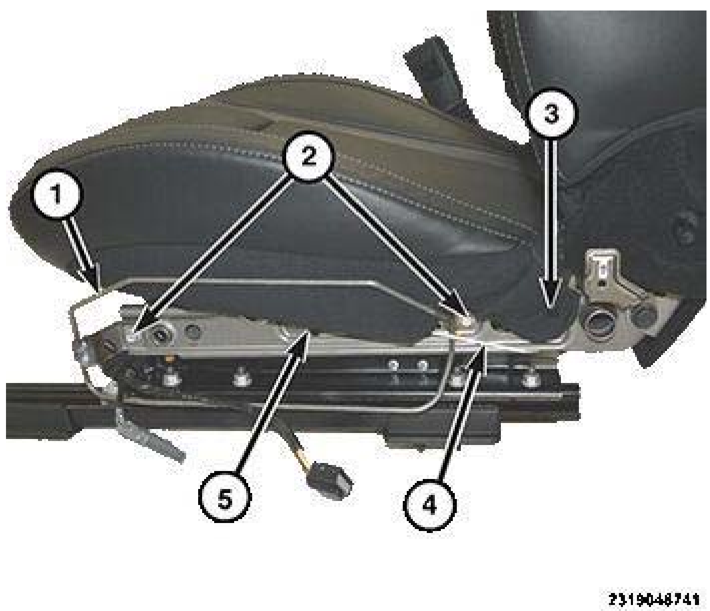

Fig. 7: Side Bracket, String, Fastener, Retainer & Bolts
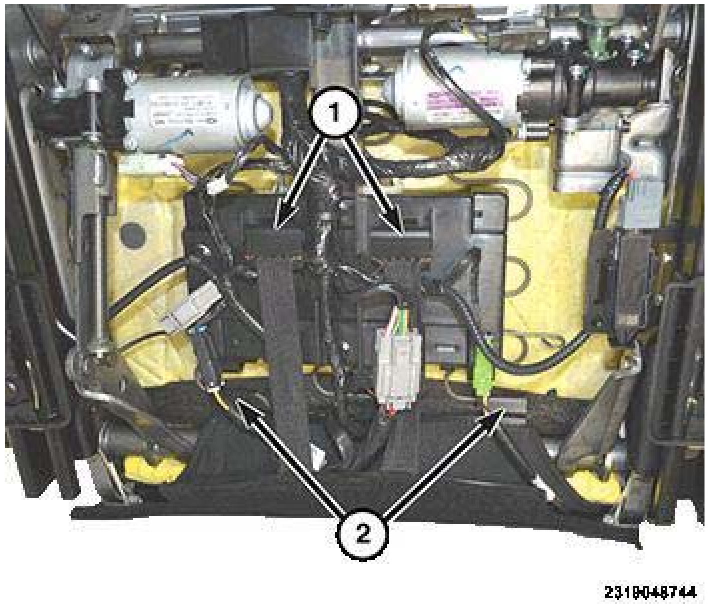
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to SEATS, FRONT, WARNING .
2. Remove the seat. Refer to SEAT, FRONT, REMOVAL .
3. Remove the seat side shields. Refer to SIDE SHIELDS, SEAT CUSHION, FRONT, REMOVAL .
4. Unhook the tether string (4) from the seat frame.

NOTE: **Note the routing of the tether string, for correct installation.**

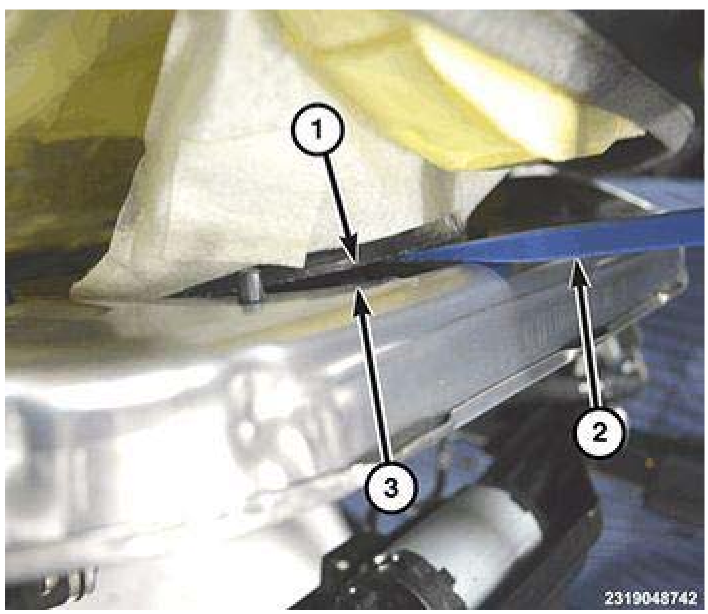
5. Remove the push fastener (3).
6. Remove the two bolts (2) and the seat side bracket (1). Position aside.

7. Release the J-hook retainer (5) from the side of the seat adjuster.



[Fig. 8: J-Hook Retainers](#)
Courtesy of CHRYSLER GROUP, LLC

8. Release the J-hook retainers (1) and (2) at the bottom of the seat.

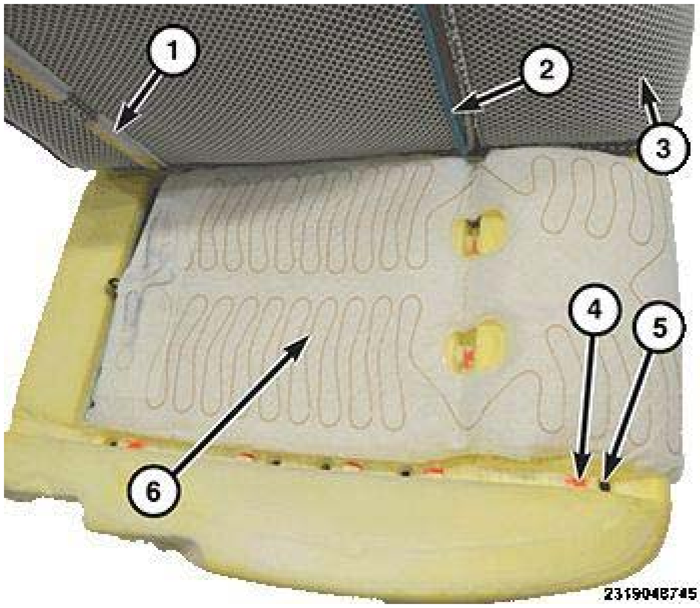


[Fig. 9: Prying Seat Cushion Ventilation Plenum From Seat Cushion Blower](#)
Courtesy of CHRYSLER GROUP, LLC

9. Carefully unwrap the cover and foam at the front of the seat cushion. Using a trim stick (2) or equivalent, pry the seat cushion ventilation plenum (1) from the seat cushion blower (3), if equipped.
10. Remove the seat cover and the seat foam as an assembly, from the seat adjuster.

NOTE: **Note the wire harness routing for correct installation.**

11. Disconnect the wire harness connector.



[Fig. 10: Seat Cushion Cover, Clips & Fastener](#)
Courtesy of CHRYSLER GROUP, LLC

12. Pull at the rear of the seat cushion cover (3) to release the hook and loop fastener (1).
13. Pull the seat cushion cover away from the foam and carefully release the clip strips (2) from the molded clips (4).
14. Remove the heated seat pad (6) from the seat cushion.

INSTALLATION

FRONT SEAT BACK

WARNING: Disable the airbag system before attempting any front seat diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury. Refer to WARNING .

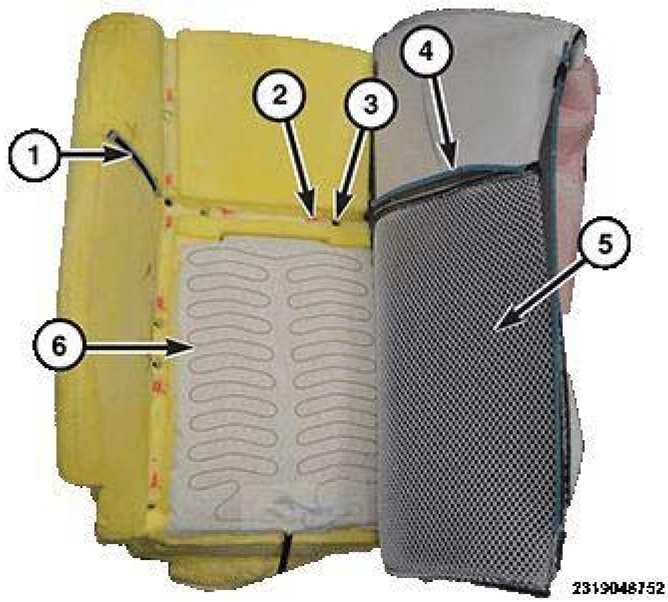


Fig. 11: Seat Back Cover, Fastener & Clips
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to SEATS, FRONT, WARNING .
2. Install the heated seat pad (6) to the seat back foam.
3. Position the seat back cover (3) onto the seat back foam and align the clip strips (4) to the molded clips (2).

NOTE: **Note that there is a hole (3) in the foam, next to each molded clip, to aid in clip strip alignment/installation.**

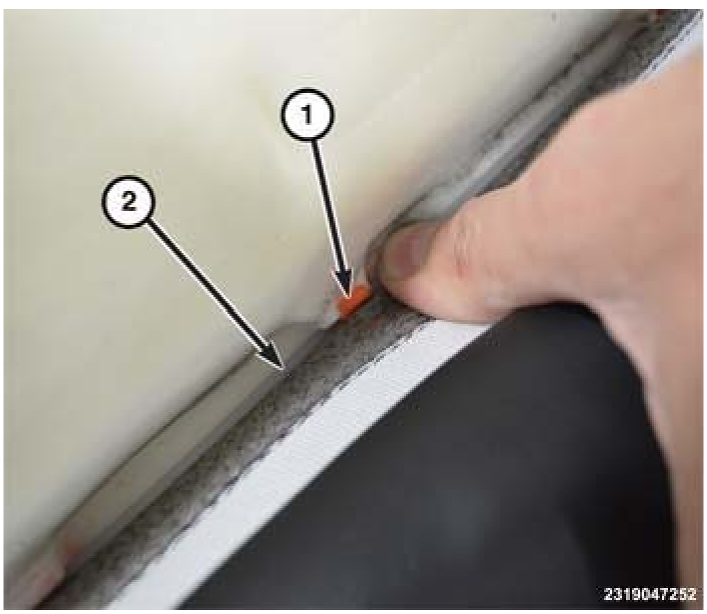

Fig. 12: Clip Strip & Molded Clip
Courtesy of CHRYSLER GROUP, LLC

4. Press the clip strip (2) into each molded clip (1).

5. Pull the seat back cover tight and fasten the hook and loop fastener on the seat back cushion.

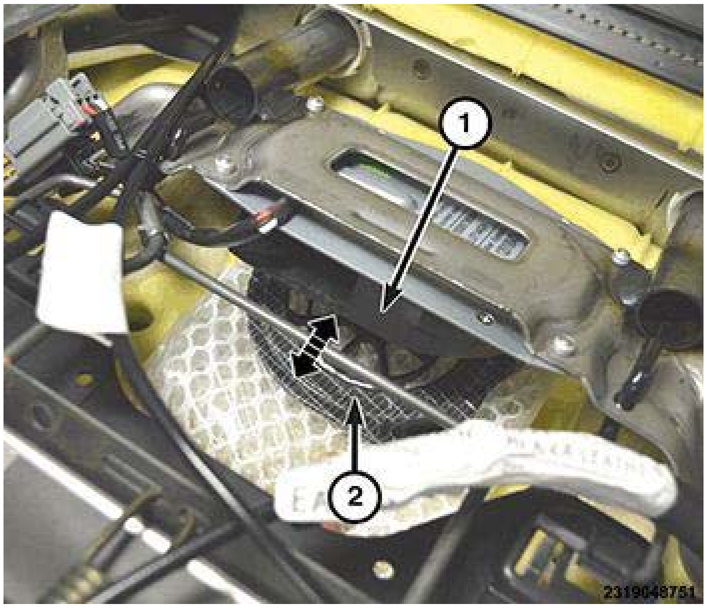

Fig. 13: Aligning Seat Back Ventilation Plenum
Courtesy of CHRYSLER GROUP, LLC

6. Position the seat back cushion assembly onto the seat back frame.
7. Align the seat cushion ventilation plenum (2) with the seat cushion blower (1) and snap into place, if equipped.

Fig. 14: Headrest Sleeve & Tab
Courtesy of CHRYSLER GROUP, LLC

8. Install the headrest sleeves (1) and hand tap to engage the tab (1).

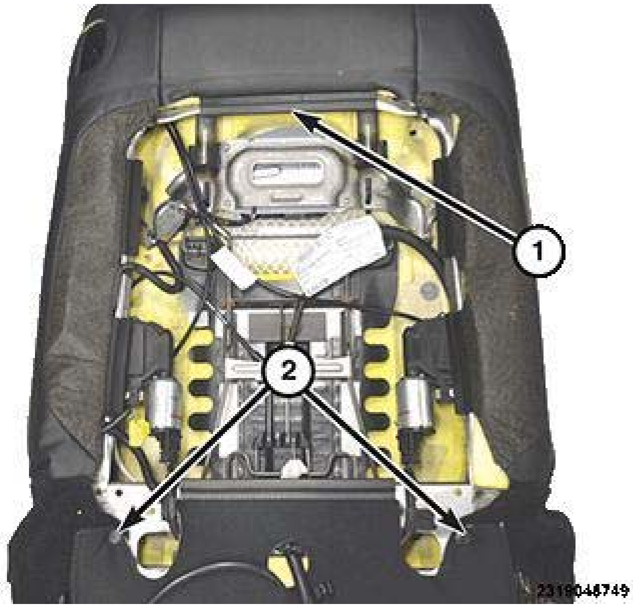

Fig. 15: J-Clip Retainers & Push Fasteners
Courtesy of CHRYSLER GROUP, LLC

9. Install all the J-clip retainers (1).
10. Install the two push fasteners (2).

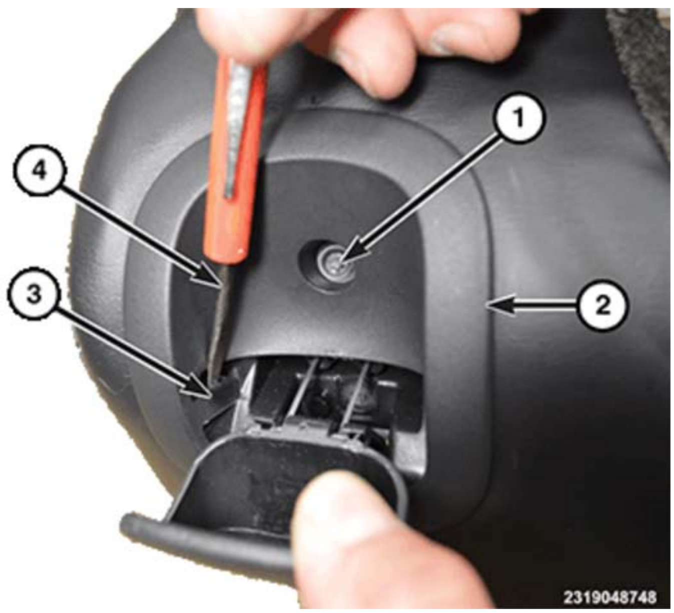

Fig. 16: Seat Back Release Cable Bezel, Tabs, Tool & Screw
Courtesy of CHRYSLER GROUP, LLC

11. Position the seat back release cable bezel (2) and push by hand to engage the tabs (3). Install the screw (1) and tighten securely.
12. Install the front seat back. Refer to **INSTALLATION** .
13. Install the front seat. Refer to **SEAT, FRONT, INSTALLATION** .

FRONT SEAT BOTTOM

WARNING: **Disable the airbag system before attempting any front seat diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury. Refer to WARNING .**

NOTE: **On all models, the front passenger seat contains an Occupant Detection Sensor (ODS) to provide information to the Occupant Restraint Controller (ORC).**

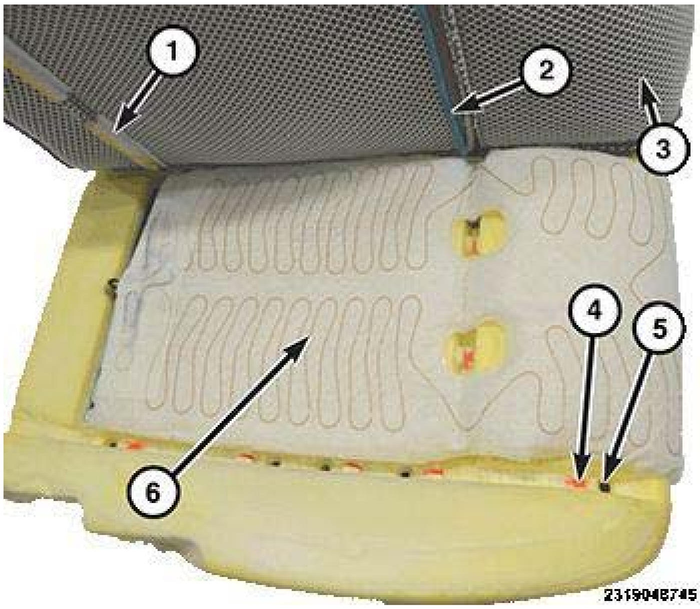

Fig. 17: Seat Cushion Cover, Clips & Fastener
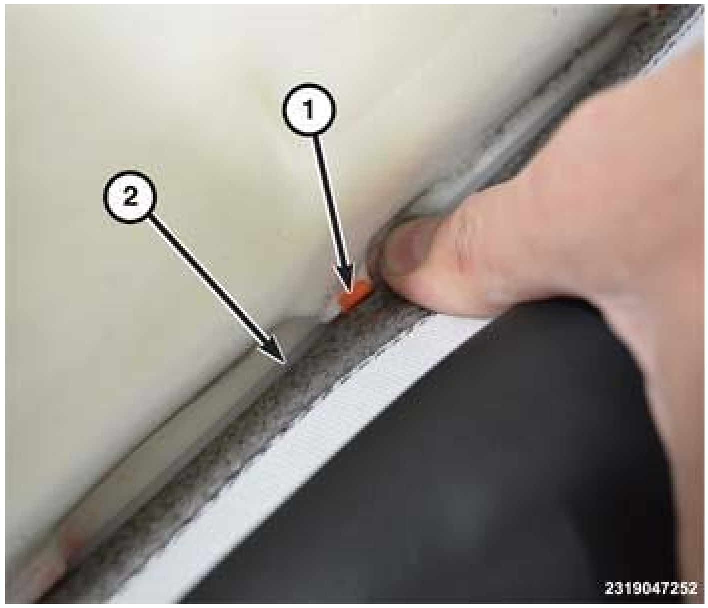
Courtesy of CHRYSLER GROUP, LLC

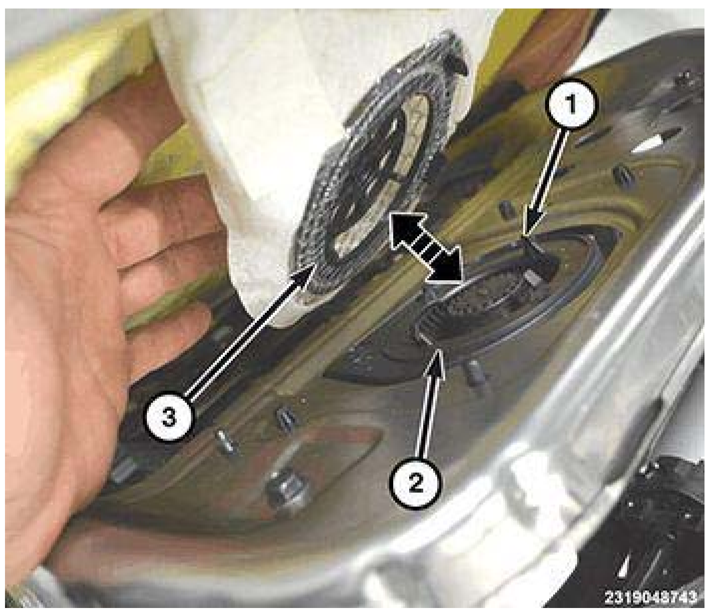
1. Insert the new heated seat pad (6) to the seat foam as shown in illustration.
2. Position the seat cover (3) onto the seat foam and align the clip strips (2) to the molded clips (4).

NOTE: **Note that there is a hole (5) in the foam, next to each molded clip, to aid in clip strip alignment/installation.**



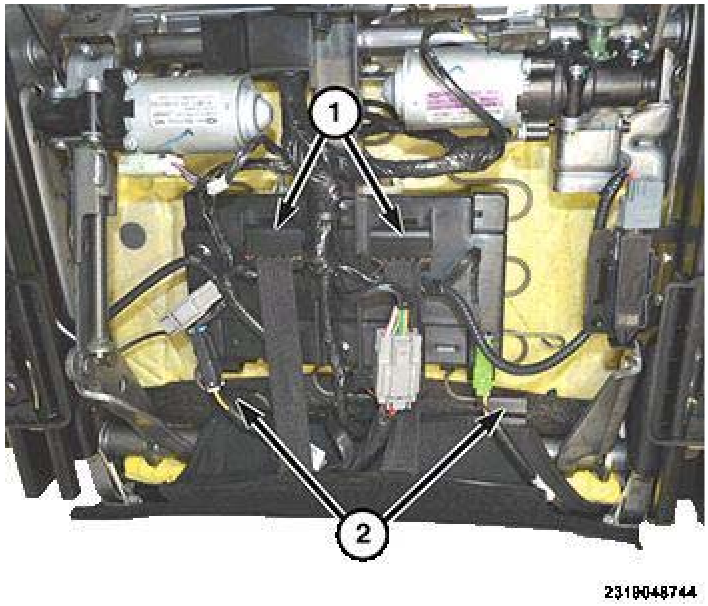
[Fig. 18: Clip Strip & Molded Clip](#)
Courtesy of CHRYSLER GROUP, LLC

3. Press the clip strip (2) into each molded clip (1).
4. Pull the seat cover tight and fasten the hook and loop fastener at the rear of the seat cushion.



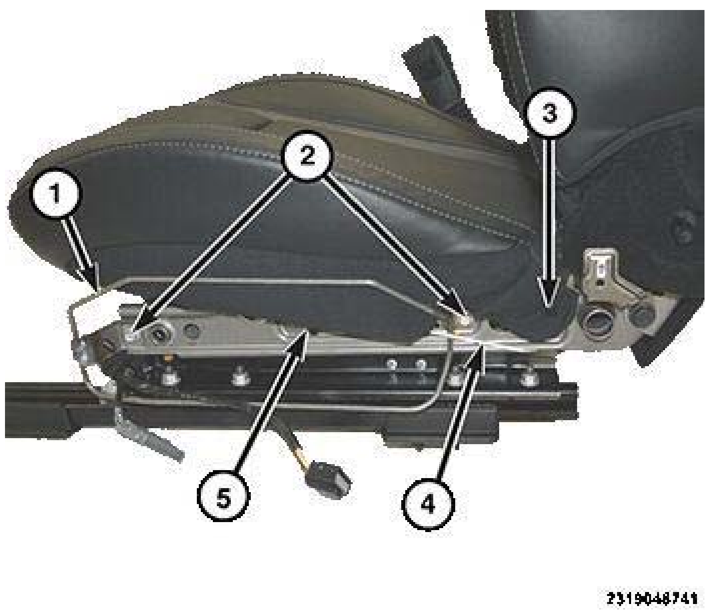
[Fig. 19: Aligning Seat Cushion Ventilation Plenum With Tabs](#)
Courtesy of CHRYSLER GROUP, LLC

5. Position the cushion assembly onto the seat adjuster.
6. Align the seat cushion ventilation plenum (3) with the tabs (1) on the seat cushion blower (2) and snap into place, if equipped.



[Fig. 20: J-Hook Retainers]
Courtesy of CHRYSLER GROUP, LLC

7. Route the wire harness, if equipped, and install the J-hook retainers (1) at the bottom of the seat.
8. When servicing the front passenger seat, if required, install the Occupant Detection Sensor (ODS) to the seat bottom cushion. Refer to **INSTALLATION** .



[Fig. 21: Side Bracket, String, Fastener, Retainer & Bolts]
Courtesy of CHRYSLER GROUP, LLC

9. Secure the J-hook retainer (5) to the side of the seat adjuster.
10. Install the seat side bracket (1) and tighten the bolts (2) securely.
11. Hook the tether string (4) to the seat. Make sure the tether string is routed as noted during removal.
12. Install the push fastener (3).
13. Install the seat side shields. Refer to **SIDE SHIELDS, SEAT CUSHION, FRONT, INSTALLATION** .

14. Install the seat. Refer to **SEAT, FRONT, INSTALLATION** .

SWITCH, HEATED SEAT

DESCRIPTION

DESCRIPTION

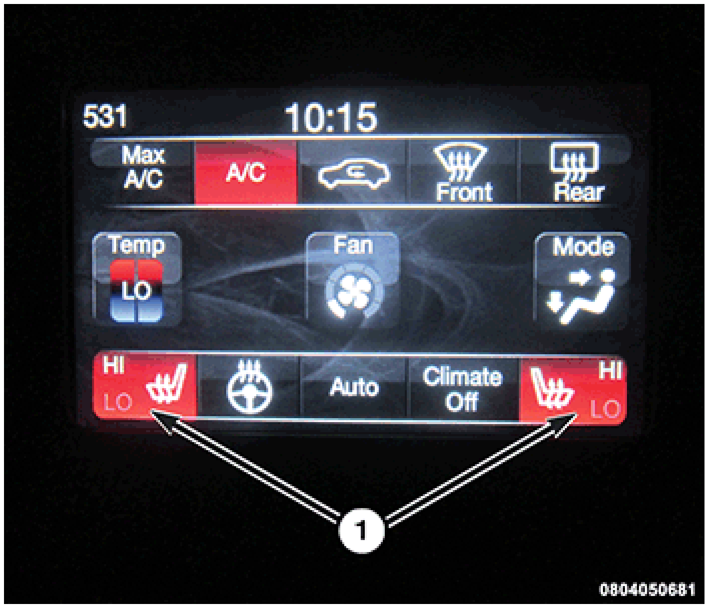


Fig. 22: Heated Seat Switches
Courtesy of CHRYSLER GROUP, LLC

The heated seat switches (1) for the optional front heated seat system are located in the U-Connect Touch ™ screen module, at the center of the instrument panel. The heated seat system allows the driver and front seat passenger to select from two different levels of electrical seat heating (HI and LO). When the heated seat switches are pressed on, each heated seat switch illuminates either HI or LO.

OPERATION

OPERATION

When either of the hard or soft front heated seat switches are pressed with the engine running, a signal is sent to the Comfort Seat and Wheel Module (CSWM) over the Controller Area Network (CAN) IHS data bus, signaling the module to energize the heating elements for the selected seat. Indicator lamps illuminate for each heated seat switch and indicate the level of heat in use (HI or LO). Pressing a heated seat switch once will select high-level heating and pressing the same switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off.

The CSWM energizes the integral solid-state relays that supply Pulse Width Modulated (PWM) current to the heating elements. During high-temperature level operation, the HI indicator illuminates on the U-Connect Touch ™ screen. After 50 minutes of high-temperature level heating, the CSWM automatically lowers the heat level to low. At that time, the LO indicator illuminates on the U-Connect Touch ™ screen. Operation on the low-temperature level setting will automatically turn off after 45 minutes.

The individual front heated seat switches located in the U-Connect Touch ™ screen module cannot be adjusted

or repaired. If a front heated seat switch or indicator is inoperative or damaged, the entire U-Connect Touch ™ screen module must be replaced. Refer to **RADIO, REMOVAL** .

REMOVAL

REMOVAL

The individual front heated seat switches located in the U-Connect Touch ™ screen radio receiver module cannot be adjusted or repaired. If a front heated seat switch or indicator is inoperative or damaged, the entire radio must be replaced. Refer to **RADIO, REMOVAL** .

INSTALLATION

INSTALLATION

The individual front heated seat switches located in the U-Connect Touch ™ screen radio receiver module cannot be adjusted or repaired. If a front heated seat switch or indicator is inoperative or damaged, the entire radio must be replaced. Refer to **RADIO, INSTALLATION** .

DTC TROUBLESHOOTING

B1030-11-EVAPORATOR TEMPERATURE SENSOR CIRCUIT - SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

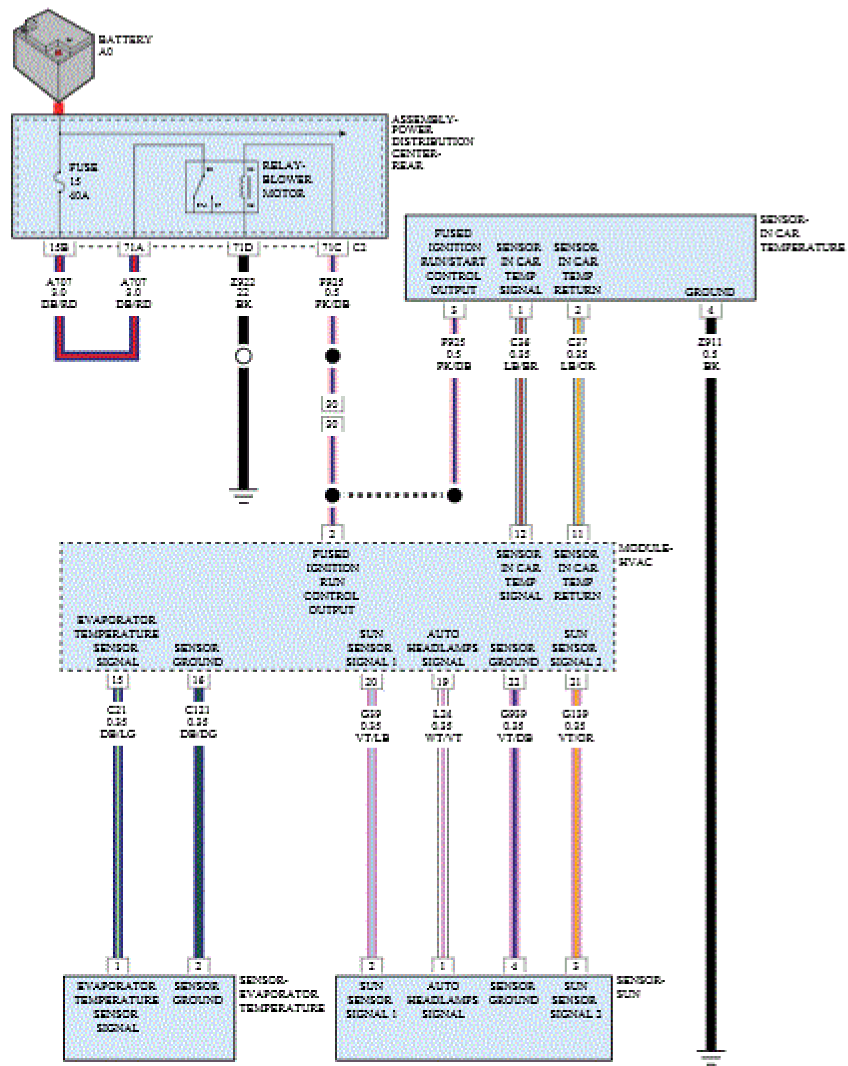

Fig. 1: HVAC Module - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Evaporator Temperature Sensor is a variable resistor that changes in conjunction with temperature, or otherwise known as a thermistor. The Evaporator Temperature Sensor is located in the HVAC housing downstream of the A/C evaporator. The HVAC Module monitors the evaporator temperature by monitoring the voltage change of the Evaporator Temperature Sensor Signal circuit. If the monitored voltage drops below or rises above a predetermined voltage, a Diagnostic Trouble Code (DTC) will set. For further information, refer to SENSOR, EVAPORATOR TEMPERATURE, OPERATION .

WHEN MONITORED

- This diagnostic runs continuously when the ignition is on.

SET CONDITION

- The HVAC Module detects less than 0.09 volts on the Evaporator Temperature Sensor Signal circuit for two seconds or more.

DEFAULT ACTION

- If the HVAC Module detects a valid voltage, the DTC will change from active to stored and will stay stored for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
EVAPORATOR TEMPERATURE SENSOR
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

        Did the DTC return?

        Yes

        - Go To 2

        No

        - Go To 5
2. **CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the HVAC Module C1 harness connector.
    3. Disconnect the Evaporator Temperature Sensor harness connector.
    4. Check for continuity between ground and the (C21) Evaporator Temperature Sensor Signal circuit at the HVAC Module C1 harness connector.

        Is there continuity between ground and the (C21) Evaporator Temperature Sensor Signal circuit?

        Yes

        - Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to ground.

- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO THE (C121) SENSOR GROUND CIRCUIT**
    1. Check for continuity between the (C21) Evaporator Temperature Sensor Signal circuit and the (C121) Sensor Ground circuit at the Evaporator Temperature Sensor harness connector.

    Is there continuity between the (C21) Evaporator Temperature Sensor Signal circuit and the (C121) Sensor Ground circuit?

    Yes

    - Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to the (C121) Sensor Ground circuit.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 4

4. **CHECK THE EVAPORATOR TEMPERATURE SENSOR**
    1. Replace the Evaporator Temperature Sensor in accordance with the Service Information. Refer to **SENSOR, EVAPORATOR TEMPERATURE, REMOVAL** . Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
    2. Cycle the ignition off for 30 seconds then back on.
    3. With the scan tool, read HVAC DTCs.

    Does this DTC reset?

    Yes

    - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

5. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Wiggle the wiring and connectors while checking for shorted and open circuits.

Were any problems found?

Yes

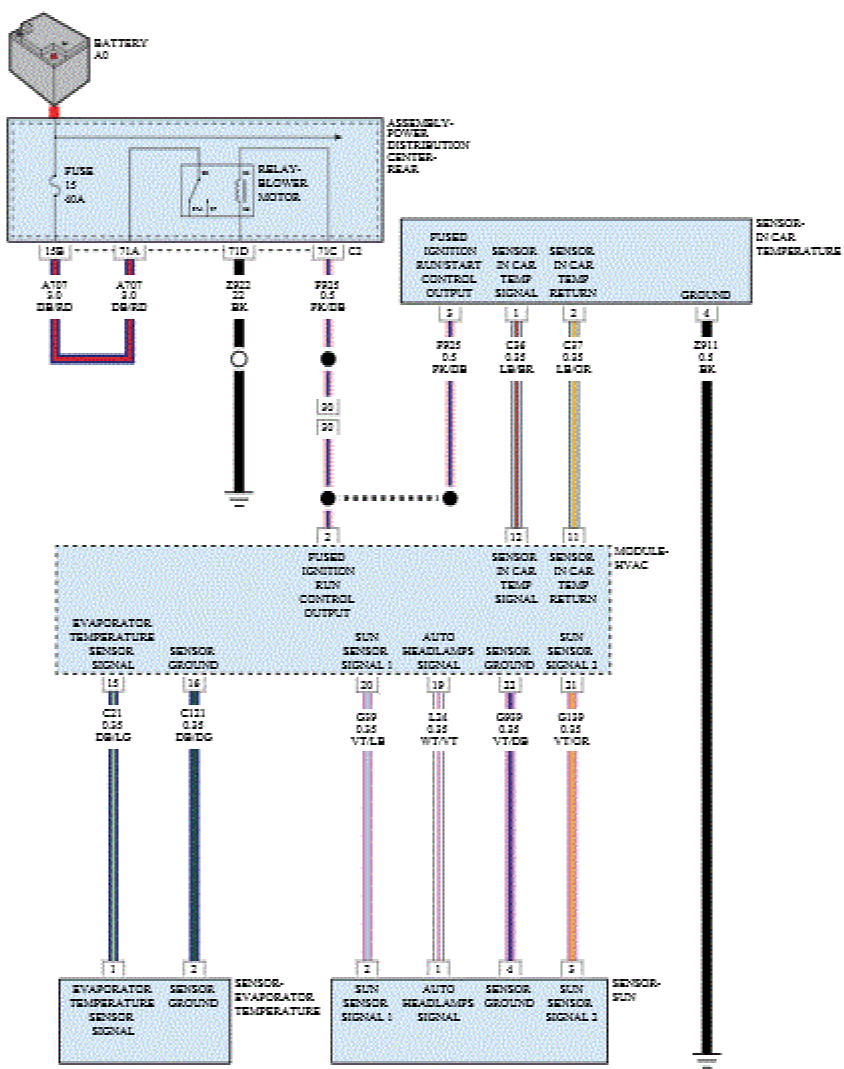
- Repair as necessary.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

B1030-15-EVAPORATOR TEMPERATURE SENSOR CIRCUIT - SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .



[Fig. 2: HVAC Module - Circuit Diagram]
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Evaporator Temperature Sensor is a variable resistor that changes in conjunction with temperature, or

otherwise known as a thermistor. The Evaporator Temperature Sensor is located in the HVAC housing downstream of the A/C evaporator. The HVAC Module monitors the evaporator temperature by monitoring the voltage change of the Evaporator Temperature Sensor Signal circuit. If the monitored voltage drops below or rises above a predetermined voltage, a Diagnostic Trouble Code (DTC) will set. For further information, refer to **SENSOR, EVAPORATOR TEMPERATURE, OPERATION** .

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following condition is met:

- Ignition on.

Set Conditions:

- The HVAC Module detects greater than 4.8 volts on the Evaporator Temperature Sensor Signal circuit for a period of two seconds or more.

Default Actions:

- If the HVAC Module detects a valid voltage, the DTC will change from active to stored and will stay stored for 100 ignition cycles.

Possible Causes
EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
EVAPORATOR TEMPERATURE SENSOR
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

    Did the DTC return?

    Yes

    - Go To 2

    No

    - Go To 6

2. **CHECK THE EVAPORATOR TEMPERATURE SENSOR**
    1. Turn the ignition off.
    2. Disconnect the Evaporator Temperature Sensor harness connector.

    NOTE: **Due to the small terminal and pin size of the Evaporator Temperature Sensor and harness connector, make sure to not damage the terminals in this process.**

    3. Connect a fused jumper wire between the (C21) Evaporator Temperature Sensor Signal circuit and the (C121) Sensor Ground circuit in the Evaporator Temperature Sensor harness connector.
    4. Turn the ignition on.
    5. With the scan tool, read the Evaporator Temperature Sensor voltage.

    Is the voltage below 0.2 volts?

    Yes

    - Replace the Evaporator Temperature Sensor in accordance with the Service Information. Refer to **SENSOR, EVAPORATOR TEMPERATURE, REMOVAL** .
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 3
3. **CHECK THE (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the jumper wire from the previous step.
    3. Disconnect the HVAC Module C1 harness connector.
    4. Ignition on, engine not running.
    5. Measure the voltage of the (C21) Evaporator Temperature Sensor Signal circuit.

    Is voltage above 0.2 volts?

    Yes

    - Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to voltage.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 4
4. **CHECK THE (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN**
    1. Turn the ignition off.
    2. Measure the resistance of the (C21) Evaporator Temperature Sensor Signal circuit between the

HVAC Module C1 harness connector and the Evaporator Temperature Sensor harness connector.

Is the resistance above 1.0 Ohm?

Yes

- Repair the (C21) Evaporator Temperature Sensor Signal circuit for an open.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 5

5. **CHECK THE (C121) SENSOR GROUND CIRCUIT FOR AN OPEN**
    1. Measure the resistance of the (C121) Sensor Ground circuit between the HVAC Module C1 harness connector and the Evaporator Temperature Sensor harness connector.

       Is the resistance above 1.0 Ohm?

       Yes

       - Repair the (C121) Sensor Ground circuit for an open.
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
6. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Wiggle the wiring and connectors while checking for shorted and open circuits.

       Were any problems found?

       Yes

       - Repair as necessary.
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Test complete.

B1058-13-RECIRCULATION DOOR CONTROL CIRCUIT - OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

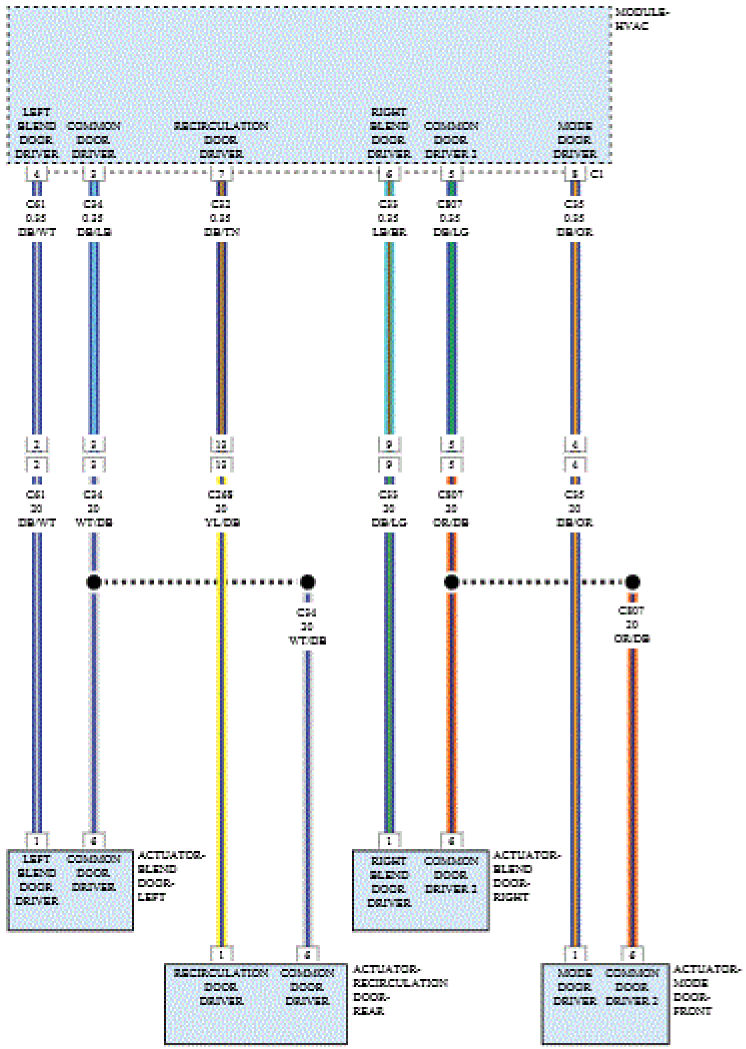


Fig. 3: HVAC Module - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

After the initial installation of the HVAC Module, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The HVAC Module drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present. For further information, refer to DESCRIPTION .

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following conditions are are met:

- Ignition on.

Set Conditions:

- The HVAC Module detects an open in the Recirculation Door control circuit.

Default Actions:

- If the HVAC Module detects a valid current draw, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
RECIRCULATION DOOR DRIVER CIRCUIT OPEN
COMMON DOOR DRIVER CIRCUIT OPEN
RECIRCULATION DOOR ACTUATOR
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

    Did the DTC return?

    Yes

    - Go To 3

    No

    - Go To 2
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. With the scan tool, perform the HVAC ACTUATOR CALIBRATION TEST.

    Did the DTC return while performing the HVAC ACTUATOR CALIBRATION TEST?

    Yes

    - Go To 3

    No

    - Go To 6

3. **CHECK THE (C32/C268) RECIRCULATION DOOR DRIVER CIRCUIT FOR AN OPEN**
    1. Turn the ignition off.
    2. Disconnect the Recirculation Door Actuator harness connector.
    3. Measure the resistance of the (C32/C268) Recirculation Door Driver circuits between the HVAC Module C1 harness connector and the Recirculation Door Actuator harness connector.

       Is the resistance above 1.0 Ohm?

       Yes

       - Repair the (C32/C268) Recirculation Door Driver circuit for an open or high resistance.
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 4
4. **CHECK THE (C34/C68) COMMON DOOR DRIVER CIRCUIT FOR AN OPEN**
    1. Measure the resistance of the (C34/C68) Common Door Driver circuits between the HVAC Module C1 harness connector and the Recirculation Door Actuator harness connector.

       Is the resistance above 1.0 Ohm?

       Yes

       - Repair the (C34/C68) Common Door Driver circuit for an open or high resistance.
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 5
5. **CHECK THE RECIRCULATION DOOR ACTUATOR**
    1. Replace the Recirculation Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, RECIRCULATION DOOR, REMOVAL** .
    2. With the scan tool, erase HVAC DTCs and perform the HVAC ACTUATOR CALIBRATION TEST.

       Did this DTC reset?

       Yes

       - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Test complete.
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Wiggle the wiring and connectors while checking for shorted and open circuits.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

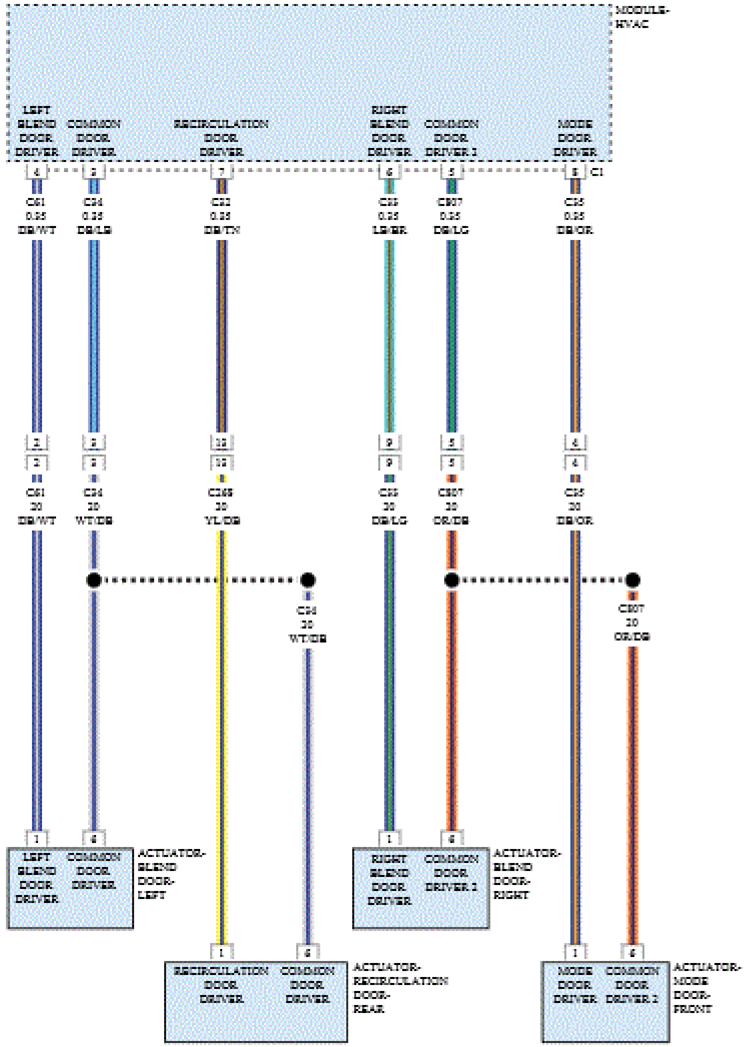
    No

    - Test complete.

B1058-92-RECIRCULATION DOOR CONTROL - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

..



[Fig. 4: HVAC Module - Circuit Diagram](#)
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

After the initial installation of the HVAC Module, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The HVAC Module drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present. For further information, refer to DESCRIPTION .

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following conditions are met:

- Ignition on.

Set Conditions:

- The HVAC Module detects no feedback pulses on the Recirculation Door Control circuits for 15 seconds or more.

Default Actions:

- If the HVAC Module detects a valid feedback pulse, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
RECIRCULATION DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
RECIRCULATION DOOR DRIVER CIRCUIT SHORTED TO GROUND
RECIRCULATION DOOR COMMON DRIVER CIRCUIT SHORTED TO VOLTAGE
RECIRCULATION DOOR COMMON DRIVER CIRCUIT SHORTED TO GROUND
RECIRCULATION DOOR BINDING
RECIRCULATION DOOR ACTUATOR
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

    Did the DTC return?

    Yes

    - Go To 2

    No

    - Go To 9
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. Using the scan tool, perform the HVAC ACTUATOR CALIBRATION TEST.

    Did any other HVAC DTCs set while performing the ACTUATOR CALIBRATION TEST?

    Yes

    - Diagnose those DTCs first. Refer to **DIAGNOSTIC CODE INDEX** .

No

- Go To 3

3. **CHECK THE (C32/C268) RECIRCULATION DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the HVAC Module C1 harness connector.
    3. Disconnect the Recirculation Door Actuator harness connector.
    4. Ignition on, engine not running.
    5. Measure the voltage of the (C32/C268) Recirculation Door Driver circuit at the HVAC Module C1 harness connector.

    Is there any voltage present?

    Yes

    - Repair the (C32/C268) Recirculation Door Driver circuit for a short to voltage.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 4

4. **CHECK THE (C34/C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Measure the voltage of the (C34/C68) Recirculation Door Common Driver circuit at the HVAC Module C1 harness connector.

    Is there any voltage present?

    Yes

    - Repair the (C34/C68) Recirculation Door Common Driver circuit for a short to voltage.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 5

5. **CHECK THE (C32/C268) RECIRCULATION DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Check for continuity between ground and the (C32/C268) Recirculation Door Driver circuit at the HVAC Module C1 harness connector.

    Is there continuity between ground and the (C32/C268) Recirculation Door Driver circuit?

    Yes

- Repair the (C32/C268) Recirculation Door Driver circuit for a short to ground.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 6

6. **CHECK THE (C34/C68) RECIRCULATION DOOR COMMON DRIVER CIRCUIT FOR A SHORT TO GROUND**
   1. Check for continuity between ground and the (C34/C68) Recirculation Door Common Driver circuit at the HVAC Module C1 harness connector.

      Is there continuity between ground and the (C34/C68) Recirculation Door Common Driver circuit?

      Yes

      - Repair the (C34/C68) Recirculation Door Common Driver circuit for a short to ground.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 7

7. **CHECK THE RECIRCULATION DOOR**
   1. Remove the Recirculation Door Actuator and check the Recirculation Door for binding and full travel. Refer to **ACTUATOR, RECIRCULATION DOOR, REMOVAL** .

      Were any problems found?

      Yes

      - Repair or replace the Recirculation Door as necessary in accordance with the Service Information. Refer to **HOUSING, HVAC, REMOVAL** .
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 8

8. **CHECK THE RECIRCULATION DOOR ACTUATOR**
   1. Replace the Recirculation Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, RECIRCULATION DOOR, REMOVAL** .
   2. Using the scan tool, erase HVAC DTCs and perform the HVAC ACTUATOR CALIBRATION TEST.

      Did this DTC reset?

      Yes

      - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .

- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

9. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Wiggle the wiring and connectors while checking for shorted and open circuits.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

B105C-00-RECIRCULATION DOOR TRAVEL RANGE TOO SMALL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

After the initial installation of the HVAC Module, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The HVAC Module drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present. For further information, refer to **DESCRIPTION** .

WHEN MONITORED

- When ever an Actuator Calibration Test is performed.

SET CONDITION

- The HVAC Module uses a pulse feedback to the controller to detect the total door movement range. If the amount of pulses required to move the door completely in both directions is less than what the controller has stored in its memory, this DTC will set.

DEFAULT ACTION

- If an Actuator Calibration Test is performed and the HVAC Module detects a valid range of the door movement span in both directions, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
RECIRCULATION DOOR BINDING
RECIRCULATION DOOR ACTUATOR
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. Ignition on.
    2. Using the scan tool, read HVAC DTCs.

       Are there any Door Control Circuit Open, Performance, or Short to Ground or Voltage DTCs present?

       Yes

       - Perform the appropriate diagnostic procedure.

         Refer to **DIAGNOSTIC CODE INDEX** .

       No

       - Go To 2
2. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

       Did the DTC return?

       Yes

       - Go To 4

No

- Go To 3

3. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. Using the scan tool, perform the HVAC ACTUATOR CALIBRATION TEST.

    Did this DTC change from Stored to Active while performing the HVAC ACTUATOR CALIBRATION TEST?

    Yes

    - Go To 4

    No

    - Go To 6

4. **CHECK THE RECIRCULATION DOOR**
    1. Remove the Recirculation Door Actuator and check the Recirculation Door for binding and full travel. Refer to **ACTUATOR, RECIRCULATION DOOR, REMOVAL** .

    Were any problems found?

    Yes

    - Repair or replace the Recirculation Door as necessary in accordance with the Service Information. Refer to **HOUSING, HVAC, REMOVAL** .
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 5

5. **CHECK THE RECIRCULATION DOOR ACTUATOR**
    1. Replace the Recirculation Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, RECIRCULATION DOOR, REMOVAL** .
    2. Using the scan tool, erase HVAC DTCs.
    3. Using the scan tool, perform the HVAC ACTUATOR CALIBRATION TEST.

    Did this DTC reset during HVAC ACTUATOR CALIBRATION TEST?

    Yes

    - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B105D-00-RECIRCULATION DOOR TRAVEL RANGE TOO LARGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

After the initial installation of the HVAC Module, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The HVAC Module drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present. For further information, refer to **DESCRIPTION** .

WHEN MONITORED

- When ever an Actuator Calibration Test is performed.

SET CONDITION

- The HVAC Module uses a pulse feedback to the controller to detect the total door movement range. If the amount of pulses required to move the door completely in both directions is greater than what the controller has stored in its memory, this DTC will set.

DEFAULT ACTION

- If an Actuator Calibration Test is performed or during normal operation and the HVAC Module detects a valid range of the door movement span in both directions, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
RECIRCULATION DOOR STOPS
RECIRCULATION DOOR
RECIRCULATION DOOR ACTUATOR
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Are there any Door Control Circuit Open, Performance, or Short to Ground or Voltage DTCs present?

    Yes

    - Perform the appropriate diagnostic procedure.

      Refer to **DIAGNOSTIC CODE INDEX** .

    No

    - Go To 2
2. **CHECK IF DTC IS ACTIVE**
    1. Ignition on, engine not running.
    2. With the scan tool, read HVAC DTCs.

    Is this DTC active?

    Yes

    - Go To 4

    No

    - Go To 3
3. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. With the scan tool, perform the HVAC Actuator Calibration Test.

    Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

Yes

- Go To 4

No

- Go To 6

4. **CHECK THE RECIRCULATION DOOR**
    1. Remove the Recirculation Door Actuator and check the Recirculation Door stops, linkage (stripped or cracked) and door. Refer to **ACTUATOR, RECIRCULATION DOOR, REMOVAL** .

    Were there any problems found?

    Yes

    - Repair or replace the Recirculation Door as necessary in accordance with the Service Information. Refer to **HOUSING, HVAC, REMOVAL** .
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 5

5. **CHECK THE RECIRCULATION DOOR ACTUATOR**
    1. Replace the Recirculation Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, RECIRCULATION DOOR, REMOVAL** .
    2. With the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

    Did this DTC reset?

    Yes

    - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Wiggle the wiring and connectors while checking for shorted and open circuits.

Were there any problems found?

Yes

- Repair as necessary.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

B106A-01-REAR-DEFROST-(EBL)-CONTROL CIRCUIT-GENERAL ELECTRICAL FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following condition is met:

- Ignition on.

Set Conditions:

- The HVAC Module detects an open or short to ground on the Defogger Relay Control circuit.

Default Actions:

- If the HVAC Module detects a valid current draw, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
DEFOGGER RELAY CONTROL CIRCUIT OPEN
DEFOGGER RELAY CONTROL CIRCUIT SHORT TO GROUND
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

    Did the DTC return?

Yes

- Go To 2

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

2. **CHECK THE DEFOGGER RELAY CONTROL CIRCUIT FOR AN OPEN**
    1. Turn the ignition off.
    2. Disconnect the HVAC Module Harness connector.
    3. Remove the Rear Defrost relay from the PDC.
    4. Measure the resistance of the Rear Defogger Relay Control circuit between the HVAC Module harness connector and the Rear Defrost Relay in the PDC.

    Is the resistance above 5.0 Ohms ?

    Yes

    - Repair the Defogger Relay Control circuit for an open.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 3
3. **CHECK THE DEFOGGER RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND**
    1. Check for continuity between ground and the Rear Defogger Relay Control circuit at the HVAC Module Harness connector.

    Is there continuity between ground and the Rear Defogger Relay Control circuit?

    Yes

    - Repair the Defogger Relay Control circuit for a short to ground.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B10B2-00-A-C-COOL-DOWN-TEST-PERFORMANCE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The HVAC Module has software to enable it to perform an A/C Cool Down Test by a command using a scan tool. This test checks for evaporator temperature drop over a predetermined time. If the test fails, this DTC will set. However, certain test conditions are required to perform this test. Failure to run this test within those parameters can result in failure of the test.

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following condition is met:

- Whenever an A/C Cooldown Test is performed.

Set Conditions:

- This DTC is set whenever the A/C Cooldown Test is performed and the desired temperature drop is not achieved by the system.

Default Actions:

- The DTC will go to stored after a successful A/C Cooldown Test.

Possible Causes
A/C SYSTEM WORKING IMPROPERLY

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

CONDITIONS FOR A/C COOLDOWN TEST

1. The following condition must be met before running the A/C Cooldown test.
    - No Powertrain Control Module (PCM) DTCs present.
    - No Communication DTCs present.
    - Condenser cooling fan working properly.
    - No active HVAC evaporator temperature sensor, sun sensor, recirculation, mode, or blend door actuator DTCs present.
    - The refrigerant system must be fully charged.
    - The blower motor must operate correctly in all speeds.
    - The evaporator temperature must be above 12.7Â° C (55Â° F).
    - The A/C compressor must be turned off.
    - Blower must be on high.

    Are all of the above conditions met before running the A/C Cooldown Test?

    Yes

    - Refer to **DIAGNOSIS AND TESTING** for additional Cooldown Test related diagnostic information and testing procedures and repair as necessary.

..

NOTE: **Run the Cooldown Test again after any repairs are performed.**

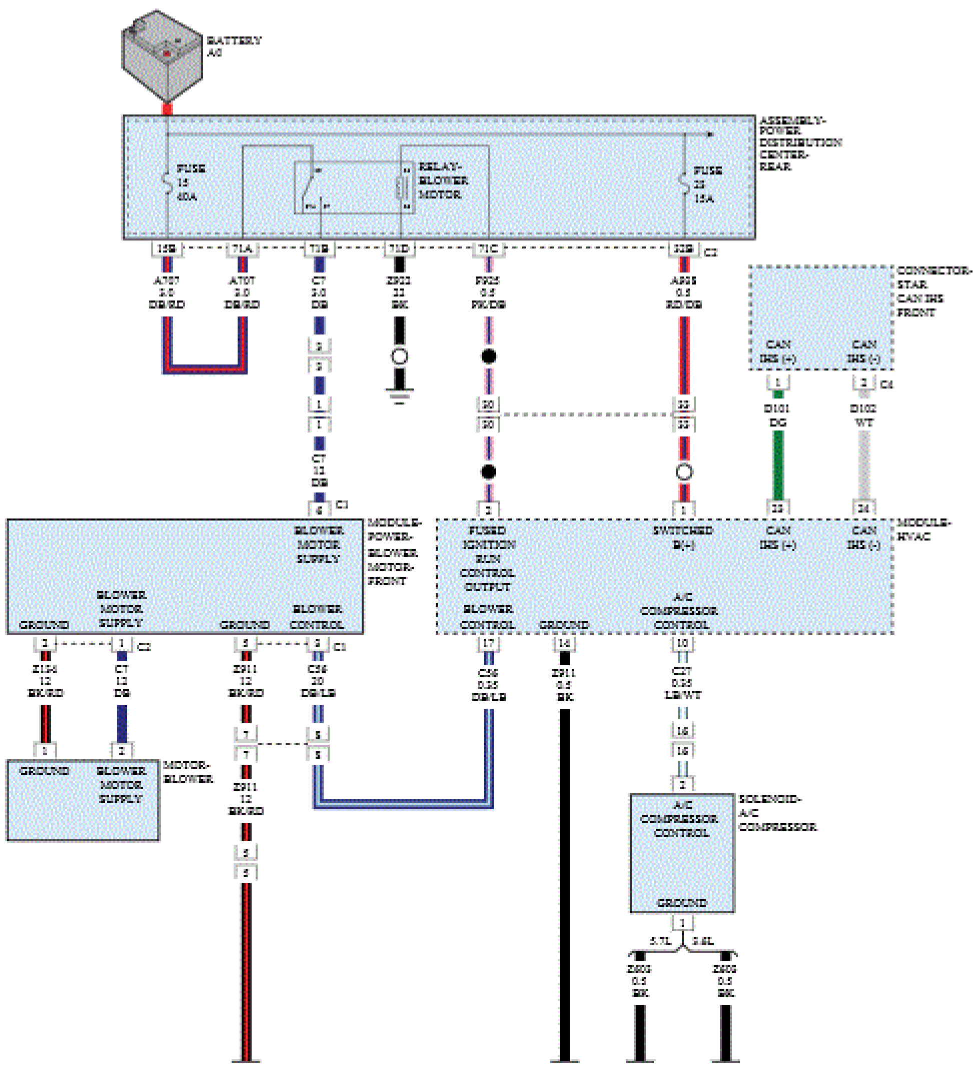
- If the Cooldown Test passes, testing is complete.

No

- Run the A/C Cooldown test again with the above test conditions.

B10E8-12-BLOWER MOTOR CONTROL CIRCUIT - SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .



[Fig. 5: HVAC Module Circuit Diagram]

Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The HVAC Module constantly monitors the Blower Control circuit to the Blower Motor Power Module for proper operation. If the voltage or the Pulse Width Modulation (PWM) on that circuit drops below or rises above a predetermined value, a DTC will set. For further information, refer to [OPERATION] .

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following condition is met:

- Ignition on.

Set Conditions:

- If the HVAC Module detects the Blower Motor Control circuit Pulse Width Modulation (PWM) is less than 0% and or greater than 100% or PWM equals 0% for the period of 30 seconds.

Possible Causes
BLOWER CONTROL CIRCUIT SHORTED TO VOLTAGE
BLOWER MOTOR CONTROL MODULE
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

       Did the DTC return?

       Yes

       - Go To 2

       No

       - Go To 4
2. **CHECK THE (C56) BLOWER CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the Blower Motor Power Module C1 harness connector.
    3. Disconnect the HVAC Module C1 harness connector.
    4. Ignition on, engine not running.
    5. Measure the voltage of the (C56) Blower Control circuit at the HVAC Module C1 harness connector.

       Is there any voltage present?

Yes

- Repair the (C56) Blower Control circuit for a short to voltage.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE BLOWER MOTOR POWER MODULE**
    1. Turn the ignition off.
    2. Replace the Blower Motor Power Module in accordance with the Service Information. Refer to **MODULE, POWER, BLOWER MOTOR, REMOVAL** .
    3. Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    Did the DTC return during or after the HVAC VERIFICATION TEST?

    Yes

    - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .

    No

    - Test complete.
4. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Wiggle the wiring and connectors while checking for shorted and open circuits.

    Were any problems found?

    Yes

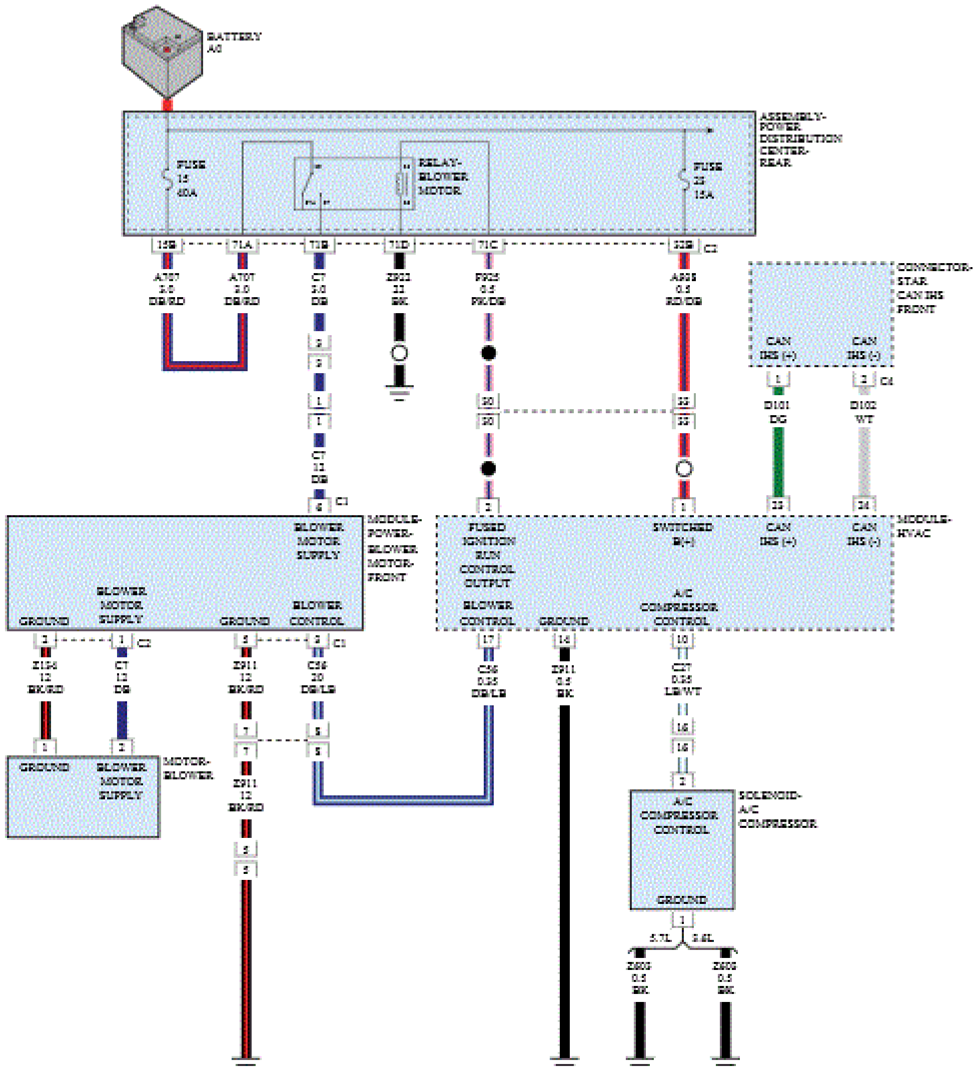
    - Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

B10E8-14-BLOWER MOTOR CONTROL CIRCUIT - SHORT TO GROUND OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .



[Fig. 6: HVAC Module Circuit Diagram](#)
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The HVAC Module constantly monitors the Blower Control circuit to the Blower Motor Power Module for proper operation. If the voltage or the Pulse Width Modulation (PWM) on that circuit drops below or rises above a predetermined value, a DTC will set. For further information, refer to **OPERATION** .

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following condition is met:

- Ignition on.

Set Conditions:

- If the HVAC Module detects the Blower Motor Control circuit Pulse Width Modulation (PWM) is less than 0% and or greater than 100% or PWM equals 100% for the period of 30 seconds.

Possible Causes
BLOWER CONTROL CIRCUIT SHORTED TO GROUND
BLOWER CONTROL CIRCUIT OPEN
GROUND CIRCUIT OPEN
BLOWER CONTROL MODULE
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

       Did the DTC return?

       Yes

       - Go To 2

       No

       - Go To 6
2. **CHECK THE (C56) BLOWER CONTROL CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the Blower Motor Power Module C1 harness connector
    3. Disconnect the HVAC Module C1 harness connector.
    4. Check for continuity between ground and the (C56) Blower Control circuit at the Blower Motor Power Module C1 harness connector.

       Is there continuity between ground and the (C56) Blower Control circuit?

       Yes

       - Repair the (C56) Blower Control circuit for an short to ground.
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 3

3. **CHECK THE (C56) BLOWER CONTROL CIRCUIT FOR AN OPEN**
    1. Turn the ignition off.
    2. Measure the resistance of the (C56) Blower Control circuit between the HVAC Module harness connector and the Blower Motor Power Module harness connector.

       Is the resistance above 100k Ohms?

       Yes

       - Repair the (C56) Blower Control circuit for an open.
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 4
4. **CHECK THE (Z911) GROUND CIRCUIT FOR AN OPEN**
    1. With a 12-volt test light connected to 12 volts, check the (Z911) Ground circuit at the HVAC Module C1 harness connector.

       NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

       Does the test light illuminate brightly?

       Yes

       - Repair the (Z911) Ground circuit for an open.
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 5
5. **CHECK THE BLOWER MOTOR POWER MODULE**
    1. Turn the ignition off.
    2. Replace the Blower Motor Power Module in accordance with the Service Information. Refer to **MODULE, POWER, BLOWER MOTOR, REMOVAL** .
    3. Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       Did the DTC reset during or after the HVAC VERIFICATION TEST?

       Yes

       - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

- Test complete.

6. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Wiggle the wiring and connectors while checking for shorted and open circuits.

    Were any problems found?

    Yes

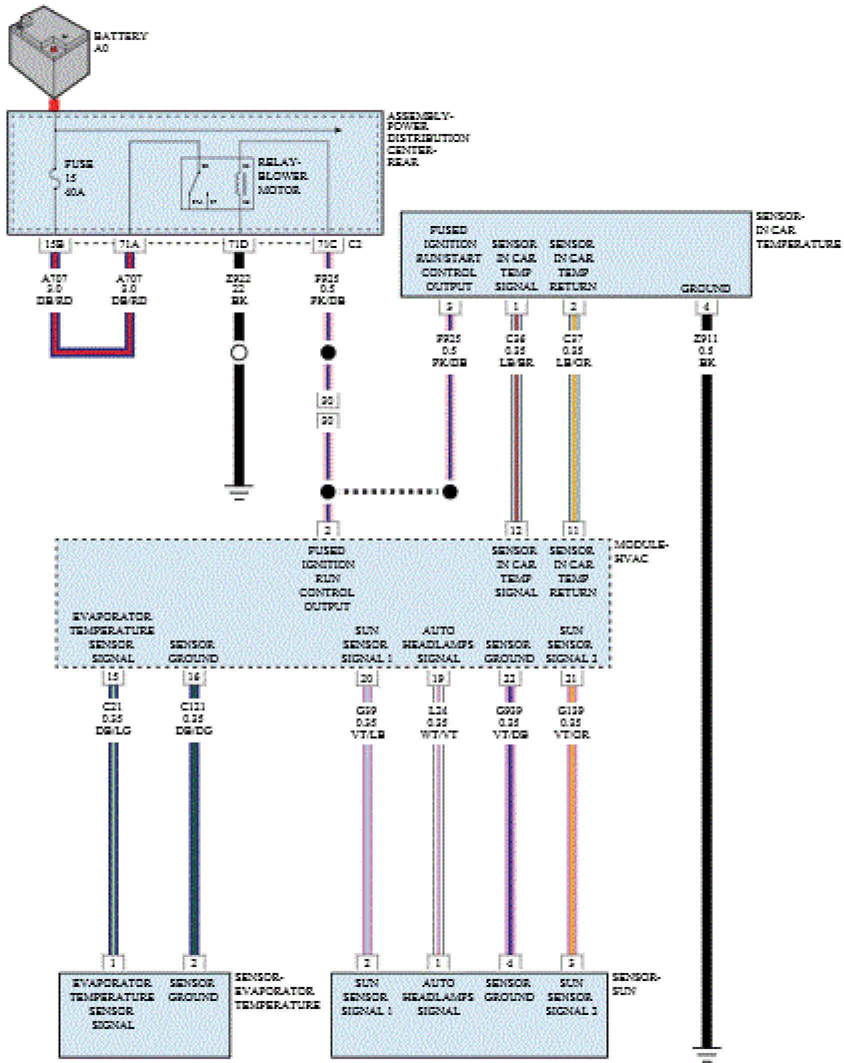
    - Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

B1107-11-CABIN TEMPERATURE SENSOR 1 CIRCUIT - SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .



[Fig. 7: HVAC Module - Circuit Diagram](#)

Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The HVAC Module uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the HVAC Module to assure that they are in range. An active Diagnostic trouble Code (DTC) indicates that a sensor is out of range. A stored DTC indicates that the sensor was out of range but is currently within range.

The Cabin Temperature Sensor (also known as the in car temperature sensor) uses a temperature thermistor which changes in its resistive value with differences in air temperature of the interior cabin. Air is drawn from the passenger compartment by an aspirator (small fan driven by a 12-volt electric motor) which circulates air over the temperature thermistor. The HVAC Module receives the resistance value over a two wire circuit that is used to calculate the temperature and make any adjustments to maintain the optimum passenger compartment comfort. The Cabin Temperature Sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged.

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following condition is met:

- Ignition on.

Set Conditions:

- When the In Car Temperature Sensor signal to the HVAC Module is less than 0.5 volt for a continuous period of 1200 msec. or more.

Default Actions:

- If the HVAC Module detects a valid signal, the DTC will change from active to stored and will stay stored for 100 ignition cycles.

Possible Causes
IN CAR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND
IN CAR TEMPERATURE SENSOR
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

        Did the DTC return?

        Yes

        - Go To 2

        No

        - Go To 5
2. **CHECK IF THE CABIN TEMPERATURE SENSOR IS PROPERLY CONNECTED**
    1. Turn the ignition off.
    2. Check the connector to In Car Temperature Sensor for proper connection and the terminals for damage or corrosion.

        Is the In Car Temperature Sensor connector properly connected and terminals undamaged or corroded?

Yes

- Go To 3

No

- Repair connector and terminals as necessary.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **CHECK THE (C36) IN CAR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
    1. Disconnect the HVAC Module C1 harness connector.
    2. Disconnect the In Car Temperature Sensor harness connector.
    3. Check for continuity between ground and the (C36) In Car Temperature Sensor Signal circuit at the HVAC Module C1 harness connector.

    Is there continuity between ground and the (C36) In Car Temperature Sensor Signal circuit?

    Yes

    - Repair the (C36) Cabin Temperature Sensor Signal circuit for a short to ground.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 5
4. **CHECK THE CABIN TEMPERATURE SENSOR**
    1. Remove the Cabin Temperature Sensor. Refer to **SENSOR, TEMPERATURE, IN-CAR, REMOVAL** .
    2. Measure the resistance of the Cabin Temperature Sensor and compare the resistance to the Cabin Temperature Sensor Resistance Chart in the Service Information. Refer to **SENSOR, TEMPERATURE, IN-CAR, DIAGNOSIS AND TESTING** .

    Is the Cabin Temperature Sensor within the specified limits of Cabin Temperature Sensor Resistance Chart?

    Yes

    - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Replace the Cabin Temperature Sensor in accordance to the Service Information. Refer to **SENSOR, TEMPERATURE, IN-CAR, INSTALLATION** .
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
5. **CHECK THE WIRING AND CONNECTORS**

1. The conditions necessary to set the DTC are not present at this time.
2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B1107-15-CABIN TEMPERATURE SENSOR 1-CIRCUIT SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

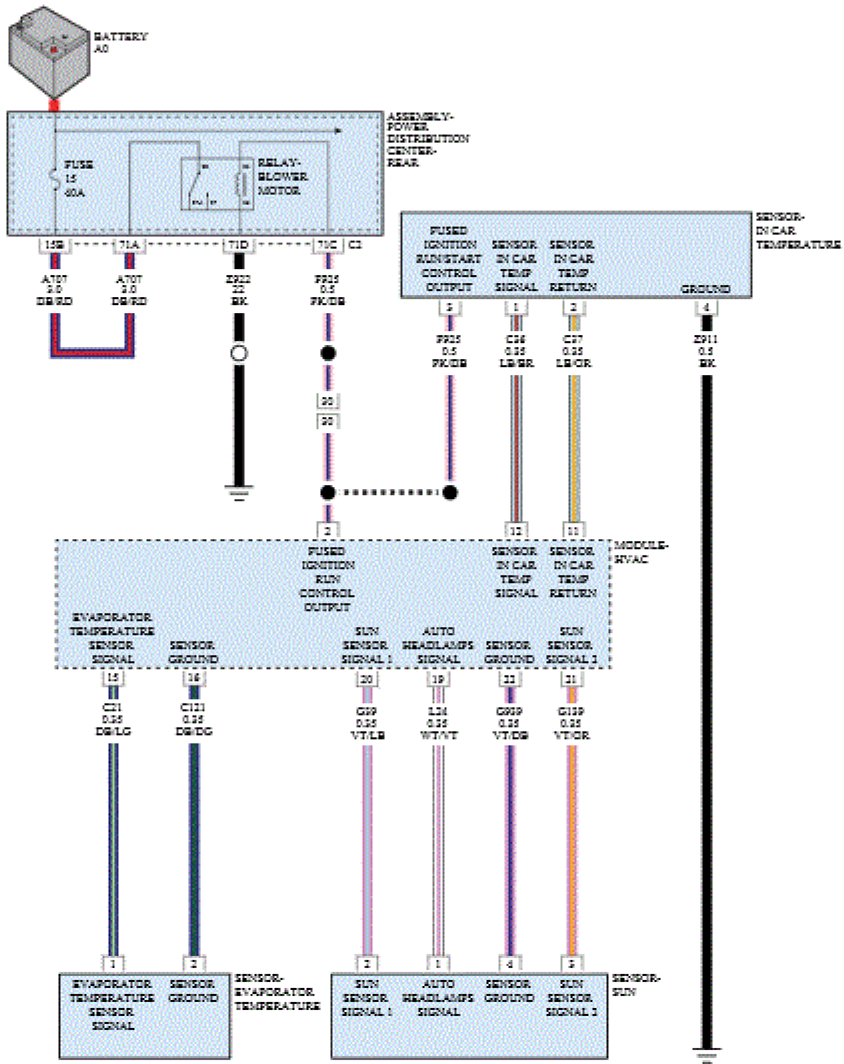


Fig. 8: HVAC Module - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The HVAC Module uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the HVAC Module to assure that they are in range. An active Diagnostic trouble Code (DTC) indicates that a sensor is out of range. A stored DTC indicates that the sensor was out of range but is currently within range.

The In-Car Temperature Sensor uses a temperature thermistor which changes in its resistive value with differences in air temperature of the interior cabin. Air is drawn from the passenger compartment by an aspirator (small fan driven by a 12-volt electric motor) which circulates air over the temperature thermistor. The HVAC Module receives the resistance value over a two wire circuit that is used to calculate the temperature and make any adjustments to maintain the optimum passenger compartment comfort. The In-Car Temperature Sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged.

WHEN MONITORED

SET CONDITION

- This DTC will set when the In-Car Temperature Sensor signal to the HVAC Module is greater than 4.9 volts for a continuous period of 1200 milliseconds or more.

DEFAULT ACTION

- If the HVAC Module detects a valid signal, the DTC will change from active to stored and will remain stored for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
IN-CAR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
IN-CAR TEMPERATURE SENSOR
HVAC MODULE

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

    Did the DTC return?

    Yes

    - Go To 2

    No

    - Go To 6
2. **CHECK IF THE IN-CAR TEMPERATURE SENSOR IS PROPERLY CONNECTED**
    1. Turn the ignition off.
    2. Check the connector to In-Car Temperature Sensor for proper connection and the terminals for damage or corrosion.

    Is the In-Car Temperature Sensor connector properly connected and terminals undamaged or corroded?

    Yes

    - Go To 3

No

- Repair connector and terminals as necessary.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

3. **CHECK THE (C36) IN-CAR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the A/C Heater Module C1 harness connector.
   3. Disconnect the In-Car Temperature Sensor harness connector.
   4. Ignition on, engine not running.
   5. Measure the voltage of the (C36) In-Car Temperature Sensor Signal circuit at the In-Car Temperature Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (C36) In-Car Temperature Sensor Signal circuit for a short to voltage.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 4

4. **CHECK THE (C36) IN-CAR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Measure the resistance of the (C36) In-Car Temperature Sensor Signal circuit between the HVAC Module C1 harness connector and the In-Car Temperature Sensor harness connector.

   Is the resistance above 1.0 Ohm?

   Yes

   - Repair the (C36) In-Car Temperature Sensor Signal circuit for an open or high resistance.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 5

5. **CHECK THE IN-CAR TEMPERATURE SENSOR**
   1. Remove the In-Car Temperature Sensor. Refer to **SENSOR, TEMPERATURE, IN-CAR, REMOVAL** .
   2. Measure the resistance of the In-Car Temperature Sensor and compare the resistance to the In-Car Temperature Sensor Resistance Chart in the Service Information. Refer to **SENSOR, TEMPERATURE, IN-CAR, DIAGNOSIS AND TESTING** .

   Is the In-Car Temperature Sensor within the specified limits of In-Car Temperature Sensor

Resistance Chart?

Yes

- Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Replace the In-Car Temperature Sensor in accordance to the Service Information. Refer to **SENSOR, TEMPERATURE, IN-CAR, INSTALLATION** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Wiggle the wiring and connectors while checking for shorted and open circuits.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

B11C2-13-FRONT MODE DOOR 1 CONTROL CIRCUIT - OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

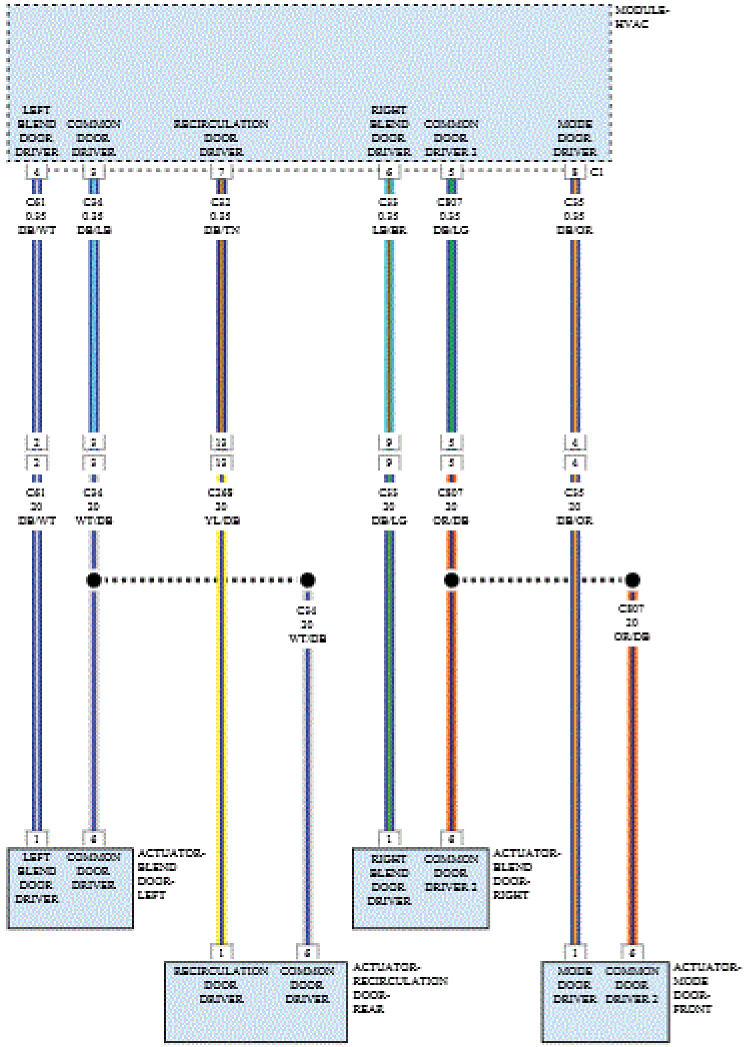

Fig. 9: HVAC Module - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

After the initial installation of the HVAC Module, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The HVAC Module drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present. For further information, refer to **DESCRIPTION** .

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following condition is met:

- Ignition on.

Set Conditions:

- The HVAC Module detects an open in the Mode Door control circuit.

Default Actions:

- If the HVAC Module detects a valid current draw, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
MODE DOOR DRIVER CIRCUIT OPEN
COMMON DOOR DRIVER 2 CIRCUIT OPEN
MODE DOOR ACTUATOR
HVAC MODULE

Always perform the HVAC PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

    Did the DTC return?

    Yes

    - Go To 3

    No

    - Go To 2
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. With the scan tool, perform the HVAC ACTUATOR CALIBRATION TEST.

    Did this DTC change from Stored to Active while performing the HVAC ACTUATOR CALIBRATION TEST?

    Yes

    - Go To 3

    No

    - Go To 6

3. **CHECK THE (C35/C66) MODE DOOR DRIVER CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the HVAC Module C1 harness connector.
   3. Disconnect the Mode Door Actuator harness connector.
   4. Measure the resistance of the (C35/C66) Mode Door Driver circuit between the HVAC Module C1 harness connector and the Mode Door Actuator harness connector.

      Is the resistance above 1.0 Ohm?

      Yes

      - Repair the (C35/C66) Mode Door Driver circuit for an open or high resistance.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4
4. **CHECK THE (C807/C266) COMMON DOOR DRIVER 2 CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (C807/C266) Common Door Driver 2 circuit between the HVAC Module C1 harness connector and the Mode Door Actuator harness connector.

      Is the resistance above 1.0 Ohm?

      Yes

      - Repair the (C807/C266) Common Door Driver 2 circuit for an open or high resistance.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 5
5. **CHECK THE MODE DOOR ACTUATOR**
   1. Replace the Mode Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, MODE DOOR, REMOVAL** .
   2. With the scan tool, erase HVAC DTCs and perform the HVAC ACTUATOR CALIBRATION TEST.

      Did this DTC reset?

      Yes

      - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

B11C2-92-FRONT MODE DOOR 1 CONTROL - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

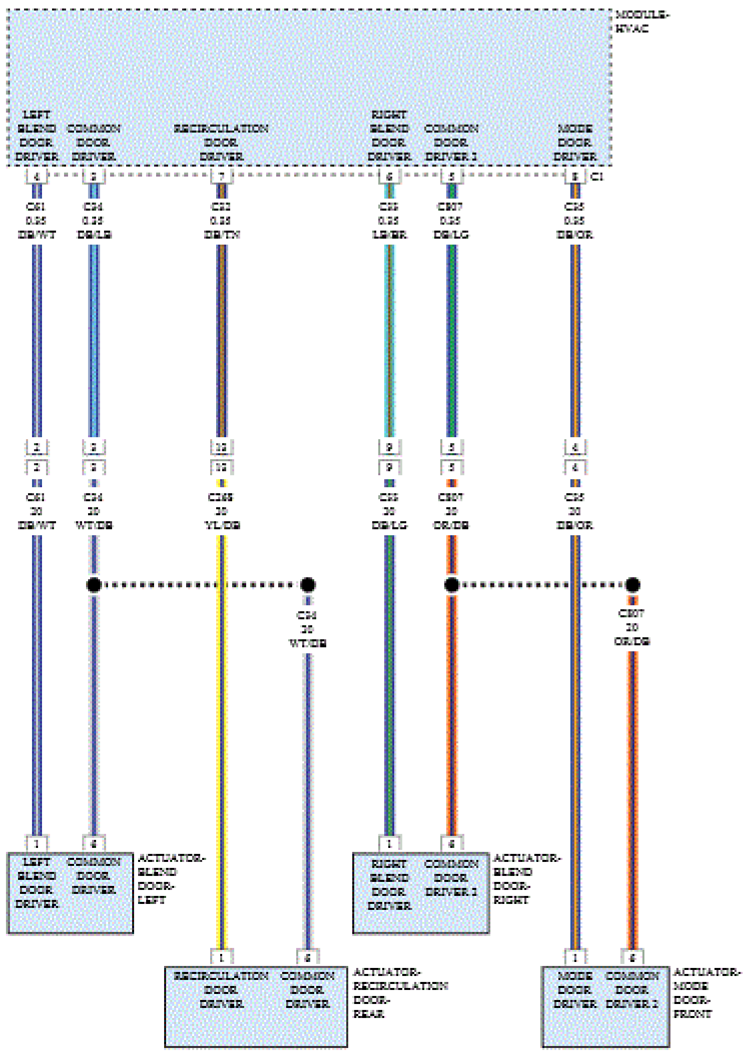

Fig. 10: HVAC Module - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

After the initial installation of the HVAC Module, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The HVAC Module drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present. For further information, refer to DESCRIPTION .

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following condition is met:

- Ignition on.

Set Conditions:

- The HVAC Module detects no feedback pulses on the Mode Door Control circuits for 15 seconds or more.

Default Actions:

- If the HVAC Module detects a valid feedback pulse, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
MODE DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
MODE DOOR DRIVER CIRCUIT SHORTED TO GROUND
MODE DOOR COMMON 2 DRIVER CIRCUIT SHORTED TO VOLTAGE
MODE DOOR COMMON 2 DRIVER CIRCUIT SHORTED TO GROUND
MODE DOOR BINDING
MODE DOOR ACTUATOR
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

    Did the DTC return?

    Yes

    - Go To 2

    No

    - Go To 9
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. With the scan tool, perform the HVAC ACTUATOR CALIBRATION TEST.

    Did any other HVAC DTCs set while performing the ACTUATOR CALIBRATION TEST?

    Yes

    - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

No

- Go To 3

3. **CHECK THE (C35/C66) MODE DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the HVAC Module C1 harness connector.
    3. Disconnect the Mode Door Actuator harness connector.
    4. Ignition on, engine not running.
    5. Measure the voltage of the (C35/C66) Mode Door Driver circuit at the Mode Door Actuator harness connector.

    Is there any voltage present?

    Yes

    - Repair the (C35/C66) Mode Door Driver circuit for a short to voltage.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 4

4. **CHECK THE (C807/C266) MODE DOOR COMMON 2 DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Measure the voltage of the (C807/C266) Mode Door Common 2 Driver circuit at the Mode Door Actuator harness connector.

    Is there any voltage present?

    Yes

    - Repair the (C807/C266) Mode Door Common 2 Driver circuit for a short to voltage.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 5

5. **CHECK THE (C35/C66) MODE DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Check for continuity between ground and the (C35/C66) Mode Door Driver circuit at the Mode Door Actuator harness connector.

    Is there continuity between ground and the (C35/C66) Mode Door Driver circuit?

    Yes

    - Repair the (C35/C66) Mode Door Driver circuit for a short to ground.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 6

6. **CHECK THE (C807/C266) COMMON 2 DRIVER CIRCUIT FOR A SHORT TO GROUND**
    1. Check for continuity between ground and the (C807/C266) Common 2 Driver circuit at the Mode Door Actuator harness connector.

       Is there continuity between ground and the (C807/C266) Common 2 Driver circuit?

       Yes

       - Repair the (C807/C266) Common 2 Driver circuit for a short to ground.
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 7
7. **CHECK THE MODE DOOR**
    1. Remove the Mode Door Actuator and check the Mode Door for binding and full travel. Refer to **ACTUATOR, MODE DOOR, REMOVAL** .

       Were any problems found?

       Yes

       - Repair or replace the Mode Door as necessary in accordance with the Service Information. Refer to **HOUSING, HVAC, REMOVAL** .
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 8
8. **CHECK THE MODE DOOR ACTUATOR**
    1. Replace the Mode Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, MODE DOOR, REMOVAL** .
    2. Using the scan tool, erase HVAC DTCs and perform the HVAC ACTUATOR CALIBRATION TEST.

       Did this DTC reset?

       Yes

       - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

- Test complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

9. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. Using the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Wiggle the wiring and connectors while checking for shorted and open circuits.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

B11C3-00-FRONT MODE DOOR 1 TRAVEL RANGE TOO SMALL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

After the initial installation of the HVAC Module, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The HVAC Module drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present. For further information, refer to **ACTUATOR, MODE DOOR, OPERATION** .

WHEN MONITORED

- When ever an Actuator Calibration Test is performed.

SET CONDITION

- The HVAC Module uses a pulse feedback to the controller to detect the total door movement range. If the amount of pulses required to move the door completely in both directions is less than what the controller has stored in its memory, this DTC will set.

DEFAULT ACTION

- If an Actuator Calibration Test is performed and the HVAC Module detects a valid range of the door

movement span in both directions, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
MODE DOOR BINDING
MODE DOOR ACTUATOR
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. Ignition on.
    2. With the scan tool, read HVAC DTCs.

       Are there any Door Control Circuit Open, Performance, or Short to Ground or Voltage DTCs present?

       Yes

       - Repair the HVAC DTCs.

         Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

       No

       - Go To 2
2. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

       Did the DTC return?

       Yes

       - Go To 4

       No

- Go To 3

3. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. With the scan tool, perform the HVAC ACTUATOR CALIBRATION TEST.

       Did this DTC change from Stored to Active while performing the HVAC ACTUATOR CALIBRATION TEST?

       Yes

       - Go To 4

       No

       - Go To 6

4. **CHECK THE MODE DOOR**
    1. Remove the Mode Door Actuator and check the Mode Door for binding and full travel. Refer to **ACTUATOR, MODE DOOR, REMOVAL** .

       Were any problems found?

       Yes

       - Repair or replace the Mode Door as necessary in accordance with the Service Information. Refer to **HOUSING, HVAC, REMOVAL** .
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 5

5. **CHECK THE MODE DOOR ACTUATOR**
    1. Replace the Mode Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, MODE DOOR, REMOVAL** .
    2. With the scan tool, erase HVAC DTCs.
    3. With the scan tool, perform the HVAC ACTUATOR CALIBRATION TEST.

       Did this DTC reset during HVAC Actuator Calibration Test?

       Yes

       - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Test complete.

6. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.

2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following condition is met:

- Ignition on.

Set Conditions:

- The HVAC Module detects an open in the Passenger Blend Door control circuit.

Default Actions:

- If the HVAC Module detects a valid current draw, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
RIGHT BLEND DOOR DRIVER CIRCUIT OPEN
COMMON DOOR DRIVER 2 CIRCUIT OPEN
RIGHT BLEND DOOR ACTUATOR
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

    Did the DTC return?

    Yes

    - Go To 3

No

- Go To 2

2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. With the scan tool, perform the HVAC Actuator Calibration Test.

    Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

    Yes

    - Go To 3

    No

    - Go To 6

3. **CHECK THE (C33/52) RIGHT BLEND DOOR DRIVER CIRCUIT FOR AN OPEN**
    1. Turn the ignition off.
    2. Disconnect the HVAC Module C1 harness connector.
    3. Disconnect the Right Blend Door Actuator harness connector.
    4. Measure the resistance of the (C33/52) Right Blend Door Driver circuit between the HVAC Module C1 harness connector and the Right Blend Door Actuator harness connector.

    Is the resistance above 1.0 Ohm?

    Yes

    - Repair the (C33/52) Right Blend Door Driver circuit for an open or high resistance.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 4

4. **CHECK THE (C807/252) COMMON DOOR DRIVER 2 CIRCUIT FOR AN OPEN**
    1. Measure the resistance of the (C807/252) Common Door Driver 2 circuit between the HVAC Module C1 harness connector and the Right Blend Door Actuator harness connector.

    Is the resistance above 1.0 Ohm?

    Yes

    - Repair the (C807/252) Common Door Driver 2 circuit for an open or high resistance.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 5

5. **CHECK THE RIGHT BLEND DOOR ACTUATOR**

1. Replace the Right Blend Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, BLEND DOOR, REMOVAL** .
2. With the scan tool, erase HVAC DTCs and perform the HVAC ACTUATOR CALIBRATION TEST.

   Did this DTC reset?

   Yes

   - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

      Were any problems found?

      Yes

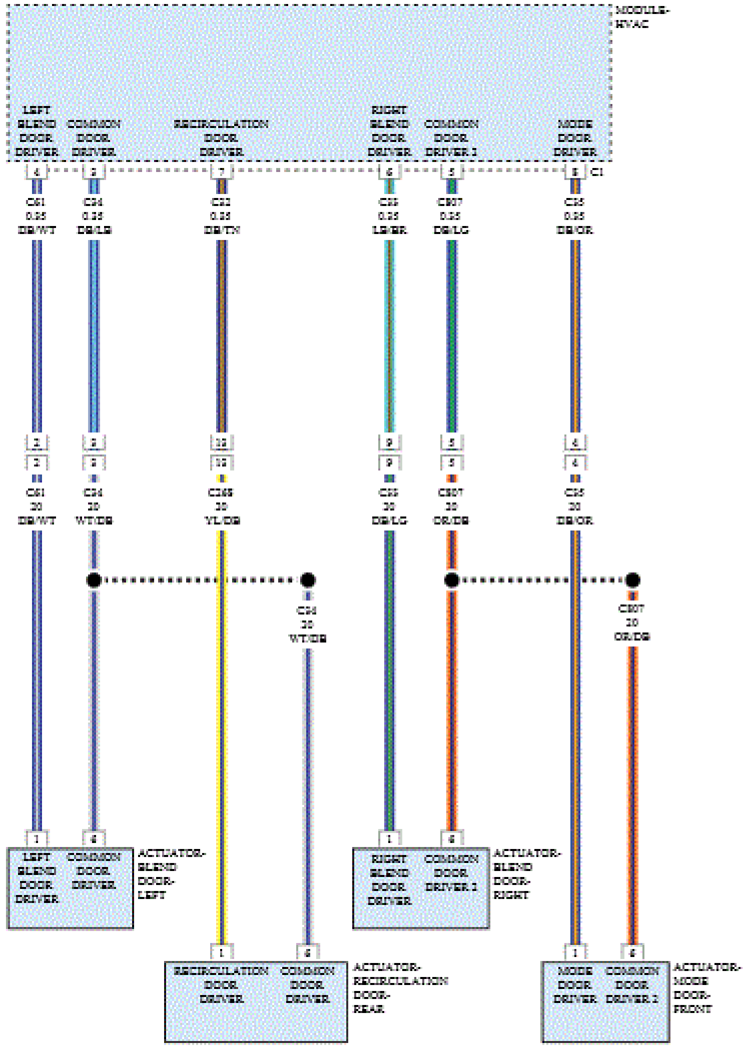
      - Repair as necessary.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

B11C8-92-RIGHT TEMPERATURE DOOR CONTROL - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .



[Fig. 12: HVAC Module - Circuit Diagram](#)
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

After the initial installation of the HVAC Module, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The HVAC Module drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present. For further information, refer to **DESCRIPTION** .

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following condition is met:

- Ignition on.

Set Conditions:

- The HVAC Module detects no feedback pulses on the Right Blend Door Driver circuits for 15 seconds or more.

Default Actions:

- If the HVAC Module detects a valid feedback pulse, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
RIGHT BLEND DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
RIGHT BLEND DOOR DRIVER CIRCUIT SHORTED TO GROUND
COMMON DOOR DRIVER 2 CIRCUIT SHORTED TO VOLTAGE
COMMON DOOR DRIVER 2 CIRCUIT SHORTED TO GROUND
RIGHT BLEND DOOR BINDING
RIGHT BLEND DOOR ACTUATOR
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. With the scan tool, read HVAC DTCs and record on the repair order.
   2. Record the Environmental Data.
   3. With the scan tool, erase DTCs.
   4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
   5. With the scan tool, read HVAC DTCs.

      Did the DTC return?

      Yes

      - Go To 2

      No

      - Go To 9
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
   1. With the scan tool, perform the HVAC Actuator Calibration Test.

      Did any other HVAC DTCs set while performing the Actuator Calibration Test?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

No

- Go To 3

3. **CHECK THE (C33/52) RIGHT BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the HVAC Module C1 harness connector.
    3. Disconnect the Right Blend Door Actuator harness connector.
    4. Turn the ignition on.
    5. Measure the voltage of the (C33/52) Right Blend Door Driver circuit at the Passenger Blend Door Actuator harness connector.

    Is there any voltage present?

    Yes

    - Repair the (C33/52) Right Blend Door Driver circuit for a short to voltage.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 4

4. **CHECK THE (C807/252) COMMON DOOR DRIVER 2 CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Measure the voltage of the (C807/252) Common Door Driver 2 circuit at the Right Blend Door Actuator harness connector.

    Is there any voltage present?

    Yes

    - Repair the (C807/252) Common Door Driver 2 circuit for a short to voltage.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 5

5. **CHECK THE (C33/52) RIGHT BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Check for continuity between ground and the (C33/52) Right Blend Door Driver circuit at the Right Blend Door Actuator harness connector.

    Is there continuity between ground and the (C33/52) Right Blend Door Driver circuit?

    Yes

- Repair the (C33/52) Right Blend Door Driver circuit for a short to ground.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 6

6. **CHECK THE (C807/252) COMMON DOOR DRIVER 2 CIRCUIT FOR A SHORT TO GROUND**
    1. Check for continuity between ground and the (C807/252) Common Door Driver 2 circuit at the Right Blend Door Actuator harness connector.

    Is there continuity between ground and the (C807/252) Common Door Driver 2 circuit?

    Yes

    - Repair the (C807/252) Common Door Driver 2 circuit for a short to ground.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 7

7. **CHECK THE RIGHT BLEND DOOR**
    1. Remove the Right Blend Door Actuator and check the Right Blend Door for binding and full travel. Refer to **ACTUATOR, BLEND DOOR, REMOVAL** .

    Were any problems found?

    Yes

    - Repair or replace the Right Blend Door as necessary in accordance with the Service Information. Refer to **HOUSING, HVAC, REMOVAL** .
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 8

8. **CHECK THE RIGHT BLEND DOOR ACTUATOR**
    1. Replace the Right Blend Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, BLEND DOOR, REMOVAL** .
    2. With the scan tool, erase HVAC DTCs and perform the HVAC ACTUATOR CALIBRATION TEST.

    Did this DTC reset?

    Yes

    - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

9. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Wiggle the wiring and connectors while checking for shorted and open circuits.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

B11C9-00-RIGHT TEMPERATURE DOOR TRAVEL TOO SMALL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

After the initial installation of the HVAC Module, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The HVAC Module drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present.     - Test complete.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**

1. The conditions necessary to set the DTC are not present at this time.
2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were there any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11CA-00-RIGHT TEMPERATURE DOOR TRAVEL TOO LARGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

After the initial installation of the HVAC Module, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The HVAC Module drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present. For further information, refer to **DESCRIPTION** .

WHEN MONITORED

- When ever an Actuator Calibration Test is performed.

SET CONDITION

- The HVAC Module uses a pulse feedback to the controller to detect the total door movement range. If the amount of pulses required to move the door completely in both directions is greater than what the controller has stored in its memory, this DTC will set.

DEFAULT ACTION

- If an Actuator Calibration Test is performed or during normal operation and the HVAC Module detects a valid range of the door movement span in both directions, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
RIGHT BLEND DOOR STOPS
RIGHT BLEND DOOR
RIGHT BLEND DOOR ACTUATOR
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. Turn the ignition on.
    2. With the scan tool, read HVAC DTCs.

        Are there any Door Control Circuit Open, Performance, or Short to Ground or Voltage DTCs present?

        Yes

        - Repair the HVAC DTCs in accordance with the service information.

          Refer to **DIAGNOSTIC CODE INDEX** .

        No

        - Go To 2
2. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

        Did the DTC return?

        Yes

        - Go To 4

        No

        - Go To 3
3. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. With the scan tool, perform the HVAC Actuator Calibration Test.

Did this DTC change from Stored to Active while performing the HVAC System Test?

Yes

- Go To 4

No

- Go To 6

4. **CHECK THE RIGHT BLEND DOOR**
    1. Remove the Right Blend Door Actuator and check the Right Blend Door stops, linkage (stripped or cracked) and door. Refer to **ACTUATOR, BLEND DOOR, REMOVAL** .

       Were any problems found?

       Yes

       - Repair or replace the Right Blend Door as necessary in accordance with the Service Information. Refer to **HOUSING, HVAC, REMOVAL** .
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 5
5. **CHECK THE RIGHT BLEND DOOR ACTUATOR**
    1. Replace the Right Blend Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, BLEND DOOR, REMOVAL** .
    2. With the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

       Did this DTC reset?

       Yes

       - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Test complete.
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
6. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.

4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11CB-13-MAIN/LEFT TEMPERATURE DOOR CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

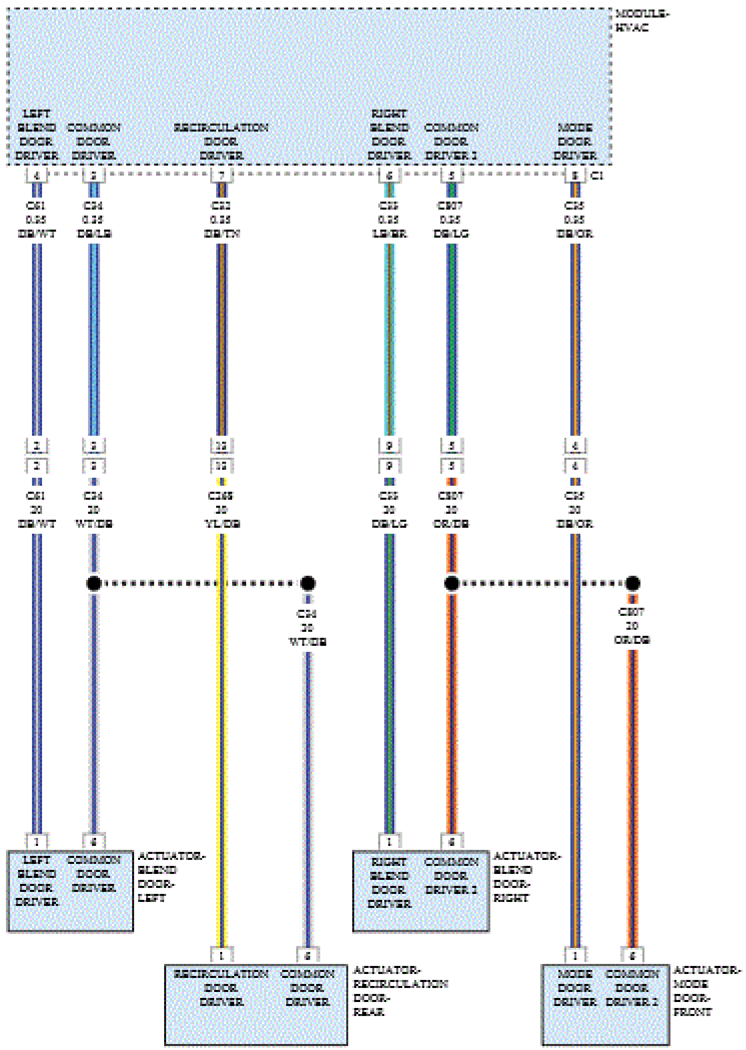

Fig. 13: HVAC Module - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

After the initial installation of the HVAC Module, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The HVAC Module drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present. For further information, refer to **DESCRIPTION** .

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following condition is met:

- Ignition on.

Set Conditions:

- The HVAC Module detects an open in the Left Blend Door control circuit.

Default Actions:

- If the HVAC Module detects a valid current draw, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
LEFT BLEND DOOR DRIVER CIRCUIT OPEN
COMMON DOOR DRIVER CIRCUIT OPEN
LEFT BLEND DOOR ACTUATOR
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

    Did the DTC return?

    Yes

    - Go To 3

No

- Go To 2

2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. With the scan tool, perform the HVAC ACTUATOR CALIBRATION TEST.

       Did this DTC change from Stored to Active while performing the HVAC ACTUATOR CALIBRATION TEST?

       Yes

       - Go To 3

       No

       - Go To 6

3. **CHECK THE (C61/C55) LEFT BLEND DOOR DRIVER CIRCUIT FOR AN OPEN**
    1. Turn the ignition off.
    2. Disconnect the HVAC Module C1 harness connector.
    3. Disconnect the Left Blend Door Actuator harness connector.
    4. Measure the resistance of the (C61/C55) Left Blend Door Driver circuit between the HVAC Module C1 harness connector and the Left Blend Door Actuator harness connector.

       Is the resistance above 1.0 Ohm?

       Yes

       - Repair the (C61/C55) Left Blend Door Driver circuit for an open or high resistance.
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 4

4. **CHECK THE (C34/C255) COMMON DOOR DRIVER CIRCUIT FOR AN OPEN**
    1. Measure the resistance of the (C34/C255) Common Door Driver circuit between the HVAC Module C1 harness connector and the Left Blend Door Actuator harness connector.

       Is the resistance above 1.0 Ohm?

       Yes

       - Repair the (C34/C255) Common Door Driver circuit for an open or high resistance.
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 5

5. **CHECK THE LEFT BLEND DOOR ACTUATOR**

1. Replace the Left Blend Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, BLEND DOOR, REMOVAL** .
2. With the scan tool, erase HVAC DTCs and perform the HVAC ACTUATOR CALIBRATION TEST.

   Did this DTC reset?

   Yes

   - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

B11CB-92-MAIN/LEFT TEMPERATURE DOOR CONTROL - PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

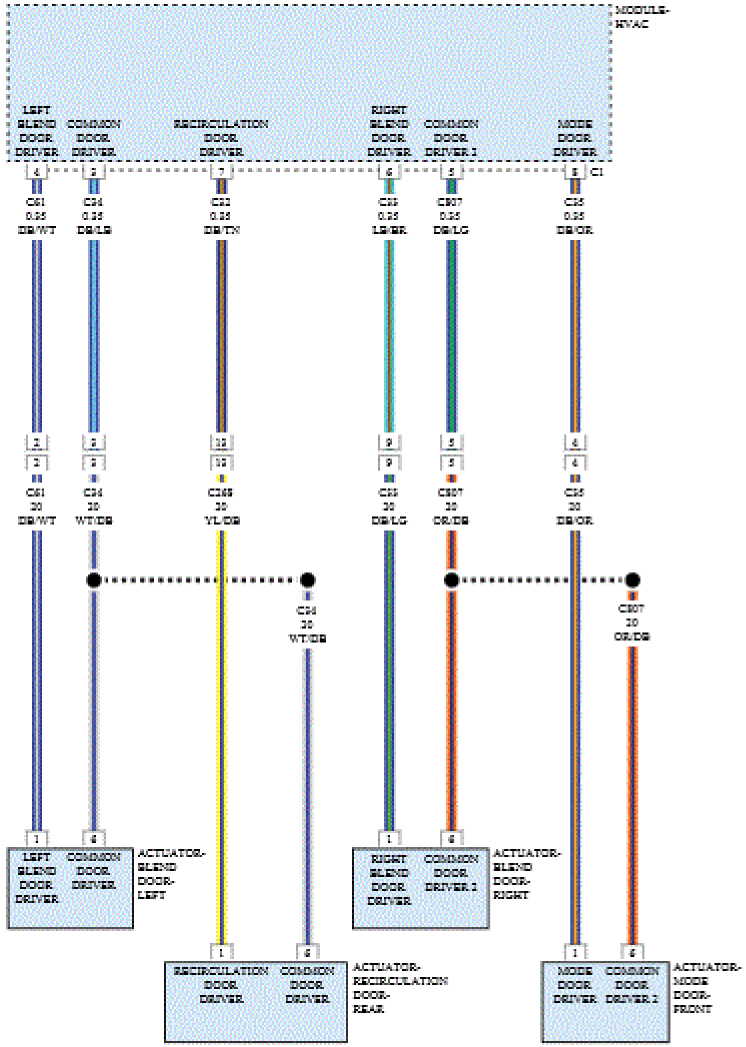

Fig. 14: HVAC Module - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

After the initial installation of the HVAC Module, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The HVAC Module drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present. For further information, refer to DESCRIPTION .

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following condition is met:

- Ignition on.

Set Conditions:

- The HVAC Module detects no feedback pulses on the Left Blend Door Driver circuits for 15 seconds or more.

Default Actions:

- If the HVAC Module detects a valid feedback pulse, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
LEFT BLEND DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
LEFT BLEND DOOR DRIVER CIRCUIT SHORTED TO GROUND
COMMON DOOR DRIVER CIRCUIT SHORTED TO VOLTAGE
COMMON DOOR DRIVER CIRCUIT SHORTED TO GROUND
LEFT BLEND DOOR BINDING
LEFT BLEND DOOR ACTUATOR
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

       Did the DTC return?

       Yes

       - Go To 2

       No

       - Go To 9
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. With the scan tool, perform the HVAC Actuator Calibration Test.

       Did any other HVAC DTCs set while performing the Actuator Calibration Test?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

No

- Go To 3

3. **CHECK THE (C61/C55) LEFT BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the HVAC Module C1 harness connector.
    3. Disconnect the Left Blend Door Actuator harness connector.
    4. Turn the ignition on.
    5. Measure the voltage of the (C61/C55) Left Blend Door Driver circuit at the Left Blend Door Actuator harness connector.

    Is there any voltage present?

    Yes

    - Repair the (C61/C55) Left Blend Door Driver circuit for a short to voltage.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 4
4. **CHECK THE (C34/C255) COMMON DOOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Measure the voltage of the (C34/C255) Common Door Driver circuit at the Left Blend Door Actuator harness connector.

    Is there any voltage present?

    Yes

    - Repair the (C34/C255) Common Door Driver circuit for a short to voltage.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 5
5. **CHECK THE (C61/C55) LEFT BLEND DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Check for continuity between ground and the (C61/C55) Left Blend Door Driver circuit at the Left Blend Door Actuator harness connector.

    Is there continuity between ground and the (C61/C55) Left Blend Door Driver circuit?

    Yes

    - Repair the (C61/C55) Left Blend Door Driver circuit for a short to ground.

- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 6

6. **CHECK THE (C34/C255) COMMON DOOR DRIVER CIRCUIT FOR A SHORT TO GROUND**
    1. Check for continuity between ground and the (C34/C255) Common Door Driver circuit at the Left Blend Door Actuator harness connector.

       Is there continuity between ground and the (C34/C255) Common Door Driver circuit?

       Yes

       - Repair the (C34/C255) Common Driver circuit for a short to ground.
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 7

7. **CHECK THE LEFT BLEND DOOR**
    1. Remove the Left Blend Door Actuator and check the Left Blend Door for binding and full travel. Refer to **ACTUATOR, BLEND DOOR, REMOVAL** .

       Were any problems found?

       Yes

       - Repair or replace the Left Blend Door as necessary in accordance with the Service Information. Refer to **ACTUATOR, BLEND DOOR, REMOVAL** .
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 8

8. **CHECK THE LEFT BLEND DOOR ACTUATOR**
    1. Replace the Left Blend Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, BLEND DOOR, REMOVAL** .
    2. With the scan tool, erase HVAC DTCs and perform the HVAC ACTUATOR CALIBRATION TEST.

       Did this DTC reset?

       Yes

       - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

9. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Wiggle the wiring and connectors while checking for shorted and open circuits.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

B11CC-00-MAIN/LEFT TEMPERATURE DOOR TRAVEL TOO SMALL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

After the initial installation of the HVAC Module, the controller is calibrated to each individual blend/mode door actuator. These calibrations are stored as in the number of pulses it takes to move the door from one stop to another. The HVAC Module drives the Door Actuators by the use of Door Driver circuit and a Common Door Driver circuit and monitors all door actuator pulses to detect door movement in both directions. Most of the door actuators share a common door driver circuit but each door actuator has its own unique driver circuit. Due to shared circuitry, similar Diagnostic Trouble Codes (DTCs) can set at the same time for multiple actuators depending upon the type of circuit malfunction, its location, and the direction the actuator is moving when the malfunction is present. For further information, refer to **DESCRIPTION** .

WHEN MONITORED

- When ever an Actuator Calibration Test is performed.

SET CONDITION

- The HVAC Module uses a pulse feedback to the controller to detect the total door movement range. If the amount of pulses required to move the door completely in both directions is less than what the controller has stored in its memory, this DTC will set.

DEFAULT ACTION

- If an Actuator Calibration Test is performed and the HVAC Module detects a valid range of the door movement span in both directions, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

POSSIBLE CAUSES

Possible Causes
RELATED DTCS PRESENT
LEFT BLEND DOOR BINDING
LEFT BLEND DOOR ACTUATOR
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR RELATED DTCS**
    1. Turn the ignition on.
    2. With the scan tool, read HVAC DTCs.

    Are there any Door Control Circuit Open, Performance, or Short to Ground or Voltage DTCs present?

    Yes

    - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

    No

    - Go To 2
2. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

    Did the DTC return?

    Yes

    - Go To 4

    No

    - Go To 3

3. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. With the scan tool, perform the HVAC ACTUATOR CALIBRATION TEST.

       Did this DTC change from Stored to Active while performing the HVAC ACTUATOR CALIBRATION TEST?

       Yes

       - Go To 4

       No

       - Go To 6
4. **CHECK THE LEFT BLEND DOOR**
    1. Remove the Left Blend Door Actuator and check the Left Blend Door for binding and full travel. Refer to **ACTUATOR, BLEND DOOR, REMOVAL** .

       Were any problems found?

       Yes

       - Repair or replace the Left Blend Door as necessary in accordance with the Service Information. Refer to **HOUSING, HVAC, REMOVAL** .
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 5
5. **CHECK THE LEFT BLEND DOOR ACTUATOR**
    1. Replace the Left Blend Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, BLEND DOOR, REMOVAL** .
    2. With the scan tool, erase HVAC DTCs.
    3. With the scan tool, perform the HVAC ACTUATOR CALIBRATION TEST.

       Did this DTC reset?

       Yes

       - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Test complete.
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
6. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.

2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

    No

    - Go To 5
5. **CHECK THE LEFT BLEND DOOR ACTUATOR**
    1. Replace the Left Blend Door Actuator in accordance with the Service Information. Refer to **ACTUATOR, BLEND DOOR, REMOVAL** .
    2. With the scan tool, erase HVAC DTCs and perform the HVAC Actuator Calibration Test.

    Did this DTC reset?

    Yes

    - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
6. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Wiggle the wiring and connectors while checking for shorted and open circuits.

    Were there any problems found?

    Yes

- Repair as necessary.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

B11D3-00-A/C COOLDOWN TEST PERFORMANCE - COMPRESSOR NOT ENGAGED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

- Whenever an A/C Cooldown Test is performed.

SET CONDITION

- The HVAC Module receives a BUS message from the Powertrain Control Module (PCM) that the compressor is not engaged when it is requested.

POSSIBLE CAUSES

Possible Causes
LOSS OF COMMUNICATION WITH THE PCM OR MULTIPLE BUS PROBLEMS
PCM A/C COMPRESSOR DTCS
A/C SYSTEM LEAK
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR ACTIVE BUS COMMUNICATION DTCS**
    1. Turn the ignition on.
    2. With the scan tool, read BCM DTCs and record on the repair order.

    Are there any Active BUS Communication DTCs present?

    Yes

    - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

    No

    - Go To 2
2. **CHECK FOR STORED BUS COMMUNICATION DTCS**
    1. Turn the ignition on.
    2. With the scan tool, read DTCs.

Are there any inactive or stored BUS Communication DTCs present?

Yes

- Refer to **STORED LOST COMMUNICATION DTCS** and perform the Stored Lost Communication DTCs diagnostic procedure.

No

- Go To 3

3. **CHECK FOR PCM A/C COMPRESSOR DTCS**
    1. Turn the ignition on.
    2. With the scan tool, read PCM DTCs and record on the repair order.

    Are there any PCM A/C Compressor DTCs present?

    Yes

    - Refer to **DTC INDEX** and perform the appropriate diagnostic procedure.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Go To 4
4. **CHECK THE A/C COMPRESSOR**
    1. Start the Engine.
    2. Using the A/C heater Control, request A/C maximum cool.

    Does the A/C Compressor Clutch engage?

    Yes

    - Go To 5

    No

    - Diagnose and repair the A/C Compressor in accordance with the service information.

      Refer to **COMPRESSOR, A/C, DIAGNOSIS AND TESTING** .
5. **CHECK IF THE DTC RESETS**
    1. Turn the ignition off.
    2. Turn the ignition on.
    3. With the scan tool, erase HVAC DTCs.
    4. Turn the ignition off.
    5. Turn the ignition on.
    6. With the scan tool, perform the A/C Cooldown Test. Follow the instructions on the scan tool.

7. With the scan tool, read HVAC DTCs.

   Does this DTC reset?

   Yes

   - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 6

6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

      Were there any problems found?

      Yes

      - Repair as necessary.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

B11D5-00-A/C COOLDOWN TEST PERFORMANCE - EVAP TEMP SENSOR ERROR

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Evaporator Temperature Sensor is a variable resistor that changes in conjunction with temperature, or otherwise known as a thermistor. The Evaporator Temperature Sensor is located in the HVAC housing downstream of the A/C evaporator. The HVAC Module monitors the evaporator temperature by monitoring the voltage change of the Evaporator Temperature Sensor Signal circuit. If the monitored voltage drops below or rises above a predetermined voltage, a Diagnostic Trouble Code (DTC) will set. For further information, refer to **SENSOR, EVAPORATOR TEMPERATURE, OPERATION** .

WHEN MONITORED

- Whenever an A/C Cooldown Test is performed.

SET CONDITION

- The HVAC Module detects a circuit malfunction with the Evaporator Temperature Sensor during a Cooldown Test.

POSSIBLE CAUSES

Possible Causes
EVAPORATOR TEMPERATURE SENSOR DTC PRESENT
EVAPORATOR TEMPERATURE SENSOR
HVAC CONTROL

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

       Did the DTC return?

       Yes

       - Go To 2

       No

       - Go To 4
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. With the scan tool, perform the HVAC Actuator Calibration Test.

       Did any other HVAC DTCs set while performing the Actuator Calibration Test?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

       No

       - Go To3
3. **CHECK THE EVAPORATOR TEMPERATURE SENSOR**
    1. Replace the Evaporator Temperature Sensor in Accordance with the Service Information. Refer to **SENSOR, EVAPORATOR TEMPERATURE, REMOVAL** .
    2. With the scan tool, erase HVAC DTCs.

3. Cycle the ignition off for 30 seconds then back on.
4. With the scan tool, perform an A/C Cooldown Test.
5. With the scan tool, read HVAC DTCs.

   Does this DTC reset?

   Yes

   - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

4. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were any problems found?

   Yes

   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11FE-11-VARIABLE A/C COMPRESSOR CONTROL - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

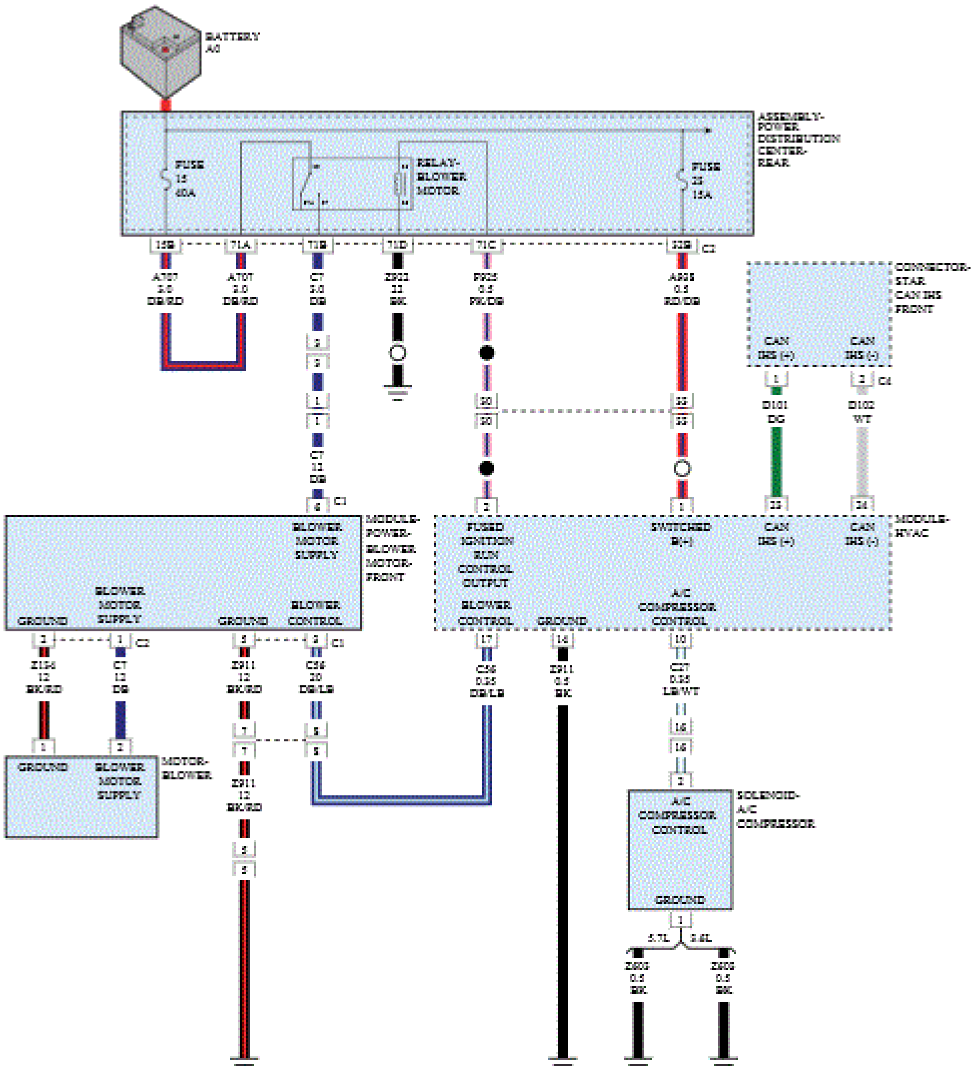

Fig. 15: HVAC Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following condition is met:

- Ignition on

Set Conditions:

- The HVAC Module detects a short to ground on the A/C compressor control circuit.

Default Actions:

- If the HVAC Module detects a valid current draw, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
A/C COMPRESSOR CONTROL CIRCUIT SHORTED TO GROUND

Possible Causes
A/C COMPRESSOR
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

    Did the DTC return?

    Yes

    - Go To 3

    No

    - Go To 2
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. With the scan tool, perform the HVAC Actuator Calibration Test.

    Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

    Yes

    - Go To 3

    No

    - Go To 5
3. **CHECK THE (C27) A/C CONTROL CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the HVAC Module C1 harness connector.
    3. Disconnect the A/C Compressor harness connector.
    4. Check for continuity between ground and the (C27) A/C Compressor control circuit at the A/C Compressor harness connector.

    Is there continuity between ground and the (C27) A/C Compressor control circuit?

Yes

- Repair the (C27) A/C Compressor control circuit for a short to ground.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 4

4. **CHECK THE A/C COMPRESSOR**
   1. Diagnose the A/C Compressor in accordance with the Service Information. Refer to **DIAGNOSIS AND TESTING** .
   2. With the scan tool, erase HVAC DTCs and perform the HVAC ACTUATOR CALIBRATION TEST.

   Did this DTC reset?

   Yes

   - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were any problems found?

   Yes

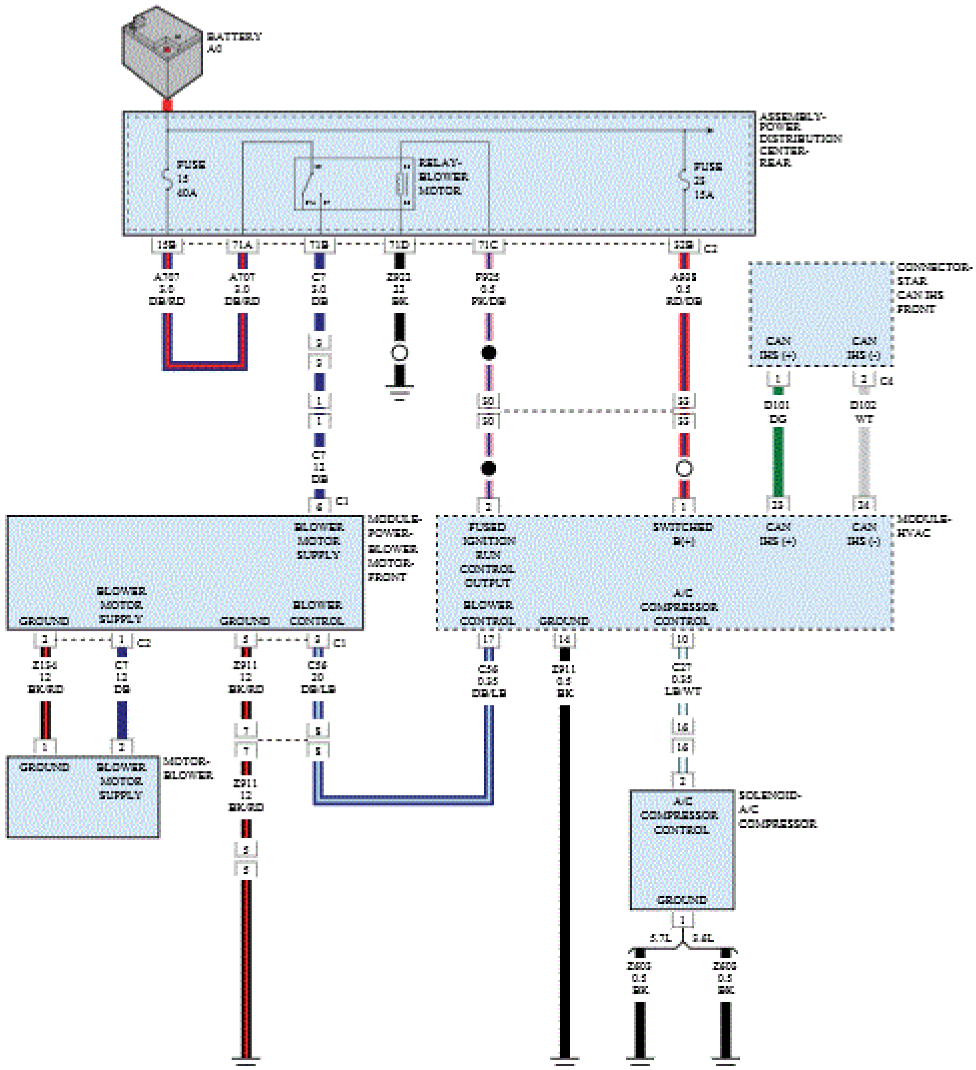
   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B11FE-12-VARIABLE A/C COMPRESSOR CONTROL - CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .



[Fig. 16: HVAC Module Circuit Diagram](#)
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following conditions are met:

- Ignition on.
- HVAC commanded on.

Set Conditions:

- The HVAC Module detects a short voltage on the A/C Compressor control circuit.

Default Actions:

- If the HVAC Module detects a valid voltage, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes

Possible Causes
A/C COMPRESSOR CONTROL CIRCUIT SHORTED TO VOLTAGE
A/C COMPRESSOR
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

       Did the DTC return?

       Yes

       - Go To 3

       No

       - Go To 2
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. With the scan tool, perform the HVAC Actuator Calibration Test.

       Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

       Yes

       - Go To 3

       No

       - Go To 5
3. **CHECK THE (C27) A/C COMPRESSOR CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the HVAC Module C1 harness connector.
    3. Disconnect the A/C Compressor harness connector.
    4. Turn the ignition on.
    5. Measure the voltage of the (C27) A/C Compressor control circuit at the A/C Compressor harness

connector.

Is there any voltage present?

Yes

- Repair the (C27) A/C Compressor control circuit for a short to voltage.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 4

4. **CHECK THE A/C COMPRESSOR**
    1. Diagnose the A/C Compressor in accordance with the Service Information. Refer to **DIAGNOSIS AND TESTING** .
    2. With the scan tool, erase HVAC DTCs and perform the HVAC ACTUATOR CALIBRATION TEST.

    Did this DTC reset?

    Yes

    - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
5. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Wiggle the wiring and connectors while checking for shorted and open circuits.

    Were any problems found?

    Yes

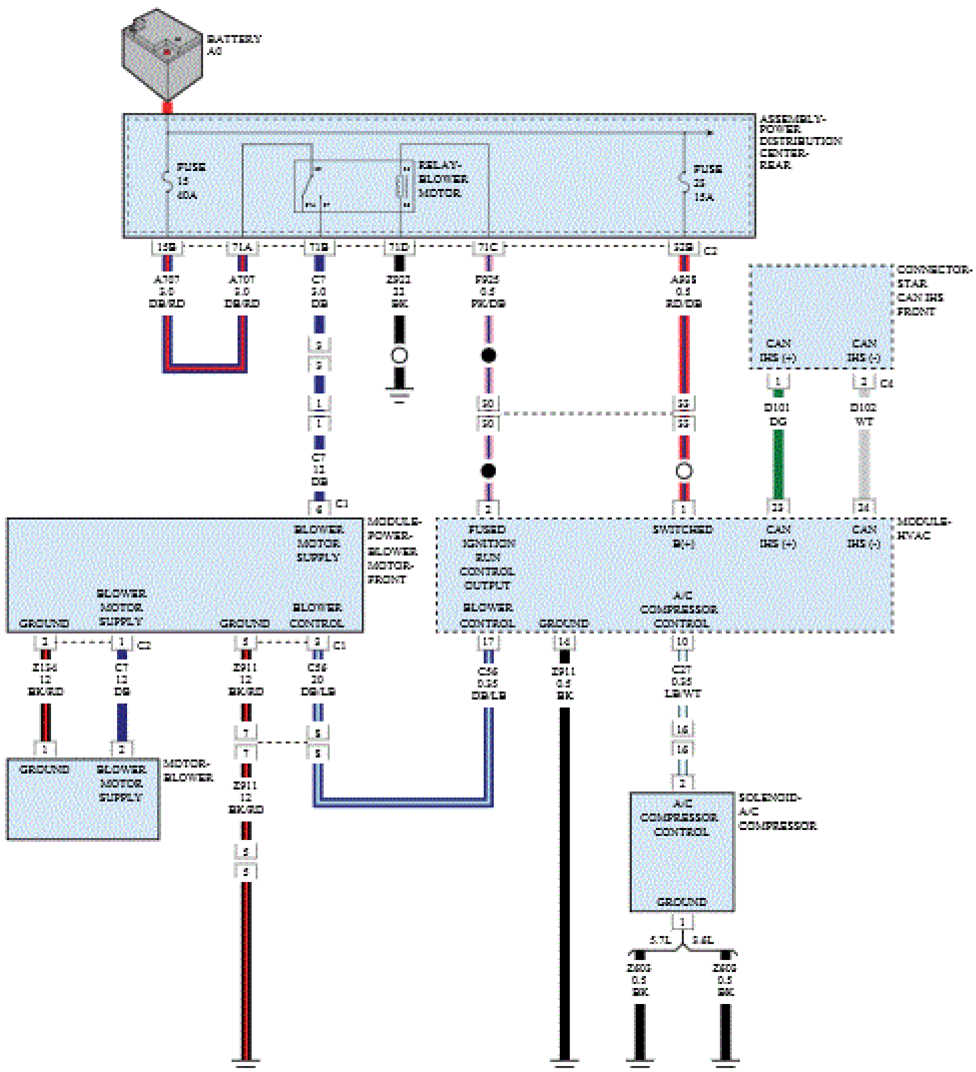
    - Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

B11FE-13-VARIABLE A/C COMPRESSOR CONTROL - CIRCUIT OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .



[Fig. 17: HVAC Module Circuit Diagram]()

Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following conditions are met:

- Ignition on.
- HVAC commanded off.

Set Conditions:

- The HVAC Module detects an open in the A/C Compressor control circuit.

Default Actions:

- If the HVAC Module detects a valid current draw, the DTC will change from Active to Stored and will stay in the controllers memory for 100 ignition cycles.

Possible Causes
A/C COMPRESSOR CONTROL CIRCUIT OPEN
A/C COMPRESSOR
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

       Did the DTC return?

       Yes

       - Go To 3

       No

       - Go To 2
2. **PERFORM HVAC ACTUATOR CALIBRATION TEST**
    1. With the scan tool, perform the HVAC Actuator Calibration Test.

       Did this DTC change from Stored to Active while performing the HVAC Actuator Calibration Test?

       Yes

       - Go To 3

       No

       - Go To 6
3. **CHECK THE (C27) A/C COMPRESSOR CONTROL CIRCUIT FOR AN OPEN**
    1. Turn the ignition off.
    2. Disconnect the HVAC Module C1 harness connector.
    3. Disconnect the A/C Compressor harness connector.

4. Measure the resistance of the (C27) A/C Compressor control circuit between the HVAC Module C1 harness connector and the A/C Compressor harness connector.

   Is the resistance above 1.0 Ohm?

   Yes

   - Repair the (C27) A/C Compressor control circuit for an open or high resistance.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 5

4. **CHECK THE (Z603) A/C COMPRESSOR SOLENOID GROUND CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (Z603) A/C Compressor Solenoid ground circuit between the HVAC Module harness connector and the A/C Compressor harness connector.

      Is the resistance below 3.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the (Z603) A/C Compressor Solenoid ground circuit for an open
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
5. **CHECK THE A/C COMPRESSOR**
   1. Diagnose the A/C Compressor in accordance with the Service Information. Refer to **DIAGNOSIS AND TESTING** .
   2. With the scan tool, erase HVAC DTCs and perform the HVAC ACTUATOR CALIBRATION TEST.

      Did this DTC reset?

      Yes

      - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
6. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC

was set.

3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
4. Wiggle the wiring and connectors while checking for shorted and open circuits.

Were any problems found?

Yes

- Repair as necessary.
- Perform the HVAC VERIFICATION TEST. Refer to STANDARD PROCEDURE.

No

- Test complete.

B1600-11-LEFT SOLAR SENSOR - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

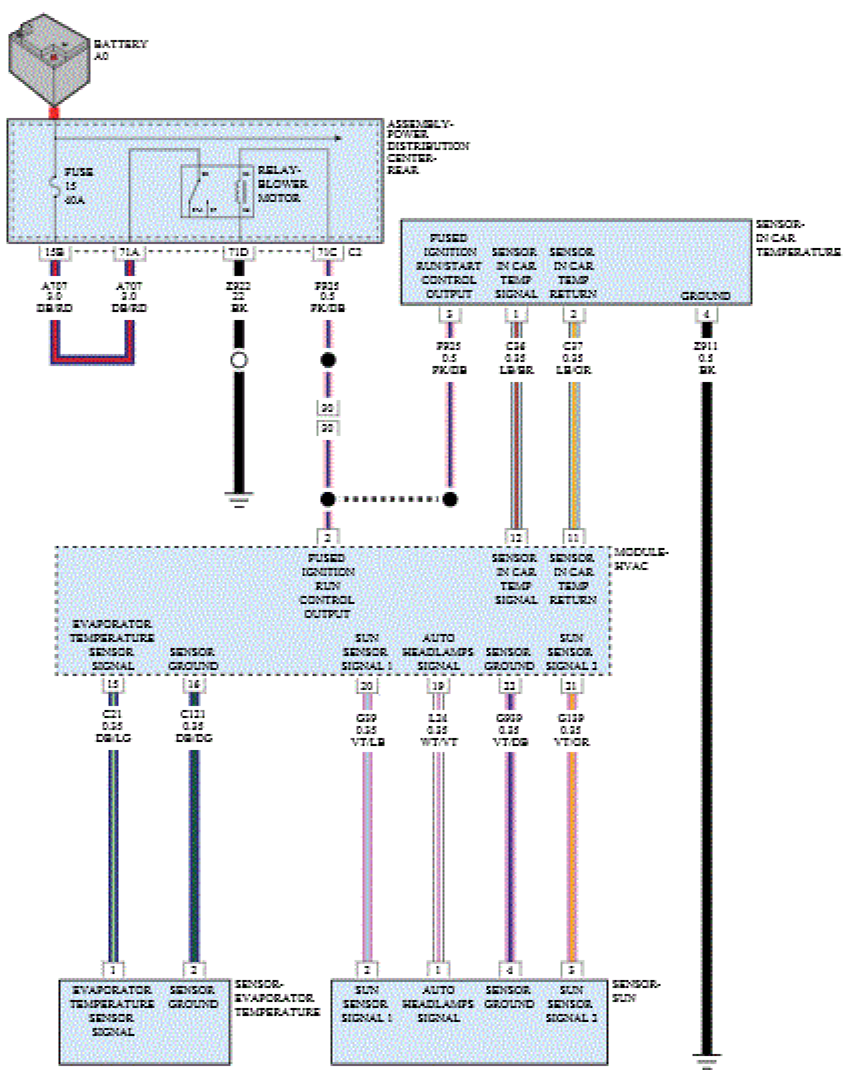


Fig. 18: HVAC Module - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The HVAC Module uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the HVAC Module to assure that they are in range. If those sensors fall out of predetermined ranges a Diagnostic Trouble Code (DTC) will set. For further information, refer to SENSOR, SUN, OPERATION .

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following condition is met:

- ignition on.

Set Conditions:

- If the HVAC Module detects on Sun Sensor Signal 1 circuit a voltage less than 0.5 volt for the period of two seconds or more.

Default Actions:

- This DTC has a de-maturing time of 20 msec. If the DTCs status changes from active to stored, the DTC will stay in memory for 100 ignition cycles.

Possible Causes
SUN SENSOR 1 SIGNAL CIRCUIT SHORTED TO GROUND
SUN SENSOR
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

    Did the DTC return?

    Yes

    - Go To 2

No

- Go To 4

2. **CHECK (G39) SUN SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the HVAC Module C1 harness connector.
   3. Disconnect the Sun Sensor harness connector.
   4. Check for continuity between ground and the (G39) Sun Sensor 1 Signal circuit at the Sun Sensor harness connector.

   Is there continuity between ground and the (G39) Sun Sensor 1 Signal circuit?

   Yes

   - Repair the (G39) Sun Sensor 1 Signal circuit for a short to ground.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE SUN SENSOR AND HVAC MODULE**
   1. Replace the Sun Sensor in accordance with the Service Information. Refer to **SENSOR, SUN, REMOVAL** .
   2. Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   Did this DTC reset while performing the HVAC Verification Test?

   Yes

   - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

4. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were any problems found?

Yes

- Repair as necessary.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

B1600-15-LEFT SOLAR SENSOR - CIRCUIT SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

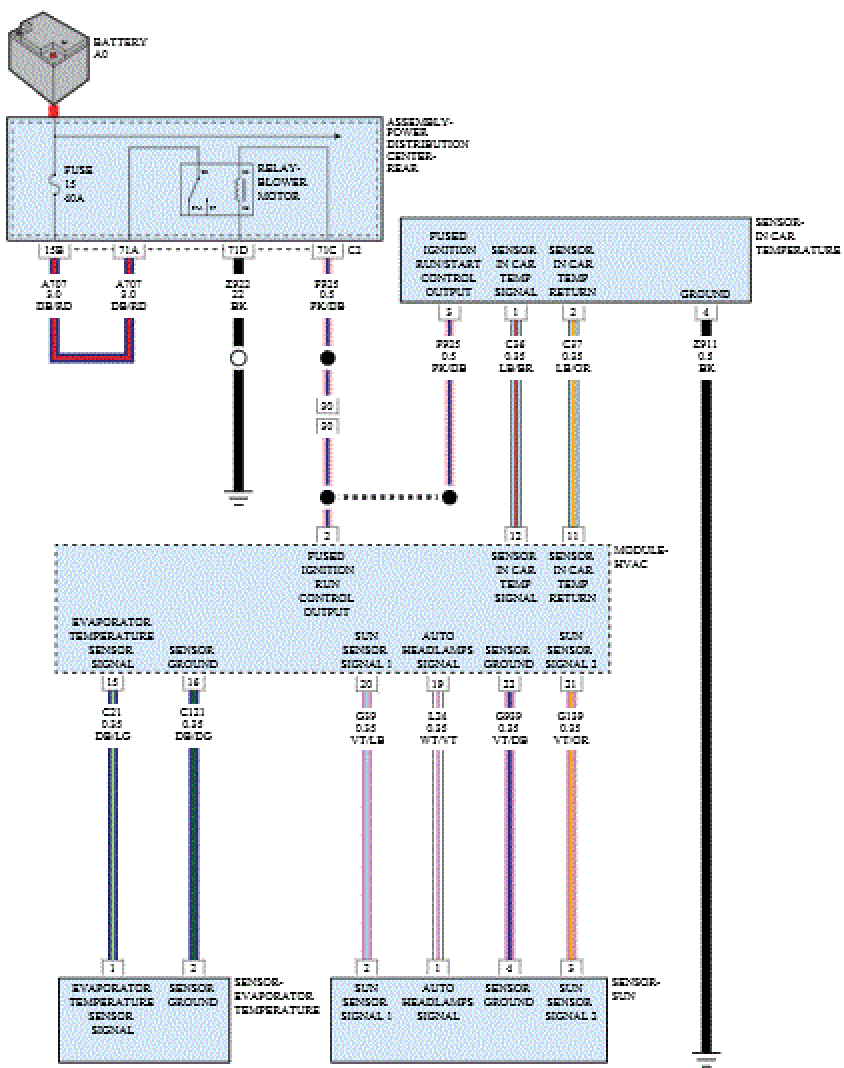

Fig. 19: HVAC Module - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The HVAC Module uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the HVAC Module to assure that they are in range. If those sensors fall

out of predetermined ranges a Diagnostic Trouble Code (DTC) will set. For further information, refer to **SENSOR, SUN, OPERATION** .

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following condition is met:

- Ignition on.

Set Conditions:

- If the HVAC Module detects on the Sun Sensor 1 Signal circuit a voltage greater than 4.8 volts for the period of two seconds or more.

Default Actions:

- This DTC has a de-maturing time of 20 msec. If the DTCs status changes from active to stored, the DTC will stay in memory for 100 ignition cycles.

Possible Causes
SUN SENSOR 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
SUN SENSOR 1 SIGNAL CIRCUIT OPEN
SUN SENSOR RETURN CIRCUIT OPEN
SUN SENSOR
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

    Did the DTC return?

    Yes

    - Go To 2

    No

    - Go To 6
2. **CHECK THE (G39) SUN SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

1. Turn the ignition off.
2. Disconnect the Sun Sensor harness connector.
3. Disconnect the HVAC Module C1 harness connector.

NOTE: **Check connectors - Clean/repair as necessary.**

4. Turn the ignition on.
5. Check the voltage of the (G39) Sun Sensor 1 Signal circuit at the Sun Sensor harness connector.

   Is there any voltage present?

   Yes

   - Repair the (G39) Sun Sensor 1 Signal circuit for an short to voltage.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 3

3. **CHECK THE (G39) SUN SENSOR 1 SIGNAL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Measure the resistance of the (G39) Sun Sensor 1 Signal circuit between the HVAC Module C1 harness connector and the Sun Sensor harness connector.

      Is the resistance above 3.0 Ohms?

      Yes

      - Repair the (G39) Sun Sensor 1 Signal circuit for an open.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 4

4. **CHECK THE (C939) SUN SENSOR RETURN CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (G939) Sun Sensor Return circuit between the HVAC Module C1 harness connector and the Sun Sensor harness connector.

      Is the resistance above 3.0 Ohms?

      Yes

      - Repair the (C939) Sun Sensor Return circuit for an open.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Go To 5

5. **CHECK THE SUN SENSOR AND HVAC MODULE**
    1. Turn the ignition off.
    2. Replace the Sun Sensor in accordance with the Service Information. Refer to **SENSOR, SUN, REMOVAL** .
    3. Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    Did the DTC reset during or after the HVAC Verification Test?

    Yes

    - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.
6. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Wiggle the wiring and connectors while checking for shorted and open circuits.

    Were any problems found?

    Yes

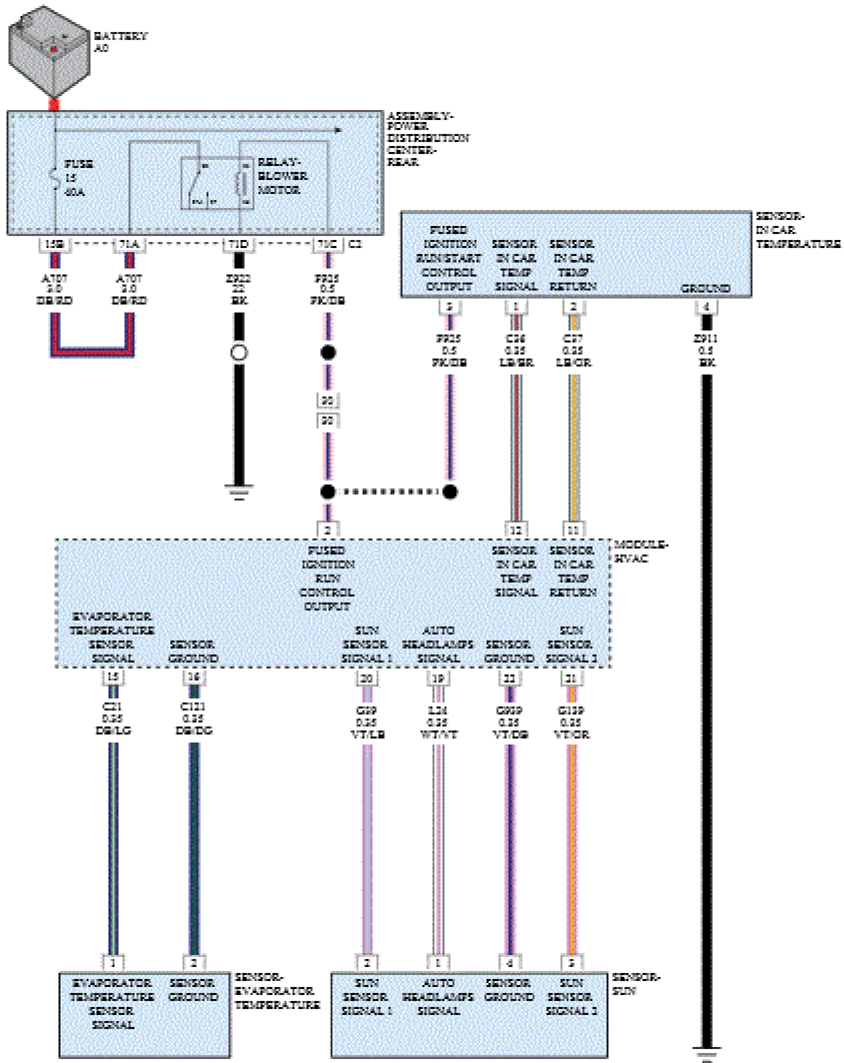
    - Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

B1603-11-RIGHT SOLAR SENSOR - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .



[Fig. 20: HVAC Module - Circuit Diagram](#)

Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The HVAC Module uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the HVAC Module to assure that they are in range. If those sensors fall out of predetermined ranges a Diagnostic Trouble Code (DTC) will set. For further information, refer to SENSOR, SUN, OPERATION .

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following condition is met:

- Ignition on.

Set Conditions:

- If the HVAC Module detects on Sun Sensor 2 Signal circuit a voltage less than 0.5 volts for the period of two seconds or more.

Default Actions:

- This DTC has a de-maturing time of 20 msec. If the DTCs status changes from active to stored, the DTC will stay in memory for 100 ignition cycles.

Possible Causes
SUN SENSOR 2 SIGNAL CIRCUIT SHORTED TO GROUND
SUN SENSOR
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

    Did the DTC return?

    Yes

    - Go To 2

    No

    - Go To 4
2. **CHECK (G139) SUN SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the HVAC Module C1 harness connector.
    3. Disconnect the Sun Sensor harness connector.
    4. Check for continuity between ground and the (G139) Sun Sensor 2 Signal circuit at the Sun Sensor harness connector.

    Is there continuity between ground and the (G139) Sun Sensor 2 Signal circuit?

    Yes

    - Repair the (G139) Sun Sensor 2 Signal circuit for a short to ground.
    - Perform the HVAC VERIFICATION TEST. Refer to STANDARD PROCEDURE.

    No

- Go To 3

3. **CHECK THE SUN SENSOR AND HVAC MODULE**
    1. Replace the Sun Sensor in accordance with the Service Information. Refer to **SENSOR, SUN, REMOVAL** .
    2. Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    Did this DTC reset while performing the HVAC Verification Test?

    Yes

    - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

4. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Wiggle the wiring and connectors while checking for shorted and open circuits.

    Were any problems found?

    Yes

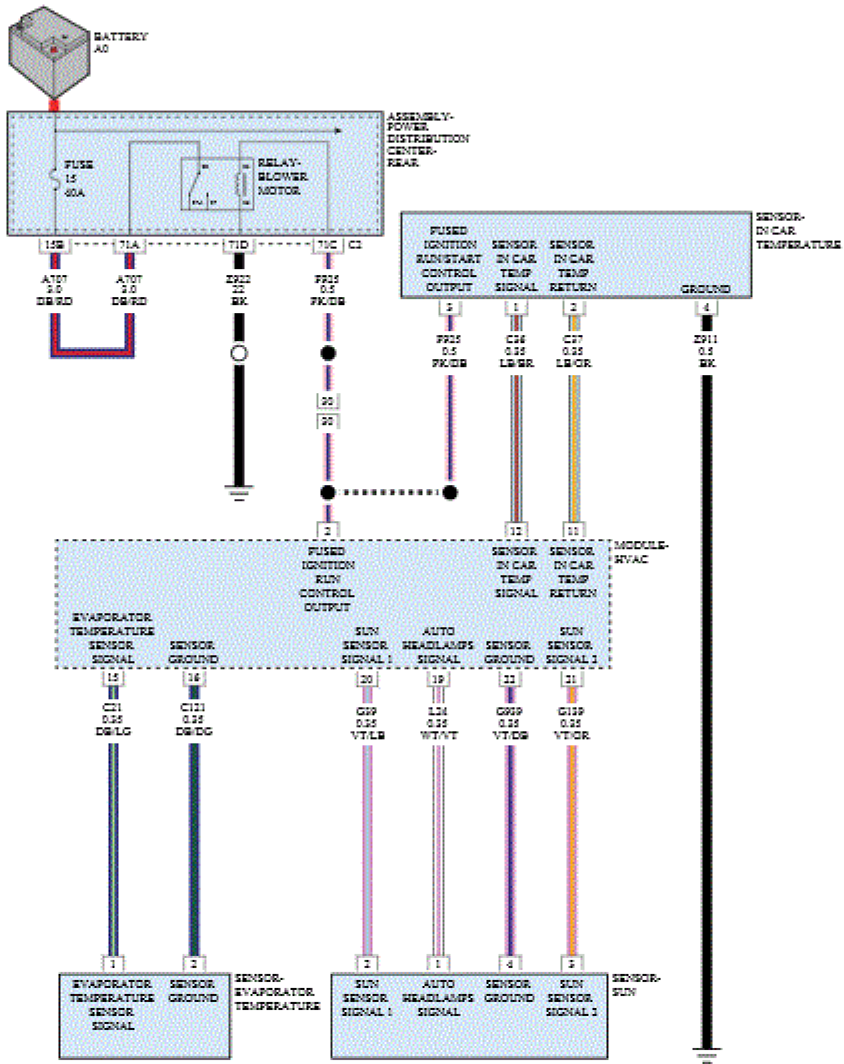
    - Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

B1603-15-RIGHT SOLAR SENSOR - CIRCUIT SHORT TO BATTERY OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .



[Fig. 21: HVAC Module - Circuit Diagram]

Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The HVAC Module uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the HVAC Module to assure that they are in range. If those sensors fall out of predetermined ranges a Diagnostic Trouble Code (DTC) will set. For further information, refer to SENSOR, SUN, OPERATION .

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following condition is met:

- Ignition on.

Set Conditions:

- If the HVAC Module detects on the Sun Sensor 2 Signal circuit a voltage greater than 4.8 volts for the period of two seconds or more.

Default Actions:

- This DTC has a de-maturing time of 20 msec. If the DTCs status changes from active to stored, the DTC will stay in memory for 100 ignition cycles.

Possible Causes
SUN SENSOR 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
SUN SENSOR 2 SIGNAL CIRCUIT OPEN
SUN SENSOR RETURN CIRCUIT OPEN
SUN SENSOR
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

    Did the DTC return?

    Yes

    - Go To 2

    No

    - Go To 6
2. **CHECK THE (G139) SUN SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the Sun Sensor harness connector.
    3. Disconnect the HVAC Control C1 harness connector.

    NOTE: Check connectors - Clean/repair as necessary.

    4. Turn the ignition on.
    5. Check the voltage of the (G139) Sun Sensor 2 Signal circuit at Sun Sensor harness connector.

    Is there any voltage present?

    Yes

- Repair the (G139) Sun Sensor 2 Signal circuit for an short to voltage.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (G139) SUN SENSOR 2 SIGNAL CIRCUIT FOR AN OPEN**
    1. Turn the ignition off.
    2. Measure the resistance of the (G139) Sun Sensor 2 Signal circuit between the HVAC Control C1 harness connector and the Sun Sensor harness connector.

       Is the resistance above 3.0 Ohms?

       Yes

       - Repair the (G139) Sun Sensor 2 Signal circuit for an open.
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 4

4. **CHECK THE (G939) SUN SENSOR RETURN CIRCUIT FOR AN OPEN**
    1. Measure the resistance of the (G939) Sun Sensor Return circuit between the HVAC Control C1 harness connector and the Sun Sensor harness connector.

       Is the resistance above 3.0 Ohms?

       Yes

       - Repair the (G939) Sun Sensor Return circuit for an open.
       - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       No

       - Go To 5

5. **CHECK THE SUN SENSOR AND HVAC CONTROL**
    1. Turn the ignition off.
    2. Replace the Sun Sensor in accordance with the Service Information. Refer to **SENSOR, SUN, REMOVAL** .
    3. Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

       Did the DTC reset during or after the HVAC Verification Test?

       Yes

       - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .

- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

6. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Wiggle the wiring and connectors while checking for shorted and open circuits.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

B160F-11-TWILIGHT/AMBIENT LIGHT SENSOR INPUT - CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

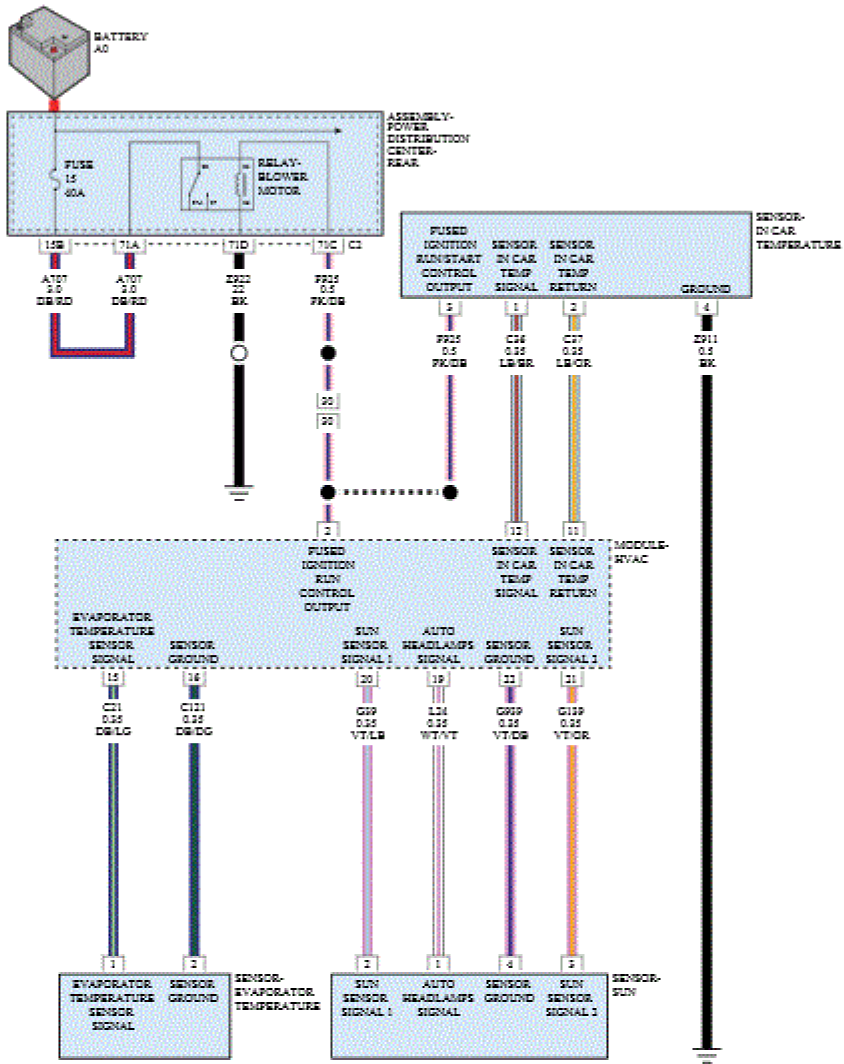


Fig. 22: HVAC Module - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The HVAC Module uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the HVAC Module to assure that they are in range. If those sensors fall out of predetermined ranges a Diagnostic Trouble Code (DTC) will set. For further information, refer to SENSOR, SUN, OPERATION .

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following condition is met:

- Ignition on.

Set Conditions:

- If the HVAC Module detects on the Auto Headlamps Signal circuit a voltage less than 0.25 volts for the period of two seconds or more.

Default Actions:

- This DTC has a de-maturing time of 20 msec. If the DTCs status changes from active to stored, the DTC will stay in memory for 100 ignition cycles.

Possible Causes
AUTO HEADLAMPS SIGNAL CIRCUIT SHORTED TO GROUND
SUN SENSOR
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. With the scan tool, read HVAC DTCs and record on the repair order.
   2. Record the Environmental Data.
   3. With the scan tool, erase DTCs.
   4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
   5. With the scan tool, read HVAC DTCs.

      Did the DTC return?

      Yes

      - Go To 2

      No

      - Go To 4
2. **CHECK (L24) AUTO HEADLAMPS SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the HVAC Module C1 harness connector.
   3. Disconnect the Sun Sensor harness connector.
   4. Check for continuity between ground and the (L24) Auto Headlamps Signal circuit at the HVAC Module C1 harness connector.

      Is there continuity between ground and the (L24) Auto Headlamps Signal circuit?

      Yes

      - Repair the (L24) Auto Headlamps Signal circuit for a short to ground.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

- Go To 3

3. **CHECK THE SUN SENSOR AND HVAC MODULE**
    1. Replace the Sun Sensor in accordance with the Service Information. Refer to **SENSOR, SUN, REMOVAL** .
    2. Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    Did this DTC reset while performing the HVAC Verification Test?

    Yes

    - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

4. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Wiggle the wiring and connectors while checking for shorted and open circuits.

    Were any problems found?

    Yes

    - Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

B160F-15-TWILIGHT-AMBIENT LIGHT SENSOR - CIRCUIT SHORT TO BATTERY OR GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

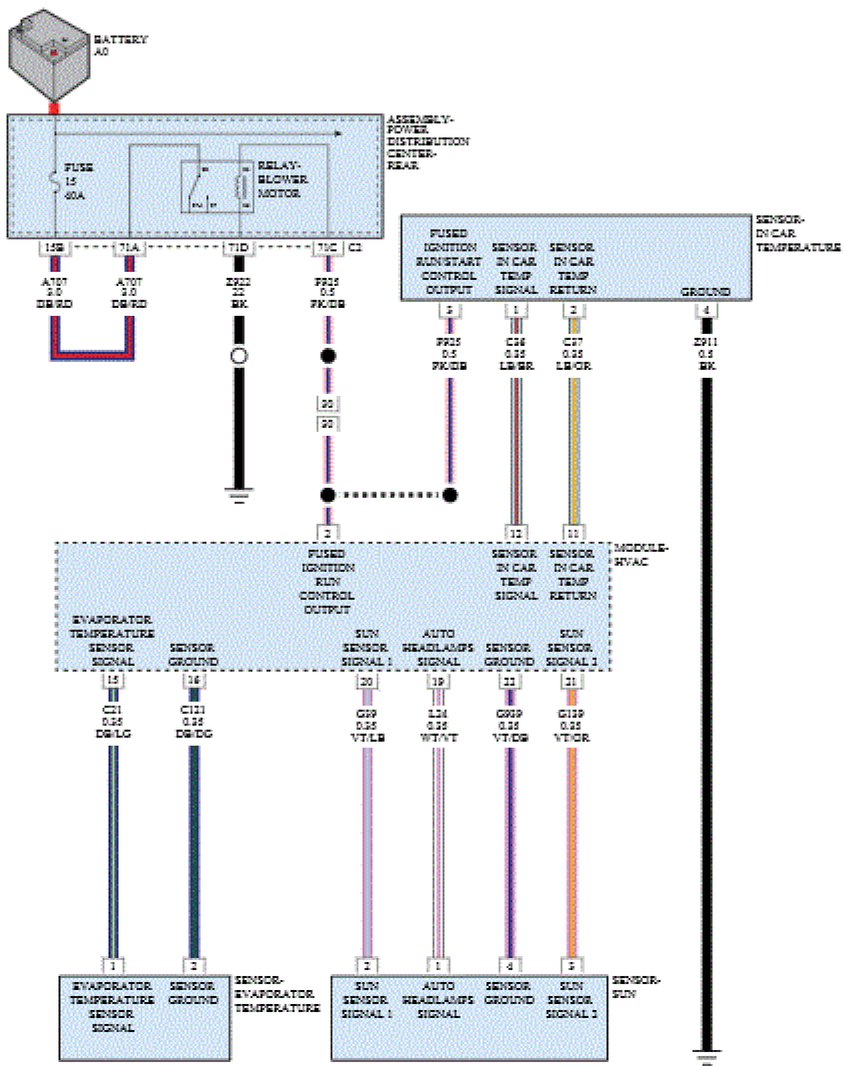

Fig. 23: HVAC Module - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The HVAC Module uses a variety of sensors to adjust HVAC operation to obtain optimal performance. These sensors are continuously monitored by the HVAC Module to assure that they are in range. If those sensors fall out of predetermined ranges a Diagnostic Trouble Code (DTC) will set. For further information, refer to SENSOR, SUN, OPERATION .

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following condition is met:

- ignition on.

Set Conditions:

- If the HVAC Module detects on the Auto Headlamps Signal circuit a voltage greater than 4.83 volts for the period of two seconds or more.

Default Actions:

- This DTC has a de-maturing time of 20 msec. If the DTCs status changes from active to stored, the DTC will stay in memory for 100 ignition cycles.

Possible Causes
AUTO HEADLAMPS SIGNAL CIRCUIT SHORTED TO VOLTAGE
AUTO HEADLAMPS SIGNAL CIRCUIT OPEN
SUN SENSOR RETURN CIRCUIT OPEN
SUN SENSOR
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

    Did the DTC return?

    Yes

    - Go To 2

    No

    - Go To 6
2. **CHECK THE (L24) AUTO HEADLAMPS SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the HVAC Module C1 harness connector.
    3. Disconnect the Sun Sensor harness connector.
    4. Turn the ignition on.
    5. Measure the voltage of the (L24) Auto Headlamps Signal circuit between the HVAC Module C1 harness connector and the Sun Sensor harness connector.

    Is there any voltage present?

    Yes

    - Repair the (L24) Auto Headlamps Signal circuit for a short to voltage.

- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Go To 3

3. **CHECK THE (L24) AUTO HEADLAMPS SIGNAL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Measure the resistance of the (L24) Auto Headlamps Signal circuit between the HVAC Module C1 harness connector and the Sun Sensor harness connector.

      Is the resistance below 3.0 Ohms?

      Yes

      - Go To 4

      No

      - Repair the (L24) Auto Headlamps Signal circuit for an open.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
4. **CHECK THE (G939) SUN SENSOR RETURN CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (G939) Sun Sensor Return circuit between the HVAC Module C1 harness connector and the Sun Sensor harness connector.

      Is the resistance below 3.0 Ohms?

      Yes

      - Go To 5

      No

      - Repair the (G939) Sun Sensor Return circuit for an open.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.
5. **CHECK THE SUN SENSOR AND HVAC MODULE**
   1. Replace the Sun Sensor in accordance with the Service Information. Refer to **SENSOR, SUN, REMOVAL** .
   2. Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      Did this DTC reset while performing the HVAC Verification Test?

      Yes

      - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

- Test complete.

6. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Wiggle the wiring and connectors while checking for shorted and open circuits.

    Were any problems found?

    Yes

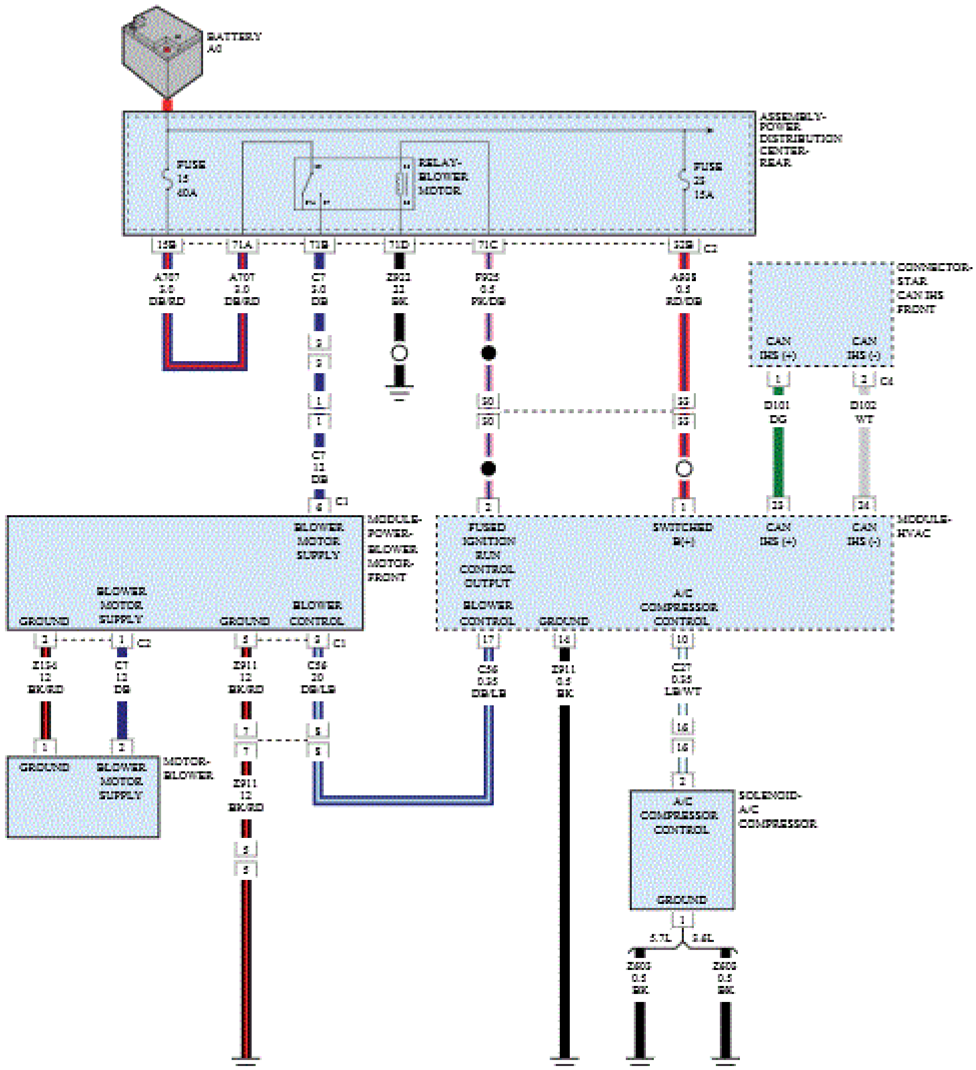
    - Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

B210A-84-SYSTEM VOLTAGE LOW - SIGNAL BELOW ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .



[Fig. 24: HVAC Module Circuit Diagram]

Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The A/C Heater Module constantly monitors battery and ignition voltage as well as battery voltage derived from BUS communication to ensure proper operation. If the voltage to the controller is out of range, it could cause damage to the controller or its respective components. If the voltage of either circuit drops below or rises above a predetermined calibration a Diagnostic Trouble Code (DTC) will set.

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following condition is met:

- Ignition on.

Set Conditions:

- If the system voltage or ignition voltage broadcast over the BUS is low for period of 15 seconds.

Possible Causes
RELATED BCM DTCS PRESENT
RELATED CHARGING SYSTEM DTCS PRESENT
RELATED HVAC DTCS PRESENT
OTHER CONTROLLERS REPORTING UNDER VOLTAGE CONDITION
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR BCM DTCS**
    1. Ignition on, engine not running.
    2. With the scan tool, read DTCs.

    Are there any Body Control Module (BCM) DTCs present?

    Yes

    - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

    No

    - Go To 2
2. **CHECK FOR POWERTRAIN CONTROL MODULE DTCS**
    1. With the scan tool, read DTCs.

    Are there any Powertrain Control Module (PCM) charging system DTCs present?

    Yes

    - Refer to **DTC INDEX** and perform the appropriate diagnostic procedure.

    No

    - Go To 3
3. **CHECK FOR HVAC DTCS**
    1. With the scan tool, read HVAC DTCs.

    Is the DTC B210D-84-Battery Voltage Low - Signal Below Allowable Range present also?

    Yes

    - Refer to **B210D-84-BATTERY VOLTAGE LOW - SIGNAL BELOW ALLOWABLE RANGE** and perform the diagnostic procedure .

    No

- Go To 4

4. **CHECK IF THE DTC IS ACTIVE**
    1. With the scan tool, read HVAC DTCs.

    NOTE: **It can take up to 15 seconds or more for this DTC to mature.**

    Is this DTC active?

    Yes

    - Go To 5

    No

    - Go To 6

5. **CHECK IF OTHER CONTROLLERS ARE REPORTING AN UNDER VOLTAGE CONDITION**
    1. With the scan tool, read DTCs.

    Are any other controllers reporting an under voltage condition?

    Yes

    - Refer to **DTC INDEX** and perform the appropriate diagnostic procedure.

    No

    - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Wiggle the wiring and connectors while checking for shorted and open circuits.

    Were there any problems found?

    Yes

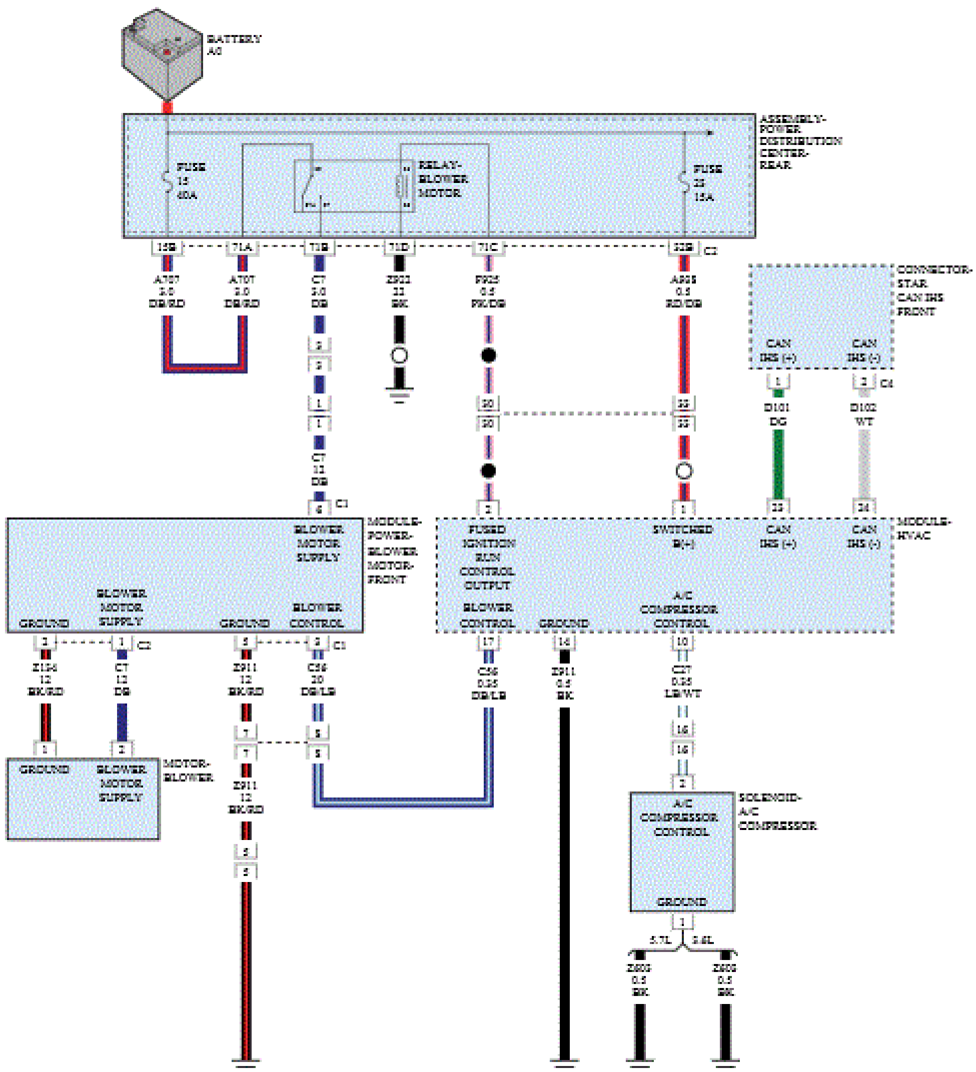
    - Repair as necessary.
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

    No

    - Test complete.

B210B-85-SYSTEM VOLTAGE HIGH - SIGNAL ABOVE ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .



[**Fig. 25: HVAC Module Circuit Diagram**]()
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The A/C Heater Control constantly monitors battery and ignition voltage as well as battery voltage derived from BUS communication to ensure proper operation. If the voltage to the controller is out of range, it could cause damage to the controller or its respective components. If the voltage of either circuit drops below or rises above a predetermined calibration a Diagnostic Trouble Code (DTC) will set.

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following condition is met:

- Ignition on.

Set Conditions:

- If the system voltage or ignition voltage broadcast over the BUS is higher than monitored controller voltage the for period of 15 seconds.

Possible Causes
RELATED BCM DTCS PRESENT
RELATED CHARGING SYSTEM DTCS PRESENT
RELATED HVAC DTCS PRESENT
OTHER CONTROLLERS REPORTING OVER VOLTAGE CONDITION
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR BCM DTCS**
    1. Ignition on, engine not running.
    2. With the scan tool, read DTCs.

    Are there any Body Control Module (BCM) DTCs present?

    Yes

    - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

    No

    - Go To 2
2. **CHECK FOR POWERTRAIN CONTROL MODULE DTCS**
    1. With the scan tool, read DTCs.

    Are there any Powertrain Control Module (PCM) charging system DTCs present?

    Yes

    - Refer to **DTC INDEX** and perform the appropriate diagnostic procedure.

    No

    - Go To 3
3. **CHECK FOR HVAC DTCS**
    1. With the scan tool, read HVAC DTCs.

    Is the DTC B210E-85-Battery Voltage High - Signal Above Allowable Range present also?

    Yes

    - Refer to **B210E-85-BATTERY VOLTAGE HIGH - SIGNAL ABOVE ALLOWABLE RANGE** and perform the diagnostic procedure .

No

- Go To 4

4. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read HVAC DTCs and record on the repair order.
    2. Record the Environmental Data.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read HVAC DTCs.

    Did the DTC return?

    Yes

    - Go To 5

    No

    - Go To 6

5. **CHECK IF OTHER CONTROLLERS ARE REPORTING AN OVER VOLTAGE CONDITION**
    1. With the scan tool, read DTCs.

    Are any other controllers reporting an over voltage condition?

    Yes

    - Refer to **DTC INDEX** and perform the appropriate diagnostic procedure.

    No

    - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
    - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

6. **CHECK THE WIRING AND CONNECTORS**
    1. The conditions necessary to set the DTC are not present at this time.
    2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
    3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
    4. Wiggle the wiring and connectors while checking for shorted and open circuits.

    Were there any problems found?

    Yes

    - Repair as necessary.

- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Test complete.

B210D-84-BATTERY VOLTAGE LOW - SIGNAL BELOW ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

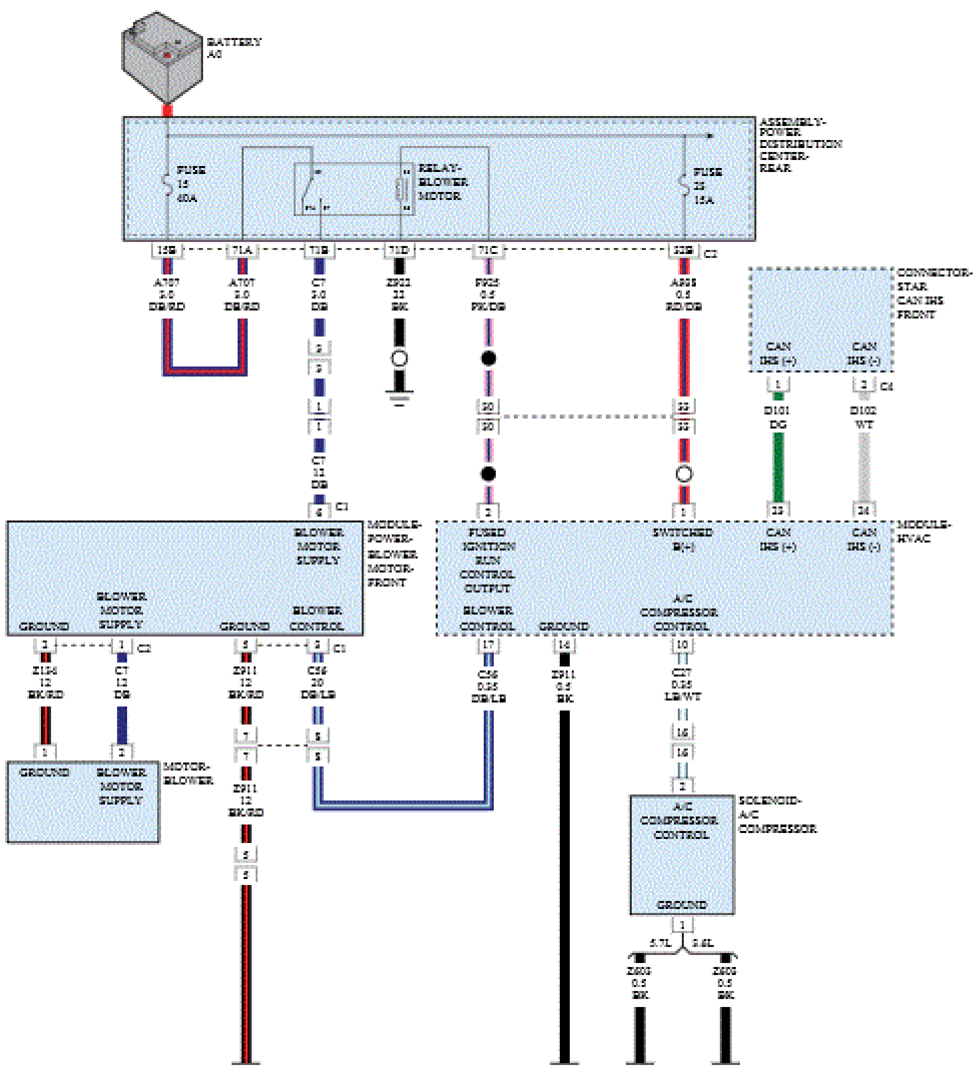


Fig. 26: HVAC Module Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The A/C Heater Module constantly monitors battery and ignition voltage as well as battery voltage derived from BUS communication to ensure proper operation. If the voltage to the controller is out of range, it could cause damage to the controller or its respective components. If the voltage of either circuit drops below or rises above a predetermined calibration a Diagnostic Trouble Code (DTC) will set.

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following condition is met:

- Ignition on.

Set Conditions:

- If the HVAC Module detects a voltage less than 9.5 volts for the period of 15 seconds or more.

Default Actions:

- This DTC has a de-maturing time of 20 msec. If the DTCs status changes from active to stored, the DTC will stay in memory for 100 ignition cycles.

Possible Causes
RELATED CHARGING SYSTEM DTCS PRESENT
FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN
FUSED B(+) CIRCUIT OPEN
GROUND CIRCUIT OPEN
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR CHARGING SYSTEM DTCS**
    1. With the scan tool, read PCM DTCs and record on the repair order.

       Are there any charging system DTCs present in the Powertrain Control Module (PCM)?

       Yes

       - Refer to **DTC INDEX** and perform the appropriate diagnostic procedure.

       No

       - Go To 2
2. **CHECK FOR BODY CONTROL MODULE DTCS**
    1. With the scan tool, read BCM DTCs and record on the repair order.

       Are there any BCM DTCS present?

       Yes

       - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

       No

       - Go To 3
3. **CHECK FOR AN ACTIVE DTC**

1. With the scan tool, read HVAC DTCs.

   Is the DTC active?

   Yes

   - Go To 4

   No

   - Go To 7

4. **CHECK THE (F925) FUSED IGNITION SWITCH OUTPUT CIRCUIT FOR AN OPEN**
   1. Turn the ignition on.
   2. While back probing, measure the voltage of the (F925) Fused Ignition Switch Output circuit in the HVAC Module C1 harness connector.

   Is the voltage 9.5 volts or below?

   Yes

   - Repair the (F925) Fused Ignition Switch Output circuit for an open or high resistance.

     NOTE: **If the fuse is open, make sure to check for a short to ground on the (F925) Fused Ignition Switch Output circuit.**

   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 5

5. **CHECK THE (A938) FUSED B(+) CIRCUIT FOR AN OPEN**
   1. Turn the ignition on.
   2. While back probing, measure the voltage of the (A938) Fused B (+) circuit in the HVAC Module C1 harness connector.

   Is the voltage 9.5 volts or below?

   Yes

   - Repair the (A938) Fused B (+) circuit for an open or high resistance.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Go To 6

6. **CHECK THE (Z911) GROUND CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Disconnect the HVAC Module C1 harness connector.

3. With a 12-volt test light connected to 12 volts, check the (Z911) Ground circuit at the HVAC Module C1 harness connector.

NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

Does the test light illuminate brightly?

Yes

- Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Repair the (Z911) Ground circuit for an open.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

7. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

   Were any problems found?

   Yes

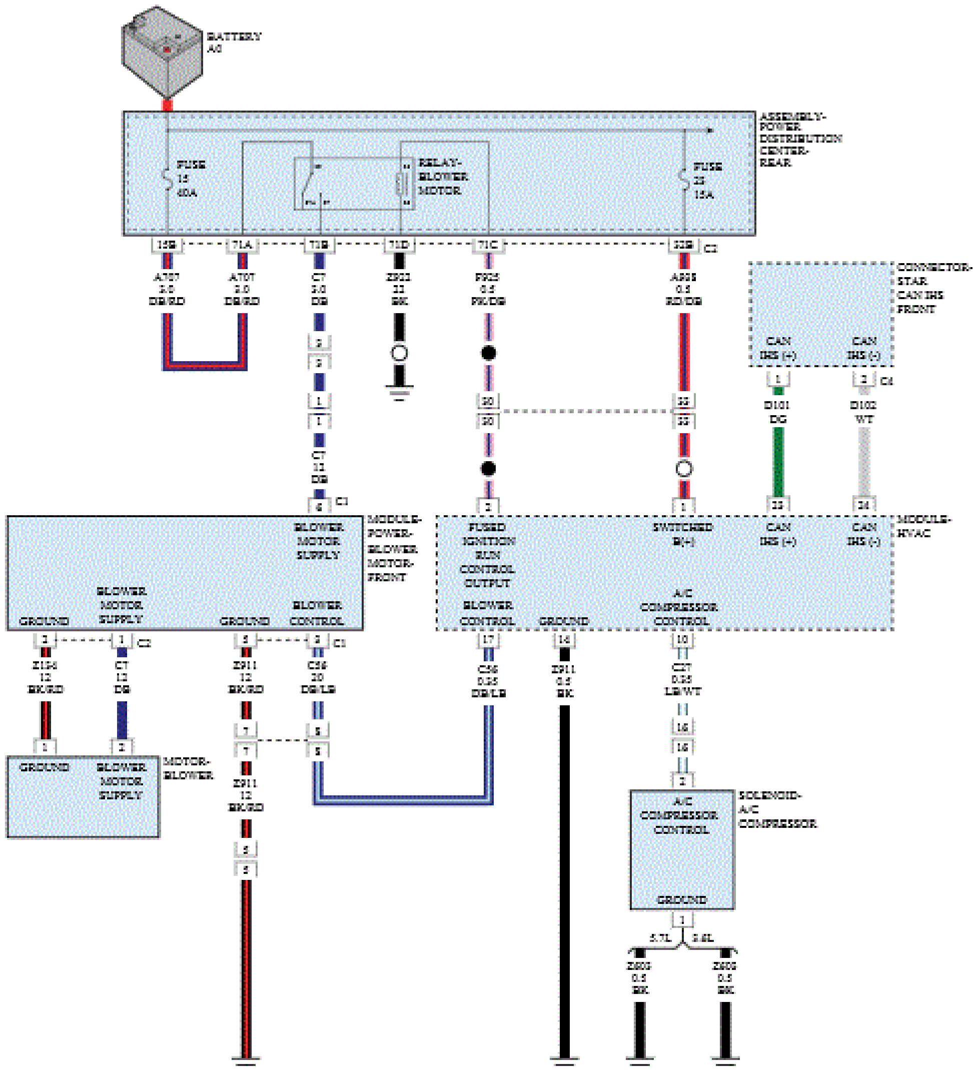
   - Repair as necessary.
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

   No

   - Test complete.

B210E-85-BATTERY VOLTAGE HIGH - SIGNAL ABOVE ALLOWABLE RANGE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .



[Fig. 27: HVAC Module Circuit Diagram](#)

Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The A/C Heater Module constantly monitors battery and ignition voltage as well as battery voltage derived from BUS communication to ensure proper operation. If the voltage to the controller is out of range, it could cause damage to the controller or its respective components. If the voltage of either circuit drops below or rises above a predetermined calibration a Diagnostic Trouble Code (DTC) will set.

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following condition is met:

- Ignition on.

Set Conditions:

- If the HVAC Module detects a voltage greater than 16.0 volts for the period of 15 seconds or more.

Default Actions:

- This DTC has a de-maturing time of 20 msec. If the DTCs status changes from active to stored, the DTC will stay in memory for 100 ignition cycles.

Possible Causes
RELATED CHARGING SYSTEM DTCS PRESENT
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

1. **CHECK FOR CHARGING SYSTEM DTCS**
   1. With the scan tool, read PCM DTCs and record on the repair order.

      Are there any charging system DTCs present in the Powertrain Control Module (PCM)?

      Yes

      - Refer to **DTC INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 2
2. **CHECK FOR BODY CONTROL MODULE DTCS**
   1. With the scan tool, read BCM DTCs and record on the repair order.

      Are there any BCM DTCS present?

      Yes

      - Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

      No

      - Go To 3
3. **CHECK FOR AN ACTIVE DTC**
   1. With the scan tool, read HVAC DTCs.

      Is the DTC active?

      Yes

      - Go To 4

      No

      - Go To 5
4. **CHECK IF OTHER CONTROLLERS ARE REPORTING AN OVER VOLTAGE CONDITION**

1. Turn the ignition on.
2. With the scan tool read DTCs.

   Are any other controllers reporting an over voltage condition?

   Yes

   - Refer to **DTC INDEX** and perform the appropriate diagnostic procedure.

   No

   - Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
   - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

5. **CHECK THE WIRING AND CONNECTORS**
   1. The conditions necessary to set the DTC are not present at this time.
   2. With the scan tool, check the Environmental Data to help identify the conditions in which the DTC was set.
   3. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
   4. Wiggle the wiring and connectors while checking for shorted and open circuits.

      Were any problems found?

      Yes

      - Repair as necessary.
      - Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

      No

      - Test complete.

B222A-00-VEHICLE LINE MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The A/C Heater Module checks for vehicle configuration using communication over the BUS. If the stored configuration does not match the configuration stored in the controller this DTC will set.

WHEN MONITORED AND SET CONDITIONS

When Monitored: continuously when the following condition is met:

- Ignition on.

Set Conditions:

- This DTC sets if the stored configuration does not match the configuration stored in the controller.

Possible Causes
VEHICLE CONFIGURATION NOT STORED IN THE BODY CONTROL MODULE (BCM)
CONTROL MODULE INSTALLED IN INCORRECT VEHICLE
HVAC MODULE

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

CHECK THE VEHICLE CONFIGURATION

NOTE: **The DTC must be active and no BUS communication DTCs present before performing this test. If BUS communication DTCs are present, perform there respective test first. If the DTC is stored, erase the DTC and cycle the ignition. If the DTC resets and changes to active, then proceed.**

1. With the scan tool, check the vehicle configuration stored in the Body Control Module (BCM).
2. With the scan tool, check the vehicle configuration stored in the HVAC Module (HVAC).

Pick the answer that best describes your findings:

BCM has wrong or no vehicle configuration.

- With the scan tool, program the proper vehicle configuration in the BCM.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

HVAC has wrong vehicle configuration but BCM has correct configuration.

- Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

HVAC and BCM have proper calibration and the DTC is active in the HVAC.

- Check if other modules such as the Powertrain Control Module (PCM) have the wrong configuration stored in the controller and reprogram or replace as necessary. If all other modules show the proper configuration, replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

B222D-00-ECU UNABLE TO CONFIGURE-CONFIGURATION NOT LEARNED

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

SET CONDITION

- A valid configuration is not detected for greater than 2 seconds after ignition on.

POSSIBLE CAUSES

Possible Causes
VEHICLE CONFIGURATION NOT STORED IN THE BODY CONTROL MODULE (BCM)
CONTROL MODULE INSTALLED IN INCORRECT VEHICLE
HVAC MODULE

Always perform the HVAC Pre-Diagnostic Troubleshooting procedure before proceeding. Refer to STANDARD PROCEDURE.

DIAGNOSTIC TEST

CHECK THE VEHICLE CONFIGURATION

NOTE: **The DTC must be active and no BUS communication DTCs present before performing this test. If BUS communication DTCs are present, perform there respective test first. If the DTC is stored, erase the DTC and cycle the ignition. If the DTC resets and changes to active, then proceed.**

1. With the scan tool, check the vehicle configuration stored in the Body Control Module (BCM).
2. With the scan tool, check the vehicle configuration stored in the HVAC Module.

Pick the answer that best describes your findings:

BCM has wrong or no vehicle configuration

- With the scan tool, program the proper vehicle configuration in the BCM.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

HVAC Module has wrong vehicle configuration but BCM has correct configuration.

- Replace and program the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

HVAC Module and BCM have proper calibration and the DTC is active in the HVAC.

- Check if other modules such as the Powertrain Control Module (PCM) have the wrong configuration stored in the controller and reprogram or replace as necessary. If all other modules show the proper configuration, replace the HVAC Module in accordance with the Service Information. Refer to **MODULE, HVAC, REMOVAL** .
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

U0010-00-CAN INTERIOR BUS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

DIAGNOSTIC TEST

CHECK FOR AN ACTIVE DTC

1. Turn the ignition on.
2. With the scan tool, create a Vehicle Scan Report and attach it to the repair order.
3. With the scan tool, read PDM DTCs.

   Is the DTC active?

   Yes

   - Perform the U0010-00 CAN Interior Bus diagnostic procedure in the BCM. Refer to **U0010-00-CAN INTERIOR BUS** .

   No

   - Perform the Stored Lost Communication DTCs diagnostic procedure. Refer to **STORED LOST COMMUNICATION DTCS** .

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0147-00-LOST COMMUNICATION WITH TELEMATICS GATEWAY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

SET CONDITION

- No BUS messages received from the Radio Receiver Module for approximately 10 seconds.

POSSIBLE CAUSES

Possible Causes
CAN-AT BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
RADIO RECEIVER MODULE NOT CONFIGURED CORRECTLY
RADIO RECEIVER MODULE (RRM)
MODULE THAT SET THIS DTC

Always perform the PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE before proceeding.

DIAGNOSTIC TEST

VERIFY DTC IS ACTIVE

1. Turn the ignition on.
2. With the scan tool, read active DTCs.

   Is this DTC active?

Yes

- **Refer to DIAGNOSIS AND TESTING** and perform the Lost Communication with Radio Receiver Module diagnostic procedure.

No

- **Refer to STORED LOST COMMUNICATION DTCS** and perform the Stored Lost Communication DTCs diagnostic procedure.

STANDARD PROCEDURE

HVAC VERIFICATION TEST

Perform the following procedures to verify that the repair(s) are valid.

1. Make sure that all accessories are turned off.
2. Make sure that the battery is fully charged.
3. Turn the ignition off.
4. Disconnect all jumper wires and reconnect all previously disconnected components and connectors.
5. With the scan tool, record and erase all Diagnostic Trouble Codes (DTCs) from ALL modules.
6. Turn the ignition off, remove the scan tool from the DLC (Data Link Connector). Open the door and close the door. Wait a minimum 30 seconds, then turn the ignition on. Reconnect the scan tool.

NOTE: **Disconnecting the scan tool and opening and closing the door will allow the controller to enter into sleep mode.**

7. With the scan tool perform the HVAC ACTUATOR CALIBRATION TEST.
8. Start and run the engine for two minutes while operating all functions of the system that caused the original concern.
9. With the scan tool, check for DTCs in all modules.

Is the original condition still present or are there any other HVAC DTCs present?

Yes

- Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

No

- Repair is complete.

HVAC PRE-DIAGNOSTIC TROUBLESHOOTING PROCEDURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Perform the following steps prior to any diagnostic procedure(s).

- Testing should only be performed with the battery fully charged to avoid false diagnosis.

- With the scan tool, read Powertrain Control Module (PCM) Diagnostic Trouble Codes (DTCs). If PCM DTCs are present, refer to **DTC INDEX** and perform the appropriate diagnostic procedure(s) before proceeding .
- Depending on the vehicle configuration, with the scan tool, read Body Control Module (BCM) DTCs. If BCM DTCs are present, refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure(s) before proceeding.
- With the scan tool, read HVAC DTCs. Record all Stored, Active, and Pending DTC information.
- With the scan tool, read the Environmental Data. Use this data to help identify the conditions in which the DTC was set.
- Refer to the When Monitored and Set Conditions for this DTC. DTCs can set at ignition on, at start up, or operating under specific conditions.
- Using the wiring diagram as a guide, inspect the wiring and connectors related to this circuit and clean/repair as necessary.
- Check for controller software updates if applicable. Some conditions can be corrected by upgrading the controller software.

NOTE: **If the controller is updated with new software, with the scan tool, perform a HVAC Actuator Calibration Test.**

- Check for Service Information Tune-ups or Service Bulletins for any possible causes that may apply.

Did any of the above procedures repair the vehicle?

Yes

- Testing is complete.
- Perform the HVAC VERIFICATION TEST. Refer to **STANDARD PROCEDURE**.

No

- Refer to **DIAGNOSTIC CODE INDEX** and perform the appropriate diagnostic procedure.

.

2015-16 HVAC

Heating & Air Conditioning - Service Information - Challenger

DESCRIPTION

DESCRIPTION

A Manual Temperature Control (MTC) or an Automatic Temperature Control (ATC) Dual Zone heating and A/C system is available on this vehicle.

To maintain the performance level of the Heating, Ventilation and Air Conditioning (HVAC) system, the engine cooling system must be properly maintained. The use of a bug screen is not recommended. Any obstructions in front of the radiator or A/C condenser will reduce the performance of the A/C and engine cooling systems.

The engine cooling system includes the radiator, thermostat, radiator hoses and the engine coolant pump. Before opening or attempting any service to the engine cooling system. Refer to STANDARD PROCEDURE .

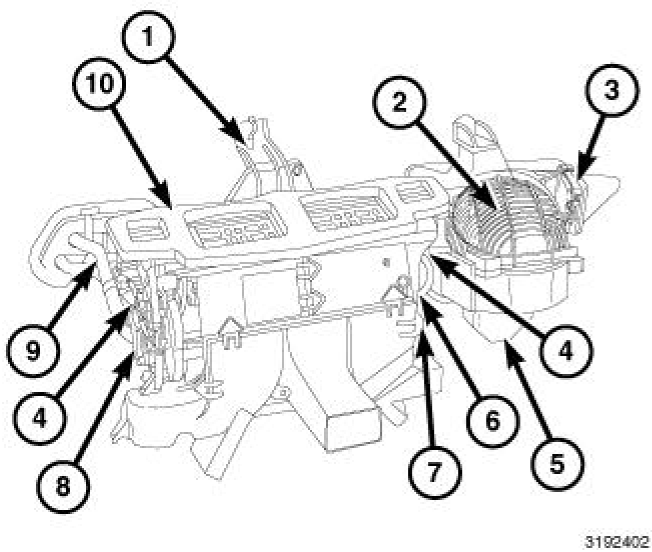

Fig. 1: HVAC Housing Components
Courtesy of CHRYSLER GROUP, LLC

All vehicles are equipped with a common front Dual Zone HVAC housing (1). The heating and A/C system combines heating, ventilating and A/C capabilities into a single unit mounted within the passenger compartment, behind the instrument panel. The HVAC housing includes:

- Recirculation-air door and actuator (2)
- Heater, Ventilation and Air Conditioning Module (HVAC) (3)
- Blend-air doors and actuators (4)
- Blower motor (5)
- Blower motor power module (6)
- Evaporator temperature sensor (7)
- Mode-air doors and actuator (8)

- Heater core (9)
- A/C evaporator (10)

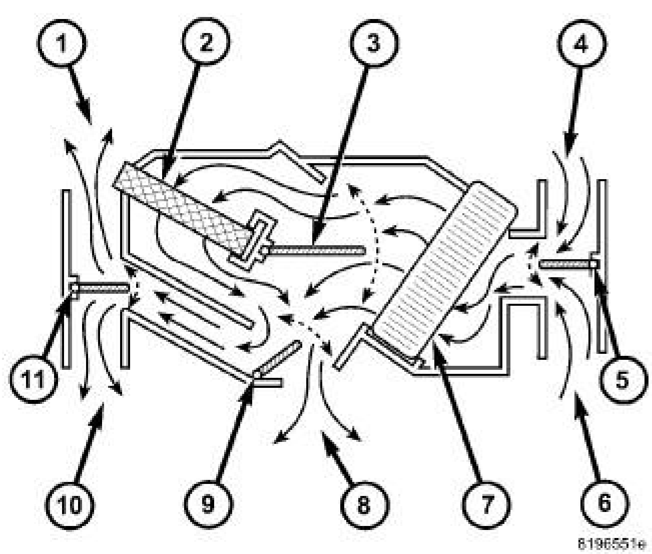
Based upon the system and selected mode, conditioned air can exit the HVAC housing through one or a combination of the three main housing outlets: defrost, panel or floor. The defrost and panel outlets are located on the top of the HVAC housing and the floor outlets are located on the bottom of the HVAC housing. Once the conditioned air exits the HVAC housing, it is further directed through molded plastic ducts to the outlets within the vehicle interior. These outlets and their locations are as follows:

- **Defroster Outlets** - Two large defroster outlets are located near the center of the instrument panel top cover, near the base of the windshield.
- **Side Window Demister Outlets** - Two front side window demister outlets, one located on each front door, near the A-pillars.
- **Panel Outlets** - There are four panel outlets in the instrument panel, one located near each outboard end of the instrument panel facing the rear of the vehicle and one located on each side of the touch screen interface, at the center of the instrument panel.
- **Floor Outlets** - There are four floor outlets, one located above each front footwell and one located under each front seat.
- **Console Outlets** - There are two console outlets located at the back of the center floor console, facing the rear of the vehicle.

OPERATION

OPERATION

The heating and A/C systems used in this vehicle are blend-air type systems. In a blend air system, a blend-air door controls the amount of conditioned air that is allowed to flow through, or around the heater core. In the Dual Zone system, separate blend-air doors are used to provide completely independent side-to-side temperature control of the discharge air. The temperature controls determine the discharge air temperatures by operating the blend door actuators, which move the blend-air doors. This design allows almost immediate control of output air temperatures.



[Fig. 2: Blend Air System Schematic](#)
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Typical blend air system shown in the illustration.**

The heating and A/C system pulls outside (ambient) air through the fresh air intake (4) located at the cowl panel at the base of the windshield and into the air inlet housing above the Heating, Ventilation and Air Conditioning (HVAC) housing and passes through the A/C evaporator (7). Air flow is then directed either through or around the heater core (2). This is done by adjusting the position of the blend-air doors (3) with the temperature controls on the switchbank or the U-Connect Touch ™ screen module. Air flow is then directed out the floor outlet (8), instrument panel outlet (10) or the defroster outlet (1) in various combinations by adjusting the position of the mode-air doors (9 and 11) using the mode controls on the switchbank or the U-Connect Touch ™ screen module. The temperature and mode controls use electrical actuators to operate the air doors.

The velocity of the air flow out of the outlets can be manually or automatically adjusted, depending on the system. using the blower motor control on the switchbank or the U-Connect Touch ™ screen module.

The fresh air intake can be shut off by pressing the Recirculation button on the switchbank or the U-Connect Touch ™ screen module. This will operate the electrically actuated recirculation-air door (5), which closes off the fresh air intake. With the fresh air intake closed, the conditioned air within the vehicle is pulled back into the HVAC housing through the recirculation air intake (6).

The A/C compressor can be engaged by pressing the A/C (snowflake) button on the switchbank or the U-Connect Touch ™ screen module. The A/C compressor will automatically engage based on humidity sensor readings to help prevent windshield fogging.

The defroster outlets receive airflow from the HVAC housing through the molded plastic defroster duct, which is secured to the top of the HVAC housing. The airflow from the defroster duct is directed by fixed vanes in the defroster outlet grille and cannot be adjusted.

The side window demister outlets receive airflow from the HVAC housing through the defroster duct and molded plastic demister ducts, which are secured to the instrument panel support. The airflow from the side window demister outlets is directed by fixed vanes and cannot be adjusted. The demisters operate when the mode control is set in any Floor to Defrost position.

The instrument panel outlets receive airflow from the HVAC housing through a molded plastic center panel duct and two end panel ducts. The left and right side panel ducts are mounted directly on the HVAC unit. There is no intermediate ducts between them. The Left duct directs air to the driver inboard and outboard registers and right panel duct directs air to the passenger inboard and outboard registers. The two end panel ducts direct airflow to the left and right instrument panel outlets, while the center panel duct directs airflow to the two center panel outlets. Each of these outlets can be individually adjusted to direct or shut off the flow of air leaving the outlets.

The front and rear floor outlets receive airflow from the HVAC housing through the front and rear floor ducts which are secured to each side of the HVAC housing. The front floor ducts are in-molded to the close out panels and thy are not rigidly secured to the unit. The rear seat ducts direct airflow beneath the carpet to the outlets located near the front of each rear seat foot well. None of the floor outlets can be adjusted.

NOTE: **It is important to keep the air intake opening clear of debris. Leaf particles and other debris that is small enough to pass through the cowl opening screen can**

accumulate within the HVAC housing. The closed, warm, damp and dark environment created within the housing is ideal for the growth of certain molds, mildews and other fungi. Any accumulation of decaying plant matter provides an additional food source for fungal spores, which enter the housing with the fresh intake-air. Excess debris, as well as objectionable odors created by decaying plant matter and growing fungi can be discharged into the passenger compartment during heater-A/C operation if the air intake opening is not kept clear of debris.

The A/C system is designed for use of an A/C expansion valve (TXV) to meter the flow of refrigerant to the A/C evaporator. To maintain minimum evaporator temperature and prevent evaporator freezing, an evaporator temperature sensor input is supplied to the HVAC module. In turn, the Powertrain Control Module (PCM) cycles the A/C clutch on and off as necessary to optimize A/C system performance and to protect the A/C system from evaporator freezing.

DIAGNOSIS AND TESTING

A/C PERFORMANCE

The A/C system is designed to provide the passenger compartment with low temperature and low humidity air. The A/C evaporator, located in the Heating, Ventilation and Air Conditioning (HVAC) housing is cooled to temperatures near the freezing point. As warm damp air passes over the fins of the A/C evaporator, the air transfers its heat to the refrigerant in the evaporator coils and the moisture in the air condenses on the evaporator fins. During periods of high heat and humidity, an A/C system will be more effective in the Recirculation mode (max A/C). With the system in the Recirculation mode, only air from the passenger compartment passes through the A/C evaporator. As the passenger compartment air dehumidifies, the A/C system performance levels rise.

Humidity has an important bearing on the temperature of the air delivered to the interior of the vehicle. It is important to understand the effect that humidity has on the performance of the A/C system. When humidity is high, the A/C evaporator has to perform a double duty. It must lower the air temperature, and it must lower the temperature of the moisture in the air that condenses on the evaporator fins. Condensing the moisture in the air transfers heat energy into the evaporator fins and coils. This reduces the amount of heat the A/C evaporator can absorb from the air. High humidity greatly reduces the ability of the A/C evaporator to lower the temperature of the air.

However, evaporator capacity used to reduce the amount of moisture in the air is not wasted. Removing some of the moisture out of the air entering the vehicle adds to the comfort of the passengers. Although, an owner may expect too much from their A/C system on humid days. A performance test is the best way to determine whether the system is performing up to design standards. This test also provides valuable clues as to the possible cause of trouble with the A/C system.

A/C PERFORMANCE TEST

WARNING: **Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.**

CAUTION: **The use of an A/C recycling/charging station for purposes of determining the**

actual charge level of an A/C system is not recommended. Service recycling/charging stations do not reflect the correct amount of refrigerant charge in the A/C system after a single "reclaim" cycle. Tests have shown that it can take two or more "reclaim" cycles to remove all of the refrigerant charge, depending on the equipment being used. Use only the following procedure for determining the proper charge level.

NOTE: **The A/C Cool down test which can be initiated on the Manual Temperature Control (MTC) or Automatic Temperature Control (ATC) system is not a valid test to determine A/C performance. It is intended to be only used at the assembly plant and should not be used at a dealer or repair facility. Use only the following procedure to check A/C performance.**

1. Make sure the following conditions are met in the area where this test is to be performed:
   - Maximum ambient temperature: 43.3Â°C (110Â°F)
   - Minimum ambient temperature: 15.5Â°C (60Â°F)
   - Maximum relative humidity: 90%
   - Minimum relative humidity: 20%
2. Using a scan tool, check for Diagnostic Trouble Codes (DTCs) related to the Controller Area Network (CAN) data bus, Telematics Gateway (TGW), Heater, Ventilation and Air Conditioning Module (HVAC), Body Control Module (BCM) and Powertrain Control Module (PCM). If no DTCs are found, go to STEP 3. If any DTCs are found, repair as required, then proceed to STEP 3.
3. Operate the heating and A/C system under the following conditions.
   - Engine at normal operating temperature
   - Engine at normal idle speed
   - No sun-load in the cabin of the vehicle
   - Vehicle doors and windows closed
   - Transmission in Park or Neutral with the park brake On.
   - A/C heater controls set to Recirculation mode, full cool, panel mode, high blower and with A/C compressor engaged. If the A/C compressor does not engage, see the **A/C SYSTEM DIAGNOSIS TABLE**.
   - All panel outlet vanes open and positioned straight rearward

   NOTE: **If the following step is not performed, the results of this test will not be accurate.**

4. Using a scan tool, operate the engine cooling fans at high speed from the PCM View>Actuators.
5. Insert a thermometer in the driver side center panel air outlet and operate the A/C system until the thermometer temperature stabilizes or a minimum of five minutes.

   NOTE: **This procedure requires you to know what the temperature and relative humidity is in your location at the time of the test.**

6. With the A/C clutch engaged, compare the observed panel outlet air temperature along with the ambient temperature of the work area and the relative humidity to the Maximum Panel Outlet Temperature chart.

Refer to **Fig. 3**

7. If the air outlet temperature fails to meet the specifications shown in **Fig. 3** the Maximum Panel Outlet Temperature chart, see the A/C SYSTEM DIAGNOSIS table.

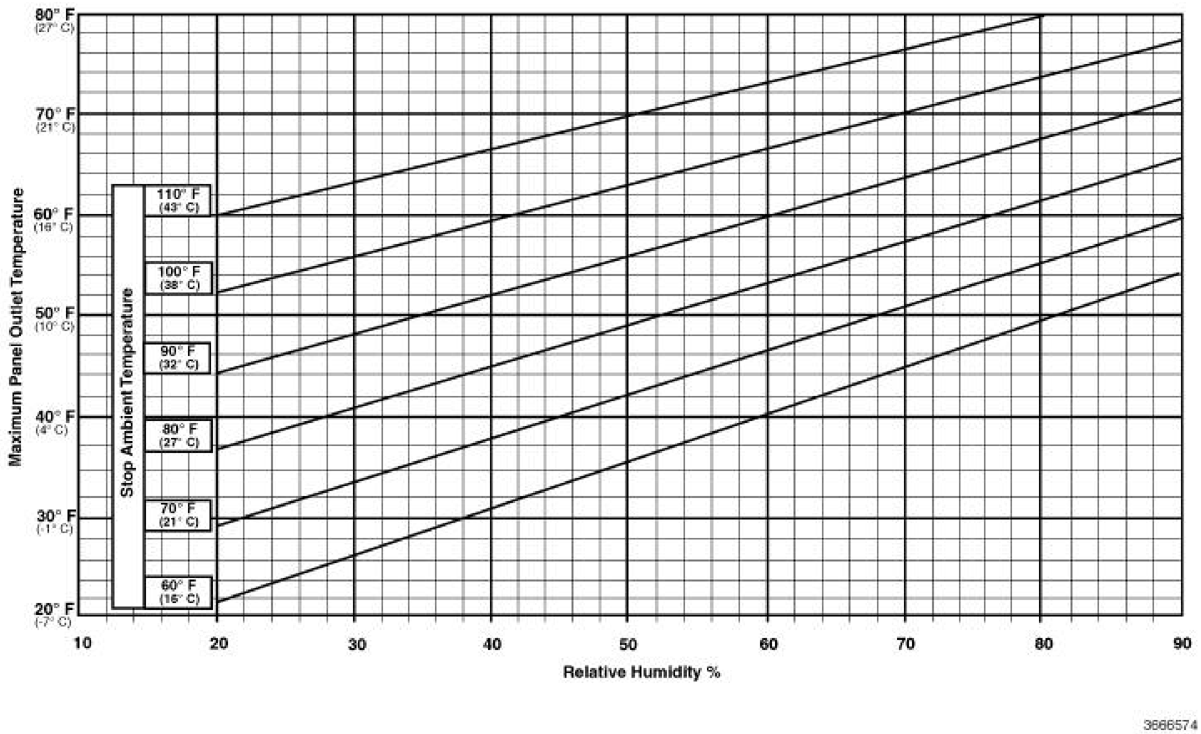


Fig. 3: Maximum Panel Outlet Temperature
Courtesy of CHRYSLER GROUP, LLC

A/C SYSTEM DIAGNOSIS

Condition	Possible Causes	Correction
Rapid A/C clutch cycling (ten or more cycles per minute).	1. Low refrigerant system charge.	1. See Refrigerant System Leaks in this service information, refer to **DIAGNOSIS AND TESTING** . Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
Equal pressures, but the A/C clutch does not engage.	1. No refrigerant in the refrigerant system.	1. See Refrigerant System Leaks in this service information, refer to **DIAGNOSIS AND TESTING** . Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
Ā	2. Open fuse.	2. See the appropriate Wiring Information. Check the fuses in the Power Distribution Center (PDC) and the Rear Power Distribution Center (PDC). Repair the shorted circuit or component and replace the fuse(s), if required.

Condition	Possible Causes	Correction
Ā	3. Inoperative A/C clutch.	3. See A/C Compressor in this service information, refer to **COMPRESSOR, A/C** . Test the A/C clutch and coil and replace, if required.
Ā	4. Improperly installed or inoperative evaporator temperature sensor.	4. See Evaporator Temperature Sensor in this service information, refer to **SENSOR, EVAPORATOR TEMPERATURE** . Test the sensor and replace, if required.
Ā	5. Inoperative A/C pressure transducer.	5. See A/C Pressure Transducer in this service information, refer to **TRANSDUCER, A/C PRESSURE** . Test the sensor and replace, if required.
Ā	6. Inoperative control module, CAN bus or wiring.	6. See the appropriate Electrical Diagnostic Procedures for testing of the modules and CAN bus, and see the appropriate Wiring Information for compressor control circuit repair, if required.
Normal pressures, but A/C Performance Test air temperatures at center panel outlet are too high.	1. Excessive refrigerant oil in system.	1. See Refrigerant Oil Level in this service information, refer to **STANDARD PROCEDURE**. Recover the refrigerant from the refrigerant system and inspect the refrigerant oil content. Restore the refrigerant oil to the proper level, if required.
Ā	2. Blend door actuator(s) improperly installed or inoperative.	2. See Blend Door Actuator in this service information, refer to **ACTUATOR, BLEND DOOR** . Inspect the actuator(s) for proper operation and replace, if required.
Ā	3. Blend-air door(s) inoperative or sealing improperly.	3. See HVAC Housing in this service information, refer to **HOUSING, HVAC** . Inspect the blend-air door(s) for proper operation and sealing. Repair if required.
The low side pressure is normal or slightly low, and the high side pressure is too low.	1. Low refrigerant system charge.	1. See Refrigerant System Leaks in this service information, refer to **DIAGNOSIS AND TESTING** . Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
Ā	2. Refrigerant flow through the A/C evaporator is restricted.	2. See A/C Evaporator in this service information, refer to **EVAPORATOR, A/C** . Replace the restricted A/C evaporator, if required.
Ā	3. Inoperative A/C compressor.	3. See A/C Compressor in this service information, refer to **COMPRESSOR, A/C** . Replace the A/C compressor, if required.

Condition	Possible Causes	Correction
The low side pressure is normal or slightly high, and the high side pressure is too high.	1. A/C condenser air flow restricted.	1. See A/C Condenser in this service information, refer to **CONDENSER, A/C** . Check the A/C condenser for damaged fins, foreign objects obstructing air flow through the condenser fins, and missing or improperly installed air seals. Clean, repair, or replace components as required.
Ā	2. Refrigerant flow through the A/C receiver/drier is restricted.	2. See A/C Receiver/Drier in this service information, refer to **DRIER, A/C RECEIVER** . Replace the restricted A/C receiver/drier, if required.
Ā	3. Inoperative radiator cooling fan.	3. See **ENGINE COOLING SYSTEM** . Test the radiator cooling fan and replace, if required.
Ā	4. Refrigerant system overcharged.	4. See Refrigerant System Charge in this service information, refer to **STANDARD PROCEDURE** . Recover the refrigerant from the refrigerant system. Charge the refrigerant system to the proper level, if required.
Ā	5. Air in the refrigerant system.	5. See Refrigerant System Leaks in this service information, refer to **DIAGNOSIS AND TESTING** . Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
Ā	6. Engine overheating.	6. See **ENGINE COOLING SYSTEM** . Test the engine cooling system and repair, if required.
The low side pressure is too high, and the high side pressure is too low.	1. Accessory drive belt slipping.	1. See **ENGINE COOLING SYSTEM** . Inspect the accessory drive belt condition and tension. Repair as required.
Ā	2. Inoperative A/C expansion valve.	2. See A/C Expansion Valve in this service information, refer to **VALVE, A/C EXPANSION** . Replace the valve, if required.
Ā	3. Inoperative A/C compressor.	3. See A/C Compressor in this service information, refer to **COMPRESSOR, A/C** . Replace the A/C compressor, if required.
The low side pressure is too low, and the high side pressure is too high.	1. Restricted refrigerant flow through the refrigerant lines.	1. See Liquid Line, Suction Line and Discharge Line in this service information, refer to **LINE, A/C DISCHARGE**, **LINE, A/C LIQUID** and **LINE, A/C SUCTION** . Inspect the refrigerant lines for kinks, tight bends or improper routing. Correct the routing or replace the refrigerant line, if

Condition	Possible Causes	Correction
		required.
Ā	2. Restricted refrigerant flow through the A/C expansion valve.	2. See A/C Expansion Valve in this service information, refer to **VALVE, A/C EXPANSION**. Replace the valve, if required.
Ā	3. Restricted refrigerant flow through the A/C condenser.	3. See A/C Condenser in this service information, refer to **CONDENSER, A/C** . Replace the restricted A/C condenser, if required.

HEATER PERFORMANCE

See **ENGINE COOLING SYSTEM** before performing the following tests. Check the engine coolant level and flow, engine coolant reserve/recovery system operation, accessory drive belt condition and tension, radiator air flow and the fan drive operation. Perform the A/C System Performance Test, which is found within the HVAC System Test. Refer to **STANDARD PROCEDURE** . If any Diagnostic Trouble Codes (DTCs) are found, repair as necessary. Refer to the **DTC INDEX** article.

MAXIMUM HEATER OUTPUT

Engine coolant is delivered to the heater core through two heater hoses. With the engine idling at normal operating temperature, set the temperature control to the full hot position, the mode control to the floor position, and the blower motor control to the highest speed position. Using a test thermometer, check the temperature of the air being discharged at the front floor outlets. Compare the test thermometer reading to the HEATER TEMPERATURE REFERENCE CHART.

HEATER TEMPERATURE REFERENCE

Ambient Air Temperature	**16Ā° C (60Ā° F)**	**21Ā° C (70Ā° F)**	**27Ā° C (80Ā° F)**	**32Ā° C (90Ā° F)**
Minimum Heater System Air Outlet Temperature	52Ā° C (125Ā° F)	56Ā° C (133Ā° F)	59Ā° C (139Ā° F)	62Ā° C (144Ā° F)

See **ENGINE COOLING SYSTEM** if the heater outlet air temperature is below the minimum specification. Both of the heater hoses should be hot to the touch. The coolant return heater hose should be slightly cooler than the coolant supply heater hose. If the return hose is much cooler than the supply hose, locate and repair the engine coolant flow obstruction in the cooling system.

OBSTRUCTED COOLANT FLOW

Possible locations or causes of obstructed coolant flow are as follows:

- Low coolant level
- Inoperative water pump
- Inoperative thermostat
- Pinched or kinked heater hoses
- Improper heater hose routing

- Plugged heater hoses or supply and return ports at the cooling system connections
- Plugged heater core

If proper coolant flow through the cooling system is verified, and heater outlet air temperature is low, a mechanical problem may exist.

MECHANICAL PROBLEMS

Possible locations or causes of insufficient heat due to mechanical problems are as follows:

- Obstructed cowl air intake
- Obstructed heater system outlets
- Inoperative engine thermostat
- Inoperative blower motor system
- Inoperative Heater, Ventilation and Air Conditioning Module (HVAC)
- Inoperative blend door actuator(s)
- Inoperative, obstructed or improperly installed blend-air door(s)
- Restricted cabin air filter

TEMPERATURE CONTROL

If the air outlet temperature cannot be adjusted with the temperature controls, the following may require service:

- Inoperative switchbank, U-Connect Touch ™ screen module or Heater, Ventilation and Air Conditioning Module (HVAC).
- Inoperative blend door actuator(s).
- Inoperative, obstructed or improperly installed blend-air door.
- Inoperative related wiring harness or connectors.

STANDARD PROCEDURE

STANDARD PROCEDURE - A/C EVAPORATOR CLEANING

Some vehicle operators may experience a musty odor from the A/C system, primarily at start up in hot and humid climates. This odor may be the result of microbial growth on the cooling coil. During normal A/C system operation, condensation forms in and around the A/C cooling coil. When airborne pollutants mix with this condensation, bacteria and fungi growth begins and odor may result.

If the vehicle operator experiences a musty odor when operating the A/C system, perform the following procedure.

WARNING: Always use eye protection, rubber gloves and protective clothing when performing the following procedure. Avoid continuous breathing of vapors from evaporator coil cleaning and sealing fluids. Avoid contact with skin and eyes. Failure to follow these instruction may result in possible serious or fatal injury.

1. On models equipped with a cabin air filter, remove the filter and inspect for dirt and debris. Refer to

FILTER, CABIN AIR, REMOVAL. Discard the used cabin filter if required.

2. Remove the cowl top panel. Refer to **COVER, COWL PANEL, REMOVAL** .
3. Clean any dirt and debris that may be present at the HVAC fresh air inlet screen and at the top of the cowl panel.
4. Install the cowl top panel. Refer to **COVER, COWL PANEL, INSTALLATION** .
5. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
6. Inspect the evaporator drain hose or tube (depending on application) for foreign material that may be blocking the drain and repair as necessary.
7. Once drain operation has been verified;
    - when equipped with a rubber drain hose, temporarily pinch the drain hose closed using an appropriate pair of heater hose pliers.
    - when equipped with a solid plastic drain tube, obtain an appropriate size rubber or plastic cap or plug and temporarily cap or plug the drain tube.
8. Remove the support and lower the vehicle.
9. Place a protective cover over the front passenger side floor and seat area.
10. Remove the blower motor. Refer to **MOTOR, BLOWER, REMOVAL**.
11. Remove the blower motor power module. Refer to **MODULE, POWER, BLOWER MOTOR, REMOVAL**.
12. Clean any dirt and debris that may be present inside the HVAC blower motor housing and all readily accessible areas inside the HVAC housing. If necessary, use a vacuum with a small flexible hose, and do not damage the evaporator core fins.
13. Using PSE Flex Spray Delivery Tool 534-62644 or equivalent, completely coat the entire surface of A/C evaporator with three bottles of MoparĀ® Cooling Coil Cleaner through the blower motor and power module or resistor openings. Be sure to use all of the coil cleaner in each container.
14. Allow the vehicle to sit for 30 minutes.
15. Raise and support the vehicle.

WARNING: Excess cooling coil cleaner will drain from the evaporator housing when the clamp, cap or plug is removed from the evaporator drain hose or tube. Always use eye protection, rubber gloves and protective clothing. Avoid continuous breathing of vapors from evaporator coil cleaning fluid. Avoid contact with skin and eyes. Failure to follow these instruction may result in possible serious or fatal injury.

16. Remove the previously installed clamp, cap or plug from the evaporator drain hose or tube and allow excess coil cleaner to drain from the HVAC housing.
17. Remove the support and lower the vehicle.
18. Refill the three empty coil cleaner bottles with clean tap water.
19. Using PSE Flex Spray Delivery Tool 534-62644 or equivalent, completely rinse the entire surface of A/C evaporator with the three bottles of clean tap water through the blower motor and power module openings. Be sure to use all of the water in each container.
20. Install the blower motor. Refer to **MOTOR, BLOWER, INSTALLATION**.
21. Install the blower motor power module. Refer to **MODULE, POWER, BLOWER MOTOR,**

..

INSTALLATION.

22. Disconnect the wire harness connector from the A/C compressor to disable compressor operation. Refer to **COMPRESSOR, A/C, REMOVAL**.
23. Start the engine
24. Adjust all the windows so they are open approximately 8 mm (0.5 in).
25. Set the A/C heater controls to the following:
    - air distribution to Panel and Recirculation mode
    - temperature to full heat
26. Allow the vehicle to run for 20 minutes.
27. Turn the engine off.
28. Raise and support the vehicle.
29. Inspect the evaporator drain hose or tube (depending on application) for foreign material that may have blocked the drain during evaporator coil cleaning and repair as necessary.
30. Once drain operation has been verified;
    - when equipped with a rubber drain hose, temporarily pinch the drain hose closed using an appropriate pair of heater hose pliers.
    - when equipped with a solid plastic drain tube, obtain an appropriate size rubber or plastic cap or plug and temporarily cap or plug the drain tube.
31. Remove the support and lower the vehicle.
32. Remove the blower motor. Refer to **MOTOR, BLOWER, REMOVAL**.
33. Remove the blower motor power module. Refer to **MODULE, POWER, BLOWER MOTOR, REMOVAL**.
34. Using PSE Flex Spray Delivery Tool 534-62644 or equivalent, completely coat the entire surface of A/C evaporator with one bottle of MoparÂ® Cooling Coil Coating through the blower motor and power module openings. Be sure to use all of the coil coating in the container.

NOTE: Be sure to thoroughly clean out the spray delivery tool with warm water once coil coating is complete to prevent damage to the tool.

35. Refill the empty bottles with clean warm tap water and completely rinse out the PSE Flex Spray Delivery Tool 534-62644, or equivalent.
36. Allow the vehicle to sit for 30 minutes.
37. Install the blower motor. Refer to **MOTOR, BLOWER, INSTALLATION**.
38. Install the blower motor power module. Refer to **MODULE, POWER, BLOWER MOTOR, INSTALLATION**.
39. Raise and support the vehicle.

WARNING: Excess cooling coil coating will drain from the evaporator housing when the clamp, cap or plug is removed from the evaporator drain hose or tube. Always use eye protection, rubber gloves and protective clothing. Avoid continuous breathing of vapors from evaporator coil sealing fluid. Avoid contact with skin and eyes. Failure to follow these instruction may result in possible serious or fatal injury.

40. Remove the previously installed clamp, cap or plug from the evaporator drain hose or tube and allow excess coil coating to drain from the HVAC housing.
41. Lower the vehicle.
42. Start the engine
43. Adjust all the windows so they are open approximately 8 mm (0.5 in).
44. Set the A/C heater controls to the following:
    - air distribution to Panel and Recirculation mode
    - temperature to full heat
45. Allow the vehicle to run for 20 minutes.
46. Turn vehicle off.
47. Remove protective cover from front passenger side floor and seat area.
48. On models equipped with a cabin air filter, install the filter. Refer to **FILTER, CABIN AIR, INSTALLATION**.
49. Connect the wire harness connector to the A/C compressor. Refer to **COMPRESSOR, A/C, INSTALLATION**.
50. Verify proper heating and A/C system operation.

SPECIFICATIONS

A/C SYSTEM

Item	Description	Notes
A/C Clutch Air Gap	0.35 - 0.60 mm (0.014 - 0.024 in.)	All Engines

CONTROLS

ACTUATOR, BLEND DOOR

DESCRIPTION

DESCRIPTION

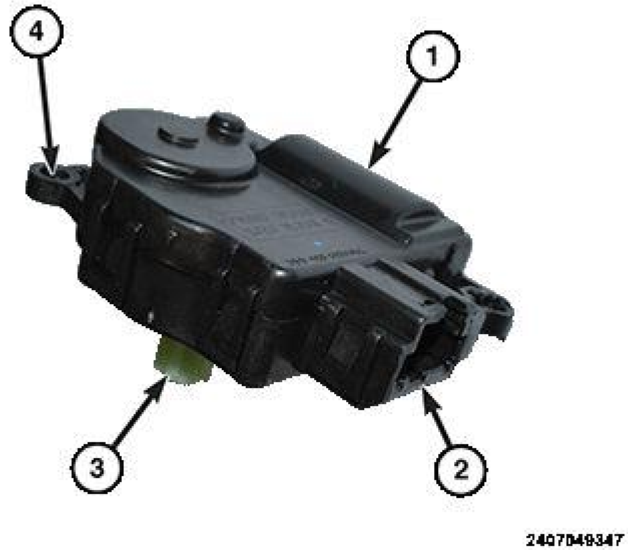

Fig. 4: Identifying Actuator Components
Courtesy of CHRYSLER GROUP, LLC

The two blend door actuators (1) for the Dual Zone heating and A/C system are reversible, 12 volt Direct Current (DC) servo motors. One blend door actuator is located on each side of the distribution housing.

The blend door actuators are contained within a black molded plastic case with an integral wire connector receptacle (2). An output shaft with splines (3) connect each blend door actuator to the respective blend door linkage. Three integral mounting tabs (4) allow each actuator to be secured to the air distribution housing.

The blend door actuators do not require mechanical indexing to the blend door linkage, as they are electronically calibrated by the Heater, Ventilation and Air Conditioning (HVAC) Module. The heating and A/C system must be re-calibrated each time an actuator motor is replaced. Refer to **STANDARD PROCEDURE** .

The blend door actuators are interchangeable with each other, and with the actuators for the recirculation and mode-air doors.

OPERATION

OPERATION

The two blend door actuators are connected to the Heater, Ventilation and Air Conditioning (HVAC) Module through the vehicle electrical system by dedicated two-wire lead and connectors of the HVAC wire harness. The blend door actuators can move the blend-air doors in two directions. When the HVAC module pulls the voltage on one side of the motor connection high and the other connection low, the blend-air door will move in one direction. When the HVAC module reverses the polarity of the voltage to the motor, the blend-air door moves in the opposite direction.

When the HVAC module makes the voltage to both connections high or both connections low, the blend-air doors stops and will not move. The HVAC module uses a pulse-count positioning system to monitor the operation and relative position of the blend door actuators and the blend-air doors. The HVAC module learns the blend-air doors stop positions during the calibration procedure and will store a Diagnostic Trouble Code (DTC) for any problems it detects in the blend door actuator circuits.

The blend door actuators are diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The blend door actuators cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system. Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: The Dual Zone heating and A/C system has two blend door actuators, one for the driver side and one for the passenger side.

LEFT SIDE

6. Install the push fasteners, connect the wire harness connector and install the instrument panel closeout (3).
7. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.
8. Initiate the Actuator Calibration function using a scan tool. Refer to **STANDARD PROCEDURE** .

ACTUATOR, MODE DOOR

DESCRIPTION

DESCRIPTION

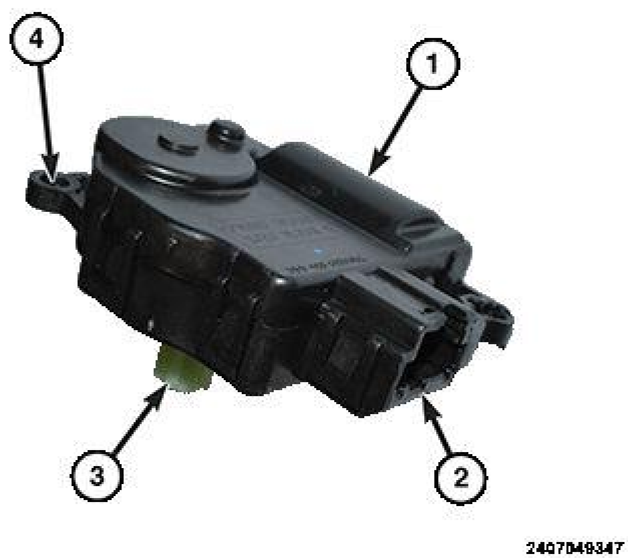

Fig. 13: Identifying Actuator Components
Courtesy of CHRYSLER GROUP, LLC

The mode door actuator (1) for the Dual Zone heating and A/C system is a reversible, 12 volt Direct Current (DC) servo motor, which is mechanically connected to the mode-air doors. The mode door actuator is located on the driver side end of the air distribution housing.

The mode door actuator is contained within a black molded plastic case with an integral wire connector receptacle (2). An output shaft with splines (3) connect it to mode door linkage and integral mounting tabs (4) allow the actuator to be secured to the air distribution housing.

The mode door actuator does not require mechanical indexing to the mode door linkage, as it is electronically calibrated by the Heater, Ventilation and Air Conditioning (HVAC) Module. The heating and A/C system must be re-calibrated each time an actuator motor is replaced. Refer to **STANDARD PROCEDURE** .

The mode door actuator is interchangeable with the actuators for the recirculation and blend-air doors.

OPERATION

OPERATION

The mode door actuator is connected to the Heater, Ventilation and Air Conditioning (HVAC) Module through the vehicle electrical system by a dedicated two-wire lead and connector of the HVAC wire harness.

The mode door actuator can move the floor, defrost/demist and the panel-air doors in two directions. When the HVAC module pulls the voltage on one side of the motor connection high and the other connection low, the mode-air doors will move in one direction. When the HVAC module reverses the polarity of the voltage to the motor, the mode-air doors moves in the opposite direction.

When the HVAC module makes the voltage to both connections high or both connections low, the mode-air doors stop and will not move. The HVAC module uses a pulse-count positioning system to monitor the operation and relative position of the mode door actuator and the mode-air doors. The HVAC module learns the mode-air doors stop position during the calibration procedure and will store a Diagnostic Trouble Code (DTC) for any problems it detects in the mode door actuator circuits.

The mode door actuator is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The mode door actuator cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system. Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

3. Install the two screws (4) that secure the mode door actuator (2) to the bracket (3) and securely tighten the screws.
4. Connect the HVAC wire harness connector (1) to the mode door actuator.
5. Install the steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
6. Install the left side instrument panel closeout.
7. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.
8. Initiate the Actuator Calibration function using a scan tool. Refer to **STANDARD PROCEDURE** .

ACTUATOR, RECIRCULATION DOOR

DESCRIPTION

DESCRIPTION

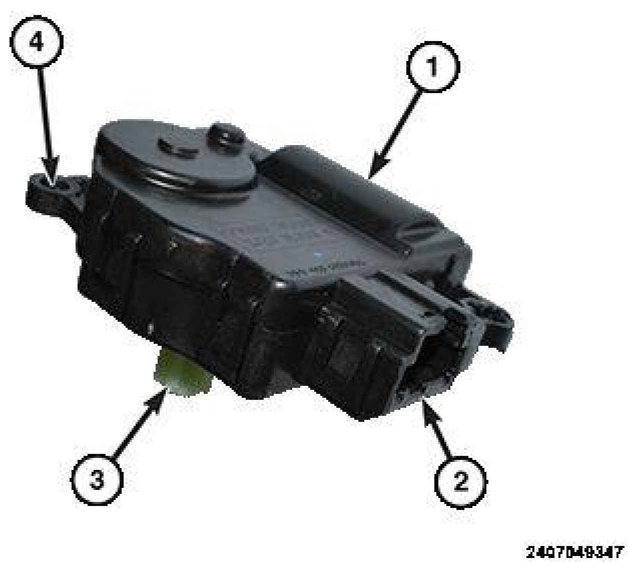

Fig. 17: Identifying Actuator Components
Courtesy of CHRYSLER GROUP, LLC

The recirculation door actuator (1) for the Dual Zone heating and A/C system is a reversible, 12 volt Direct Current (DC) servo motor, which is directly connected to the pivot shaft of the recirculation-air door. The recirculation door actuator is located on the left side of the air inlet housing.

The recirculation door actuator is contained within a black molded plastic case with an integral wire connector receptacle (2). An output shaft with splines (3) connect it to recirculation door shaft and integral mounting tabs (4) allow the actuator to be secured to the air inlet housing.

The recirculation door actuator does not require mechanical indexing to the recirculation-air door, as it is electronically calibrated by the Heater, Ventilation and Air Conditioning (HVAC) Module. The heating and A/C system must be re-calibrated each time an actuator motor is replaced. Refer to **STANDARD PROCEDURE** .

The recirculation door actuator is interchangeable with the actuators for the blend and mode air doors.

OPERATION

OPERATION

The recirculation door actuator is connected to the A/C heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the HVAC wire harness.

The recirculation door actuator can move the recirculation-air door in two directions. When the Heater, Ventilation and Air Conditioning (HVAC) module pulls the voltage on one side of the motor connection high and the other connection low, the recirculation-air door will move in one direction. When the HVAC module reverses the polarity of the voltage to the motor, the recirculation-air door moves in the opposite direction. When the HVAC module makes the voltage to both connections high or both connections low, the recirculation-air door stops and will not move.

The HVAC module uses a pulse-count positioning system to monitor the operation and relative position of the recirculation door actuator and the recirculation-air door. The HVAC module learns the recirculation-air door stop positions during the calibration procedure and will store a Diagnostic Trouble Code (DTC) for any problems it detects in the recirculation door actuator circuits.

The recirculation door actuator is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The recirculation door actuator cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system. Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

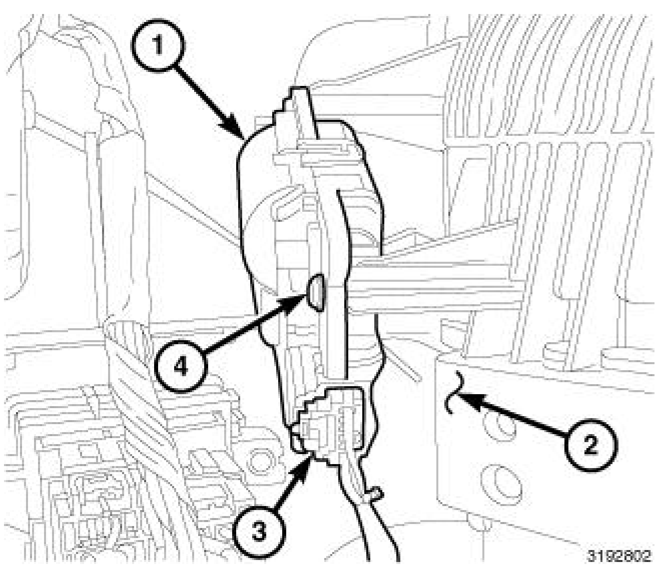

Fig. 18: Recirculation Door Actuator Removal/Installation

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Remove the glove box. Refer to **GLOVE BOX, INSTRUMENT PANEL, REMOVAL** .
3. Disconnect the HVAC wire harness connector (3) from the recirculation door actuator (1).
4. Remove the two screws (4) that secure the recirculation door actuator to the air inlet housing (2) and remove the actuator.

INSTALLATION

INSTALLATION

3. Install the two screws (4) that secure the recirculation door actuator (1) to the air inlet housing (2) and securely tighten the screws.
4. Connect the HVAC wire harness connector (3) to the recirculation door actuator.
5. Install the glove box. Refer to **GLOVE BOX, INSTRUMENT PANEL, INSTALLATION** .
6. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.
7. Initiate the Actuator Calibration function using a scan tool. Refer to **STANDARD PROCEDURE** .

CONTROL, A/C AND HEATER

DESCRIPTION

DESCRIPTION

A Manual Temperature Control (MTC) and an Automatic Temperature Control (ATC) Dual Zone heating and A/C system are available for this vehicle. The Dual Zone heating and A/C system allows both the driver and the front seat passenger the ability to individually regulate air temperature for their side of the vehicle. All controls are identified by International Standards Organization (ISO) graphic symbols.

The ATC heating and A/C system can automatically adjust the air temperature, airflow volume, airflow distribution and amount of inside air recirculation to maintain occupant comfort, even under changing outside weather conditions, and offers several manual override features, such as, fan speed, airflow distribution, defrost and recirculation modes.

Both heating and A/C systems provide the vehicle occupants with a number of options to help control climate and comfort within the vehicle (Refer to the Owner's Manual for more information on the features of the heating and A/C system).

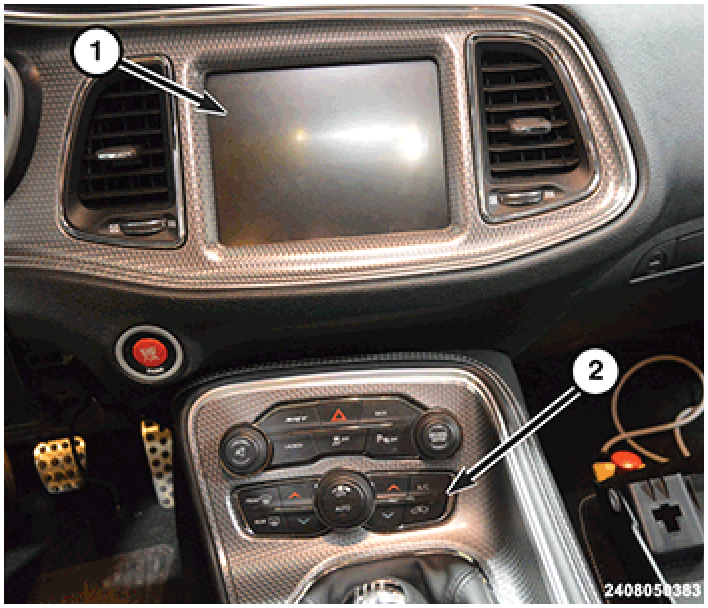

Fig. 21: Screen Module & Switch Bank
Courtesy of CHRYSLER GROUP, LLC

NOTE: Automatic Temperature Control (ATC) shown in the illustration. Manual Temperature Control (MTC) similar.

The controls for both of the Dual Zone heating and A/C systems are located in the U-Connect Touch ™ screen module (1) and on the switchbank (2) at the top of the center console.

OPERATION

AUTOMATIC TEMPERATURE CONTROL (ATC)

Each of the A/C heater controls in the front switchbank are resistor type controls. When a button is pushed, or a knob is turned, the switchbank sends a resistive signal over hard-wired circuits to the U-Connect Touch ™ screen module. The controls in the U-Connect Touch ™ screen module mimic the action selected on the switchbank. The U-Connect Touch ™ screen module communicates the heater and A/C control request signals to the Heater, Ventilation and Air Conditioning (HVAC) module.

The HVAC module is a dedicated microprocessor that automatically drives the electrically operated air-door actuators for the Dual Zone Automatic Temperature Control (ATC) heating and A/C systems. The ATC HVAC module obtains sun load, in-car temperature and evaporator temperature information through hard-wired circuits, and occupant heating and A/C settings and other required vehicle information over the Controller Area Network (CAN) data bus.

The Dual Zone ATC heating and A/C system is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

Prior to replacing an A/C heater control or HVAC module, check for any Diagnostic Trouble Codes (DTCs) related to the heating and A/C system, and run the calibration procedure to verify that the concern is not an air-door calibration issue. Refer to **STANDARD PROCEDURE** .

The individual A/C heater controls located in the switchbank cannot be adjusted or repaired. If an A/C heater control or control indicator lamp is inoperative or damaged, the entire switchbank pod must be replaced. Refer

to **POD, SWITCH BANK, REMOVAL** .

The individual A/C heater controls located in the U-Connect Touch ™ screen module cannot be adjusted or repaired. If an A/C heater control or control indicator lamp is inoperative or damaged, the entire U-Connect Touch ™ screen module must be replaced.

MANUAL TEMPERATURE CONTROL (MTC)

Each of the A/C heater controls in the front switchbank are resistor type controls. When a button is pushed, or a knob is turned, the switchbank sends a resistive signal over hard-wired circuits to the U-Connect Touch ™ screen module. The controls in the U-Connect Touch ™ screen module mimic the action selected on the switchbank. The U-Connect Touch ™ screen module communicates the heater and A/C control request signals to the Heater, Ventilation and Air Conditioning (HVAC) module.

The HVAC module is a dedicated microprocessor for the Dual Zone Manual Temperature Control (MTC) heating and A/C system. The MTC HVAC module obtains evaporator temperature information through hard-wired circuits, and occupant heating and A/C settings and other required vehicle information over the Controller Area Network (CAN) data bus.

The Dual Zone MTC heating and A/C system is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

Prior to replacing an A/C heater control or HVAC module, check for any Diagnostic Trouble Codes (DTCs) related to the heating and A/C system, and run the calibration procedure to verify that the concern is not an air-door calibration issue. Refer to **STANDARD PROCEDURE** .

The individual A/C heater controls located in the switchbank cannot be adjusted or repaired. If an A/C heater control or control indicator lamp is inoperative or damaged, the entire switchbank pod must be replaced. Refer to **POD, SWITCH BANK, REMOVAL** .

The individual A/C heater controls located in the U-Connect Touch ™ screen module cannot be adjusted or repaired. If an A/C heater control or control indicator lamp is inoperative or damaged, the entire U-Connect Touch ™ screen module must be replaced. .

MODULE, POWER, BLOWER MOTOR

DESCRIPTION

DESCRIPTION

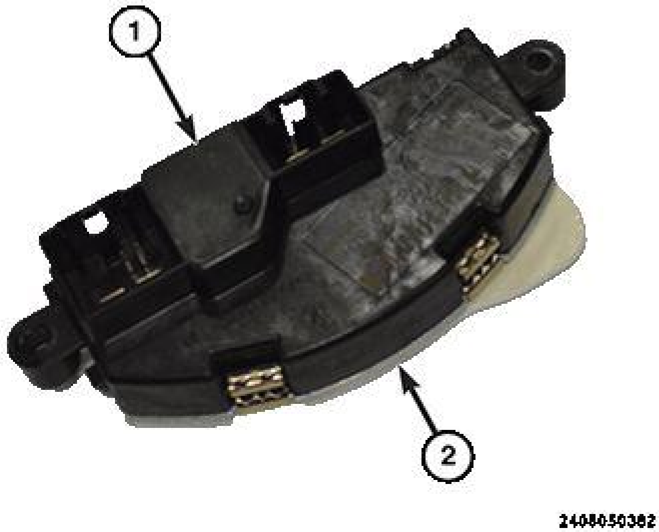

Fig. 22: Integral Connector Receptacles & Finned Aluminum Heat Sink
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Automatic Temperature Control (ATC) shown in the illustration. Manual Temperature Control (MTC) similar.**

Both the Automatic Temperature Control (ATC) and Manual Temperature Control (MTC) heating and A/C systems use a blower motor power module to control the blower motor speed.

The blower motor power module is mounted to the rear of the HVAC housing, directly behind the glove box. The blower motor power module consists of a molded plastic housing with integral wire connector receptacles (1) and mounting provisions. Concealed behind the housing is the power module electronic circuitry and a finned aluminum heat sink (2). The blower motor power module is located on the passenger side of the HVAC housing and is serviceable without removal of the HVAC housing.

The blower motor power module is accessed for service by removing the glove box.

OPERATION

OPERATION

The blower motor power module is connected to the vehicle electrical system through a dedicated lead and connector of the HVAC wire harness. A second lead and connector of the wire harness is connected to the blower motor.

On the Automatic Temperature Control (ATC) system, the blower motor power module allows the microprocessor-based Heater, Ventilation and Air Conditioning (HVAC) module to calculate and provide infinitely variable blower motor speeds based upon either manual blower switch input or the ATC programming.

On the Manual Temperature Control (MTC) system, the blower motor power module allows the HVAC module to provide a wide range of blower motor speeds throughout its operating range, based upon blower switch input.

Both the ATC and MTC systems use a Pulse Width Modulated (PWM) circuit strategy. PWM voltage is applied

to a comparator circuit which compares the PWM signal voltage to the blower motor feedback voltage. The resulting output drives the power module circuitry, which provides a linear output voltage to change or maintain the desired blower speed.

The blower motor power module is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The blower motor power module cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: **Disable the airbag system. Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.**

WARNING: **The heat sink for the blower motor power module may get very hot during normal operation. If the blower motor was turned on prior to servicing the blower motor power module, wait five minutes to allow the heat sink to cool before performing diagnosis or service. Failure to take this precaution may result in possible serious injury.**

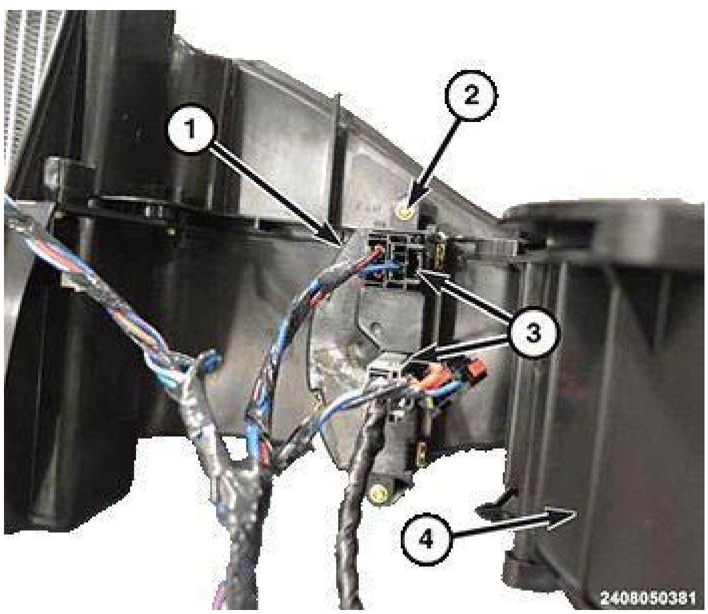

Fig. 23: Removing/Installing Blower Motor Power Module
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Remove the glove box. Refer to **GLOVE BOX, INSTRUMENT PANEL, REMOVAL** .

3. Disconnect the wire harness connectors (3) from the blower motor power module (1).
4. Remove the two screws (2) and the blower motor power module (1).

INSTALLATION

INSTALLATION

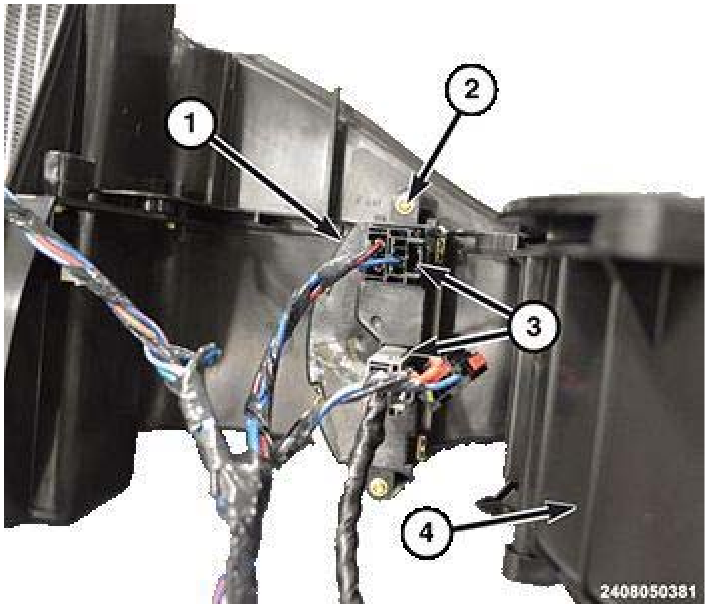

Fig. 24: Removing/Installing Blower Motor Power Module
Courtesy of CHRYSLER GROUP, LLC

1. Position the blower motor power module (1) into the HVAC housing (4).
2. Install the two screws (2) and securely tighten.
3. Connect the two wire harness connectors (3) to the blower motor power module.
4. Install the glove box. Refer to GLOVE BOX, INSTRUMENT PANEL, INSTALLATION .
5. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.

SENSOR, AMBIENT TEMPERATURE

DESCRIPTION

DESCRIPTION

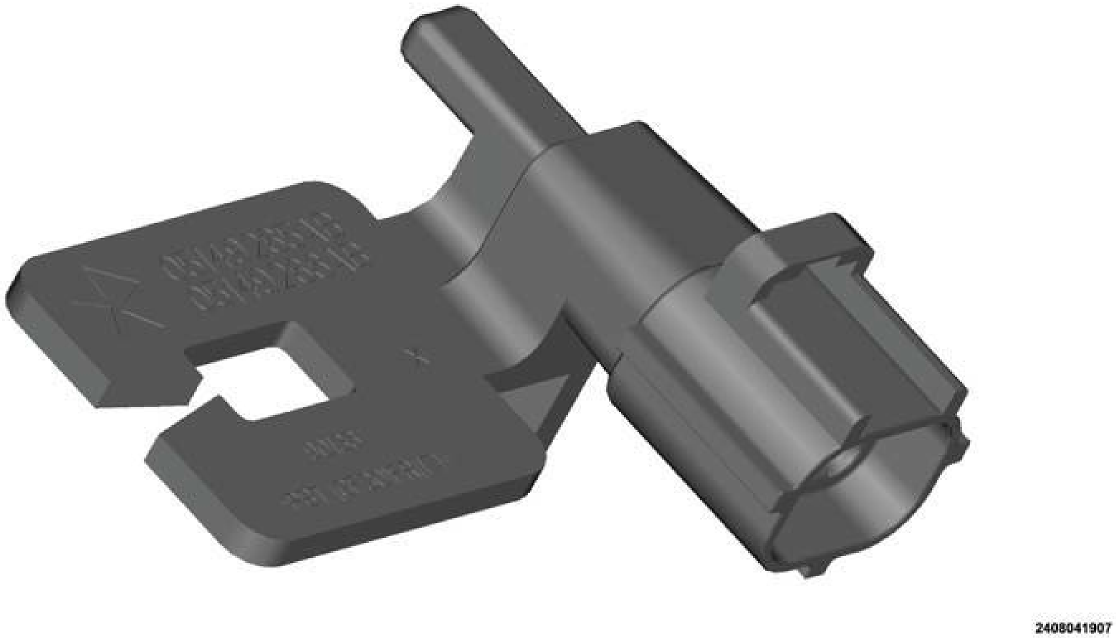

Fig. 25: Ambient Air Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

The ambient air temperature sensor is a variable resistor that monitors the air temperature outside of the vehicle. The Automatic Temperature Control (ATC) heating and A/C system uses the ambient air temperature sensor data to help maintain optimum passenger compartment temperature levels. The ambient air temperature sensor is mounted behind the grille on the right side.

OPERATION

OPERATION

The ambient air temperature sensor is a variable resistor that operates on a 5 volt Direct Current (DC) reference signal sent by the Body Control Module (BCM). The ambient air temperature sensor is connected to the BCM through a two-wire lead and connector of the vehicle wire harness. The ambient air temperature sensor changes its internal resistance in response to changes in the outside air temperature, which either increases or decreases the reference signal voltage read by the BCM. The BCM converts and broadcasts the sensor data over the Controller Area Network (CAN) data bus, where it is read by the A/C-heater control, Powertrain Control Module (PCM) and other vehicle control modules.

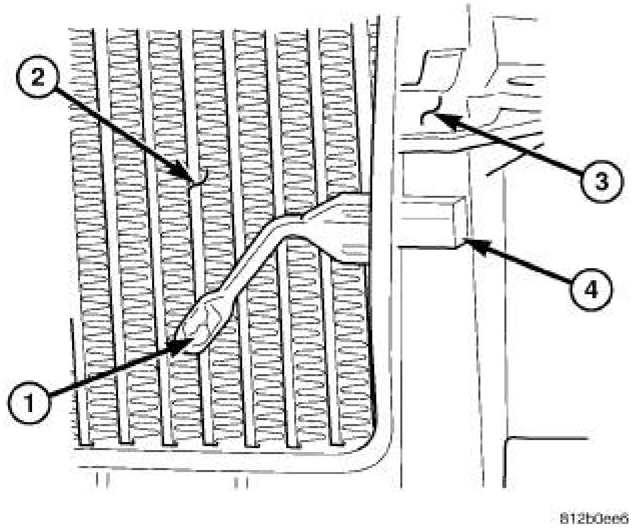
The ambient air temperature sensor is diagnosed using a scan tool. Refer to the **DTC INDEX** article. .

The ambient air temperature sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged. Refer to **SENSOR, AMBIENT TEMPERATURE, REMOVAL** .

SENSOR, EVAPORATOR TEMPERATURE

DESCRIPTION

DESCRIPTION



[Fig. 26: Evaporator Temperature Sensor, A/C Evaporator, HVAC Housing & Connector]
Courtesy of CHRYSLER GROUP, LLC

The evaporator temperature sensor (1) measures the temperature of the conditioned air downstream of the A/C evaporator (2). The evaporator temperature sensor is an electrical thermistor within a molded plastic case that is inserted into the HVAC housing (3) near the coldest point of the A/C evaporator. Two terminals within the connector receptacle (4) connect the sensor to the vehicle electrical system through a wire lead and connector of the HVAC wire harness.

The external location of the evaporator temperature sensor allows the sensor to be removed or installed without disturbing the refrigerant in the A/C system.

OPERATION

OPERATION

The evaporator temperature sensor monitors the temperature of the conditioned air downstream of the A/C evaporator and supplies an input signal to the HVAC module. The HVAC module uses the evaporator temperature sensor input signal to optimize A/C system performance and to protect the A/C system from evaporator freezing. The evaporator temperature sensor will change its internal resistance in response to the temperatures it monitors and is connected to the HVAC module through sensor ground circuit and a 5 volt Direct Current (DC) reference signal circuit. As the temperature of the A/C evaporator decreases, the internal resistance of the evaporator temperature sensor decreases.

The HVAC module uses the monitored voltage reading as an indication of evaporator temperature. The HVAC module is programmed to respond to this input by requesting the Powertrain Control Module (PCM) to cycle the A/C clutch as necessary to optimize A/C system performance and to protect the A/C system from evaporator freezing.

The evaporator temperature sensor is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The evaporator temperature sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

WARNING: Disable the airbag system. Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

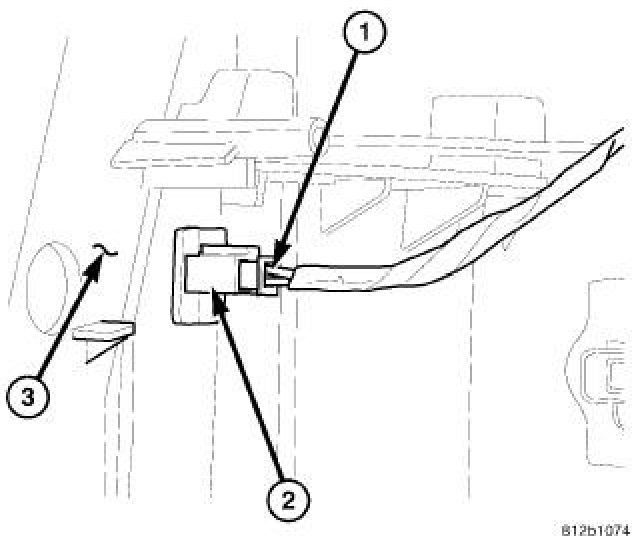


Fig. 27: Evap Temperature Sensor, Connector & HVAC Housing
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Remove the glove box. Refer to **GLOVE BOX, INSTRUMENT PANEL, REMOVAL** .
3. Disconnect the HVAC wire harness connector (1) from the evaporator temperature sensor (2), twist and remove the sensor.

INSTALLATION

INSTALLATION

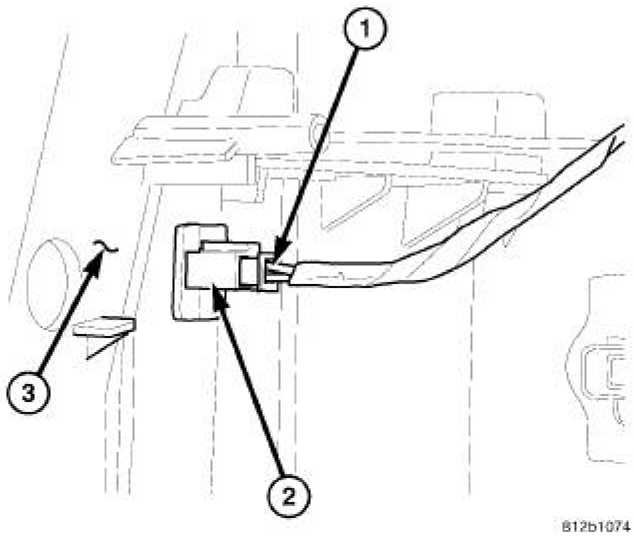

Fig. 28: Evap Temperature Sensor, Connector & HVAC Housing
Courtesy of CHRYSLER GROUP, LLC

1. Position the evaporator temperature sensor (2) into HVAC housing (3).
2. Connect the HVAC wire harness connector (1) to the evaporator temperature sensor (2).
3. Install the glove box. Refer to **GLOVE BOX, INSTRUMENT PANEL, INSTALLATION** .
4. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.

SENSOR, HUMIDITY

DESCRIPTION

DESCRIPTION

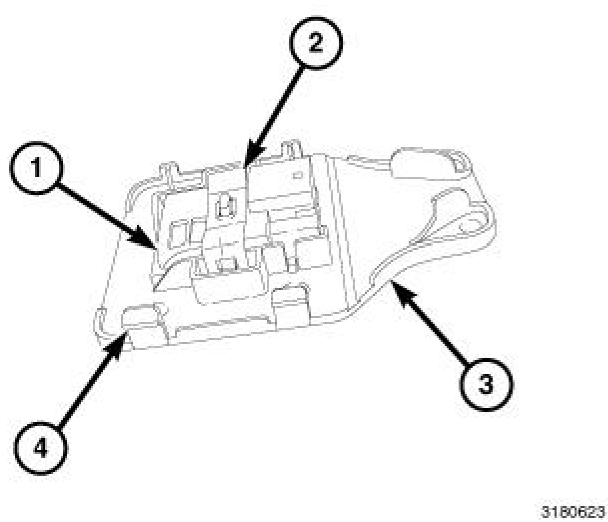

Fig. 29: Humidity Sensor, Bracket, Retaining Clip & Plastic Tabs
Courtesy of CHRYSLER GROUP, LLC

A humidity sensor (1) is used on Automatic Temperature Control (ATC) models to detect humidity levels inside the vehicle to optimize the dehumidifying effect of the A/C system. The humidity sensor is attached to a plastic bracket (3) by a metal retaining clip (2). The sensor bracket is attached to the inside of the windshield by an adhesive. A cover is attached to the sensor bracket by four plastic tabs (4). The humidity sensor is connected to the Body Control Module (BCM) by a dedicated three wire lead and connector that protrudes out from under the front of the headliner.

CAUTION: Use care when servicing the humidity sensor. The humidity sensor bracket cannot be serviced separately from the windshield. If the sensor bracket becomes damaged, the windshield will need to be replaced.

The humidity sensor can be serviced without the use of any special tools.

OPERATION

OPERATION

The humidity sensor detects humidity, dew point and windshield glass temperature, and sends this information to the Body Control Module (BCM) over a Local Interconnect Network (LIN) data bus connection. The BCM then broadcasts the message over the Controller Area Network (CAN) data bus to the HVAC module. The HVAC module automatically adjusts A/C clutch operation, amount of recirculated air, blower motor speeds and outlet modes to prevent fogging on the inside of the windshield glass. If the humidity sensor message is not received by the HVAC module, a Diagnostic Trouble Code (DTC) will set. The information the HVAC module receives from the humidity sensor can be viewed using a scan tool.

The humidity sensor is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The humidity sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

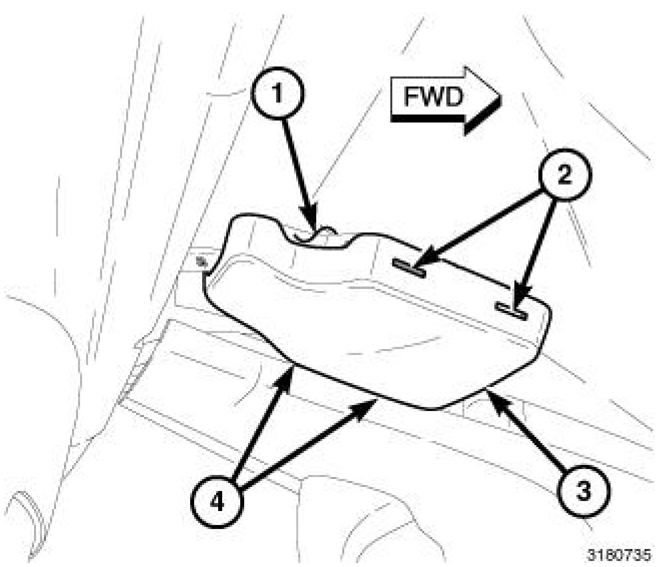

Fig. 30: Humidity Sensor Cover, Sensor Bracket & Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.

CAUTION: Use care when removing the humidity sensor cover. The humidity sensor bracket cannot be serviced separately from the windshield. If the sensor bracket becomes damaged, the windshield will need to be replaced.

2. Carefully disengage the four retaining tabs (2 and 4) that secure the cover (3) to the humidity sensor bracket (1) by pressing in on the right side of the cover, while rocking the left side of the cover off the bracket.

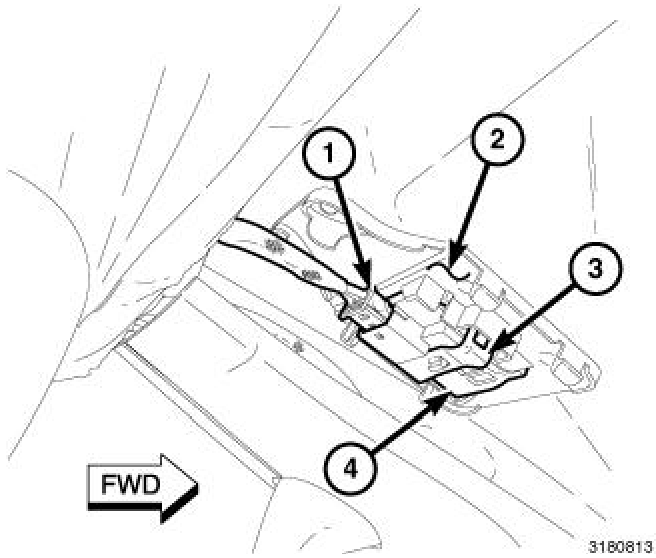

Fig. 31: Wire Harness Connector, Humidity Sensor, Bracket & Clip
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Use care when removing the humidity sensor. The humidity sensor bracket cannot be serviced separately from the windshield. If the sensor bracket becomes damaged, the windshield will need to be replaced.

3. Using a small screwdriver or similar tool, carefully disengage the metal retaining clip (3) from the sensor bracket (2) and remove the humidity sensor (4) and the clip as an assembly.
4. Disconnect the wire harness connector (1) from the humidity sensor.
5. If the humidity sensor bracket is damaged and cannot be reused, replace the windshield. Refer to **WINDSHIELD, REMOVAL** .

INSTALLATION

INSTALLATION

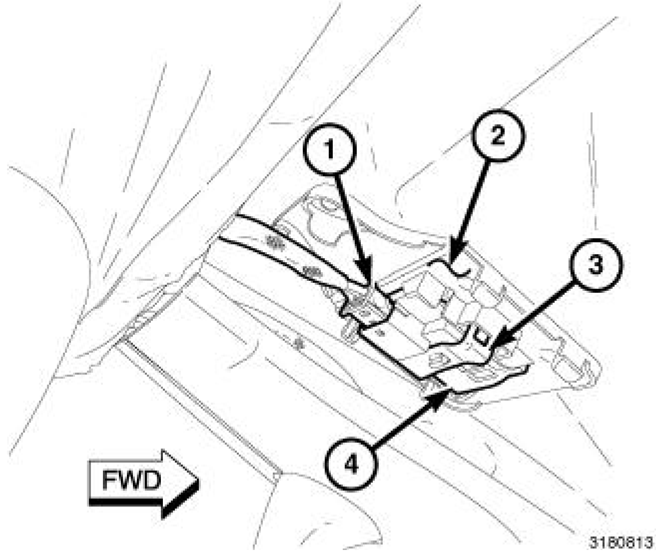

Fig. 32: Wire Harness Connector, Humidity Sensor, Bracket & Clip
Courtesy of CHRYSLER GROUP, LLC

1. If the humidity sensor bracket (1) is damaged and cannot be reused, install a new windshield. Refer to **WINDSHIELD, INSTALLATION** .
2. Connect the wire harness connector (1) to the humidity sensor (4).

CAUTION: Use care when installing the humidity sensor. The humidity sensor bracket cannot be serviced separately from the windshield. If the sensor bracket becomes damaged, the windshield will need to be replaced.

3. Position the humidity sensor to the sensor bracket (2) and engage the metal retaining clip (3) to the bracket. Make sure both sides of the retaining clip are fully engaged to the bracket.

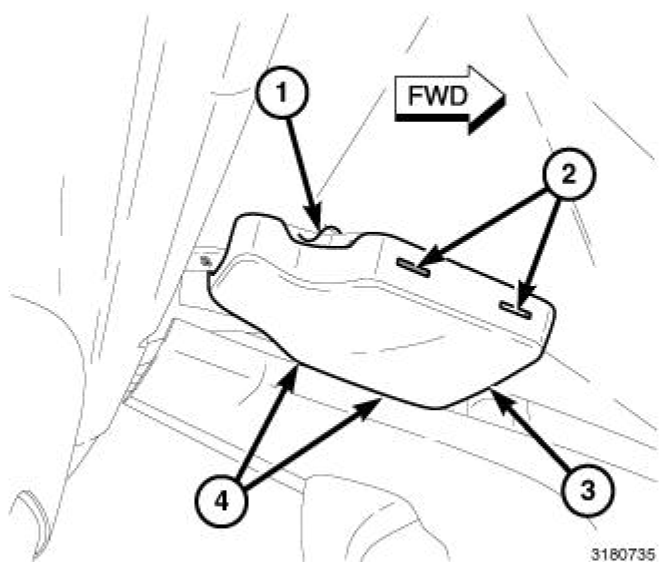

Fig. 33: Humidity Sensor Cover, Sensor Bracket & Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Use care when install the humidity sensor cover. The humidity sensor bracket cannot be serviced separately from the windshield. If the sensor

bracket becomes damaged, the windshield will need to be replaced.

4. Carefully install the humidity sensor cover (3) onto the sensor bracket (1). Make sure the four retaining tabs (2 and 4) are fully engaged to the bracket.
5. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.

SENSOR, SUN

DESCRIPTION

DESCRIPTION

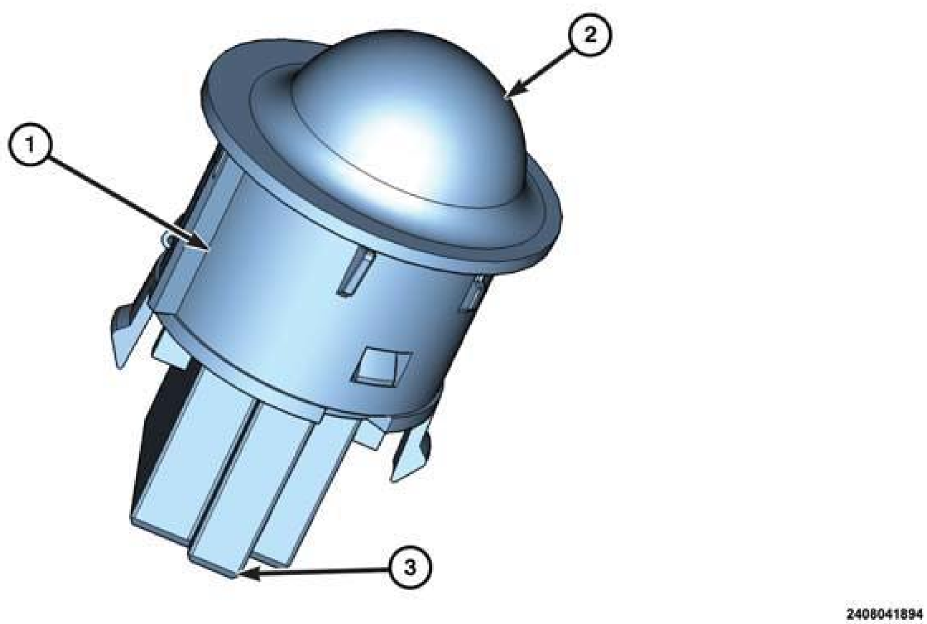

Fig. 34: Sun Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical sun sensor assembly shown in the illustration.

The Automatic Temperature Control (ATC) heating and A/C system uses a sun sensor assembly (1) to measure sun light intensity. The sun sensor assembly incorporates three sun sensors within a molded plastic case with a clear lens (2), that protrudes through the center of the defroster grille. The wire harness receptacle (3) connects the sun sensors to the vehicle electrical system through a wire lead and connector of the instrument panel wire harness.

OPERATION

OPERATION

The Automatic Temperature Control (ATC) Dual Zone heating and A/C system uses two sun sensors to balance the system in response to side-to-side variations of sun light intensity. Passengers in sun and shadow require different functional settings because they experience very different temperatures. The sun sensor assembly provides data to the HVAC module to help determine proper mode and blend-air door positions and blower motor speeds. The sun sensors are not thermistor type sensors, but rather photo diodes. For this reason the sun

sensors responds to sun light intensity rather than temperature. The sun sensor assembly is also used to sense day and night conditions for automatic headlight control, if equipped.

The sun sensor is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The sun sensor assembly cannot be adjusted or repaired and must be replaced if inoperative or damaged.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SUN SENSOR

WARNING: Disable the airbag system. Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in possible serious or fatal injury.

The sun sensor assembly is located so that the sun rays will hit the sensors in the same way that it will hit the driver and the passenger. It is important that the area in front of the sun sensor assembly be unobstructed. If the vehicle exhibits a lack of passenger comfort in sunny weather such as in the early afternoon, check for the following:

- Any items laying on top of the instrument panel are not covering the sun sensor.
- Any stickers on the windshield are not directly in front of the sun sensor.
- Confirm that the windshield wipers are properly adjusted.
- Confirm that the sun sensor is properly installed. Refer to **SENSOR, SUN, INSTALLATION**.
- Confirm that the defroster grille is properly installed. Refer to **GRILLE, DEFROSTER, INSTALLATION** .

The HVAC module continually monitors the sun sensor circuits and will store Diagnostic Trouble Codes (DTCs) for any problem it detects. The sun sensor can be tested in the vehicle with a scan tool. Refer to **DIAGNOSIS AND TESTING** .

REMOVAL

REMOVAL

WARNING: Disable the airbag system. Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in an accidental airbag deployment and possible serious or fatal injury.

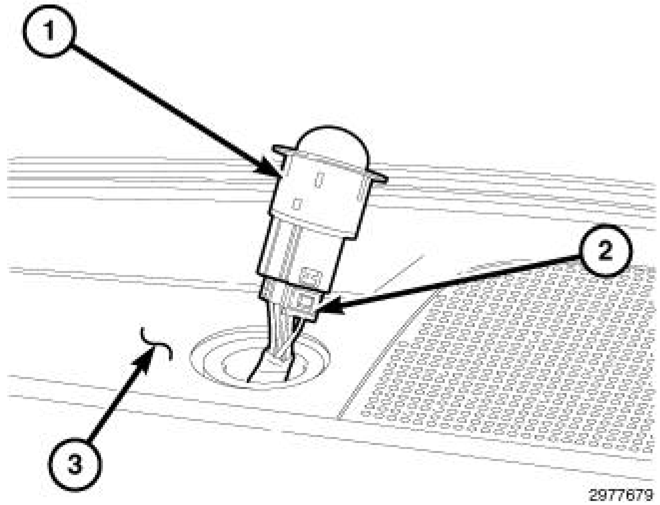

Fig. 35: Sun Sensor, Panel & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Using a small flat bladed tool, gently pry the sun sensor (1) out of the top of the instrument panel (3).
3. Disconnect the wire harness connector (2) and remove the sun sensor (1).

INSTALLATION

INSTALLATION

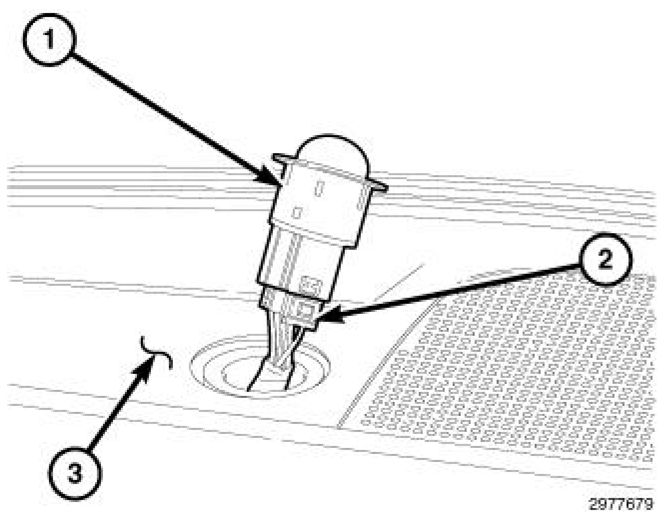

Fig. 36: Sun Sensor, Panel & Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Position the sun sensor (1) near the instrument panel (3).
2. Connect the wiring harness connector (2) to the sun sensor (1).
3. Align the tab on the sun sensor with the slot in the opening of the instrument panel and gently push the sensor into the instrument panel. Make sure the sensor is fully engaged and lies flat in the instrument

panel.

4. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.

SENSOR, TEMPERATURE, IN-CAR

DESCRIPTION

DESCRIPTION

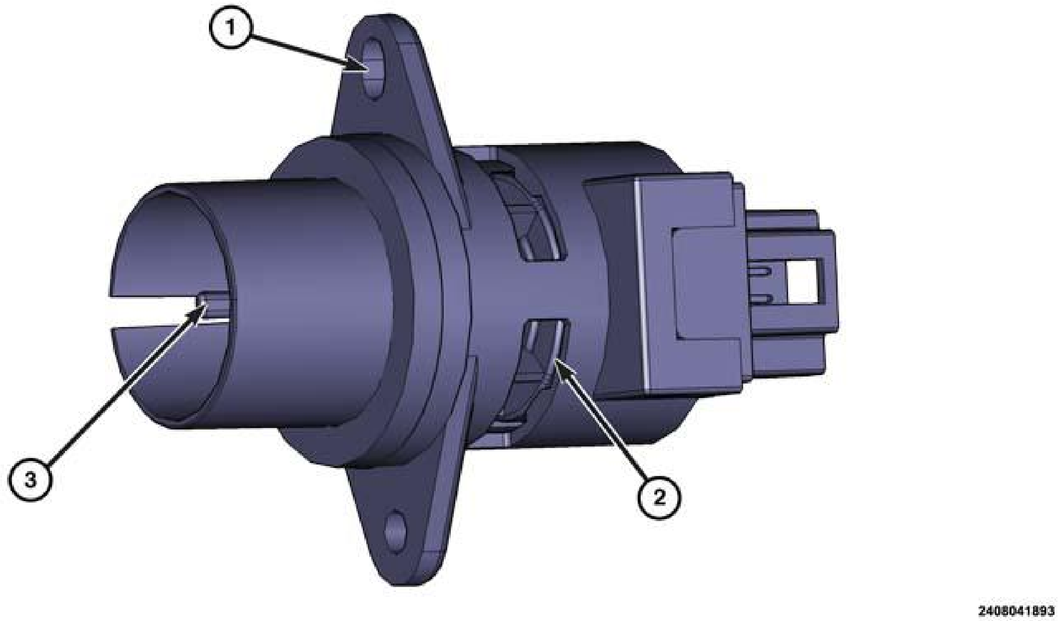

Fig. 37: In-Car Temperature Sensor, Aspirator Motor & Thermistor
Courtesy of CHRYSLER GROUP, LLC

The in-car temperature sensor is used in the Automatic Temperature Control (ATC) heating and A/C system. The in-car temperature sensor consists of an aspirator motor (2) and a temperature thermistor (3). The in-car temperature sensor sends a resistance signal to the HVAC module and is attached to the steering column cover, by integral mounting tabs (1).

OPERATION

OPERATION

Air is drawn from the passenger compartment by the aspirator motor and flows over the temperature thermistor. The thermistor changes resistance with air temperature. The Heater, Ventilation and Air Conditioning (HVAC) module for the Automatic Temperature Control (ATC) system receives the resistance signal over hard-wired circuits and calculates the temperature of the air in the passenger compartment. The ATC system then automatically makes adjustments to maintain the optimum passenger compartment comfort.

The in-car temperature sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - IN-CAR TEMPERATURE SENSOR

NOTE: **For complete circuit diagrams, refer to the appropriate Wiring Information. Wiring Information includes wiring diagrams, connector pin out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.**

Using a scan tool, check for Diagnostic Trouble Codes (DTCs) related to the in-car temperature sensor and the A/C heater module. If any DTCs are found, repair as necessary. Refer to **DIAGNOSIS AND TESTING** . If no DTCs are found, perform the two following tests. Replace the in-car temperature sensor if the sensor fails either test.

ASPIRATOR MOTOR TEST

The in-car temperature sensor uses an aspirator motor to draw air from the passenger compartment and flow the air over the temperature thermistor. Test the motor as follows:

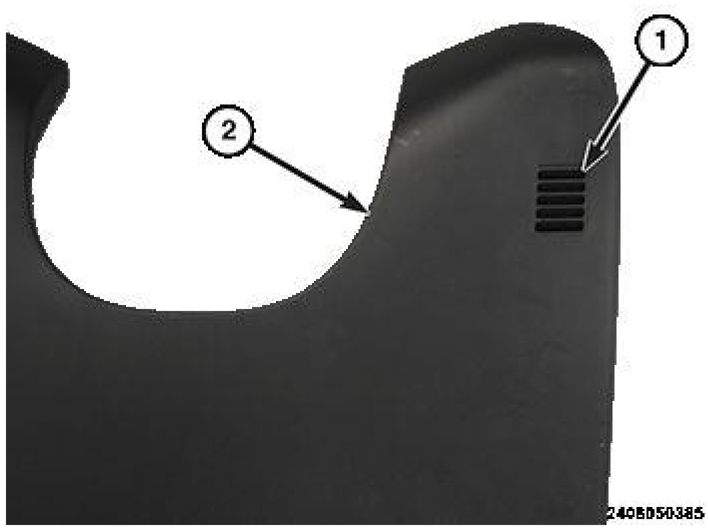

Fig. 38: Opening Grille & Opening Cover
Courtesy of CHRYSLER GROUP, LLC

1. Place the ignition in the Run position.
2. Place a small piece of newspaper in front of the aspirator motor opening grille (1), located on the steering column opening cover (2). If the paper sticks to the grille, the aspirator motor is operating properly. The piece of paper should be only large enough to cover the opening.
3. If the paper does not stick to the grille, check the in-car temperature sensor electrical connections and wiring. If connections and wiring are OK, replace the in-car temperature sensor.

TEMPERATURE THERMISTOR TEST

The in-car temperature sensor uses a temperature thermistor to provide resistance values that correlate with temperature change. Test the thermistor as follows:

1. Remove the in-car temperature sensor and place it on a workbench. Refer to **SENSOR, TEMPERATURE, IN-CAR, REMOVAL**.
2. Note the current ambient air temperature of the work area.

3. Use an ohm meter and check the resistance between pins 1 and 2 of the in-car temperature sensor. Compare the temperature of the work area to the found resistance value. The resistance should be within specifications as listed in the RESISTANCE AND TEMPERATURE CHART. If not OK, replace the in-car temperature sensor.

RESISTANCE AND TEMPERATURE		
AIR TEMPERATURE RANGE	LOW RESISTANCE RANGE (KILOHM)	HIGH RESISTANCE RANGE (KILOHM)
-21Ā° to -15Ā°C (-5Ā° to 5Ā°F)	292 Ā± 1.0	223 Ā± 0.9
-14Ā° to -9Ā°C (6Ā° to 15Ā°F)	198 Ā± 0.9	161 Ā± 0.8
-8Ā° to -4Ā°C (16Ā° to 25Ā°F)	144 Ā± 0.8	123 Ā± 0.8
-3Ā° to 1Ā°C (26Ā° to 35Ā°F)	111 Ā± 0.7	95 Ā± 0.7
2 to 7Ā°C (36Ā° to 45Ā°F)	86 Ā± 0.7	70 Ā± 0.6
8 to 12Ā°C (46Ā° to 55Ā°F)	64 Ā± 0.6	55 Ā± 0.5
13Ā° to 18Ā°C (56Ā° to 65Ā°F)	51 Ā± 0.5	42 Ā± 0.4
19Ā° to 23Ā°C (66Ā° to 75Ā°F)	39 Ā± 0.4	33 Ā± 0.3
24Ā° to 29Ā°C (76Ā° to 85Ā°F)	31 Ā± 0.3	26 Ā± 0.3
30Ā° to 35Ā°C (86Ā° to 95Ā°F)	24 Ā± 0.3	20 Ā± 0.3
36Ā° to 40Ā°C (96Ā° to 105Ā°F)	18 Ā± 0.3	16 Ā± 0.3
41Ā° to 46Ā°C (106Ā° to 115Ā°F)	15 Ā± 0.3	13 Ā± 0.3

REMOVAL

REMOVAL

WARNING: **Disable the airbag system. Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.**

NOTE: **Take the proper precautions to protect the face of the steering column opening cover from cosmetic damage while performing this procedure.**

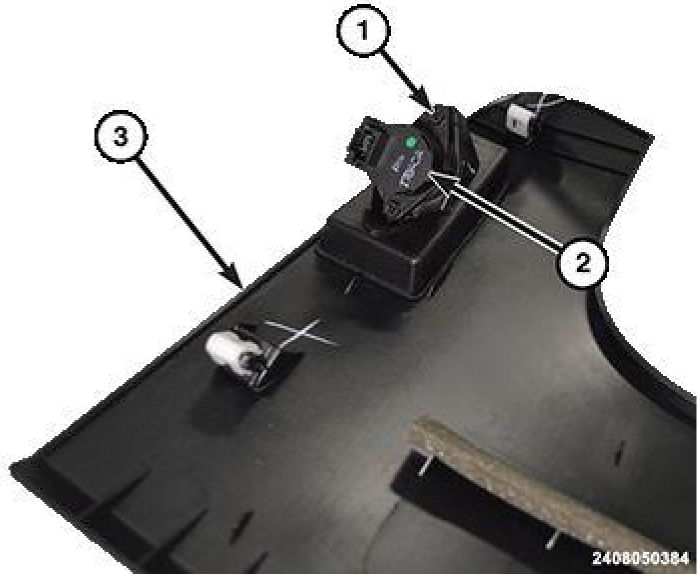

Fig. 39: Two Screws & In-Car Temperature Sensor
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Remove the steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, REMOVAL** .
3. Remove the two screws (1) and the in-car temperature sensor (2).

INSTALLATION

INSTALLATION

NOTE: **Take the proper precautions to protect the face of the steering column opening cover from cosmetic damage while performing this procedure.**

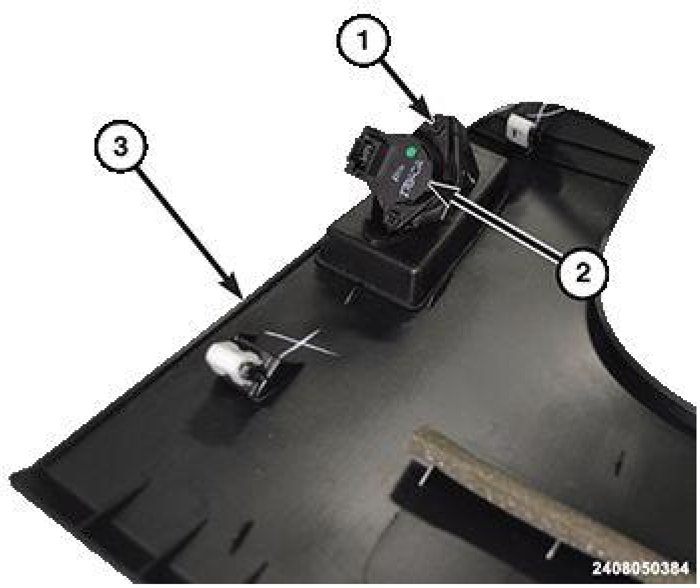

Fig. 40: Two Screws & In-Car Temperature Sensor

Courtesy of CHRYSLER GROUP, LLC

1. Position the in-car temperature sensor (2) onto the steering column opening cover (3).
2. Install the two screws (1) and securely tighten.
3. Install the steering column opening cover. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
4. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.

TRANSDUCER, A/C PRESSURE

DESCRIPTION

DESCRIPTION

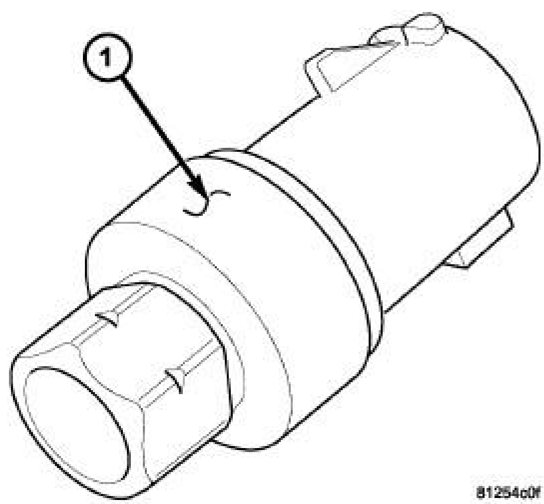

Fig. 41: A/C Pressure Transducer
Courtesy of CHRYSLER GROUP, LLC

The A/C pressure transducer (1) is a switch that is installed on a fitting located on the A/C liquid line. An internally threaded fitting on the A/C pressure transducer connects it to the externally threaded Schrader type fitting on the A/C liquid line. A rubber O-ring seals the connection between the A/C pressure transducer and the liquid line fitting. The A/C pressure transducer is connected to the vehicle electrical system by a molded plastic connector with three terminals.

OPERATION

OPERATION

The A/C pressure transducer monitors the pressures in the high side of the refrigerant system through its connection to a fitting on the A/C liquid line. The A/C pressure transducer will change its internal resistance in response to the pressures it monitors. A Schrader-type valve in the liquid line fitting permits the A/C pressure transducer to be removed or installed without disturbing the refrigerant in the A/C system.

The Powertrain Control Module (PCM) provides a five volt reference signal and a sensor ground to the A/C

pressure transducer, then monitors the output voltage of the A/C pressure transducer on a sensor return circuit to determine refrigerant pressure. The PCM is programmed to respond to the A/C pressure transducer and other sensor inputs and control the operation of the A/C clutch and the radiator cooling fan, to help optimize A/C system performance, and to protect the A/C system from damage.

The PCM will disengage the A/C clutch when high side pressure rises above 3082 kPa (447 psi) and reengage the clutch when high side pressure drops below 2937 kPa (426 psi). The A/C pressure transducer will also disengage the A/C clutch if the high side pressure drops below 110 kPa (16 psi) and will reengage the clutch when the high side pressure rises above 221 kPa (32 psi). If the refrigerant pressure rises above 1655 kPa (240 psi), the PCM will actuate the cooling fan. The A/C pressure transducer input to the PCM will also prevent the A/C clutch from engaging when ambient temperatures are below about 4.5Â°C (40Â°F) due to the pressure/temperature relationship of the refrigerant.

The A/C pressure transducer is tested using a scan tool. Refer to the **DTC INDEX** article. .

The A/C pressure transducer cannot be adjusted or repaired and must be replaced if inoperative or damaged.

REMOVAL

REMOVAL

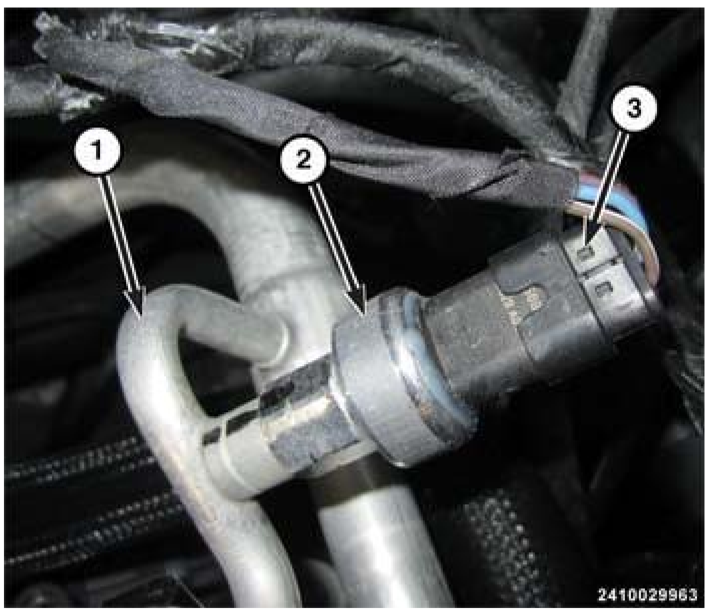

Fig. 42: Internal Heat Exchanger, Pressure Transducer & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: **It is not necessary to discharge the refrigerant system to replace the A/C pressure transducer.**

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Disconnect the wire harness connector (3) from the A/C pressure transducer (2).
3. Remove the A/C pressure transducer (2) from the Internal Heat Exchanger (1). Remove and discard the O-ring seal.

INSTALLATION

INSTALLATION

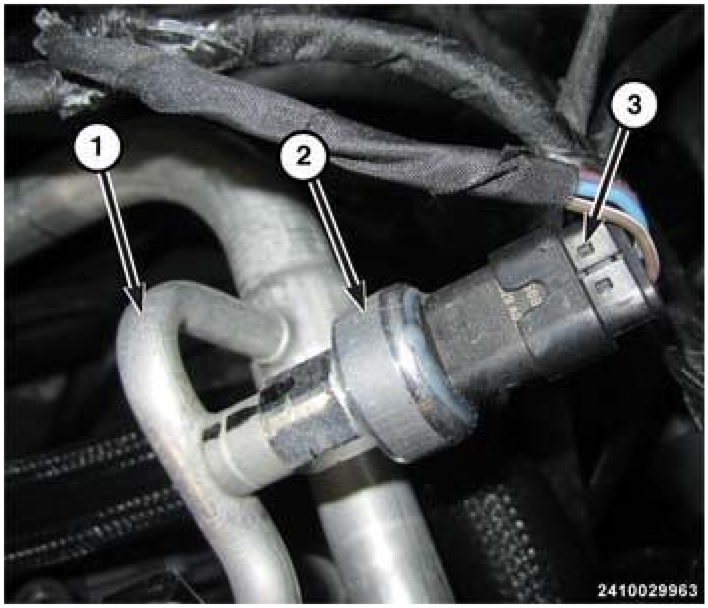

Fig. 43: Internal Heat Exchanger, Pressure Transducer & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Use only the specified O-ring as it is made of special material for this system. Use only refrigerant oil of the type required for the A/C compressor.**

1. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it onto the liquid line fitting.
2. Install the A/C pressure transducer (2) onto the Internal Heat Exchanger (1) and securely tighten the A/C pressure transducer (2).
3. Connect the wire harness connector (3) to the A/C pressure transducer (2).
4. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.

Courtesy of CHRYSLER GROUP, LLC

9. Position the front floor carpet (3) over the instrument panel bracket (2). Make sure the rear of the front floor carpet is fitted correctly over the floor panel crossmember and does not cover the rear floor air duct opening. Make sure the front of the front floor carpet is fitted under the instrument panel without interference with the steering column, the accelerator, nor the heater and air conditioner unit.
10. Install the instrument panel bracket bolt (1) and tighten securely.
11. Install the front seats. Refer to **SEAT, FRONT, INSTALLATION** .
12. Install the floor console. Refer to **CONSOLE, FLOOR, INSTALLATION** .

DUCT, INSTRUMENT PANEL

REMOVAL

REMOVAL

WARNING: On vehicles equipped with airbags, refer to RESTRAINTS - SERVICE

INFORMATION . Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

NOTE: **Take the proper precautions to protect the front face of the instrument panel from cosmetic damage.**

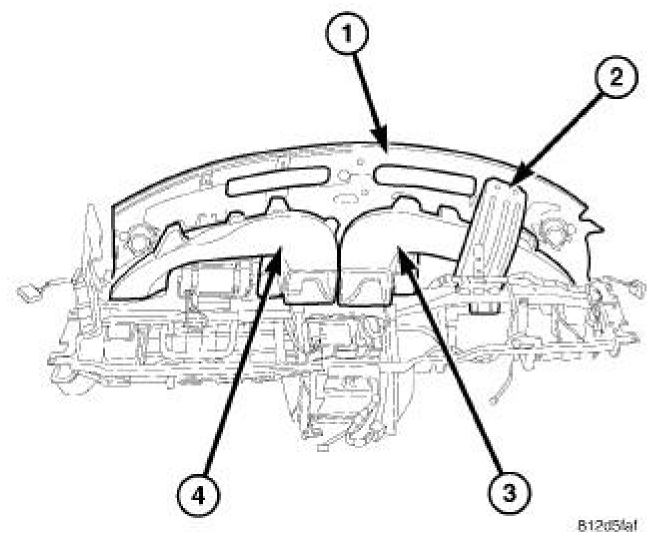

Fig. 54: Removing/Installing Instrument Panel Ducts
Courtesy of CHRYSLER GROUP, LLC

1. Remove the instrument panel and place it on a workbench. Refer to **PANEL, INSTRUMENT, REMOVAL** .
2. Remove the screw that secures the instrument panel top pad (1) to the reinforcement bracket (2).
3. Remove the four screws that secure the driver side instrument panel duct and demister duct assembly (3) to the instrument panel and remove the duct assembly.
4. Remove the four screws that secure the passenger side instrument panel duct and demister duct assembly (4) to the instrument panel and remove the duct assembly.
5. Remove the push-pin fastener that secures the left side demister duct to the right side demister duct and remove the demisters.

INSTALLATION

INSTALLATION

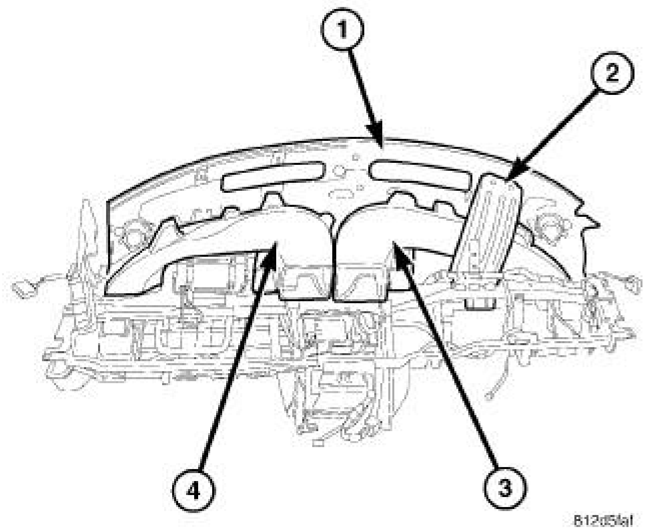

Fig. 55: Removing/Installing Instrument Panel Ducts
Courtesy of CHRYSLER GROUP, LLC

1. Position the passenger side instrument panel duct and demister duct assembly (4) into the instrument panel.
2. Install the passenger side instrument panel duct and demister duct assembly onto the outlets of the instrument panel. Make sure that the ducts are correctly installed over the instrument panel and demister outlet seals.
3. Install the four screws that secure the passenger side instrument panel duct and demister duct assembly to the instrument panel and securely tighten.
4. Position the driver side instrument panel duct and demister duct assembly (3) into the instrument panel.
5. Install the driver side instrument panel duct and demister duct assembly onto the outlets of the instrument panel. Make sure that the ducts are correctly installed over the instrument panel and demister outlet seals.
6. Install the four screws that secure the driver side instrument panel duct and demister duct assembly to the instrument panel and securely tighten.
7. Install the push-pin fastener that secures the left side demister duct to the right side demister duct.
8. Install the screw that secures the instrument panel top pad (1) to the reinforcement bracket (2) and securely tighten.
9. Install the instrument panel. Refer to **PANEL, INSTRUMENT, INSTALLATION** .

FILTER, CABIN AIR

DESCRIPTION

DESCRIPTION

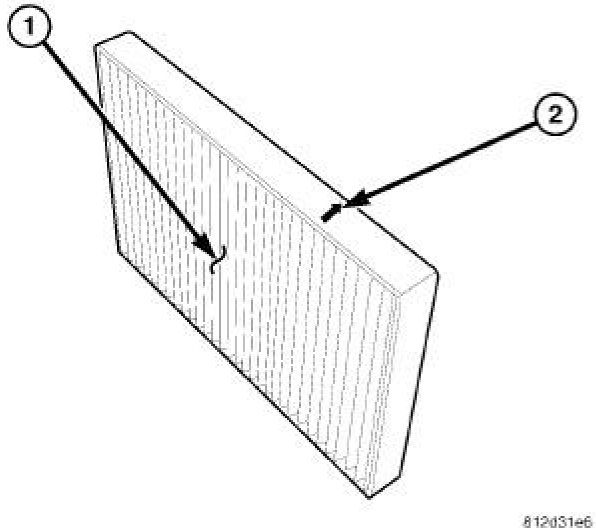

Fig. 56: Cabin Air Filter
Courtesy of CHRYSLER GROUP, LLC

All models are equipped with a cabin air filter (1) that helps purify the outside air entering the HVAC housing. The filter is mounted in the engine compartment, inside of the fresh air inlet housing of the heating-A/C system.

The filter should be replaced at least every 32, 000 km (20, 000 miles) or each year and checked if heating-A/C system performance seems lower than expected. The cabin air filter is labeled with "REAR OF VEHICLE" and an arrow (2) to indicate air flow direction through the filter.

REMOVAL

REMOVAL

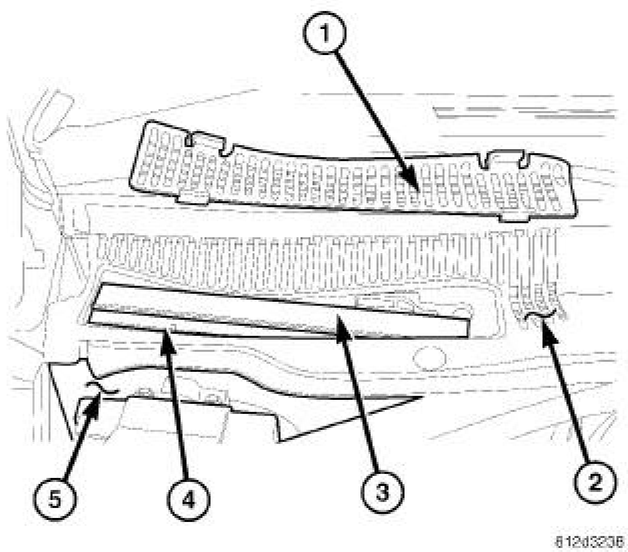

Fig. 57: Removing/Installing Particulate Air Filter
Courtesy of CHRYSLER GROUP, LLC

1. Remove the air inlet grille (1) from the wiper module screen (2) located near the dash panel in the engine

compartment.

2. Open the filter door (3) on the top of the cabin air filter housing (4) located inside of the dash panel plenum (5).

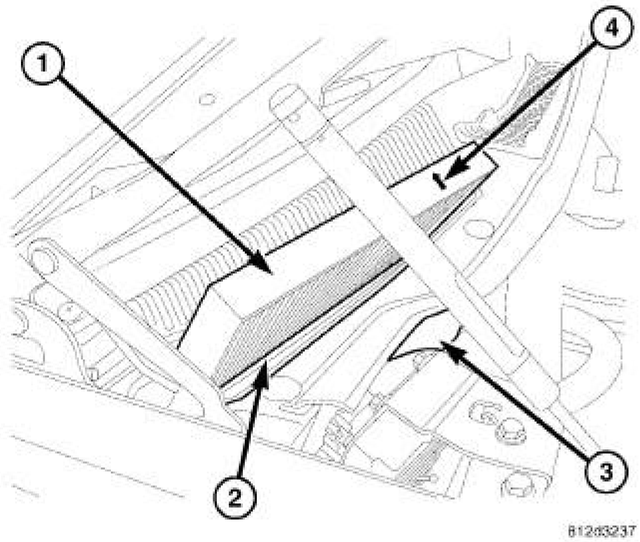

Fig. 58: Removing/Installing Particulate Air Filter
Courtesy of CHRYSLER GROUP, LLC

NOTE: **To aid in reinstallation, note the installed position of the cabin air filter prior to removal of the filter.**

3. Remove the cabin air filter (1) from the cabin air filter housing (2) located inside of the dash panel plenum (3). Note the direction of air flow indicated by an arrow (4) on the filter.

INSTALLATION

INSTALLATION

NOTE: **The cabin air filter is labeled with "REAR OF VEHICLE" and an arrow to indicate air flow direction through the filter. Make sure to properly install the cabin air filter. Failure to properly install the filter will result in the need to replace the filter sooner than required by design.**

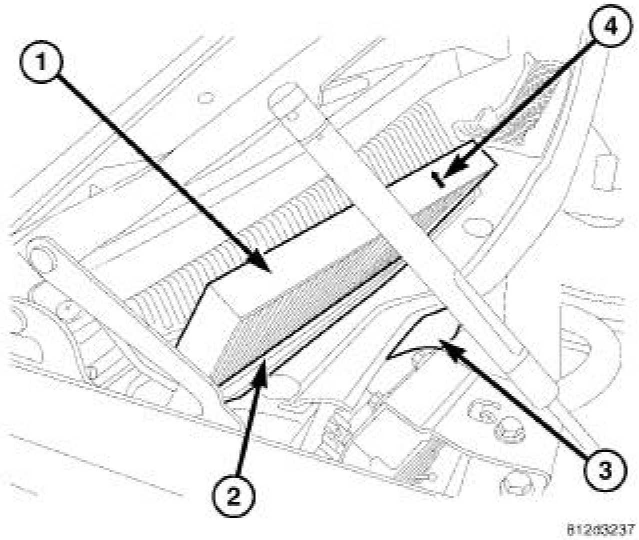

Fig. 59: Removing/Installing Particulate Air Filter
Courtesy of CHRYSLER GROUP, LLC

1. Install the cabin air filter (1) into the cabin air filter housing (2) located inside of the dash panel plenum (3). Insert the cabin air filter down directly into the filter housing with the arrow (4) on the filter pointing to the rear of the vehicle. The cabin air filter is held in place by friction between the filter element and the filter housing, so no fasteners are required.

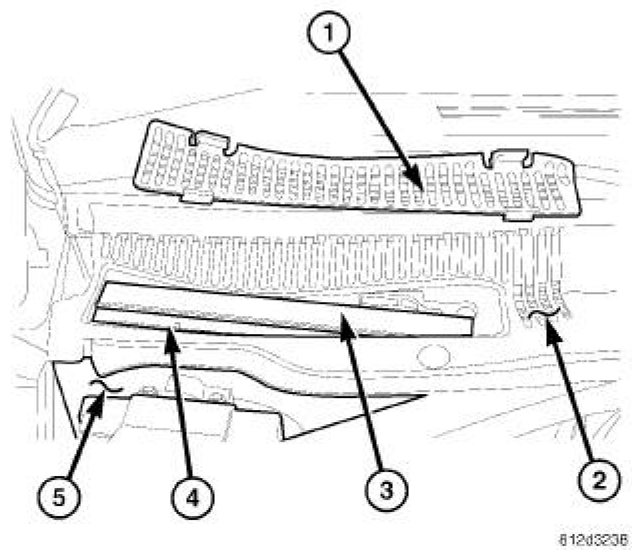

Fig. 60: Removing/Installing Particulate Air Filter
Courtesy of CHRYSLER GROUP, LLC

2. Close the filter door (3) on the top of the cabin air filter housing (4) located inside of the dash panel plenum (5).
3. Install the air inlet grille (1) onto the wiper module screen (2).

HOUSING, HVAC

REMOVAL

HOUSING - AIR DISTRIBUTION

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

WARNING: Disable the airbag system. Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

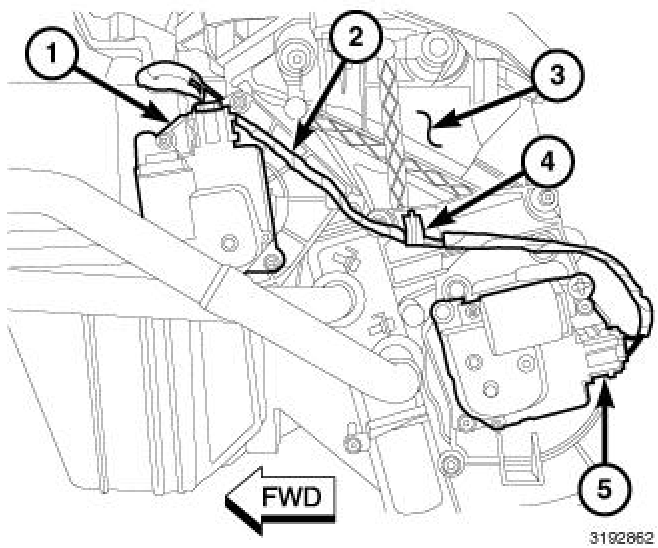

Fig. 61: HVAC Wire Harness, Mode Door Actuator, Blend Door Actuator & Air Distribution Housing
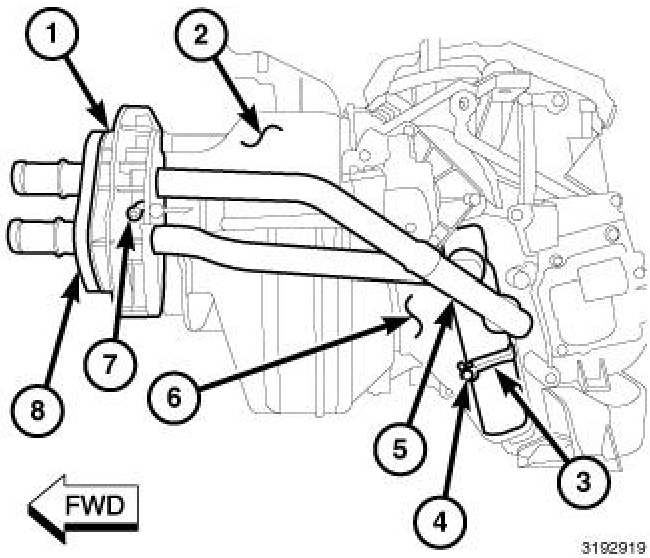
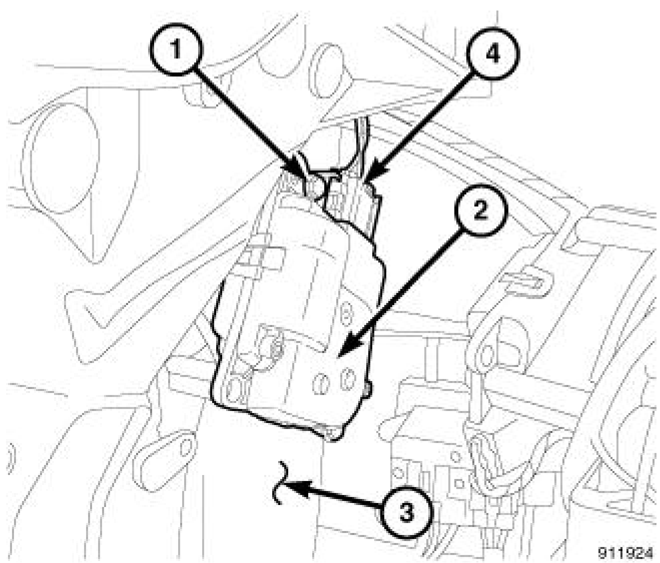
Courtesy of CHRYSLER GROUP, LLC

1. Remove the HVAC housing assembly and place it on a suitable workbench. Refer to **HOUSING, HVAC, REMOVAL**.
2. Disconnect the HVAC wire harness (2) from the mode door actuator (5) and the blend door actuator (1), located on the left side of the air distribution housing (3).
3. Disengage the HVAC wire harness from the retaining tab (4).



[Fig. 62: Screw, Flange, HVAC Housing, Retaining Screw, Bracket & Housing]
Courtesy of CHRYSLER GROUP, LLC

4. Remove the screw (7) that secure the flange (1) to the front of the HVAC housing (2) and remove the flange.
5. Remove the retaining screw (4) that secures the heater core bracket (3) to the driver side of the air distribution housing (6) and remove the bracket.
6. Disengage the heater core tubes from the foam seal (8) and carefully pull the heater core (5) straight out of the side of the air distribution housing.



[Fig. 63: Blend Door Actuator, Distribution Housing, Wire Harness Connector & Screws]
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect the HVAC wire harness (4) from the blend door actuator (2) located on the passenger side of the air distribution housing (3).

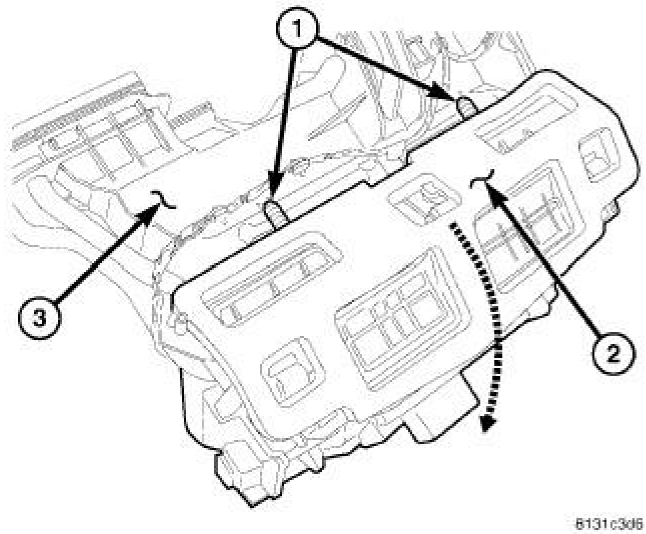


Fig. 64: HVAC Housing, Air Distribution Housing & Screws
Courtesy of CHRYSLER GROUP, LLC

8. Remove the two screws (1) and disengage the two tabs that secure the top of the air distribution housing (2) to the HVAC housing (3).
9. Tilt the top of the air distribution housing downward and disengage the two tab-and-slot type retainers, located at the bottom of the housing and remove.

HOUSING - AIR INLET

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

WARNING: Disable the airbag system. Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible serious or fatal inury.

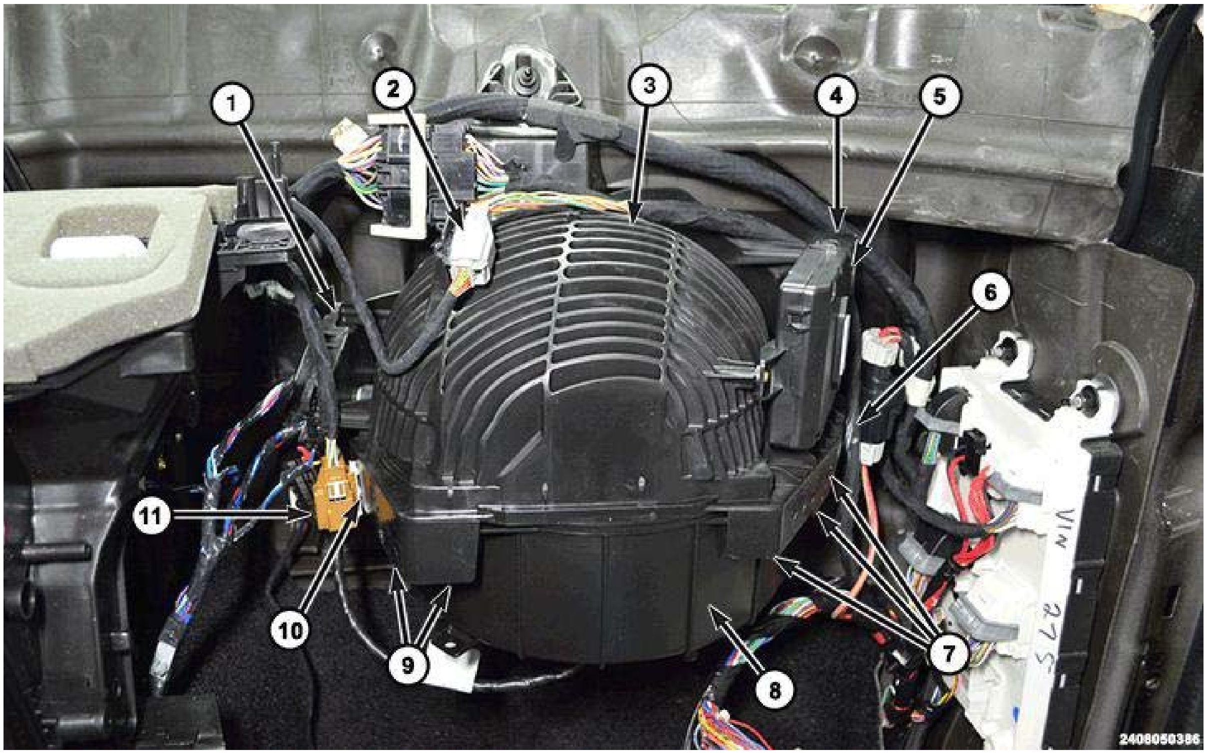

Fig. 65: Wire Harness Connector, Door Actuator, Wire Harness Connector & Air Inlet Housing
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.**

1. Remove the HVAC housing assembly and place it on a workbench. Refer to **HOUSING, HVAC, REMOVAL**.
2. Remove the three screws and the HVAC module (4).
3. Remove the five screws (7 and 9) and separate the air inlet housing (3) from the HVAC housing (8).

HOUSING - FRESH AIR INLET

WARNING: **Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.**

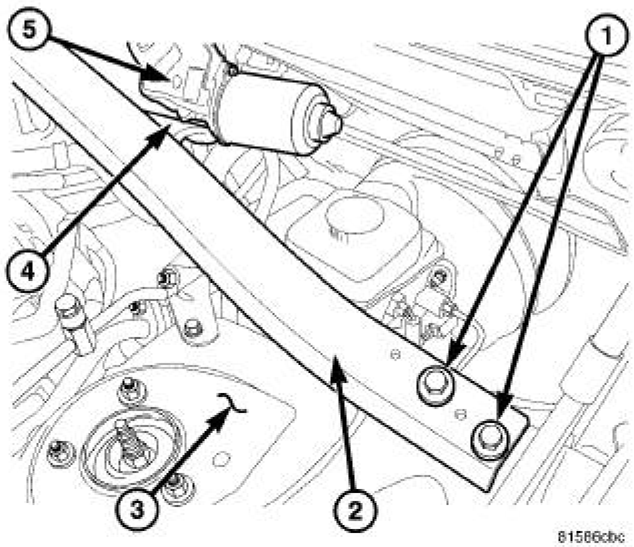

Fig. 66: Bolts, Strut Support, Driver Side Strut Tower, Bracket & Wiper Motor
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The fresh air inlet housing must be removed from the vehicle for removal of the HVAC housing.**

1. Disconnect and isolate the negative battery cable.
2. Remove the cowl top panel from the dash panel. Refer to COVER, COWL PANEL, REMOVAL .
3. Remove the two bolts (1) that secure the strut tower support (2) to the driver side strut tower (3).
4. Disengage the wiper motor (5) from the bracket (4) located on the strut tower support.

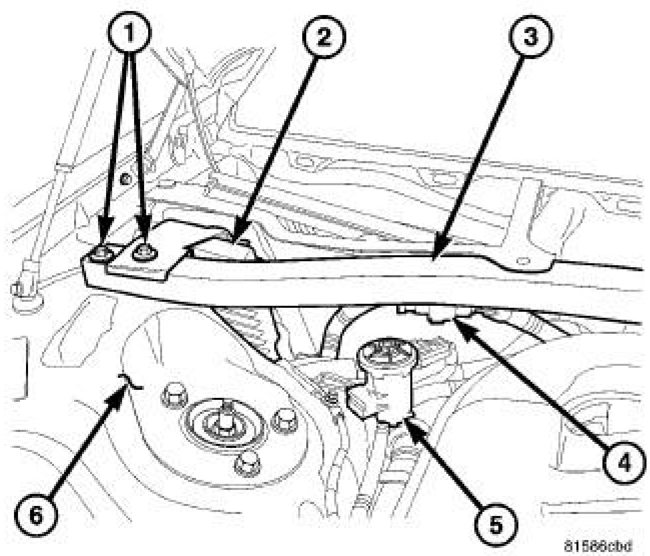

Fig. 67: Bolts, PCM, Strut Support, Wire Harness, Purge Solenoid & Passenger Side Strut Tower
Courtesy of CHRYSLER GROUP, LLC

5. Disengage the retainer that secures the wire harness (4) to the bottom of the strut tower support (3).
6. Remove the purge solenoid (5) from its mounting bracket and position the solenoid out of the way.

7. Remove the two bolts (1) that secure the strut tower support to the passenger side strut tower (6) and remove the support from the engine compartment.
8. Position the Powertrain Control Module (PCM) or the Engine Control Module (ECM) (2) (depending on engine application) out of the way.

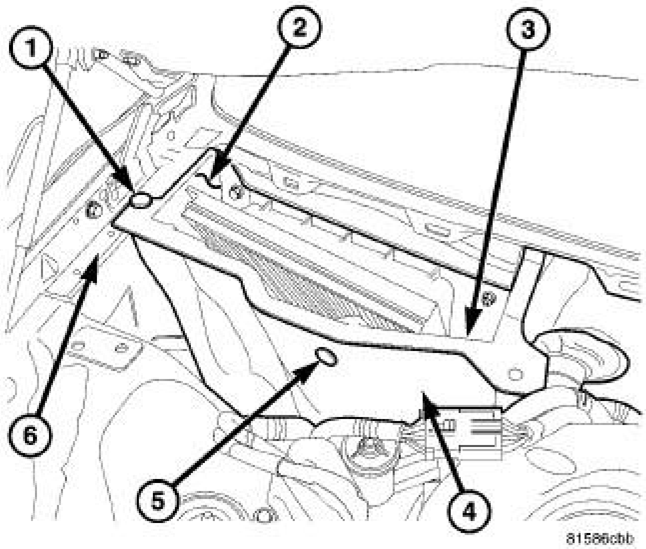

Fig. 68: Push Pins-Fresh Air Inlet Housing
Courtesy of CHRYSLER GROUP, LLC

9. Remove the push-pin retainer (1) that secures the fresh air inlet housing (2) to the passenger side inner fender (6).
10. Disengage the wire harness retainer (3) from inside the bottom of the fresh air inlet housing, if equipped.
11. Remove the push-pin retainer (5) that secures the insulator (4) to the front of the fresh air inlet housing and position the insulator out of the way.

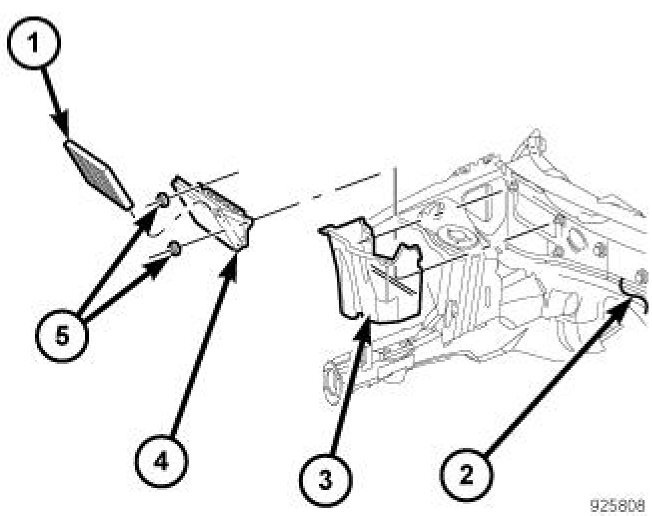

Fig. 69: Air Inlet Housing, Cabin Air Filter, Filter Housing, Dash Panel & Nuts
Courtesy of CHRYSLER GROUP, LLC

12. Remove the two nuts (5) that secure the fresh air inlet housing (3), cabin air filter (1) and filter housing (4) to the dash panel (2).
13. Remove the fresh air inlet housing, cabin air filter and filter housing as an assembly from the dash panel.

HOUSING - HVAC ASSEMBLY

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

WARNING: On vehicles equipped with airbags, refer to RESTRAINTS - SERVICE INFORMATION . Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

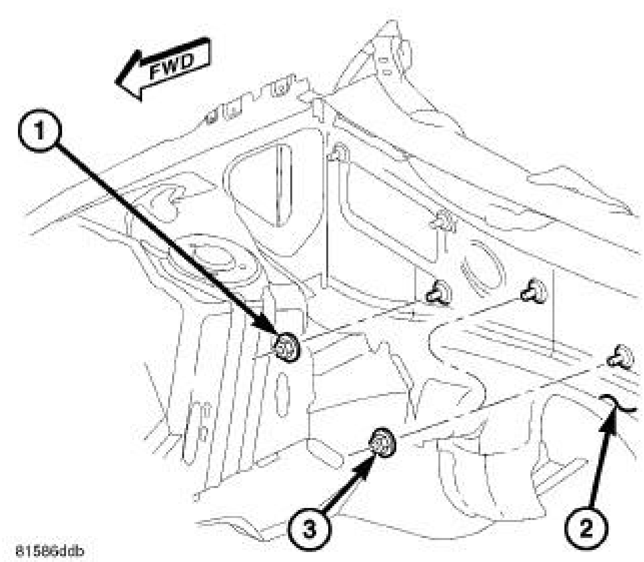

Fig. 70: Dash Panel & Nuts
Courtesy of CHRYSLER GROUP, LLC

NOTE: The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator.

1. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
2. Drain the engine cooling system. Refer to **STANDARD PROCEDURE** .
3. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
4. Remove the fresh air inlet housing from the dash panel. Refer to **HOUSING, HVAC, REMOVAL**.

5. Disconnect the A/C liquid line and the A/C suction line from the A/C evaporator. Refer to **LINE, A/C LIQUID, REMOVAL**.
6. Disconnect the heater hoses from the heater core tubes.
7. Remove the three nuts (1 and 3) that secure the HVAC housing to the engine compartment side of the dash panel (2).

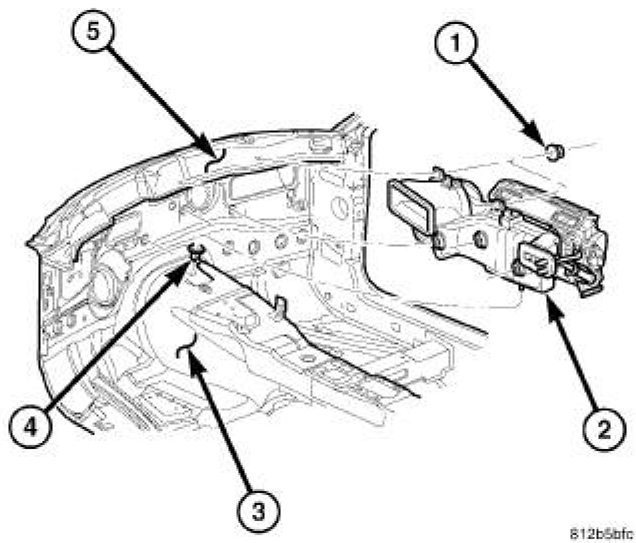

Fig. 71: HVAC Housing, Dash Panel, Nuts, Grommet & Floor Panel
Courtesy of CHRYSLER GROUP, LLC

8. Remove the instrument panel from the passenger compartment. Refer to **PANEL, INSTRUMENT, REMOVAL** .
9. Disconnect the floor console duct. Refer to **DUCT, FLOOR CONSOLE, REMOVAL**.
10. Disconnect the rear floor distribution ducts. Refer to **DUCT, FLOOR DISTRIBUTION, REMOVAL**.
11. Remove the defroster ducts. Refer to **DUCT, DEFROSTER, REMOVAL**.
12. Remove the two nuts (1) that secure the HVAC housing (2) to the passenger compartment side of the dash panel (5).
13. Pull the HVAC housing assembly rearward so that the mounting studs clear the dash panel.
14. Lift the HVAC housing assembly upwards so that the condensate drain tube clears the grommet (4) in the floor panel (3) and remove the HVAC housing assembly from the passenger compartment.

INSTALLATION

HOUSING - AIR DISTRIBUTION

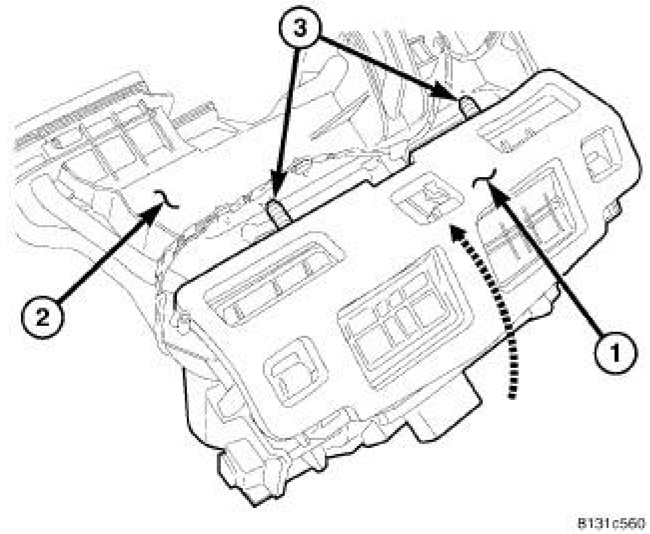

Fig. 72: Installing Air Distribution Housing
Courtesy of CHRYSLER GROUP, LLC

1. Install the air distribution housing onto the rear of the HVAC housing (2) by inserting the tabs on the bottom of the distribution housing into the slots located on the bottom of the HVAC housing and tipping the distribution housing upward until it is properly aligned with the HVAC housing.
2. Install the two screws (3) that secure the air distribution housing to the HVAC housing and tighten securely.

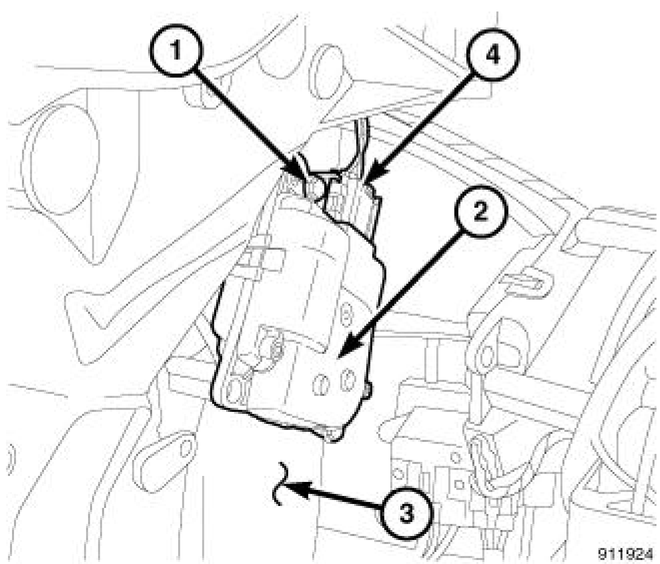

Fig. 73: Blend Door Actuator, Distribution Housing, Wire Harness Connector & Screws
Courtesy of CHRYSLER GROUP, LLC

3. Connect the HVAC wire harness (4) to the blend door actuator (2) located on the passenger side of the air distribution housing (3).

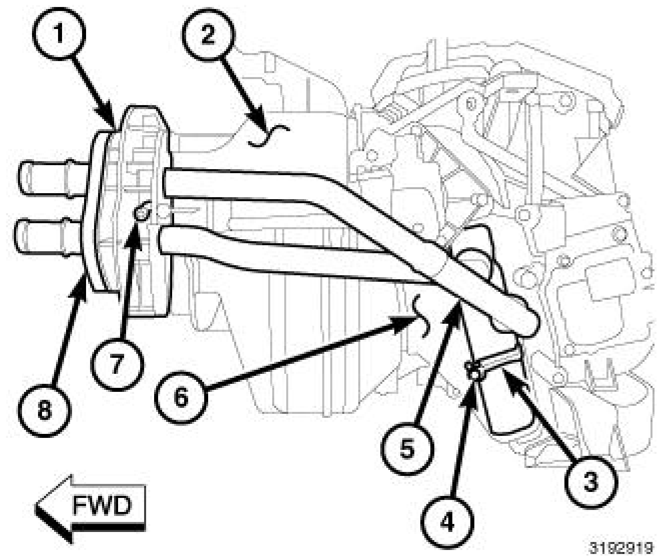

Fig. 74: Screw, Flange, HVAC Housing, Retaining Screw, Bracket & Housing
Courtesy of CHRYSLER GROUP, LLC

4. Install the heater core (5) into the driver side of the air distribution housing (6) and engage the heater core tubes to the foam seal (8).
5. Install heater core bracket (3) and retaining screw (4) and tighten securely.
6. Install the flange (1) over the heater core tubes and onto the HVAC housing (2).
7. Install the screw (7) that secure the flange to the front of the HVAC housing and tighten securely.

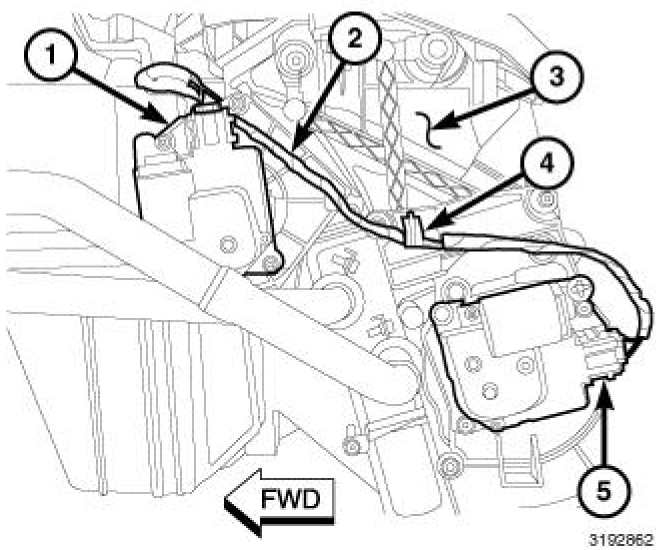

Fig. 75: HVAC Wire Harness, Mode Door Actuator, Blend Door Actuator & Air Distribution Housing
Courtesy of CHRYSLER GROUP, LLC

8. Connect the HVAC wire harness (2) to the mode door actuator (5) and the blend door actuator (1), located on the driver side of the air distribution housing (3).
9. Engage the HVAC wire harness to the retaining tab (4).
10. Install the HVAC housing assembly. Refer to **HOUSING, HVAC, INSTALLATION**.

HOUSING - AIR INLET

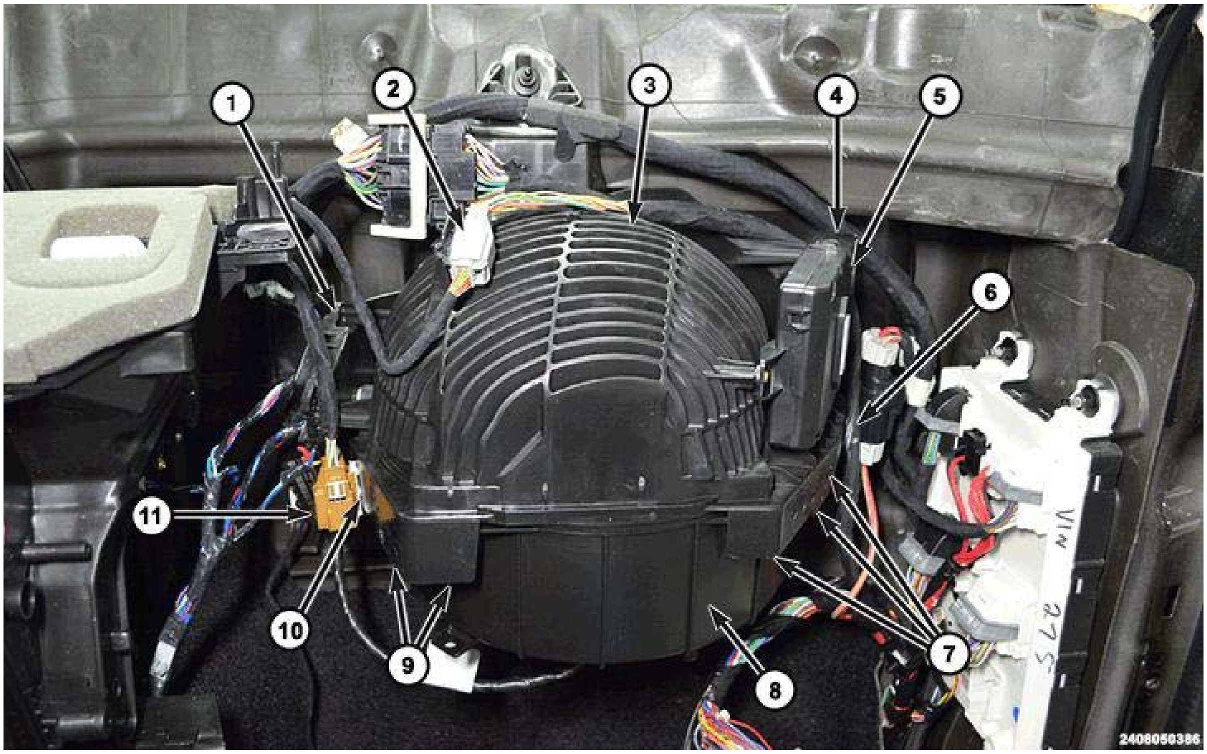

Fig. 76: Wire Harness Connector, Door Actuator, Wire Harness Connector & Air Inlet Housing
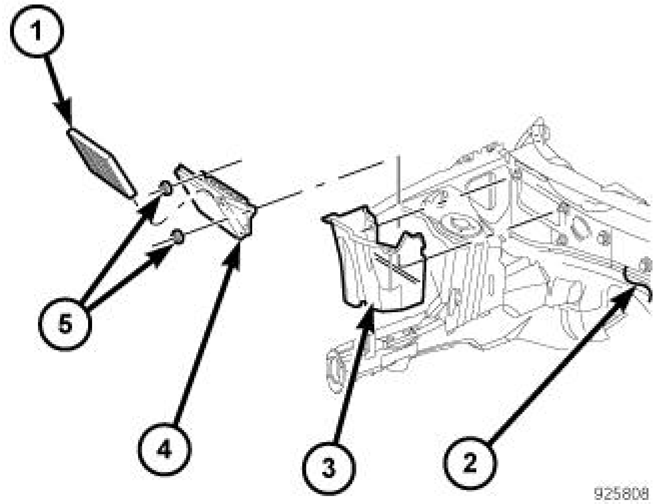
Courtesy of CHRYSLER GROUP, LLC

1. Position the air inlet housing (3) onto the HVAC housing (8).

CAUTION: Make sure that the recirculation-air door pivot shaft is properly seated in the pivot seats located on the top of the HVAC housing.

2. Install the five screws (7 and 9) that secure the air inlet housing to the HVAC housing and tighten securely.
3. Position the HVAC module and install the screws. Tighten the screws securely.
4. Install the HVAC housing assembly. Refer to **HOUSING, HVAC, INSTALLATION**.

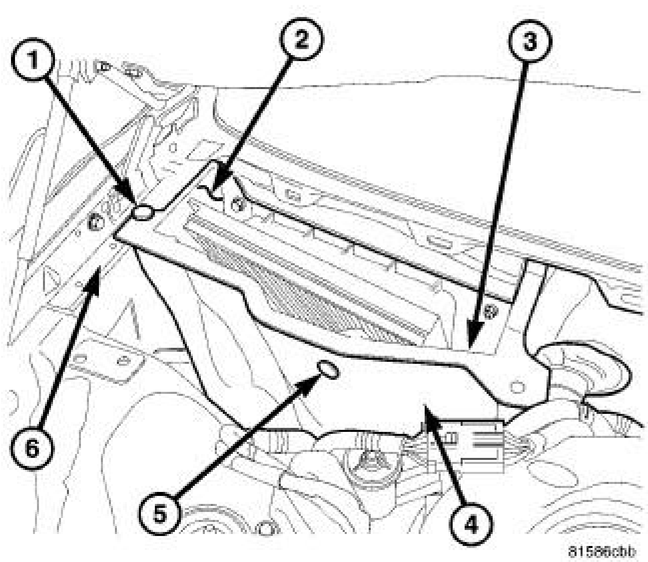
HOUSING - FRESH AIR INLET



[Fig. 77: Air Inlet Housing, Cabin Air Filter, Filter Housing, Dash Panel & Nuts]
Courtesy of CHRYSLER GROUP, LLC

NOTE: The fresh air inlet housing must be removed from the vehicle for removal of the HVAC housing.

1. Position the fresh air inlet housing (3), cabin air filter (1) and filter housing (4) as an assembly onto the engine compartment side of the dash panel (2).
2. Install the two nuts (5) that secure the fresh air inlet housing and filter housing to the dash panel and tighten securely.



[Fig. 78: Push Pins-Fresh Air Inlet Housing]
Courtesy of CHRYSLER GROUP, LLC

3. Position the insulator (4) into its installed location and install the push-pin retainer (5) that secures the insulator to the front of the fresh air inlet housing (2).
4. Install the push-pin retainer (1) that secures the fresh air inlet housing to the right inner fender (6).

5. Reach under the fresh air inlet housing and install the wire harness retainer (3) into the bottom of the air inlet housing, if equipped.

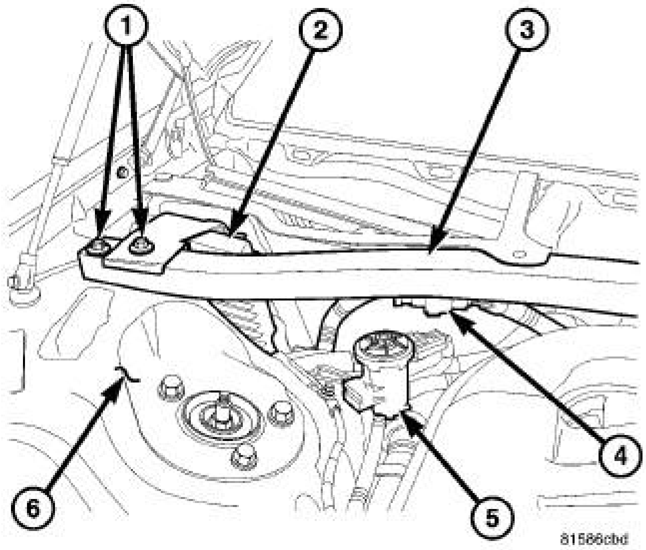


Fig. 79: Bolts, PCM, Strut Support, Wire Harness, Purge Solenoid & Passenger Side Strut Tower
Courtesy of CHRYSLER GROUP, LLC

6. Position the Powertrain Control Module (PCM) or the Engine Control Module (ECM) (2) (depending on engine application) into its installed location.
7. Position the strut tower support (3) into the engine compartment and loosely install the two bolts (1) that secure the strut tower support and the ECM/PCM to the passenger side strut tower (6).
8. Install the purge solenoid (5) onto its mounting bracket located on the right strut tower.
9. Engage the retainer that secures the wire harness (4) to the bottom of the strut tower support.

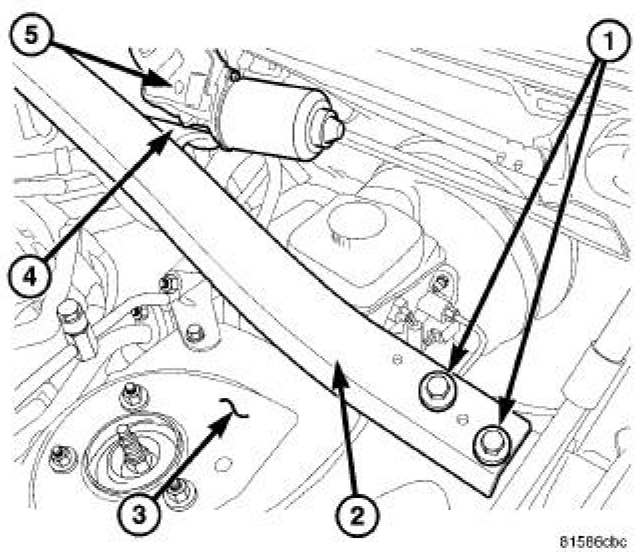

Fig. 80: Bolts, Strut Support, Driver Side Strut Tower, Bracket & Wiper Motor
Courtesy of CHRYSLER GROUP, LLC

10. Engage the wiper motor (5) to the bracket (4) located on the strut tower support (2).
11. Position the strut tower support to the driver side and loosely install the two bolts (1) that secure the support to the strut tower.
12. Tighten the strut tower support bolts to the appropriate torque specifications. Refer to **TORQUE SPECIFICATIONS** for 6.4L, **TORQUE SPECIFICATIONS** for 6.2L, **TORQUE SPECIFICATIONS** for 5.7L and **TORQUE SPECIFICATIONS** for 3.6L. .
13. Install the cowl top panel onto the dash panel. Refer to **COVER, COWL PANEL, INSTALLATION** .
14. Connect the negative battery cable.

HOUSING - HVAC ASSEMBLY

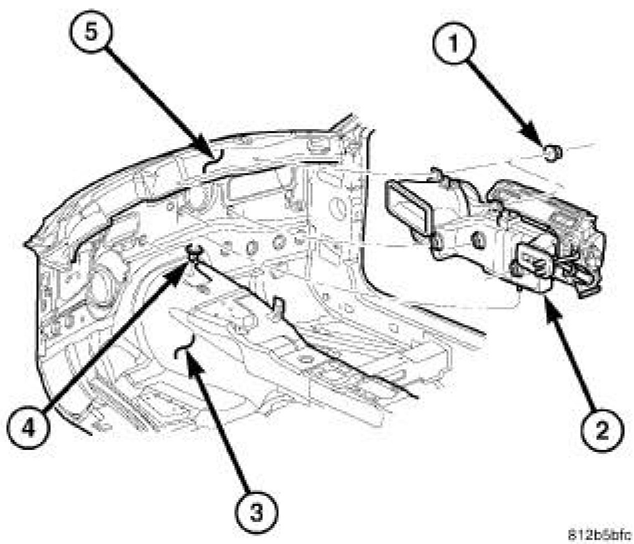

Fig. 81: HVAC Housing, Dash Panel, Nuts, Grommet & Floor Panel
Courtesy of CHRYSLER GROUP, LLC

NOTE: The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator.

1. Position the HVAC housing (2) into the passenger compartment with the mounting studs in their proper locations in the dash panel (5) and the condensate drain tube into the grommet (4) on the floor panel (3).
2. Install the two nuts (1) that secure the HVAC housing to the passenger compartment side of the dash panel and tighten securely.
3. Install the defroster ducts. Refer to **DUCT, DEFROSTER, INSTALLATION**.
4. Connect the floor distribution ducts. Refer to **DUCT, FLOOR DISTRIBUTION, INSTALLATION**.
5. Connect the floor console duct. Refer to **DUCT, FLOOR CONSOLE, INSTALLATION**.
6. Install the instrument panel. Refer to **PANEL, INSTRUMENT, INSTALLATION** .

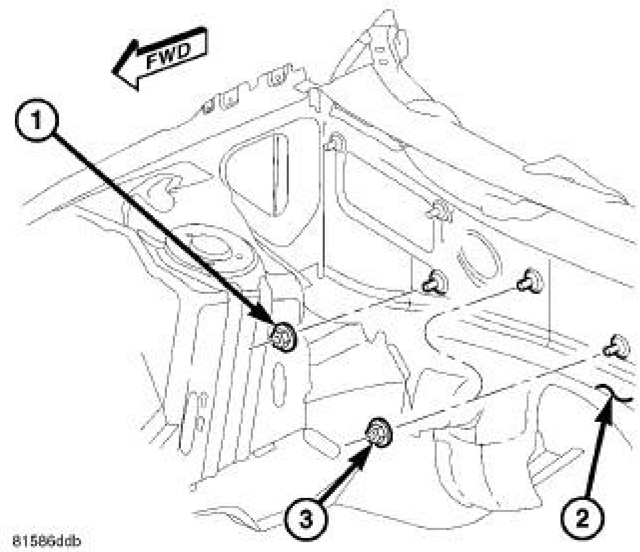

Fig. 82: Dash Panel & Nuts
Courtesy of CHRYSLER GROUP, LLC

7. Install the three nuts (1 and 3) that secure the HVAC housing to the engine compartment side of the dash panel (2) and tighten securely.
8. Connect the heater hoses to the heater core tubes.
9. Connect the A/C suction line and A/C liquid line to the A/C evaporator. Refer to **LINE, A/C LIQUID, INSTALLATION**.
10. Install the fresh air inlet housing to the engine compartment side of the dash panel. Refer to **HOUSING, HVAC, INSTALLATION**.
11. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.
12. If the heater core is being replaced, flush the cooling system. Refer to **STANDARD PROCEDURE** .
13. Refill the engine cooling system. Refer to **STANDARD PROCEDURE** .
14. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
15. Charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
16. Initiate the Actuator Calibration function using a scan tool. Refer to **STANDARD PROCEDURE** .

MOTOR, BLOWER

DESCRIPTION

DESCRIPTION

Fig. 83: Blower Motor
Courtesy of CHRYSLER GROUP, LLC

The blower motor is mounted to the bottom of the HVAC housing, on the passenger side of the vehicle. The blower motor assembly is a squirrel type blower cage (2) connected to a 12 volt Direct Current (DC) motor, located within a plastic housing (5). The blower motor has an integral wire harness bracket (1), three mounting provisions (3) and a wire connector receptacle (4).

The blower motor can be accessed for service from underneath the instrument panel.

OPERATION

OPERATION

The blower motor controls the velocity of air moving through the HVAC housing by spinning the blower wheel within the HVAC air inlet housing at the selected speed.

Both the Manual Temperature Control (MTC) and the Automatic Temperature Control (ATC) heating and A/C system use an electronic blower motor power module to control blower motor speed. The power module uses a Pulse Width Modulated (PWM) input from the Heater, Ventilation and Air Conditioning (HVAC) module and a feedback signal from the blower motor to regulate the blower motor ground path. On both systems, the blower motor receives battery current through a relay in the Power Distribution Center (PDC) whenever the ignition is in the Run position.

The blower motor control system is diagnosed using a scan tool. Refer to DIAGNOSIS AND TESTING .

The blower motor and wheel are factory balanced as an assembly and cannot be adjusted or repaired and must be replaced if inoperative or damaged.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BLOWER MOTOR

WARNING: Disable the airbag system. Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, or instrument panel

component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: **See the appropriate Wiring Information for circuit descriptions and diagrams.**

OPERATION

Possible causes of an inoperative blower motor include:

- Open fuse
- Inoperative A/C heater module
- Inoperative blower motor
- Inoperative blower motor power module
- Inoperative blower motor relay
- Inoperative blower motor switch
- Inoperative blower motor wiring or wire harness connectors

NOISE

To determine if the blower motor is the source of the noise, simply switch the blower motor on and off. To verify that the blower motor is the source of the noise, unplug the blower motor wire harness connector and operate the heating and A/C system. If the noise goes away, possible causes include:

- Deformed or damaged blower wheel
- Foreign material in blower wheel
- Foreign material in the HVAC housing
- Foreign material on fresh air inlet screen
- Improper blower motor mounting
- Worn blower motor bearings or brushes

VIBRATION

Possible causes of blower motor vibration include:

- Deformed or damaged blower wheel
- Foreign material in blower wheel
- Improper blower motor mounting
- Worn blower motor bearings

REMOVAL

REMOVAL

WARNING: **Disable the airbag system. Refer to RESTRAINTS - SERVICE INFORMATION**

before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible serious or fatal injury.

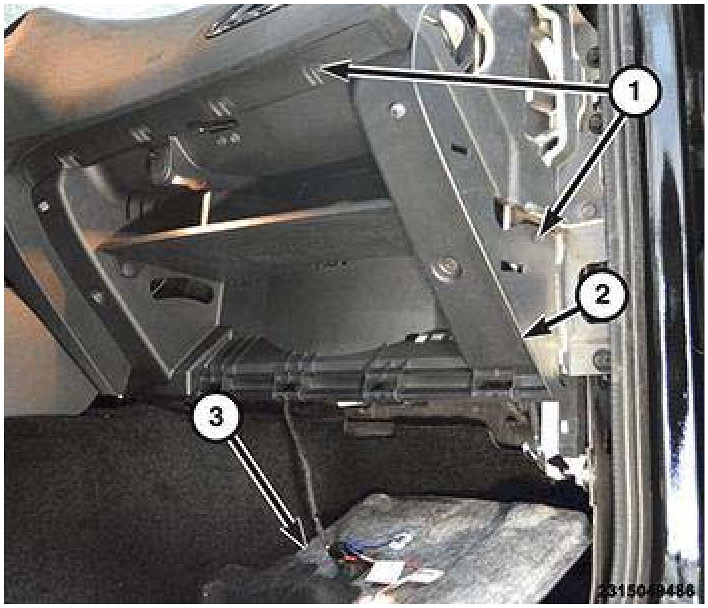

Fig. 84: Removing/Installing Instrument Panel Closeout
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Remove the push fasteners, disconnect the wire harness connector and remove the instrument panel closeout (3).

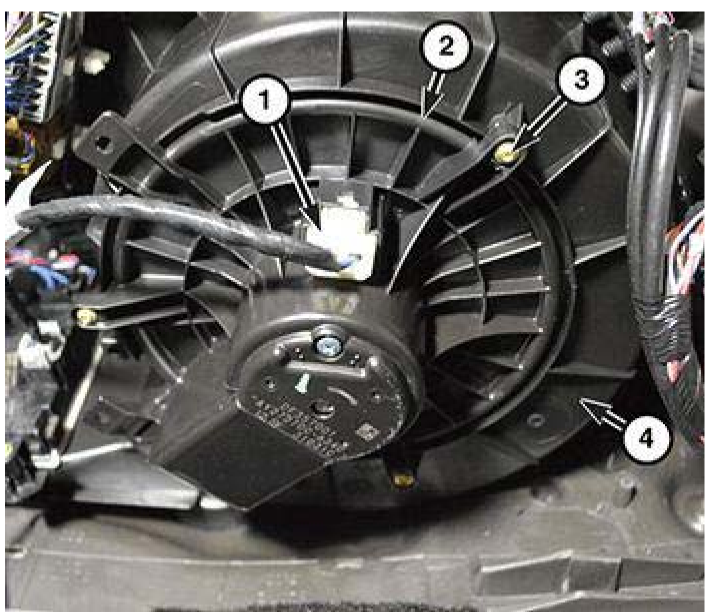

Fig. 85: Wire Harness Connector, Blower Motor, Screws & HVAC Housing

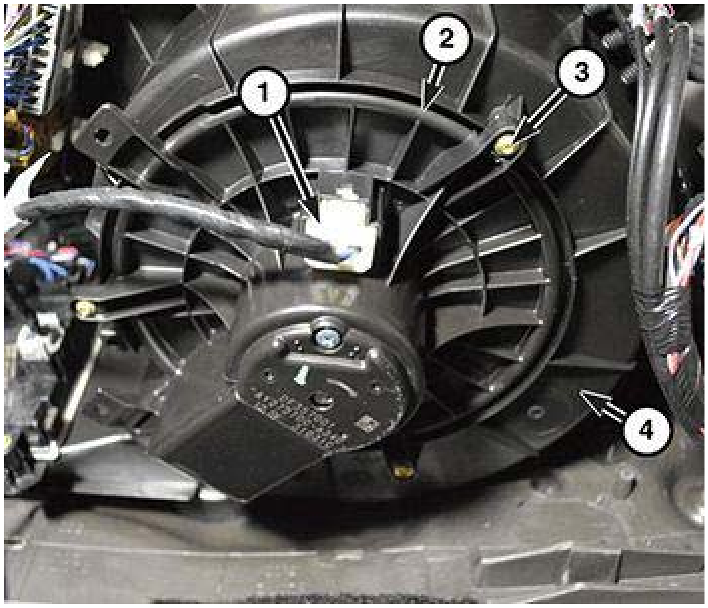
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the wire harness connector (1) from the blower motor (2).
4. Remove the three screws (3) that secure the blower motor to the HVAC housing (4) and remove the blower motor.

INSTALLATION

INSTALLATION



[Fig. 86: Wire Harness Connector, Blower Motor, Screws & HVAC Housing]
Courtesy of CHRYSLER GROUP, LLC

1. Position the blower motor (2) into the HVAC housing (4).
2. Install the three screws (3) that secure the blower motor to the HVAC housing and securely tighten the screws.
3. Connect the wire harness connector (1) to the blower motor (2).

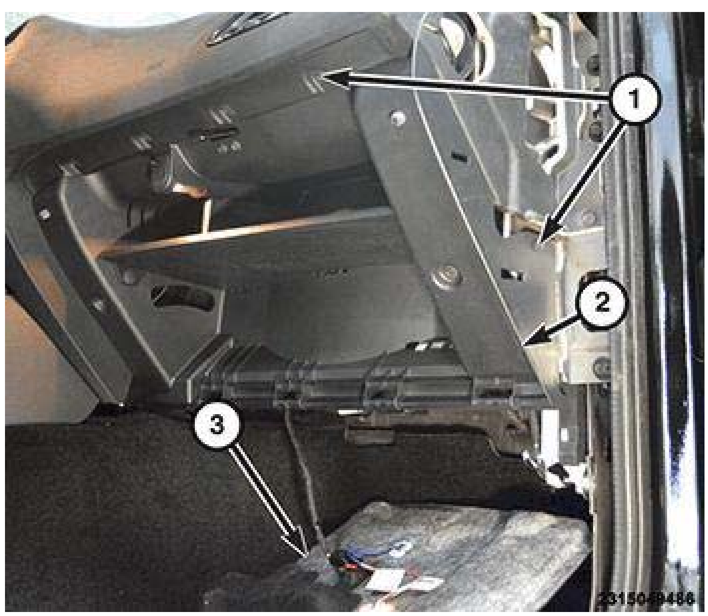


Fig. 87: Removing/Installing Instrument Panel Closeout
Courtesy of CHRYSLER GROUP, LLC

4. Install the push fasteners, connect the wire harness connector and install the instrument panel closeout (3).
5. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.

OUTLET, AIR

REMOVAL

AIR-OUTLETS

CENTER OUTLETS

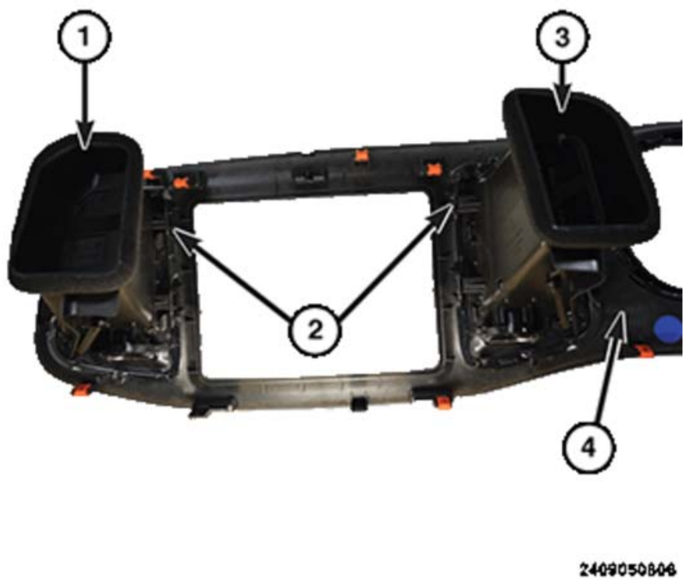

Fig. 88: Center Air Outlets, Instrument Cluster Bezel & Tabs
Courtesy of CHRYSLER GROUP, LLC

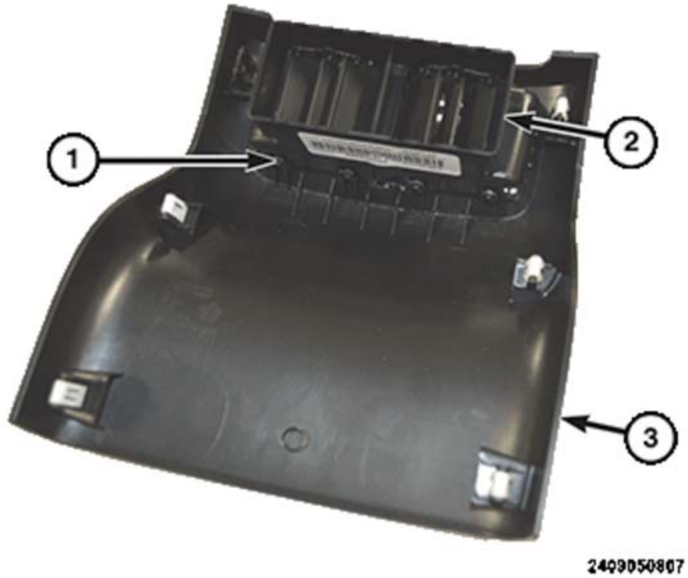
NOTE: **Take the proper precautions to protect the face of center bezel from cosmetic damage while performing this procedure.**

NOTE: **If the foam seal on the center air outlet is deformed or damaged, the seal must be replaced.**

1. When servicing the center air outlet, remove the instrument cluster bezel. Refer to **BEZEL, INSTRUMENT CLUSTER, REMOVAL** .
2. Release the tabs (2) that secure the center air outlet (1 and 3) to the instrument cluster bezel (4), then remove.

FLOOR CONSOLE OUTLETS

NOTE: **Take the proper precautions to protect the face of the floor console end cap from cosmetic damage while performing this procedure.**



[Fig. 89: Air Outlet, End Cap & Retaining Tabs](#)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the end cap (3) from the back of the floor console and place it on a workbench. Refer to **CONSOLE, FLOOR, REMOVAL** .
3. Using Trim Stick (special tool #C-4755, Trim Stick) or equivalent, disengage the retaining tabs (1) that secure the air outlet (2) to the end cap (3) and remove.

LEFT OUTBOARD OUTLET

NOTE:	**Take the proper precautions to protect the face of center bezel from cosmetic damage while performing this procedure.**
NOTE:	**If the foam seal on the left air outlet (2) is deformed or damaged, the seal must be replaced.**

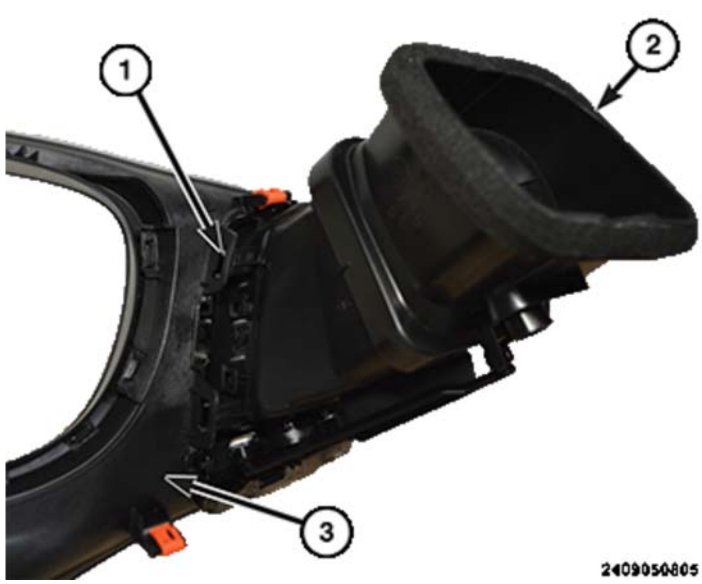


Fig. 90: Air Outlet, Retaining Tabs & Instrument Panel Bezel
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. When servicing the driver side air outlet, remove the instrument cluster bezel. Refer to **BEZEL, INSTRUMENT CLUSTER, REMOVAL** .
3. Release the tabs (1) that secure the air outlet to the instrument cluster bezel (3), then remove.

RIGHT OUTBOARD OUTLET

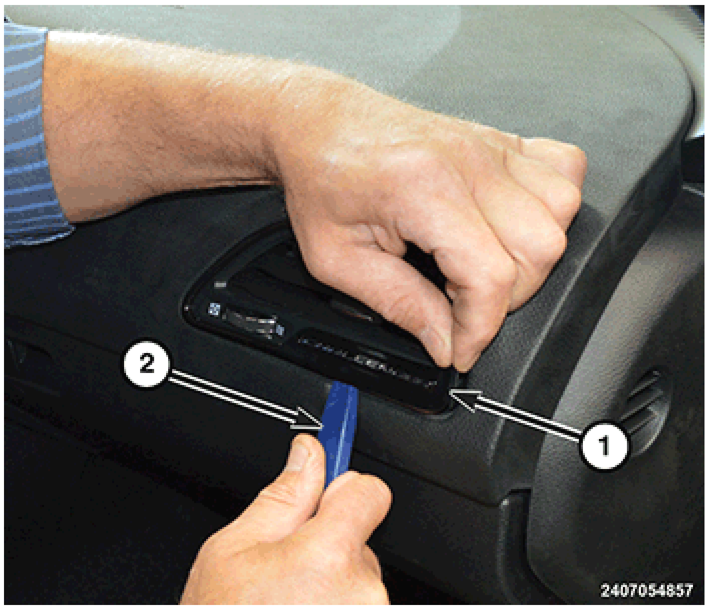

Fig. 91: Trim Stick & Trim Ring
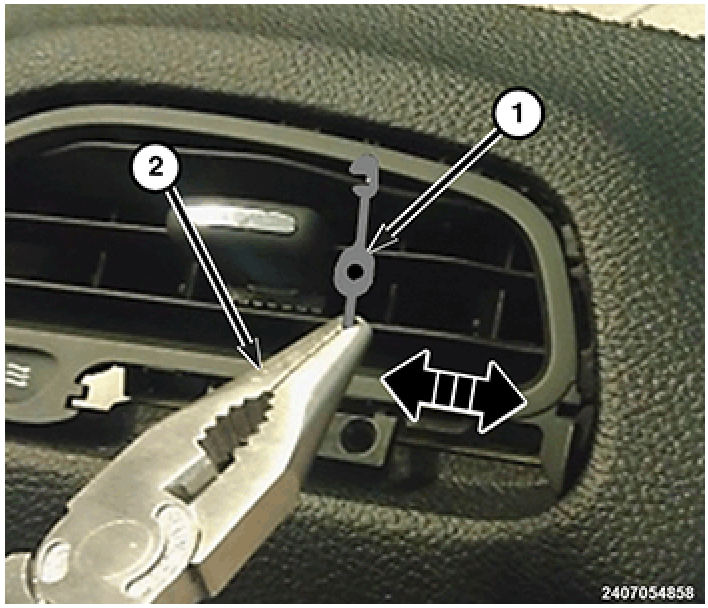
Courtesy of CHRYSLER GROUP, LLC

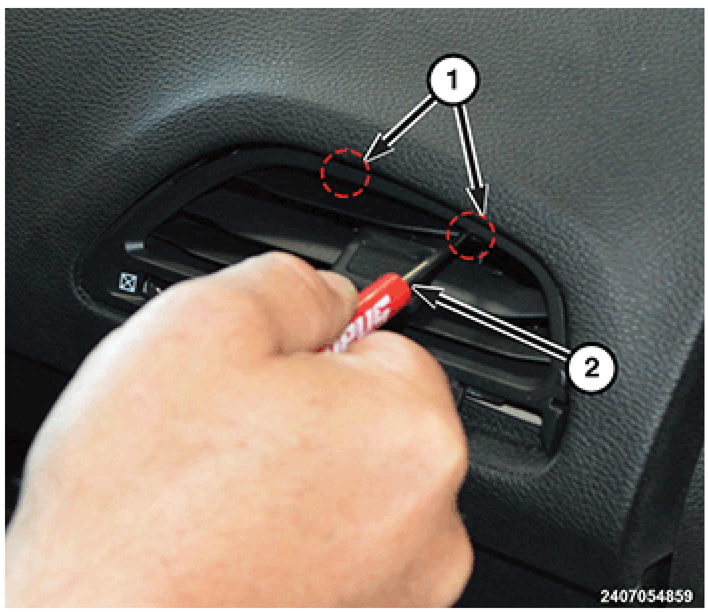
NOTE:	**Take the proper precautions to protect the instrument panel cover from damage while performing this procedure.**
NOTE:	**If the foam seal on the outlet is deformed or damaged, the seal must be replaced.**

1. Using a trim stick (2) release the trim ring (1) working around the perimeter. Once started, the trim ring can be grasped and pulled off.



[Fig. 92: Metal Link & Pliers](#)
Courtesy of CHRYSLER GROUP, LLC

2. Grasp the metal link (1) with pliers (2) and slide to the right to remove. Slight wiggle may be necessary.



[Fig. 93: Upper Tabs & Tool](#)
Courtesy of CHRYSLER GROUP, LLC

3. Locate the two tabs (1) and pry downward with a small flat bladed tool (2) to release. Ensure the tabs hold in the downward position.

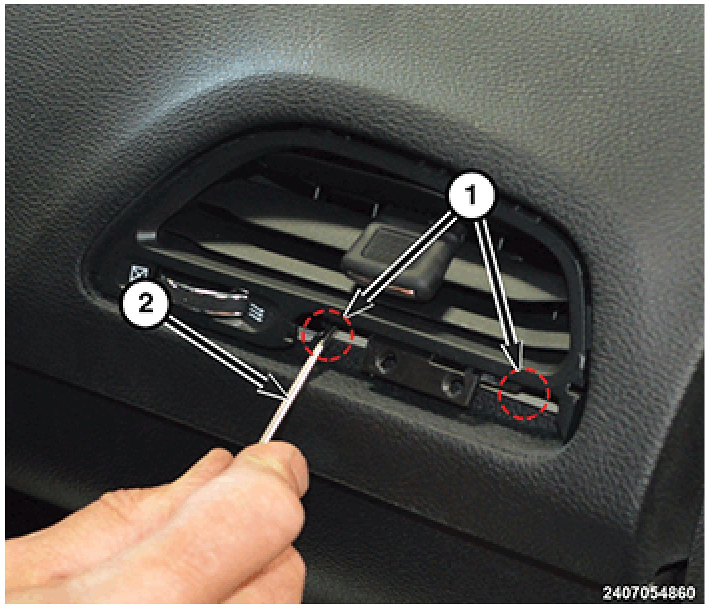


Fig. 94: Lower Tabs & Tool
Courtesy of CHRYSLER GROUP, LLC

4. Locate the two tabs (1) at the bottom and pry upward with a small flat bladed tool (2) to release. After releasing, the tab should rest on the retainer to prevent engagement.

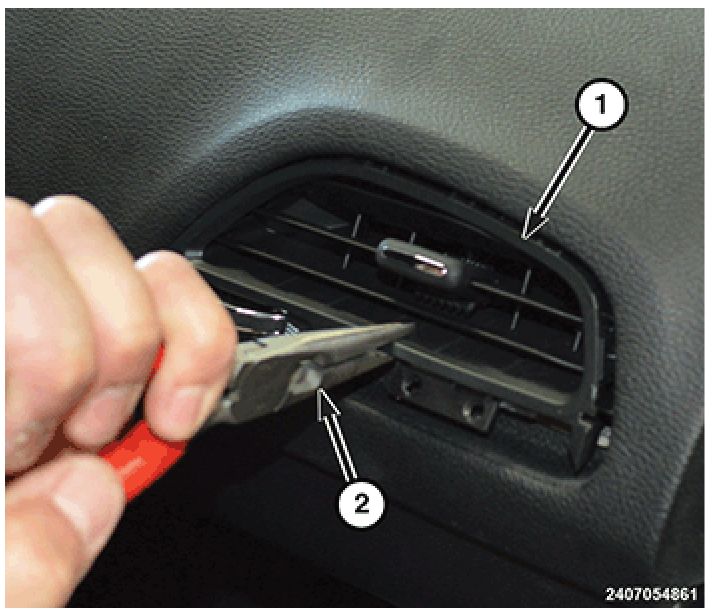

Fig. 95: Outlet & Pliers
Courtesy of CHRYSLER GROUP, LLC

5. Grasp the front edge of the outlet (1) with pliers (2) and remove.

INSTALLATION

AIR-OUTLETS

CENTER OUTLETS

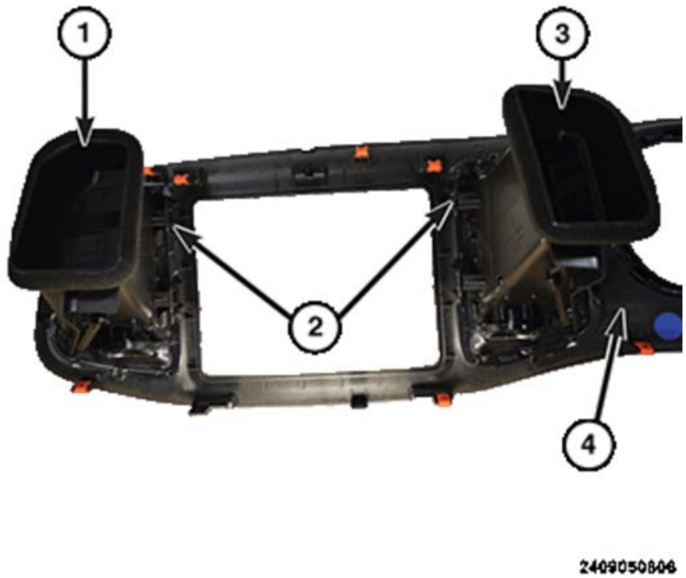

Fig. 96: Center Air Outlets, Instrument Cluster Bezel & Tabs
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Take the proper precautions to protect the face of center bezel from cosmetic damage while performing this procedure.**

NOTE: **If the foam seal on the center air outlet is deformed or damaged, the seal must be replaced.**

1. Position each air outlet (1 and 3) into the instrument cluster bezel (4).
2. Engage the retaining tabs (2) that secure each air outlet to the bezel. Make sure the retaining tabs are fully engaged.

   NOTE: **Make sure that the center air outlets are properly aligned to the ducts within the instrument panel and that the foam seals on the outlets are properly installed.**

3. Install the instrument cluster bezel. Refer to BEZEL, INSTRUMENT CLUSTER, INSTALLATION .

FLOOR CONSOLE OUTLETS

NOTE: **Take the proper precautions to protect the face of the floor console end cap from cosmetic damage while performing this procedure.**

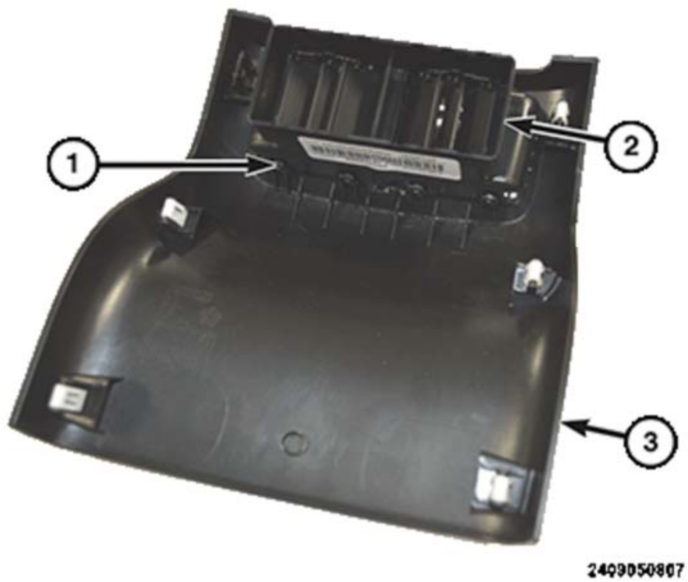

Fig. 97: Air Outlet, End Cap & Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Position the air outlet (2) onto the floor console end cap (3).
2. Engage the retaining tabs (1) that secure the air outlet to the end cap. Make sure the retaining tabs are fully engaged.

NOTE: **Make sure that the air outlet is properly aligned to the duct within the floor console.**

3. Install the floor console end cap (3) onto the back of the floor console. Refer to CONSOLE, FLOOR, INSTALLATION .
4. Connect the negative battery cable.

LEFT OUTBOARD OUTLET

NOTE: **Driver side outer outboard outlet shown in the illustration.**

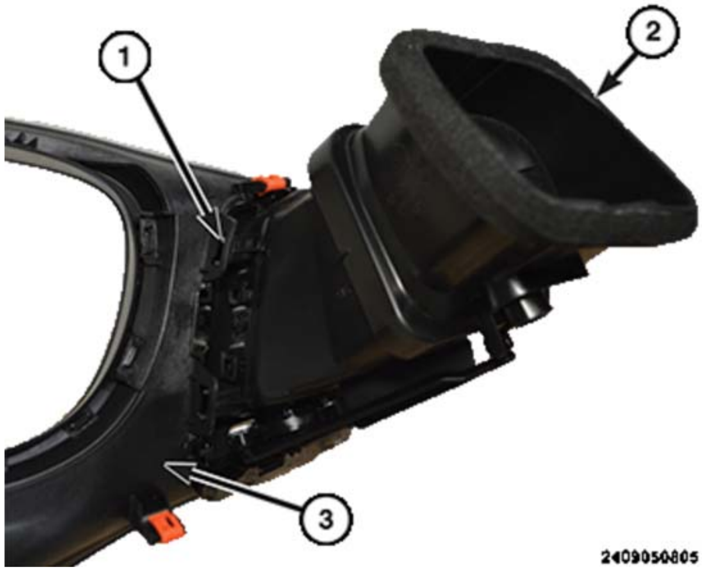

Fig. 98: Air Outlet, Retaining Tabs & Instrument Panel Bezel
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Make sure that the air outlet is properly aligned to the instrument panel bezel and that the foam seal on the outlet is properly installed.**

1. Position the air outlet (2) into the instrument panel bezel.
2. Engage the retaining tabs (1) that secure the air outlet to the instrument panel bezel (3). Make sure the retaining tabs are fully engaged.
3. Connect the negative battery cable.

RIGHT OUTBOARD OUTLET

Fig. 99: Air Outlet
Courtesy of CHRYSLER GROUP, LLC

..

1. Locate the **NEW** outlet into the instrument panel and carefully guide it into the duct. Firmly push the outlet until an audible clip noise is heard and the outlet is seated flush into the instrument panel.

PLUMBING

WARNING

WARNING

WARNING: **The A/C system contains refrigerant under high pressure. Repairs should only be performed by qualified service personnel. Serious or fatal injury may result from improper service procedures.**

WARNING: **Avoid breathing the refrigerant and refrigerant oil vapor or mist. Exposure may irritate the eyes, nose, and/or throat. Wear eye protection when servicing the A/C refrigerant system. Serious eye injury can result from direct contact with the refrigerant. If eye contact occurs, seek medical attention immediately.**

WARNING: **Do not expose the refrigerant to open flame. Poisonous gas is created when refrigerant is burned. An electronic leak detector is recommended. Serious or fatal injury may result from improper service procedures.**

WARNING: **If accidental A/C system discharge occurs, ventilate the work area before resuming service. Large amounts of refrigerant released in a closed work area will displace the oxygen and cause suffocation and serious or fatal injury.**

WARNING: **The evaporation rate of R-134a refrigerant at average temperature and altitude is extremely high. As a result, anything that comes in contact with the refrigerant will freeze. Always protect the skin or delicate objects from direct contact with the refrigerant.**

WARNING: **The R-134a service equipment or the vehicle refrigerant system should not be pressure tested or leak tested with compressed air. Some mixtures of air and R-134a have been shown to be combustible at elevated pressures. These mixtures are potentially dangerous, and may result in fire or explosion causing property damage and serious or fatal injury.**

WARNING: **The engine cooling system is designed to develop internal pressures up to 145 kPa (21 psi). Do not remove or loosen the coolant pressure cap, cylinder block drain plugs, radiator drain, radiator hoses, heater hoses, or hose clamps while the engine cooling system is hot and under pressure. Allow the vehicle to cool for a minimum of 15 minutes before opening the cooling system for service. Failure to observe this warning can result in serious burns from the heated engine coolant.**

CAUTION

CAUTION

..

CAUTION: Never add R-12 to a refrigerant system designed to use R-134a. Do not use R-12 equipment or parts on an R-134a A/C system. These refrigerants are not compatible and damage to the A/C system will result.

CAUTION: Never use R-12 refrigerant oil in an A/C system designed to use R-134a refrigerant oil. These refrigerant oils are not compatible and damage to the A/C system will result.

CAUTION: The use of A/C system sealers may result in damage to A/C refrigerant recovery/evacuation/recharging equipment and/or A/C system. Many federal, state/provincial and local regulations prohibit the recharge of A/C systems with known leaks. Chrysler LLC recommends the detection of A/C system leaks through the use of approved leak detectors and fluorescent leak detection dyes. Vehicles found with A/C system sealers should be treated as contaminated and replacement of the entire A/C refrigerant system is recommended. A/C systems found to be contaminated with A/C system sealers, A/C stop-leak products or seal conditioners voids the warranty for the A/C system.

CAUTION: Recover the refrigerant before opening any fitting or connection. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

CAUTION: If equipped, do not remove the secondary retention clip from any spring-lock coupler connection while the refrigerant system is under pressure. Recover the refrigerant before removing the secondary retention clip. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

CAUTION: The internal parts of the A/C system will remain stable as long as moisture-free refrigerant and refrigerant oil is used. Abnormal amounts of dirt, moisture or air can upset the chemical stability. This may cause operational troubles or even serious damage if present in more than very small quantities. Before disconnecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system. Keep service tools and the work area clean. Do not open the refrigerant system or uncap a replacement component until you are ready to service the system. Immediately after disconnecting a component from the refrigerant system, seal the open fittings with a cap or plug. This will prevent contamination from entering the A/C system.

CAUTION: Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open a container of refrigerant oil until you are ready to use it. Replace the cap on the oil container immediately after using. Store refrigerant oil only in a clean, airtight, and moisture-free container.

CAUTION: Do not overcharge the refrigerant system. Overcharging will cause excessive compressor head pressure and can cause compressor noise and A/C system failure.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS

WARNING: Review the safety precautions and warnings in this group before performing this procedure. Failure to follow these instructions may result in serious injury or death.

WARNING: Do not expose the refrigerant to open flame. Poisonous gas is created when refrigerant is burned. An electronic leak detector is recommended. Serious or fatal injury may result from improper service procedures.

WARNING: Use extreme care when working around a running engine. Keep hands and fingers clear of the radiator fan, accessory drive belt and all other moving components. Keep away when wearing loose clothing, jewelry or long hair that is not properly secured. Underhood components may become hot to the touch. Be careful not to come into contact with hot engine, A/C and engine cooling system components. Failure to follow these instructions may result in serious or fatal injury.

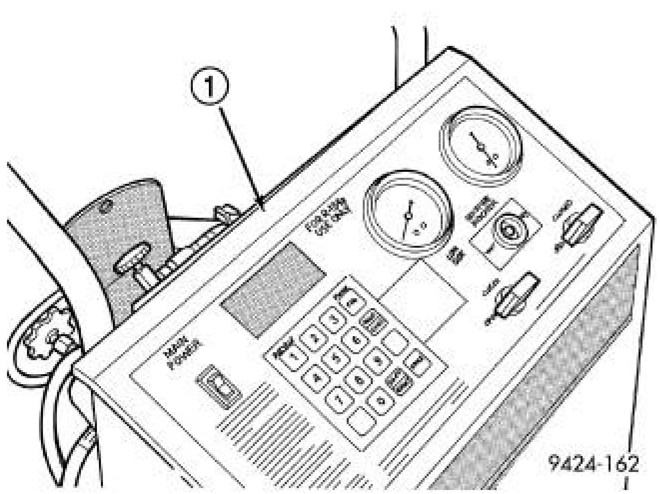
NOTE: Always conduct the A/C Performance Test as outlined in this group prior to searching for an A/C refrigerant leak. Refer to DIAGNOSIS AND TESTING.

NOTE: The A/C system in this vehicle comes equipped from the factory with fluorescent refrigerant leak detection dye installed in the refrigerant system.

When searching for a refrigerant leak in the A/C system, use an Ultra Violet (UV) light and an electronic leak detector that is designed for refrigerant used on this vehicle. It is important to use only high-quality refrigerant leak detection equipment to properly locate refrigerant system leaks, such as the equipment listed in the team PSE Service Equipment Catalog. When the use of additional leak detection dye is required, use only Chrysler LLC approved refrigerant leak detection dye, available through MoparĀ®.

STANDARD PROCEDURE

R-134A REFRIGERANT SYSTEM RECOVERY



[Fig. 100: Identifying R-134a Refrigerant Recovery/Recycling/Charging Station]
Courtesy of CHRYSLER GROUP, LLC

The R-134a refrigerant must be recovered from the A/C system prior to performing any repairs that require disconnection of an A/C refrigerant line.

When recovering the A/C refrigerant system, use an R-134a refrigerant recovery/recycling/charging station (1) that meets SAE standard J2788. Per SAE standard J2788, refrigerant recovery stations must recover 95% of the refrigerant system within 30 minutes at 21.1Ā°C (70Ā°F) and be able to measure the amount of refrigerant removed from the system to an accuracy of 28 grams (1 oz.). See the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

NOTE:	**A/C system should be tested prior to refrigerant recovery if the use of A/C system sealants are suspected. These sealants have the potential to clog refrigerant recovery equipment and cause vehicle A/C component damage. Various tool manufacturers make tool kits that detect A/C system sealants. See the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.**

If sealants are detected in an A/C system, the system should be treated as contaminated and replacement of the entire A/C refrigerant system is recommended. A/C systems found to be contaminated with A/C system sealers, A/C stop-leak products or seal conditioners void the warranty for the A/C system.

RECOVERY PROCEDURE

WARNING:	**Review the safety precautions and warnings in this group before performing this procedure. Failure to follow these instructions may result in serious injury or death.**

CAUTION:	**Various aftermarket manufacturers produce A/C system sealants that are designed to stop A/C refrigerant system leaks. The use of A/C system sealants may result in damage to A/C refrigerant recovery/evacuation/recharging equipment and/or the vehicle A/C system and are not recommended for use by Chrysler LLC.**

CAUTION:	**A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you MUST replenish any oil lost during the recovery process. See the equipment manufacturer instructions for more information.**

1. If use of aftermarket A/C system sealant is suspected, the A/C system should be tested for sealant prior to refrigerant system recovery. See the operating instructions supplied by the equipment manufacturer for proper use and care of this equipment.
2. Connect an R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2788 to the refrigerant system.
3. Recover the A/C refrigerant system following the operating instructions supplied by the recovery/recycling/charging station manufacturer.
4. Disconnect the refrigerant recovery/recycling/charging station from the refrigerant system service ports.

5. Reinstall the caps onto the refrigerant system service ports.

R-1234YF REFRIGERANT SYSTEM RECOVERY

WARNING: **Review the safety precautions and warnings in this group before performing this procedure. Failure to follow these instructions may result in serious injury or death.**

CAUTION: **Various aftermarket manufacturers produce A/C system sealants that are designed to stop A/C refrigerant system leaks. The use of A/C system sealants may result in damage to A/C refrigerant recovery/evacuation/recharging equipment and/or the vehicle A/C system and are not recommended for use by Chrysler LLC.**

Fig. 101: R-1234YF Refrigerant Recovery/Recycling/Charging Station
Courtesy of CHRYSLER GROUP, LLC

When servicing the A/C system, an R-1234YF refrigerant recovery/recycling/charging station that meets SAE standard must be used. Per SAE standard, refrigerant recovery stations must recover 95% of the refrigerant system within 30 minutes at 21.1Ā° C (70Ā° F) and be able to measure the amount of refrigerant removed from the system to an accuracy of 28 grams (1 oz.). See the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

NOTE: **A/C system should be tested prior to refrigerant recovery if the use of A/C system sealants are suspected. These sealants have the potential to clog refrigerant recovery equipment and cause vehicle A/C component damage. Various tool manufacturers make tool kits that detect A/C system sealants. See the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.**

If sealants are detected in an A/C system, the system should be treated as contaminated and replacement of the entire A/C refrigerant system is recommended. A/C systems found to be contaminated with A/C system sealers, A/C stop-leak products or seal conditioners void the warranty for the A/C system.

R-134A REFRIGERANT SYSTEM EVACUATE

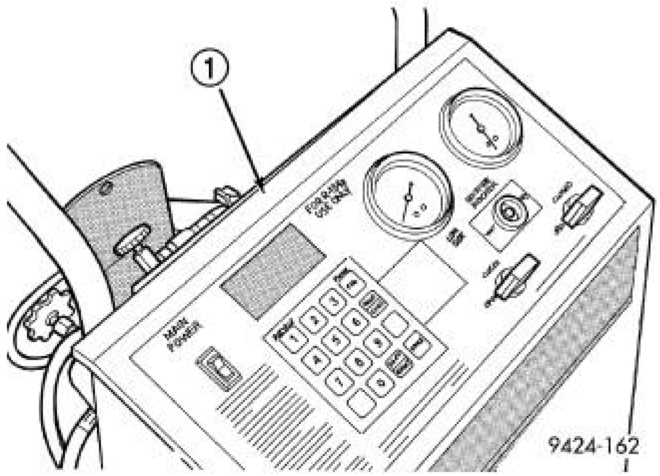


Fig. 102: Identifying R-134a Refrigerant Recovery/Recycling/Charging Station
Courtesy of CHRYSLER GROUP, LLC

If the A/C refrigerant system has been open to the atmosphere, it must be evacuated before the A/C system can be recharged with R-134a refrigerant.

NOTE: **Special effort must be used to prevent moisture from entering the A/C system oil. Moisture in the oil is very difficult to remove and will cause a reliability problem with the A/C compressor.**

Moisture and air in the A/C refrigerant system will raise the compressor head pressure above acceptable operating levels. This will reduce the performance of the A/C system and damage the A/C compressor. Moisture will boil at near room temperature when exposed to vacuum. Always use an R-134a refrigerant recovery/recycling/charging station with a vacuum pump (1) that meets SAE standard J2788, or an R-134a compatible manifold gauge set and a stand alone vacuum pump.

If an A/C compressor is left open to the atmosphere for an extended period of time, it is recommended that the refrigerant oil in the compressor be drained and replaced with new refrigerant oil to reduce the possibility of contaminating the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.

R-134A EVACUATION PROCEDURE

WARNING: **Review the safety precautions and warnings in this group before performing this procedure. Failure to follow these instructions may result in serious injury or death.**

CAUTION: **A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you MUST replenish any oil lost during the recovery process. See the equipment manufacturer instructions for more information.**

1. Recover the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

   NOTE: **When connecting service equipment couplers to refrigerant line service**

ports, verify that the valve of each coupler is fully closed prior to connecting. This will reduce the amount of effort required to make the connections.

2. Connect an R-134a refrigerant recovery/recycling/charging station with a vacuum pump that meets SAE standard J2788 to the refrigerant system, or an R-134a compatible manifold gauge set and a stand alone vacuum pump (depending on available equipment).
3. Open the refrigerant recovery/recycling/charging station or manifold gauge set valves and start the vacuum pump. The vacuum pump should run a minimum of 45 minutes prior to recharge to eliminate all moisture in system. When the low-side gauge reads to the lowest degree of vacuum possible (approximately -88 kPa (-26 in. Hg or greater) for 30 minutes, close all valves and turn off vacuum pump. If the refrigerant system fails to reach specified vacuum, the refrigerant system likely has a leak that must be corrected. If the refrigerant system maintains specified vacuum for at least 30 minutes, start the vacuum pump, open the valves and allow the refrigerant system to evacuate an additional 10 minutes.
4. Close the refrigerant recovery/recycling/charging station or manifold gauge set valves. Turn off and disconnect the vacuum pump.
5. Disconnect the refrigerant recovery/recycling/charging station or manifold gauge set from the refrigerant system service ports.
6. Install the caps onto the refrigerant system service ports.

R-1234YF REFRIGERANT SYSTEM EVACUATE

Fig. 103: R-1234YF Refrigerant Recovery/Recycling/Charging Station
Courtesy of CHRYSLER GROUP, LLC

If the A/C refrigerant system has been open to the atmosphere, it must be evacuated before the A/C system can be recharged with R-1234yf refrigerant.

NOTE: **Special effort must be used to prevent moisture from entering the A/C system oil. Moisture in the oil is very difficult to remove and will cause a reliability problem with the A/C compressor.**

Moisture and air in the A/C refrigerant system will raise the compressor head pressure above acceptable operating levels. This will reduce the performance of the A/C system and damage the A/C compressor. Moisture will boil at near room temperature when exposed to vacuum. Always use an R-1234yf refrigerant recovery/recycling/charging station with a vacuum pump that meets SAE standard J2843, or an R-1234yf compatible manifold gauge set and a stand alone vacuum pump.

If an A/C compressor is left open to the atmosphere for an extended period of time, it is recommended that the refrigerant oil in the compressor be drained and replaced with new refrigerant oil to reduce the possibility of contaminating the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.

R-1234YF EVACUATION PROCEDURE

WARNING: Review the safety precautions and warnings in this group before performing this procedure. Failure to follow these instructions may result in serious injury or death.

CAUTION: A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you MUST replenish any oil lost during the recovery process. See the equipment manufacturer instructions for more information.

1. Recover the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

   NOTE: When connecting service equipment couplers to refrigerant line service ports, verify that the valve of each coupler is fully closed prior to connecting. This will reduce the amount of effort required to make the connections.

2. Connect an R-1234yf refrigerant recovery/recycling/charging station with a vacuum pump that meets SAE standard J2843 to the refrigerant system, or an R-1234yf compatible manifold gauge set and a stand alone vacuum pump (depending on available equipment).
3. Open the refrigerant recovery/recycling/charging station or manifold gauge set valves and start the vacuum pump. The vacuum pump should run a minimum of 45 minutes prior to recharge to eliminate all moisture in system. When the low-side gauge reads to the lowest degree of vacuum possible (approximately -88 kPa (-26 in. Hg or greater) for 30 minutes, close all valves and turn off vacuum pump. If the refrigerant system fails to reach specified vacuum, the refrigerant system likely has a leak that must be corrected. If the refrigerant system maintains specified vacuum for at least 30 minutes, start the vacuum pump, open the valves and allow the refrigerant system to evacuate an additional 10 minutes.
4. Close the refrigerant recovery/recycling/charging station or manifold gauge set valves. Turn off and disconnect the vacuum pump.
5. Disconnect the refrigerant recovery/recycling/charging station or manifold gauge set from the refrigerant system service ports.
6. Install the caps onto the refrigerant system service ports.

R-134A REFRIGERANT SYSTEM CHARGE

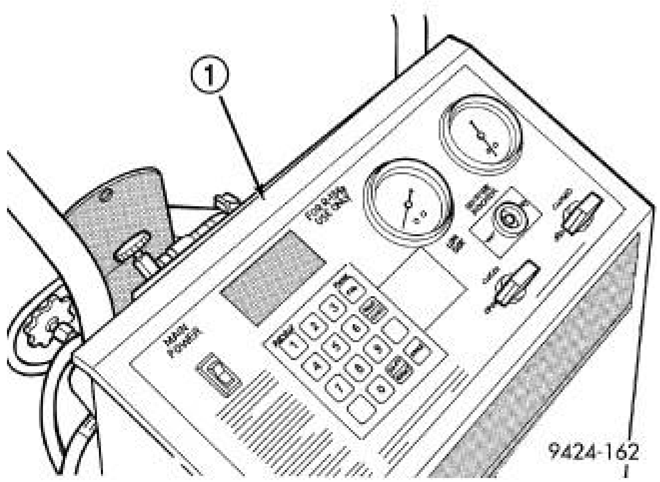

Fig. 104: Identifying R-134a Refrigerant Recovery/Recycling/Charging Station
Courtesy of CHRYSLER GROUP, LLC

After all A/C refrigerant system repairs have been completed and the refrigerant system has been evacuated, the A/C system can be recharged with R-134a refrigerant.

When charging the A/C system, use an R-134a refrigerant recovery/recycling/charging station (1) that meets SAE standard J2788. Per SAE standard J2788, refrigerant recovery stations must charge the system to an accuracy of 14 grams (0.5 oz.). See the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

R-134A CHARGING PROCEDURE

WARNING: **Review the safety precautions and warnings in this group before performing this procedure. Failure to follow these instructions may result in serious injury or death.**

CAUTION: **A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you MUST replenish any oil lost during the recovery process. See the equipment manufacturer instructions for more information.**

1. Recover and evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
2. Connect an R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2788 to the refrigerant system.
3. When required, adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.

   NOTE: **A/C system refrigerant capacity can be found on the HVAC Specification Label, located in the engine compartment.**

4. Measure the proper amount of refrigerant and heat it to 52Ā°C (125Ā°F) with the charging station. Refer to **REFRIGERANT, SPECIFICATIONS**. See the operating instructions supplied by the equipment manufacturer for proper use of this equipment.
5. Open both the low and high side valves, then open the charge valve to allow the heated refrigerant to flow

into the refrigerant system.

6. When the transfer of refrigerant has stopped, close the valves.

WARNING: Take care not to open the high side (high pressure) valve while performing STEP 7. Failure to follow these instructions may result in possible serious or fatal injury.

7. Perform the following if all of the refrigerant charge did not transfer from the dispensing device.
   - Open all of the windows in the vehicle.
   - Set the heating and A/C system so that the A/C compressor is operating and the blower motor is operating at its lowest speed setting.
   - Run the engine at a steady high idle (about 1400 rpm).
   - If the A/C compressor does not operate, test the compressor control circuits and repair as required.
   - Open the low side valve and the charge valve to allow the remaining refrigerant to flow into the refrigerant system.
   - When the transfer of refrigerant has stopped, close the valves.
8. Disconnect the refrigerant recovery/recycling/charging station from the refrigerant system service ports.
9. Reinstall the caps onto the refrigerant system service ports.

R-1234YF REFRIGERANT SYSTEM CHARGE

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

NOTE: The Underhood HVAC Specification Label contains the refrigerant fill specification of the vehicle being serviced.

Fig. 105: R-1234YF Refrigerant Recovery/Recycling/Charging Station
Courtesy of CHRYSLER GROUP, LLC

After all refrigerant system leaks have been repaired and the refrigerant system has been evacuated, a refrigerant charge can be injected into the system. Refer to **PLUMBING, STANDARD PROCEDURE**.

When charging the A/C system, use an R-1234yf refrigerant recovery/recycling/charging station that meets SAE standard J2843. Per SAE standard J2843, refrigerant recovery stations must charge the system to an accuracy of 14 grams (0.5 oz.). See the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

R-1234YF CHARGING PROCEDURE

WARNING: Review the safety precautions and warnings in this group before performing this procedure. Failure to follow these instructions may result in serious injury or death.

CAUTION: A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you MUST replenish any oil lost during the recovery process. See the equipment manufacturer instructions for more information.

1. Recover and evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
2. Connect an R-1234yf refrigerant recovery/recycling/charging station that meets SAE standard J2843 to the refrigerant system.
3. When required, adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.

   NOTE: A/C system refrigerant capacity can be found on the HVAC Specification Label, located in the engine compartment.

4. Open both the low and high side valves, then open the charge valve to allow the refrigerant to flow into the refrigerant system.
5. When the transfer of refrigerant has stopped, close the valves.

   WARNING: Take care not to open the high side (high pressure) valve while performing STEP 7. Failure to follow these instructions may result in possible serious or fatal injury.

6. Perform the following if all of the refrigerant charge did not transfer from the dispensing device.
   - Open all of the windows in the vehicle.
   - Set the heating and A/C system so that the A/C compressor is operating and the blower motor is operating at its lowest speed setting.
   - Run the engine at a steady high idle (about 1400 rpm).
   - If the A/C compressor does not operate, test the compressor control circuits and repair as required.
   - Open the low side valve and the charge valve to allow the remaining refrigerant to flow into the refrigerant system.
   - When the transfer of refrigerant has stopped, close the valves.
7. Disconnect the refrigerant recovery/recycling/charging station from the refrigerant system service ports.

..

8. Install the caps onto the refrigerant system service ports.

COMPRESSOR, A/C

DESCRIPTION

A/C CLUTCH

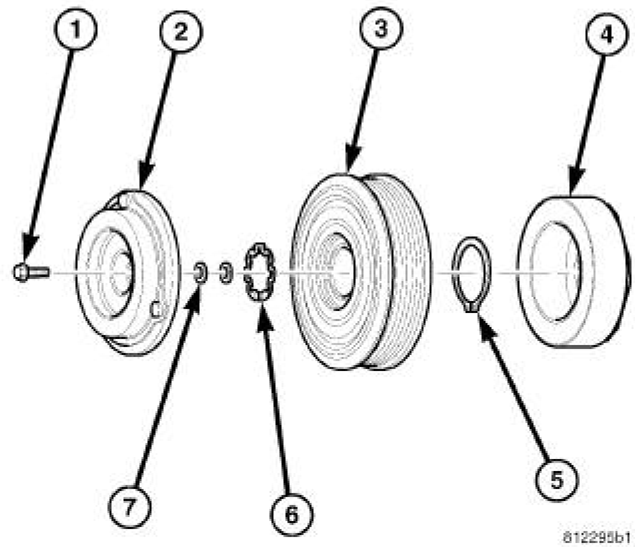

Fig. 106: A/C Compressor Clutch Components
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical A/C clutch assembly shown in the illustration.

The A/C compressor clutch assembly consists of a stationary electromagnetic A/C clutch field coil (4), pulley bearing and pulley assembly (3), clutch plate (2) and shims (7). These components provide the means to engage and disengage the A/C compressor from the engine accessory drive belt.

The A/C clutch field coil and the pulley bearing and pulley assembly are both retained on the nose of the A/C compressor with snap rings (5 and 6). The clutch plate is splined to the compressor shaft and secured with a bolt (1).

A/C COMPRESSOR

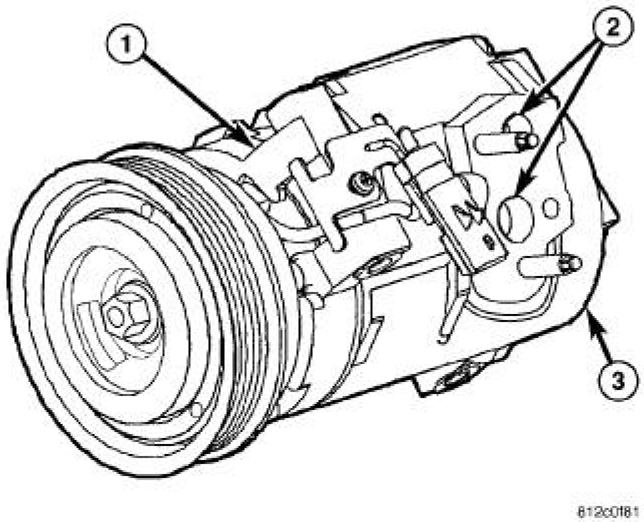

Fig. 107: A/C Compressor
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical A/C compressor shown in the illustration.

Models equipped with the 3.6L and 5.7L engine, use a Denso 10SBH17 A/C compressor. Models equipped with the 6.4L and 6.2L engine, use a Denso 10SRE18 A/C compressor.

Both A/C compressors have a variable displacement of 170 cubic centimeters (10 cubic inches) and have the suction and discharge ports (2) located on the compressor cylinder head (3), along with a label identifying the proper refrigerant.

HIGH PRESSURE RELIEF VALVE

A high pressure relief valve is located on the compressor cylinder head at the rear of the A/C compressor. Refer to **COMPRESSOR, A/C, DESCRIPTION**. This mechanical valve is designed to vent refrigerant from the A/C system to protect against damage to the A/C compressor and other A/C system components caused by condenser air flow restriction or an overcharge of refrigerant.

OPERATION

A/C CLUTCH

The A/C clutch components provide the means to engage and disengage the A/C compressor from the moving engine accessory drive belt. A/C clutch engagement is controlled by the Powertrain Control Module (PCM). When the PCM energizes the electromagnetic A/C clutch coil, it magnetically draws the clutch plate into contact with the clutch pulley and drives the compressor shaft. When the coil is not energized, the pulley freewheels on the clutch hub bearing, which is part of the pulley assembly.

A/C clutch components cannot be repaired and must be replaced if inoperative or damaged.

A/C COMPRESSOR

The A/C compressor is driven by the engine through an electric clutch, drive pulley and belt arrangement. The A/C compressor is lubricated by refrigerant oil that is circulated throughout the refrigerant system with the

refrigerant.

The A/C compressor draws in low-pressure refrigerant vapor from the A/C evaporator through its suction port. It then compresses the refrigerant into a high-pressure, high-temperature refrigerant vapor, which is then pumped to the A/C condenser through the compressor discharge port.

CAUTION: Be certain to adjust the refrigerant system oil level when replacing an A/C compressor. Failure to properly adjust the refrigerant oil level can prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

The A/C compressor cannot be repaired and must be replaced if inoperative or damaged. The compressor clutch, pulley and bearing assembly, and clutch field coil are available for service. If an internal failure of the A/C compressor has occurred, the A/C receiver/drier must also be replaced. Refer to **DRIER, A/C RECEIVER, REMOVAL**.

HIGH PRESSURE RELIEF VALVE

The high pressure relief valve vents refrigerant from the A/C system when a discharge pressure of 3445 to 4135 kPa (500 to 600 psi) or above is reached. The high pressure relief valve closes with a minimum discharge pressure of 2756 kPa (400 psi) is reached.

The high pressure relief valve should not open when the A/C system is operating correctly. If the high pressure relief valve vents refrigerant, there is most likely a problem within the A/C refrigerant system. The high pressure relief valve vents only enough refrigerant to reduce the A/C system pressure, and then re-seats itself. If the high pressure relief valve vents refrigerant, see the A/C System Diagnosis chart. Refer to **DIAGNOSIS AND TESTING**.

The high pressure relief valve is factory calibrated and cannot be adjusted or repaired, and must not be removed or otherwise disturbed. The valve is only serviced as a part of the A/C compressor.

DIAGNOSIS AND TESTING

A/C CLUTCH COIL

The A/C clutch coil electrical circuit is controlled by the Powertrain Control Module (PCM), through a relay in the Power Distribution Center (PDC). See the appropriate Wiring Information for complete HVAC wiring diagrams. Begin testing of a suspected A/C clutch coil problem by performing the preliminary checks.

PRELIMINARY CHECKS

1. Using a scan tool, check for Diagnostic Trouble Codes (DTCs) related to the A/C heater module, Body Control Module (BCM), PCM and PDC. If no DTCs are found, go to STEP 2. If any DTCs are found, repair as required.
2. Check the A/C clutch fuse in the PDC. If OK, go to STEP 3. If not OK, repair the shorted circuit and replace the fuse.
3. If the A/C clutch still will not engage, verify the refrigerant charge level by conducting the A/C Performance test. Refer to **DIAGNOSIS AND TESTING**. If the refrigerant charge level is OK, go to COIL RESISTANCE TEST and COIL CURRENT DRAW TEST. If the refrigerant charge level is not OK, adjust the refrigerant charge as required.

COIL RESISTANCE TEST

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the A/C clutch coil connector.
3. Use an ohm meter and Back Probe Tool (special tool #6801, Terminal Probe) and measure the resistance of the A/C clutch coil at the coil connector terminals.
4. See A/C CLUTCH COIL SPECIFICATIONS TABLE for acceptable A/C clutch coil resistance. Specifications apply for a work area temperature of 21Â° C (70Â° F).
   a. If the A/C clutch coil reading is below specifications, the coil is shorted and must be replaced.
   b. If the A/C clutch coil reading is above specifications, the coil is open and must be replaced.

A/C CLUTCH COIL SPECIFICATIONS

Application	Coil Resistance	Coil Current Draw
5.7L/6.4L Engines	3.3 - 3.5 ohms	3.2 amps Max @ 12V Â± 0.5V @ 21Â° C (70Â° F)
3.6L Engine	3.0 - 4.0 ohms	3.1 - 4.0 amps @ 12V Â± 0.5V @ 21Â° C (70Â° F)

COIL CURRENT DRAW TEST

1. Verify the battery state of charge. Refer to **BATTERY, DIAGNOSIS AND TESTING** .
2. Connect an ammeter (0 to 10 ampere scale selected) in series with the A/C clutch coil feed terminal using Back Probe Tool (special tool #6801, Terminal Probe). Connect a voltmeter (0 to 20 volt scale selected) to measure voltage across the battery and the A/C clutch coil.
3. With the A/C heater control in the A/C mode and the blower motor at low speed, start the engine and allow it to run at a normal idle speed.
4. The A/C clutch should engage immediately and the clutch coil supply voltage should be within two volts of the battery voltage. If the clutch coil supply voltage is OK, go to 5. If the coil supply voltage is not within two volts of battery voltage, test the clutch coil feed circuit for excessive voltage drop and repair as necessary.
5. See **A/C CLUTCH COIL SPECIFICATIONS** table for acceptable A/C clutch coil current draw. Specifications apply for a work area temperature of 21Â° C (70Â° F). If voltage is more than 12.5 volts, add electrical loads by turning on electrical accessories until voltage reads below 12.5 volts.
   a. If the A/C clutch coil current reading is zero, the coil is open and must be replaced.
   b. If the A/C clutch coil current reading is above specifications, the coil is shorted and must be replaced.

A/C SYSTEM NOISE TESTING

When investigating an A/C system related noise, you must first know the conditions under which the noise occurs. These conditions include: weather, vehicle speed, transmission in gear or neutral, engine speed, engine temperature, and any other special conditions. Noises that develop during A/C operation can often be misleading. For example: What sounds like a failed front engine bearing or connecting rod, may be caused by loose bolts, nuts, mounting brackets or a loose compressor clutch assembly.

Drive belts are speed sensitive. At different engine speeds and depending upon drive belt tension, drive belts

..

can develop noises that are mistaken for an A/C compressor noise. Improper drive belt tension can cause a misleading noise when the compressor clutch is engaged, which may not occur when the compressor clutch is disengaged. Check the accessory drive belt condition and tension as described in Cooling before beginning this procedure.

1. Select a quiet area for testing. Duplicate the complaint conditions as much as possible. Turn the A/C compressor On and Off several times to clearly identify the compressor noise. Listen to the A/C compressor while the clutch is engaged and disengaged. Probe the A/C compressor with an engine stethoscope or a long screwdriver with the handle held to your ear to better localize the source of the noise.
2. Loosen all of the compressor mounting hardware and retighten. Check the compressor clutch retainer. Be certain that the clutch field coil is mounted securely to the A/C compressor, and that the clutch plate and pulley are properly aligned and have the correct air gap. Refer to **COMPRESSOR, A/C, INSTALLATION**.
3. To duplicate high-ambient temperature conditions (high head pressure), restrict the air flow through the A/C condenser. Install a manifold gauge set or a scan tool to be certain that the discharge pressure does not exceed 2760 kPa (400 psi).
4. Check the refrigerant system plumbing for incorrect routing, rubbing or interference, which can cause unusual noises. Also check the refrigerant lines and hoses for kinks or sharp bends that will restrict refrigerant flow, which can cause noises.
5. If the noise is from opening and closing of the high pressure relief valve, recover, evacuate and recharge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
6. If the high pressure relief valve still does not seat properly, replace the A/C compressor. Refer to **COMPRESSOR, A/C, REMOVAL**.

STANDARD PROCEDURE

STANDARD PROCEDURE - A/C CLUTCH PLATE INSPECTION

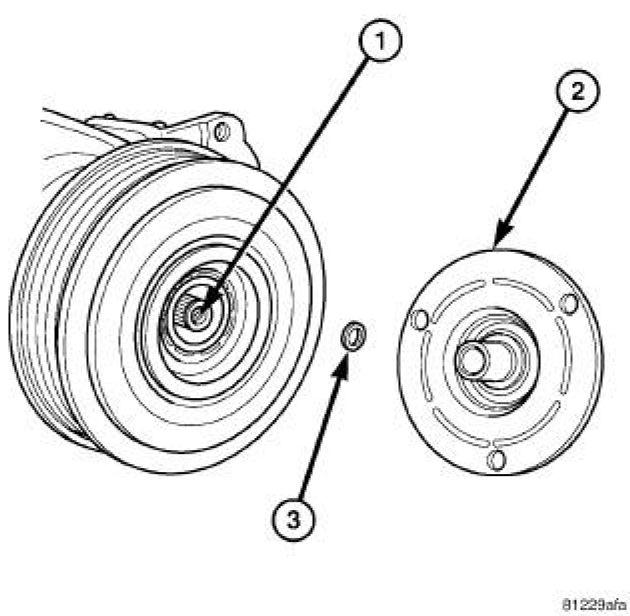

Fig. 108: Identifying Compressor Shaft, Clutch Plate & Shim
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The A/C clutch can be serviced in the vehicle. The refrigerant system can remain fully-charged during compressor clutch, pulley and bearing assembly, or coil replacement.**

Examine the friction surfaces of the pulley and the clutch plate (2) for wear. The pulley and clutch plate should be replaced if excessive wear or scoring is found.

If the friction surfaces are oily, inspect the shaft and nose area of the A/C compressor (1) for refrigerant oil. If refrigerant oil is found, the compressor shaft seal is leaking and the A/C compressor must be replaced.

Check the pulley bearing for roughness or excessive leakage of grease. The pulley and clutch plate should be replaced if bearing roughness or excessive leakage is found.

REMOVAL

A/C CLUTCH

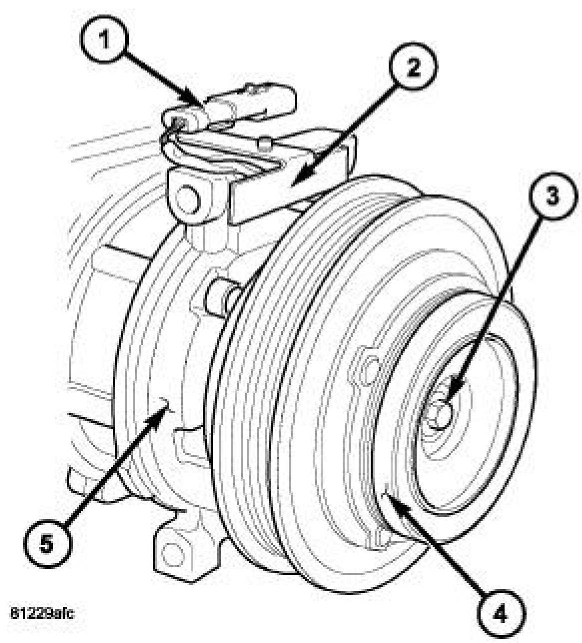

Fig. 109: A/C Compressor, Field Coil Connectors, Bracket, Clutch Plate & Shaft Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The compressor clutch assembly can be serviced with the refrigerant system fully-charged and with the A/C compressor installed on the engine.**

NOTE: **Typical A/C compressor and clutch assembly shown in illustrations.**

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. On 5.7L and 6.4L engine equipped models, remove the air intake hose and the air cleaner housing. Refer

to **BODY, AIR CLEANER, REMOVAL** for 5.7L or **BODY, AIR CLEANER, REMOVAL** for 6.4L.

3. Remove the radiator fan and shroud assembly. Refer to **FAN, COOLING, REMOVAL** .
4. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .
5. Disconnect the engine wire harness from the compressor clutch field coil connector (1) located on the top of the A/C compressor (5).

NOTE: **Some vehicles (depending on engine application) may require the A/C compressor to be removed from its installed location to gain access to the compressor shaft bolt and/or pulley and field coil snap rings. However, the refrigerant system can still remain fully charged.**

6. Carefully remove the A/C clutch coil connector and wire lead from the connector bracket (2).
7. Remove the compressor shaft bolt (3). A band-type oil filter wrench or a strap wrench may be used to hold the clutch plate (4) from rotating during bolt removal.

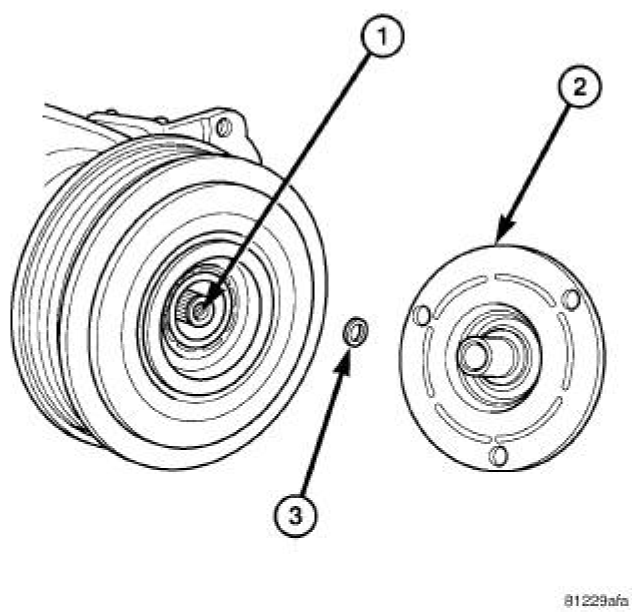

Fig. 110: Identifying Compressor Shaft, Clutch Plate & Shim
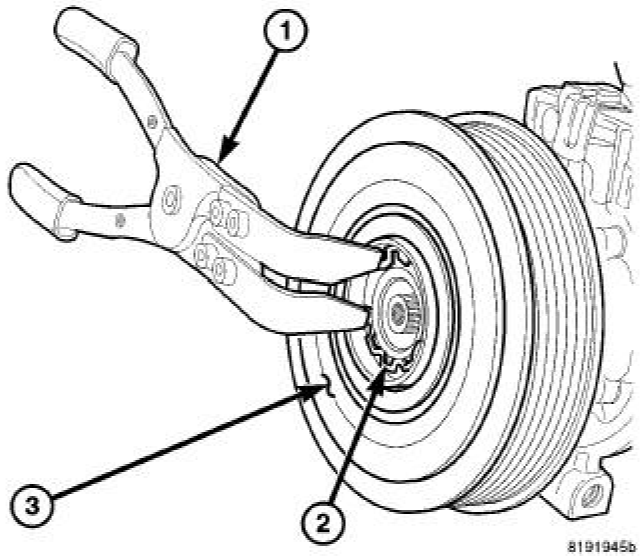
Courtesy of CHRYSLER GROUP, LLC

CAUTION: **Do not pry between the clutch plate and the pulley and bearing assembly to remove the clutch plate from the compressor shaft as this may damage the clutch plate.**

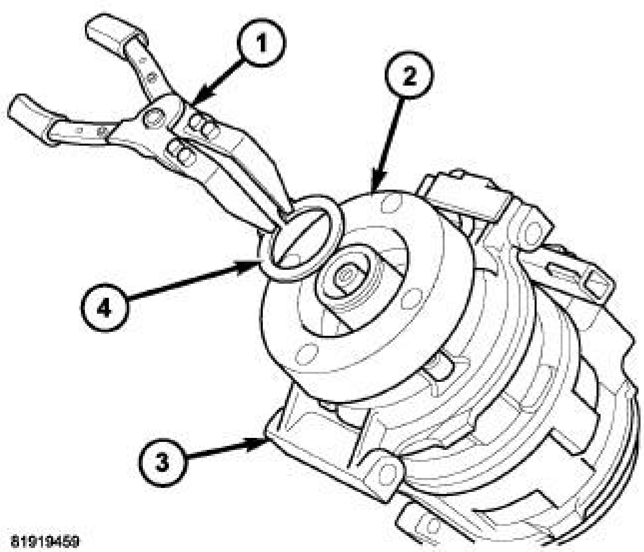
NOTE: **Use care not to lose any clutch shim(s) during removal of the clutch plate, as they may be reused during the clutch plate installation process.**

8. Tap the clutch plate (2) lightly with a plastic mallet to release it from the splines on the compressor shaft (1) and remove the clutch plate and shim(s) (3).



[**Fig. 111: Clutch Pulley & Snap Ring**]
Courtesy of CHRYSLER GROUP, LLC

9. Using A/C Snap Ring Pliers (special tool #9764, Pliers, A/C Snap Ring) (1) or equivalent, remove the snap ring (2) that secures the pulley and bearing assembly (3) to the front of the A/C compressor and remove the pulley and bearing assembly.



[**Fig. 112: Clutch Coil And Snap Ring**]
Courtesy of CHRYSLER GROUP, LLC

10. Using A/C Snap Ring Pliers (special tool #9764, Pliers, A/C Snap Ring) (1) or equivalent, remove the snap ring (4) that secures the A/C clutch coil (2) to the front of the A/C compressor (3) and remove the coil.

3.6L ENGINE

WARNING: Review the warnings and cautions for this system before performing the

procedure. Failure to follow these instructions may result in serious injury or death.

CAUTION: **The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.**

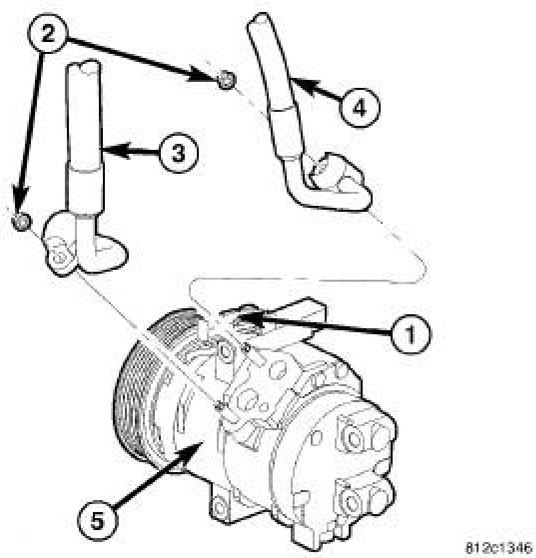


Fig. 113: Remove/Install A/C Compressor Lines
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The A/C compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the A/C clutch, clutch coil or engine.**

NOTE: **Typical A/C compressor and refrigerant lines show.**

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
3. Remove the air cleaner housing. Refer to **BODY, AIR CLEANER, REMOVAL** .
4. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .
5. Disconnect the engine wire harness from the A/C clutch connector (1).
6. Remove the nuts (2) that secure the A/C suction line (3) and A/C discharge line (4) to the A/C compressor (5).
7. Disconnect the suction and discharge lines from the A/C compressor and remove and discard the dual plane seals.
8. Install plugs in, or tape over all of the opened refrigerant line fittings and the compressor ports.

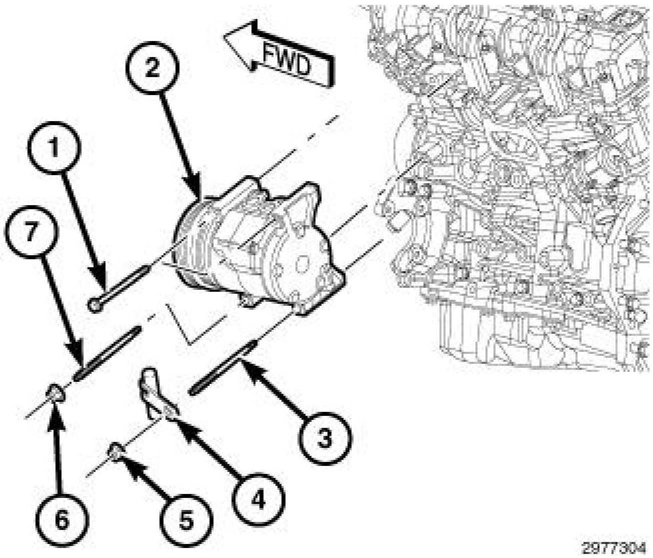

Fig. 114: Typical A/C compressor Mounting
Courtesy of CHRYSLER GROUP, LLC

9. Remove the front belly pan. Refer to **BELLY PAN, REMOVAL** or **BELLY PAN, ENGINE, REMOVAL** .
10. Remove the two nuts (5 and 6) and two studs (3 and 7).

CAUTION: Use care not to deform or damage the heater tube and bracket when servicing the A/C compressor.

11. Carefully position the heater tube and bracket (4) out of the way.
12. Support the A/C compressor and remove the two bolts (1).
13. Remove the A/C compressor from the engine compartment.

5.7L/6.4L ENGINES

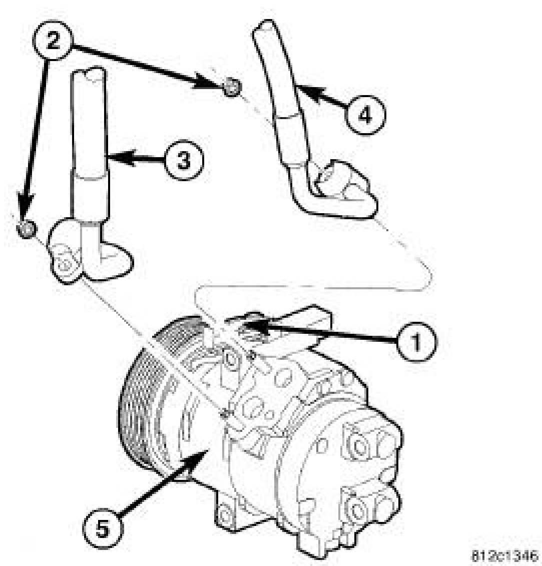

Fig. 115: Remove/Install A/C Compressor Lines

Courtesy of CHRYSLER GROUP, LLC

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: The A/C compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the A/C clutch, clutch coil or engine.

NOTE: Typical A/C compressor and refrigerant lines shown in the illustration.

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
3. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** for 5.7L or **BODY, AIR CLEANER, REMOVAL** for 6.4L. .
4. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .
5. On SRT models, position the power steering pump and reservoir out of the way. Refer to **RESERVOIR, POWER STEERING PUMP, REMOVAL** .
6. Remove the nuts (2) that secure the A/C suction line (3) and A/C discharge line (4) to the A/C compressor (5).
7. Disconnect the suction and discharge lines from the A/C compressor and remove and discard the dual plane seals.
8. Disconnect the engine wire harness from the A/C clutch connector (1).
9. Install plugs in, or tape over all of the opened refrigerant line fittings and the compressor ports.
10. Remove the front belly pan. Refer to **BELLY PAN, REMOVAL** or **BELLY PAN, ENGINE, REMOVAL** .

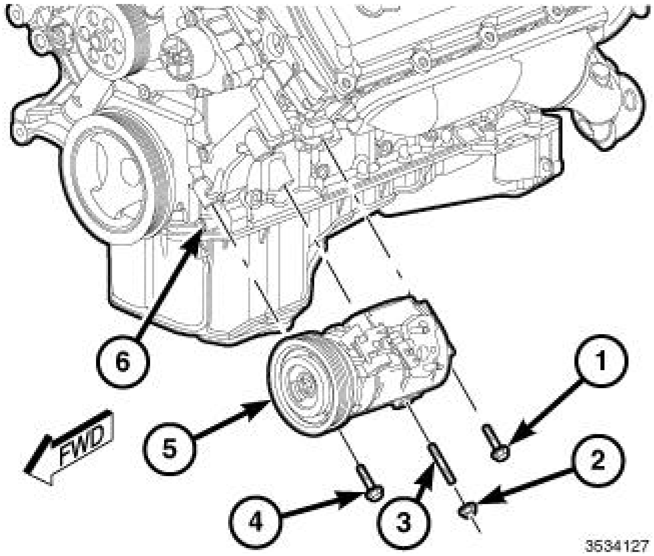

Fig. 116: Removing/Installing A/C Compressor
Courtesy of CHRYSLER GROUP, LLC

11. Remove the two bolts (1 and 4) that secure the A/C compressor (5) to the engine (6).
12. Support the A/C compressor and remove the nut (2) and stud (3).
13. Remove the A/C compressor from the engine compartment.

INSTALLATION

A/C CLUTCH

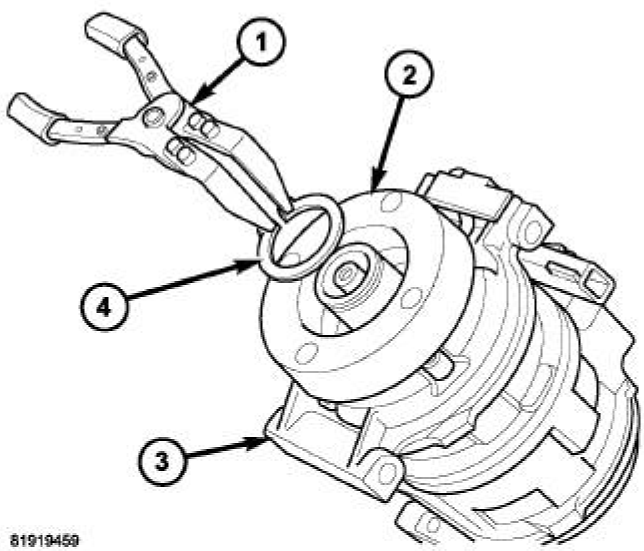

Fig. 117: Clutch Coil And Snap Ring
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical A/C compressor and clutch assembly shown in illustrations.

1. Align the dowel pin on the back of the A/C clutch coil (2) with the hole in the front of the A/C compressor (3) and position the coil onto the compressor. Be certain that the A/C clutch coil wire lead is

..

properly routed so that it is not pinched between the compressor housing and the coil.

CAUTION: **The snap ring must be fully and properly seated in the groove or it will vibrate out, resulting in a clutch failure and severe damage to the A/C compressor.**

NOTE: **A new snap ring must be used to secure the A/C clutch coil to the A/C compressor. The bevel side of the snap ring must face outward and both snap ring eyelets must be oriented to the right or to the left of the coil dowel pin location on the A/C compressor.**

2. Using A/C Snap Ring Pliers (special tool #9764, Pliers, A/C Snap Ring) (1) or equivalent, install the snap ring (4) that secures the A/C clutch coil to the front of the A/C compressor. Be certain that the snap ring is fully and properly seated in the groove and oriented correctly.

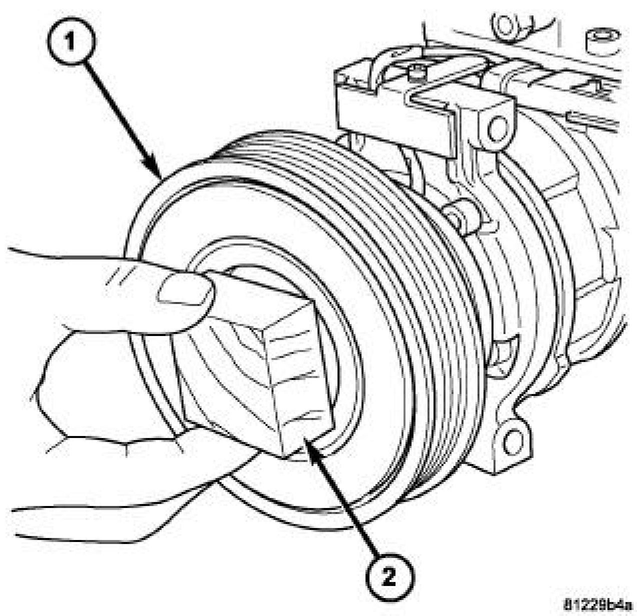

Fig. 118: Identifying Pulley & Bearing Assembly
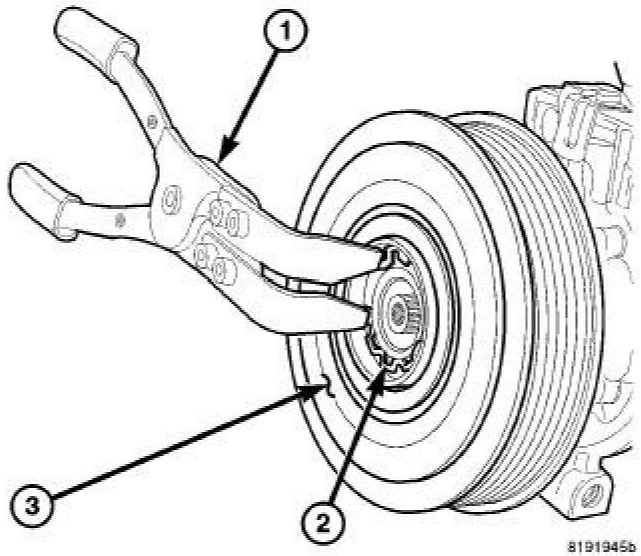
Courtesy of CHRYSLER GROUP, LLC

CAUTION: **Be certain to position the A/C clutch coil wire lead so that it is not damaged during A/C compressor pulley and bearing installation.**

CAUTION: **When installing the pulley and bearing assembly, DO NOT mar the friction surfaces of the pulley or premature failure of the clutch will result.**

3. Install the pulley and bearing assembly (1) onto the front of the A/C compressor. If necessary, tap the pulley gently with a block of wood (2) placed on the pulley friction surface.



[Fig. 119: Clutch Pulley & Snap Ring](#)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: **The snap ring must be fully and properly seated in the groove or it will vibrate out, resulting in a clutch failure and severe damage to the A/C compressor.**

NOTE: **A new snap ring must be used to secure the pulley and bearing assembly to the A/C compressor. The bevel side of the snap ring must face outward.**

4. Using A/C Snap Ring Pliers (special tool #9764, Pliers, A/C Snap Ring) (1) or equivalent, install the snap ring (2) that secures the pulley and bearing assembly (3) to the front of the A/C compressor. Be certain that the snap ring is fully and properly seated in the groove.

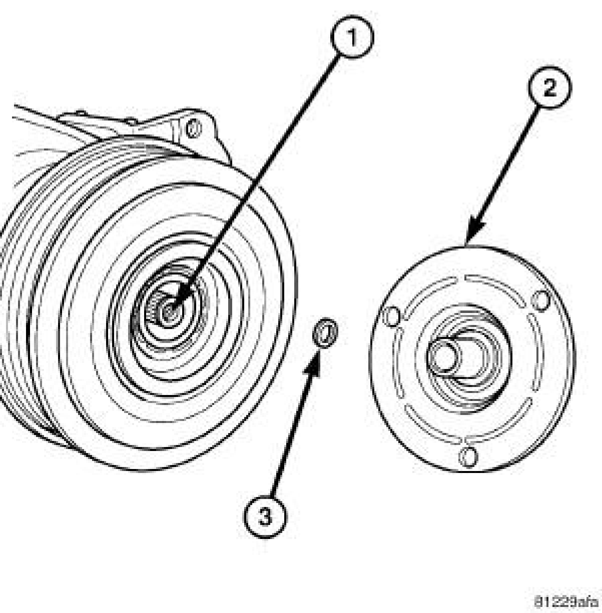


Fig. 120: Identifying Compressor Shaft, Clutch Plate & Shim
Courtesy of CHRYSLER GROUP, LLC

5. If the original clutch plate (2) and pulley and bearing assembly are to be reused, reinstall the original shim(s) (3) onto the compressor shaft (1). If a new clutch plate and pulley and bearing assembly are being used, install a trial stack of shims 2.54 mm (0.010 in.) thick onto the compressor shaft.

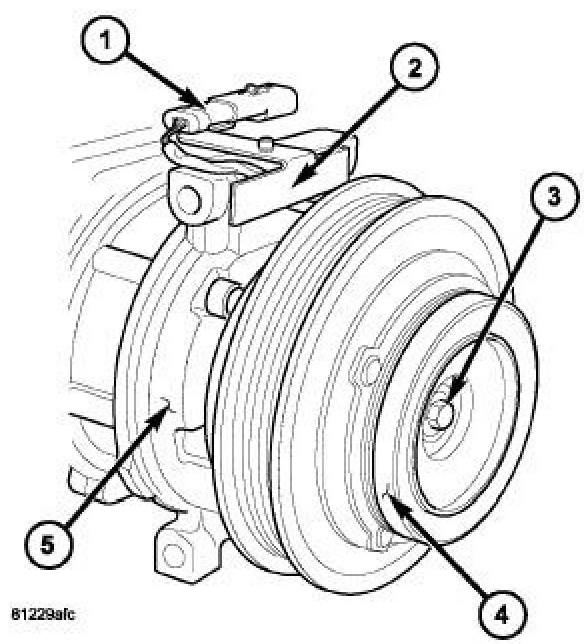

Fig. 121: A/C Compressor, Field Coil Connectors, Bracket, Clutch Plate & Shaft Bolt
Courtesy of CHRYSLER GROUP, LLC

6. Install the clutch plate (4) onto the front of the A/C compressor (5).
7. Install the compressor shaft bolt (3) and tighten to the proper torque specification. Refer to **TORQUE SPECIFICATIONS**. .

NOTE:	**The shims may compress after tightening the shaft bolt. Check the air gap in four or more places to verify the air gap is correct. Spin the pulley before performing a final check of the air gap.**
NOTE:	**On vehicles with the clutch plate recessed into the pulley, use a 90Â° wire gap gauge to measure the clutch air gap. On other vehicles, use a blade type feeler gauge to measure the air gap.**

8. With the clutch plate assembled tight against the shim(s), measure the air gap between the clutch plate and the pulley and bearing assembly. The air gap should be between 0.35 - 0.60 mm (0.014 - 0.024 in.). If the air gap is not between specifications, add or subtract shims as needed until the correct air gap is obtained.

CAUTION:	**Be certain that the A/C clutch coil wire lead is routed so that it is not pinched between the compressor housing and the coil connector bracket.**

9. Carefully route the A/C clutch coil wire lead behind the connector bracket (2).
10. Install the A/C clutch coil connector (1) onto the connector bracket.
11. Connect the engine wire harness to the A/C clutch coil connector.
12. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .
13. Install the radiator fan and shroud assembly. Refer to **FAN, COOLING, INSTALLATION** .
14. On 5.7L and 6.4L engine equipped models, install the air cleaner housing and air intake hose. Refer to **BODY, AIR CLEANER, INSTALLATION** for 5.7L or **BODY, AIR CLEANER, INSTALLATION** for 6.4L. .
15. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.
16. Verify proper A/C clutch operation.

3.6L ENGINE

CAUTION: If the A/C compressor is being replaced, be certain to adjust the refrigerant system oil level. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

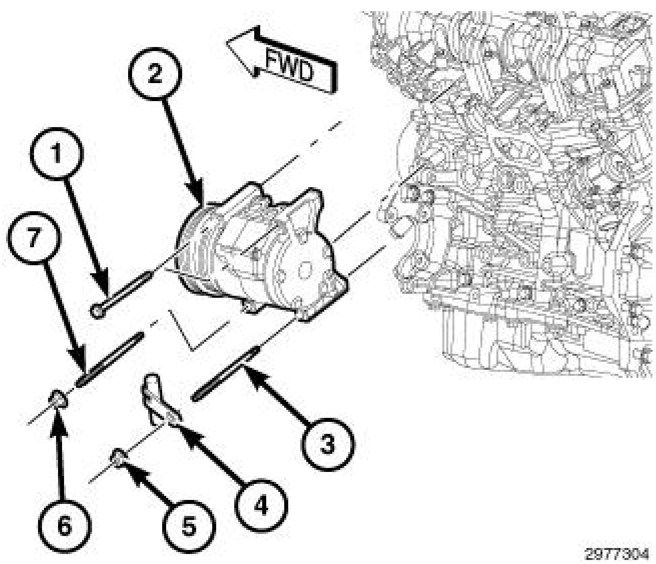

Fig. 122: Typical A/C compressor Mounting
Courtesy of CHRYSLER GROUP, LLC

NOTE: When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be removed from the new A/C compressor. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and

metal gaskets could result in a refrigerant system leak.

1. If the A/C compressor (2) is being replaced, the refrigerant oil in the old compressor must be first drained and measured. Then the oil in the new A/C compressor must be drained. Finally, the new compressor must be refilled with the same amount of new refrigerant oil that was drained out of the old compressor. When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Position the A/C compressor to the engine and install the two studs (3 and 7). Tighten the studs to the proper torque specification. Refer to **TORQUE SPECIFICATIONS** .
3. Loosely install the two bolts (1).
4. Reposition the heater tube and bracket (4) and loosely install the two nuts (5 and 6).
5. Tighten the bolts and nuts to 28 N.m (21 ft. lbs.) using the following sequence:
   - Bolt at front compressor.
   - Nut at front compressor.
   - Bolt at rear compressor.
   - Nut at rear compressor.
6. Install the front belly pan. Refer to **BELLY PAN, INSTALLATION** or **BELLY PAN, ENGINE, INSTALLATION** .

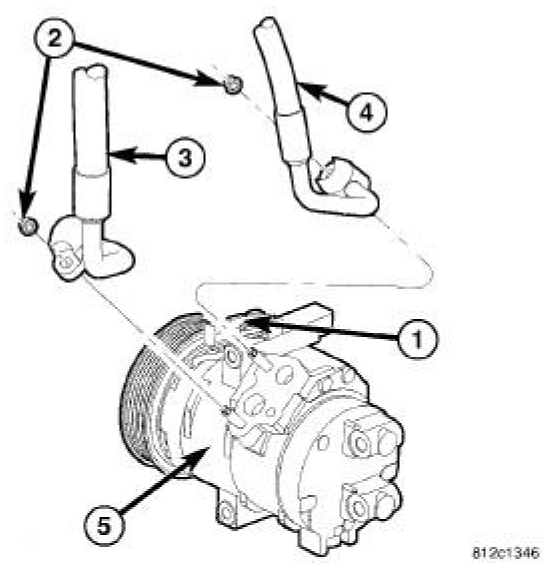

Fig. 123: Remove/Install A/C Compressor Lines
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Typical A/C compressor and refrigerant lines show.**

7. Remove the tape or plugs from the opened fittings on the A/C suction line (3) and the A/C discharge line (4) and the compressor ports.
8. Lubricate new dual plane seals with clean refrigerant oil and install them onto the suction and the discharge line fittings. Use only the specified seals as they are made of a special material for the specific refrigerant in the system. Use only refrigerant oil of the type recommended for the A/C compressor in the

vehicle.

9. Connect the suction and discharge lines onto the A/C compressor (5).
10. Install the nuts (2) that secure the suction and discharge lines to the A/C compressor and tighten to the proper torque specification. Refer to **TORQUE SPECIFICATIONS** .
11. Connect the engine wire harness to the A/C clutch connector (1).
12. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .
13. Replace the A/C receiver/drier if the A/C compressor is being replaced due to an internal failure. Refer to **DRIER, A/C RECEIVER, REMOVAL**.
14. Install the air cleaner housing. Refer to **BODY, AIR CLEANER, INSTALLATION** .
15. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.
16. Evacuate and charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

5.7L/6.4L ENGINES

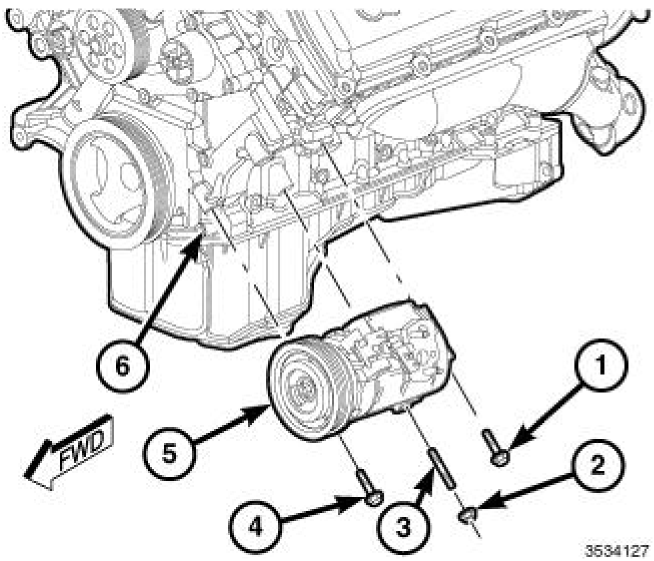

Fig. 124: Removing/Installing A/C Compressor
Courtesy of CHRYSLER GROUP, LLC

CAUTION: **If the A/C compressor is being replaced, be certain to adjust the refrigerant system oil level. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.**

CAUTION: **The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.**

NOTE: **When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be removed from the new A/C compressor. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.**

NOTE: **Replacement of the refrigerant line O-ring seals and gaskets is required anytime**

a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

1. If the A/C compressor (5) is being replaced, the refrigerant oil in the old compressor must be first drained and measured. Then the oil in the new A/C compressor must be drained. Finally, the new compressor must be refilled with the same amount of new refrigerant oil that was drained out of the old compressor. When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Position the A/C compressor to the engine (6) and install the stud (3). Tighten the stud to the proper torque specification. Refer to **TORQUE SPECIFICATIONS** .
3. Loosely install the two bolts (1 and 4) and one nut (2) that secure the A/C compressor to the engine.
4. Tighten the nut and bolts to 28 N.m (21 ft. lbs.) using the following sequence:
    - Nut at front of compressor.
    - Bolt at front of compressor.
    - Bolt at rear of compressor.
5. Install the front belly pan. Refer to **BELLY PAN, INSTALLATION** or **BELLY PAN, ENGINE, INSTALLATION** .

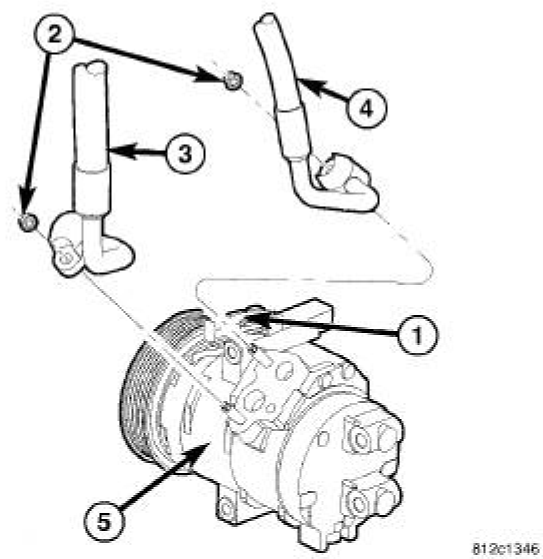

Fig. 125: Remove/Install A/C Compressor Lines
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Typical A/C compressor and refrigerant lines shown in the illustration.**

6. Connect the engine wire harness to the A/C clutch connector (1).
7. Remove the tape or plugs from the opened fittings on the A/C suction line (3) and the A/C discharge line (4) and the compressor ports.
8. Lubricate new dual plane seals with clean refrigerant oil and install them onto the suction and the discharge line fittings. Use only the specified seals as they are made of a special material for the specific refrigerant in the system. Use only refrigerant oil of the type recommended for the A/C compressor in the

vehicle.

9. Connect the A/C suction and discharge lines onto the A/C compressor (5).
10. Install the nuts (2) that secure the A/C suction and discharge lines to the A/C compressor and tighten to the proper torque specification. Refer to **TORQUE SPECIFICATIONS** .
11. On SRT models, reposition the power steering pump and reservoir. Refer to **RESERVOIR, POWER STEERING PUMP, INSTALLATION** .
12. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .
13. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION** for 5.7L or **BODY, AIR CLEANER, INSTALLATION** for 6.4L. .
14. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.
15. Evacuate and charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

CONDENSER, A/C

DESCRIPTION

DESCRIPTION

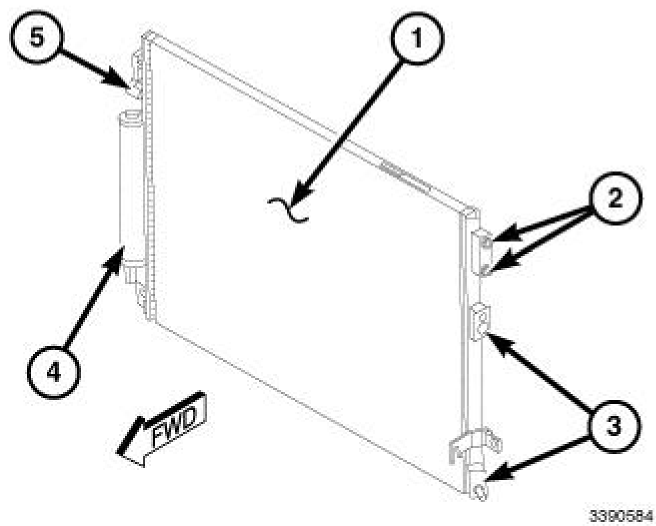

Fig. 126: A/C Condenser, A/C Refrigerant Lines, Receiver/Drier, Brackets & Integral Automatic Transmission Cooler
Courtesy of CHRYSLER GROUP, LLC

The A/C condenser (1) is located in the front of the engine compartment behind the front fascia. The A/C condenser is a heat exchanger that allows the high-pressure refrigerant gas being discharged by the A/C compressor to give up its heat to the air passing over the condenser fins, which causes the refrigerant to cool and change to a liquid state.

The A/C condenser is equipped with tapping blocks for the A/C refrigerant lines (3) and for the receiver/drier (4), mounting brackets (5) and fittings for the integral automatic transmission cooler (2).

OPERATION

OPERATION

..

When air passes through the fins of the A/C condenser, the high-pressure refrigerant gas within the A/C condenser gives up its heat. The refrigerant then condenses as it leaves the A/C condenser and becomes a high-pressure liquid. The volume of air flowing over the condenser fins is critical to the proper cooling performance of the A/C system. Therefore, it is important that there are no objects placed in front of the radiator grille openings at the front of the vehicle or foreign material on the condenser fins that might obstruct proper air flow. Also, any factory-installed air seals or shrouds must be properly reinstalled following radiator or A/C condenser service.

NOTE: **Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.**

The A/C condenser has no serviceable parts. The O-ring seals used on the connections are made from a special type of rubber not affected by refrigerant. The O-ring seals and gaskets must be replaced whenever a refrigerant line is disconnected from the A/C condenser.

The A/C condenser cannot be repaired and must be replaced if leaking or damaged.

REMOVAL

REMOVAL

WARNING: **Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.**

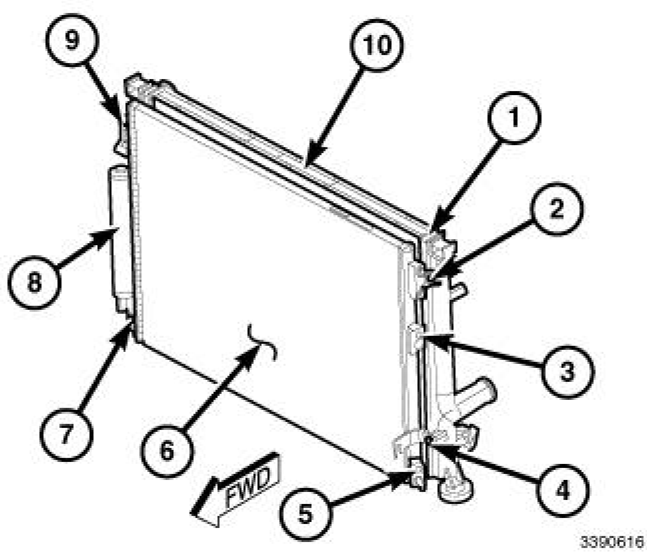

Fig. 127: Transmission Cooler Ports, Refrigerant Line Fittings, Four Bolts, Secure A/C Condenser & Radiator
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Illustration shown with A/C condenser and radiator removed from vehicle for clarity.**

1. Disconnect and isolate the negative battery cable.

2. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
3. Remove the front fascia. Refer to **FASCIA, FRONT, REMOVAL** .
4. Disconnect the automatic transmission cooler lines from the automatic transmission cooler ports (1) and install plugs in the cooler ports.
5. Disconnect the A/C discharge line and A/C liquid line from refrigerant line fittings (3 and 5). Refer to **LINE, A/C LIQUID, REMOVAL** and **LINE, A/C DISCHARGE, REMOVAL**.
6. Install plugs in, or tape over, the opened refrigerant line fittings and condenser ports.
7. Remove the four bolts (2, 4, 7 and 9) that secure A/C condenser (6) to the radiator (10).
8. Carefully tilt the bottom of the A/C condenser forward and lower the condenser out of the vehicle.
9. If required, place the A/C condenser onto a workbench and remove the A/C receiver/drier (8). Refer to **DRIER, A/C RECEIVER, REMOVAL**.

INSTALLATION

INSTALLATION

CAUTION: **Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.**

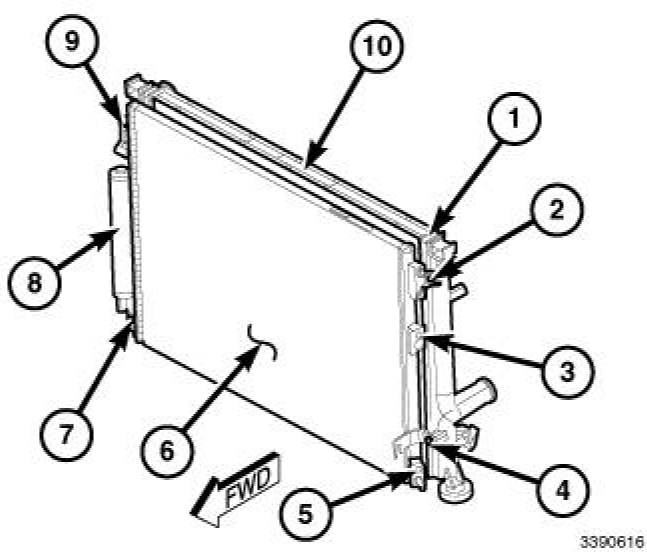

Fig. 128: Transmission Cooler Ports, Refrigerant Line Fittings, Four Bolts, Secure A/C Condenser & Radiator
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Illustration shown with A/C condenser and radiator removed from vehicle for clarity.**

NOTE: **When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.**

NOTE: **If the A/C condenser is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.**

NOTE: **Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets may result in a refrigerant system leak.**

NOTE: **Be certain that each of the radiator and condenser air seals are installed in their proper locations. These air seals are required for the A/C and engine cooling systems to perform as designed.**

1. If required, install the A/C receiver/drier (8) onto the A/C condenser (6). Refer to **DRIER, A/C RECEIVER, INSTALLATION**.
2. Carefully position the A/C condenser to the radiator (10).
3. Install the four bolts (2, 4, 7 and 9) that secure the A/C condenser to the radiator and securely tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
4. Remove the tape or plugs from the opened refrigerant line fittings and condenser ports.
5. Connect the A/C discharge line and the A/C liquid line to the refrigerant line tapping blocks (3 and 5). Refer to **LINE, A/C DISCHARGE, INSTALLATION** and **LINE, A/C LIQUID, INSTALLATION**.
6. Remove the plugs and connect the automatic transmission cooler lines to the cooler ports (1).
7. Install the front fascia. Refer to **FASCIA, FRONT, INSTALLATION** .
8. Connect the negative battery cable.
9. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
10. If the A/C condenser is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
11. Charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
12. Check the automatic transmission fluid level and fill as required. Refer to **FLUID AND FILTER, STANDARD PROCEDURE** .

CORE, HEATER

DESCRIPTION

DESCRIPTION

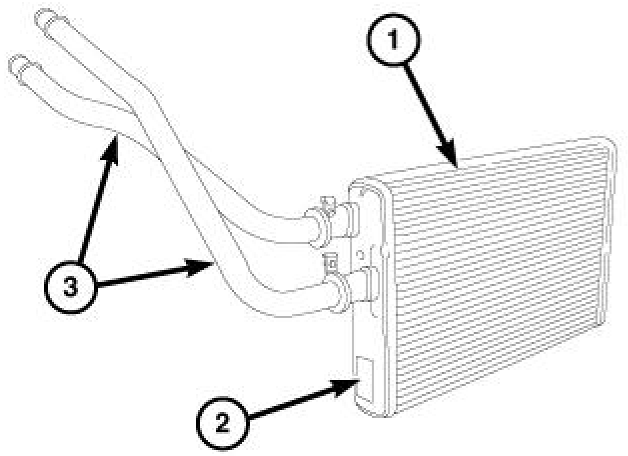

Fig. 129: Heater Core, Tubes & Tank
Courtesy of CHRYSLER GROUP, LLC

The heater core (1) is mounted into the left side of the air distribution housing, which is located behind the instrument panel. The heater core is a heat exchanger made of rows of tubes with fins. The heater core is positioned within the air distribution housing so that only the selected amount of air entering the housing passes through the heater core, before being distributed through the heating and A/C system ducts and outlets. One end of the heater core has a tank (2) that includes fittings for the heater core tubes (3) and O-ring seals.

The heater core can be serviced without removing the HVAC housing from the vehicle.

OPERATION

OPERATION

Engine coolant is circulated through the heater hoses to the heater core at all times. As the coolant flows through the heater core, heat is removed from the engine and is transferred to the heater core tubes and fins. Air directed through the heater core picks up the heat from the heater core fins. The blend-air door(s) allows control of the heater output air temperature by regulating the amount of air flowing through the heater core. The blower motor speed controls the volume of air flowing through the HVAC housing.

The heater core cannot be repaired and must be replaced if restricted, leaking or damaged.

REMOVAL

REMOVAL

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

WARNING: Disable the airbag system. Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure

way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

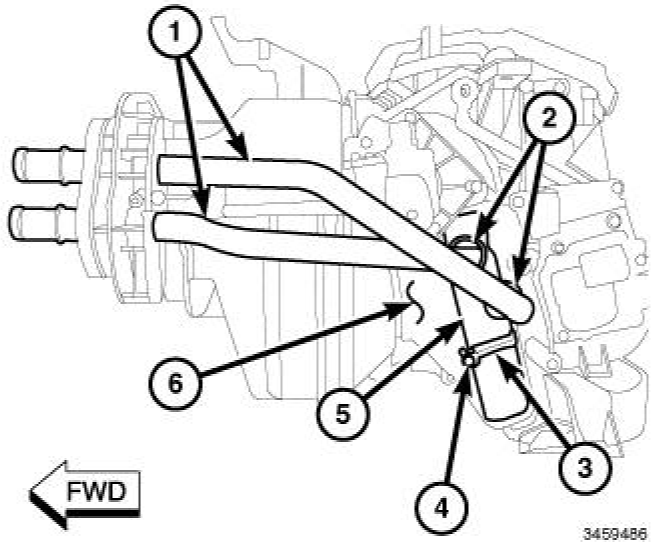

Fig. 130: Two Clamps, Heater Core Tubes, Heater Core, Screw, Heater Core Bracket & HVAC Air Distribution Housing
Courtesy of CHRYSLER GROUP, LLC

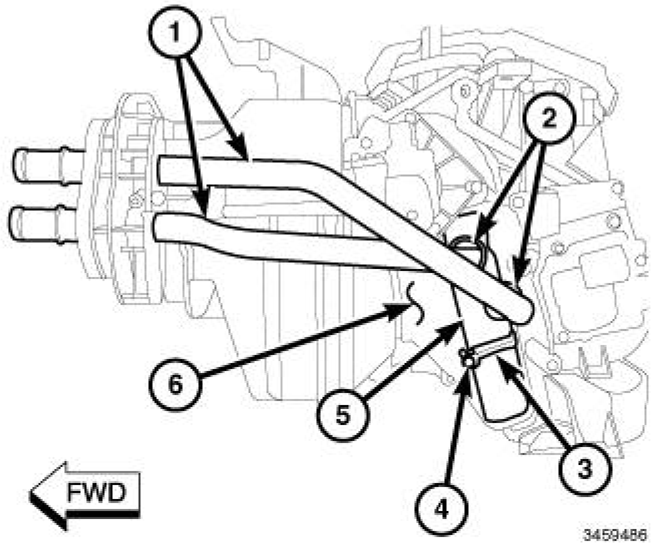
1. Remove the HVAC housing assembly. Refer to **HOUSING, HVAC, REMOVAL**.
2. Remove the two clamps (2) that secure the heater core tubes (1) to the heater core (5).

NOTE: **If required, use your fingers to rotate the clamps to gain access to the clamp retaining screws.**

3. Disconnect the heater core tubes from the heater core and position the tubes out of the way.
4. Remove and discard the heater core tube O-ring seals and install plugs in, or tape over, the opened tubes and heater core ports.
5. Remove the retaining screw (4) that secures the heater core bracket (3) to the driver side of the HVAC air distribution housing (6) and remove the bracket.
6. Carefully pull the heater core straight out of the air distribution housing.

INSTALLATION

INSTALLATION



[Fig. 131: Two Clamps, Heater Core Tubes, Heater Core, Screw, Heater Core Bracket & HVAC Air Distribution Housing]

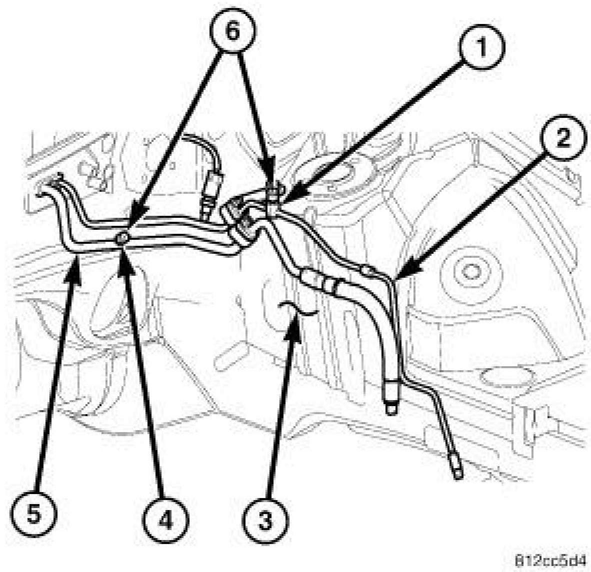
Courtesy of CHRYSLER GROUP, LLC

1. Carefully install the heater core (5) into the driver side of the HVAC air distribution housing (6).
2. Install the heater core bracket (3) and retaining screw (4) and securely tighten.
3. Remove the tape or plugs from the heater core tubes (1) and the heater core ports.
4. Lubricate new O-ring seals with clean engine coolant and install them onto the heater core tubes. Use only the specified O-ring seals as they are made of a special material for the engine cooling system.
5. Connect the heater core tubes to the heater core.
6. Install the two clamps (2) that secure the heater core tubes to the heater core and tighten securely.
7. Install the HVAC housing assembly. Refer to **HOUSING, HVAC, INSTALLATION**.

CORE, SERVICE PORT VALVE

DESCRIPTION

DESCRIPTION



[Fig. 132: Refrigerant System Service Ports Description]
Courtesy of CHRYSLER GROUP, LLC

Refrigerant system service ports are used to recover, recycle, evacuate, charge and test the A/C refrigerant system. Unique sizes are used on the two service ports to ensure the system is not accidentally contaminated with refrigerant or by service equipment used for another refrigerant.

The high side service port (1) is located on the liquid line (2) near the left shock tower (3). The low side service port (4) is located on the suction line (5) near the left shock tower. Both the high side and low side A/C service port valve cores are serviceable.

NOTE: **The protective cap aids in service port sealing and helps protect the refrigerant system from contamination. Remember to always reinstall the protective cap onto the service port when refrigerant system service is complete.**

Each of the service ports has a threaded plastic protective cap (6) installed over it from the factory. The service port caps are serviceable items.

REMOVAL

REMOVAL

WARNING: **Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.**

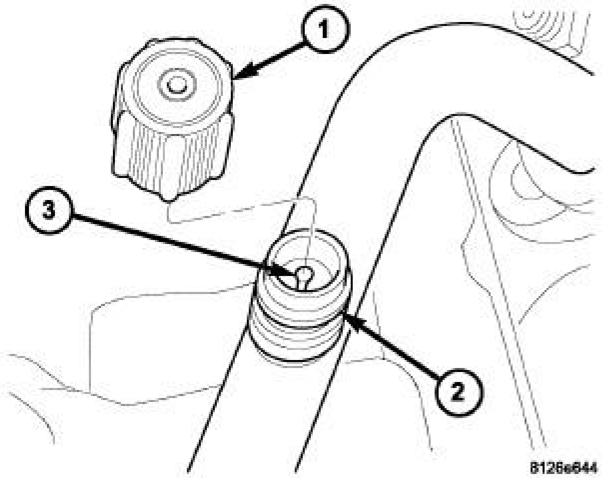


Fig. 133: Identifying A/C Service Port Components
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Typical A/C service port shown in the illustration.**

1. Remove the protective cap (1) from the service port (2).
2. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
3. Using a Schrader type valve core tool, remove the valve core (3) from the service port.
4. Install a plug in, or tape over the opened service port(s).

INSTALLATION

INSTALLATION

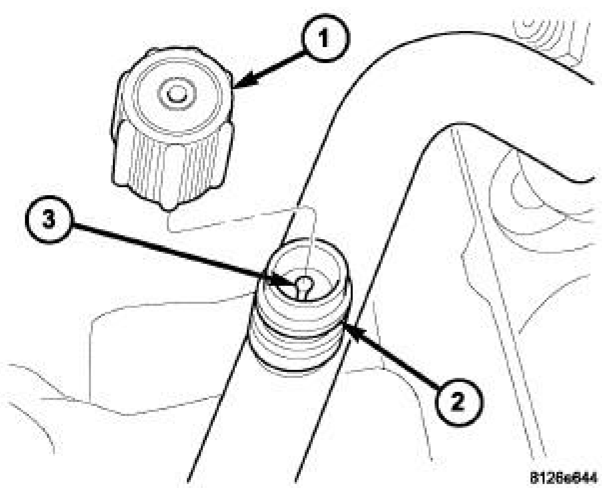

Fig. 134: Identifying A/C Service Port Components

NOTE: **Typical A/C service port shown in the illustration.**

1. Lubricate the valve core (3) with clean refrigerant oil prior to installation. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Remove the tape or plug from the service port (2).

CAUTION: **Damage may result to a service port valve core if the valve core is not fully seated in the A/C service port. Such damage can result in a loss of refrigerant.**

3. Install and tighten the valve core into the service port(s) using a Schrader type valve core tool.
4. Evacuate and charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

NOTE: **The protective cap helps aid in service port sealing and helps protect the refrigerant system from contamination. Remember to always reinstall the protective cap onto the service port when refrigerant system service is complete.**

5. Install the protective cap (1) onto the service port.

DRIER, A/C RECEIVER

DESCRIPTION

DESCRIPTION

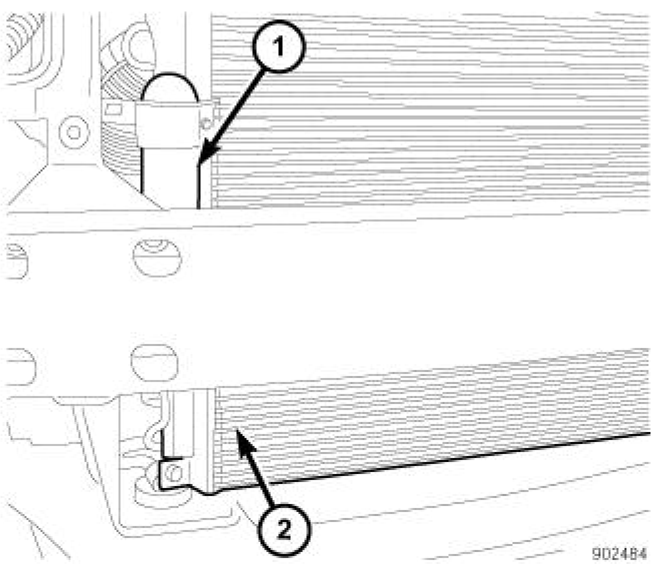

Fig. 135: Receiver/Drier & Condenser

The receiver/drier (1) stores unnecessary refrigerant, filters the refrigerant, helps remove moisture from the refrigerant and retains any refrigerant vapor that may leave the A/C condenser (2) until it becomes a liquid. The receiver/drier is installed on the high-side of the A/C system and is connected directly to the right end of the A/C condenser. The receiver/drier can be easily serviced by removing the front fascia.

OPERATION

OPERATION

The A/C receiver/drier performs a filtering action to prevent foreign material in the refrigerant from contaminating the A/C expansion valve. Refrigerant enters the A/C receiver/drier as a high-pressure, low temperature liquid. Desiccant inside the A/C receiver/drier absorbs any moisture which may have entered and become trapped within the refrigerant system. In addition, during periods of high demand operation of the A/C system, the A/C receiver/drier acts as a reservoir to store surplus refrigerant.

NOTE: **Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.**

The A/C receiver/drier has no serviceable parts except for the O-ring seals, gaskets and the high side service port valve and cap. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals and gaskets must be replaced whenever the A/C receiver/drier is removed.

The A/C receiver/drier cannot be repaired and must be replaced if leaking or damaged, or if an internal failure of the A/C compressor has occurred.

REMOVAL

REMOVAL

WARNING: **Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.**

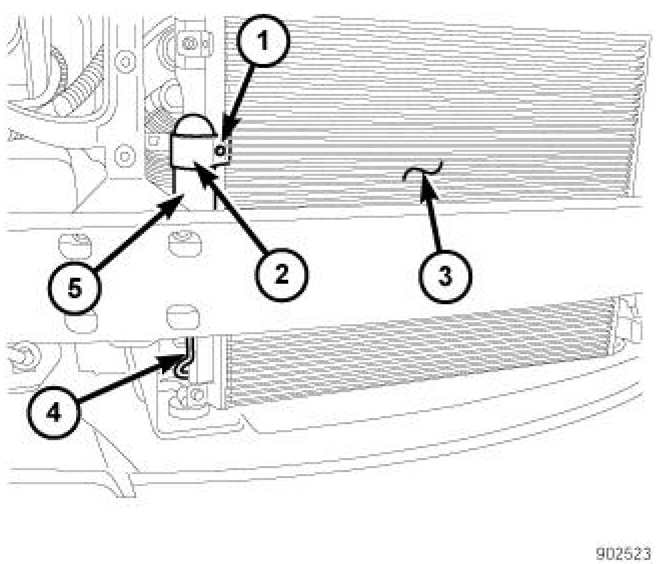

Fig. 136: Reciever/Drier, Mounting Bracket, A/C Condenser, Bolt & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD**

PROCEDURE.

3. Remove the front fascia. Refer to FASCIA, FRONT, REMOVAL .
4. Remove the screw (1) that secures the receiver/drier mounting bracket (2) to the right end of the A/C condenser (3).
5. Remove the bolt (4) that secures the receiver/drier (5) to the A/C condenser.
6. Disconnect the receiver/drier from the A/C condenser and remove and discard the dual-plane seal.
7. Install plugs in, or tape over the opened receiver/drier fitting and the condenser ports.

INSTALLATION

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Failure to properly adjust the refrigerant oil level prevents the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: When replacing multiple A/C system components, refer to the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.

NOTE: If only the A/C receiver/drier is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

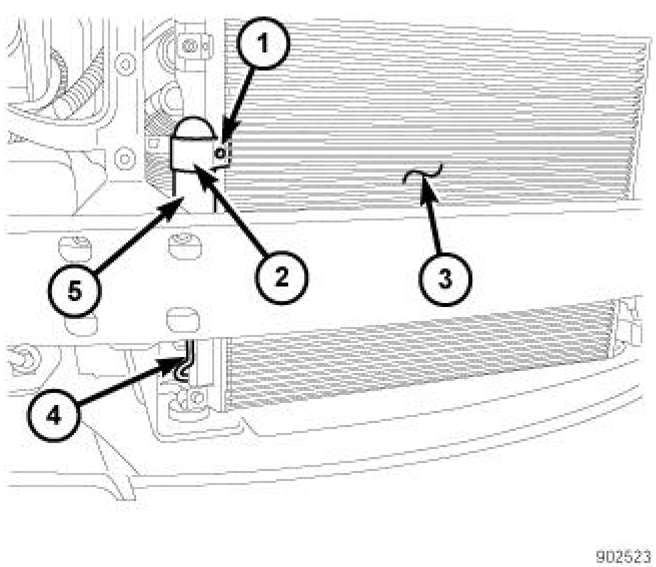

Fig. 137: Reciever/Drier, Mounting Bracket, A/C Condenser, Bolt & Screw

Courtesy of CHRYSLER GROUP, LLC

1. Position the receiver/drier (5) into the engine compartment.
2. Remove the tape or plugs from the receiver/drier fitting and the ports of the A/C condenser (3).
3. Lubricate a new dual-plane seal with clean refrigerant oil and install it onto the receiver/drier fitting. Use only the specified seal, as it is made of a special material for the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the receiver/drier to the right end of the A/C condenser.
5. Install the bolt (4) that secures the receiver/drier to the A/C condenser and tighten to the proper torque specification. Refer to **TORQUE SPECIFICATIONS** .
6. Install the receiver/drier mounting bracket (2) onto the A/C condenser.
7. Install the screw (1) securing the receiver/drier mounting bracket onto the A/C condenser and tighten to the proper torque specification. Refer to **TORQUE SPECIFICATIONS** .
8. Install the front fascia. Refer to **FASCIA, FRONT, INSTALLATION** .
9. Connect the negative battery cable.
10. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
11. If the A/C receiver/drier is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, refer to the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
12. Charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

EVAPORATOR, A/C

DESCRIPTION

DESCRIPTION

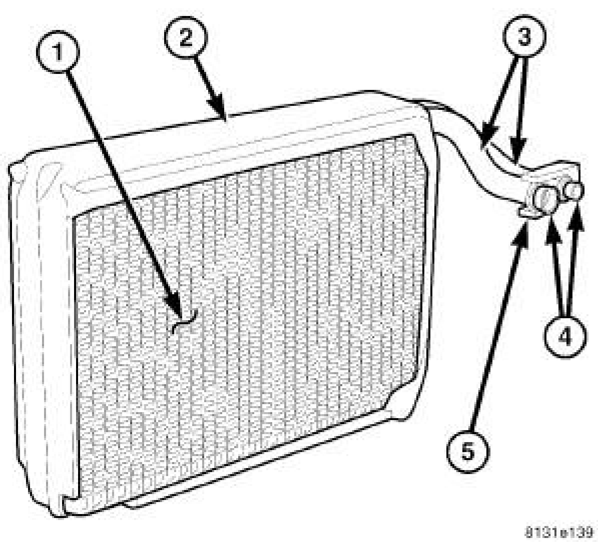

Fig. 138: A/C Evaporator, Insulator, Tubes, O-Rings, & Tapping Block

Courtesy of CHRYSLER GROUP, LLC

The A/C evaporator (1) for the heating-A/C system is located within the HVAC housing, behind the instrument panel. The A/C evaporator and its insulator (2) are positioned in the HVAC housing so that all air entering the housing must pass over the evaporator fins before it is distributed through the heating-A/C system ducts and outlets. However, air passing over the evaporator fins will only be conditioned when the A/C compressor is engaged and circulating refrigerant through the A/C evaporator.

The A/C evaporator tubes (3) are connected and sealed to the A/C expansion valve by use of rubber O-rings (4) and a tapping block (5).

The A/C evaporator can only be serviced by removing and disassembling the HVAC housing assembly.

OPERATION

OPERATION

Refrigerant enters the A/C evaporator from the A/C expansion valve as a low temperature, low pressure mixture of liquid and gas. As air flows over the fins of the A/C evaporator, the humidity in the air condenses on the fins, and the heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low pressure gas when it leaves the A/C evaporator.

NOTE: **Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line or expansion valve is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.**

The A/C evaporator has no serviceable parts except for the O-ring seals. The O-ring seals used on the connections are made from a special type of rubber not affected by refrigerant. The O-ring seals must be replaced whenever the A/C expansion valve is removed from the A/C evaporator.

The A/C evaporator cannot be repaired and must be replaced if leaking or damaged.

REMOVAL

REMOVAL

WARNING: **Disable the airbag system. Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.**

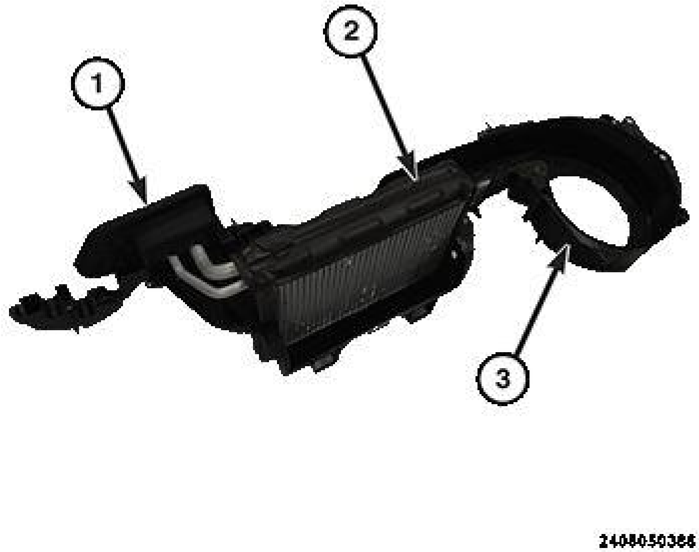

Fig. 139: A/C Evaporator, Foam Seal & HVAC Housing
Courtesy of CHRYSLER GROUP, LLC

1. Remove the HVAC housing assembly. Refer to **HOUSING, HVAC, REMOVAL**.
2. Disassemble the HVAC housing as necessary to access the A/C evaporator (1).
3. Carefully lift the A/C evaporator and the foam seal (2) out of the lower half of the HVAC housing (3).

NOTE: **If the foam seal at the front of the HVAC housing is deformed or damaged, the seal must be replaced.**

4. Remove the A/C expansion valve, tapping block and foam seal from the A/C evaporator. Refer to **VALVE, A/C EXPANSION, REMOVAL**.

INSTALLATION

INSTALLATION

CAUTION: **Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.**

NOTE: **When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.**

NOTE: **If the A/C evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.**

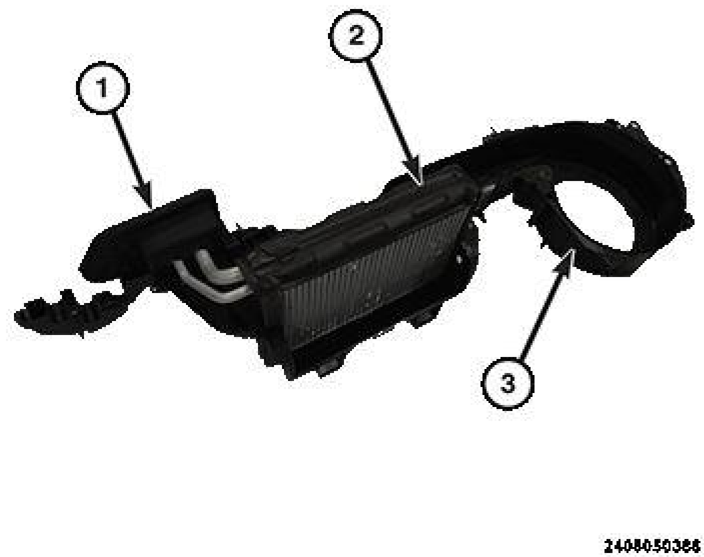

Fig. 140: A/C Evaporator, Foam Seal & HVAC Housing
Courtesy of CHRYSLER GROUP, LLC

1. Install the foam seal (2), tapping block and A/C expansion valve onto the A/C evaporator (1). Refer to **VALVE, A/C EXPANSION, INSTALLATION**.
2. Install the A/C evaporator into the lower half of the HVAC housing (3). Make sure that the evaporator drain within the HVAC housing is clean and unrestricted and that the insulator around the A/C evaporator is properly installed.
3. Assemble the HVAC housing.

NOTE: **If the A/C evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.**

4. Install the HVAC housing assembly. Refer to **HOUSING, HVAC, INSTALLATION**.

LINE, A/C DISCHARGE

REMOVAL

REMOVAL

WARNING: **Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.**

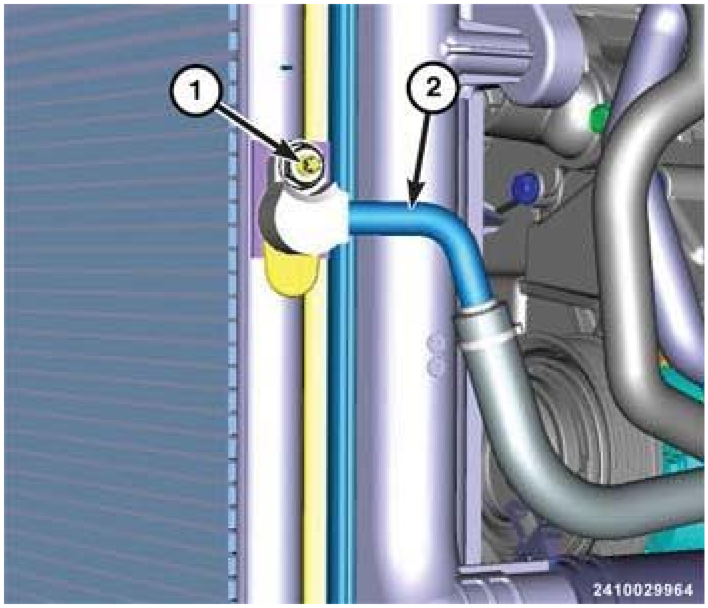

Fig. 141: A/C Discharge Line & Nut
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
3. Remove the air cleaner housing. Refer to **BODY, AIR CLEANER, REMOVAL** for 3.6L, **BODY, AIR CLEANER, REMOVAL** for 5.7L, **BODY, AIR CLEANER, REMOVAL** for 6.2L or **BODY, AIR CLEANER, REMOVAL** for 6.4L.
4. Reach through the headlamp opening in the upper radiator support and remove the nut (1) that secures the A/C discharge line (2) to the A/C condenser.
5. Disconnect the A/C discharge line from the A/C condenser and remove and discard the dual plane seal.
6. Install plugs in, or tape over the discharge line fitting and condenser inlet port.

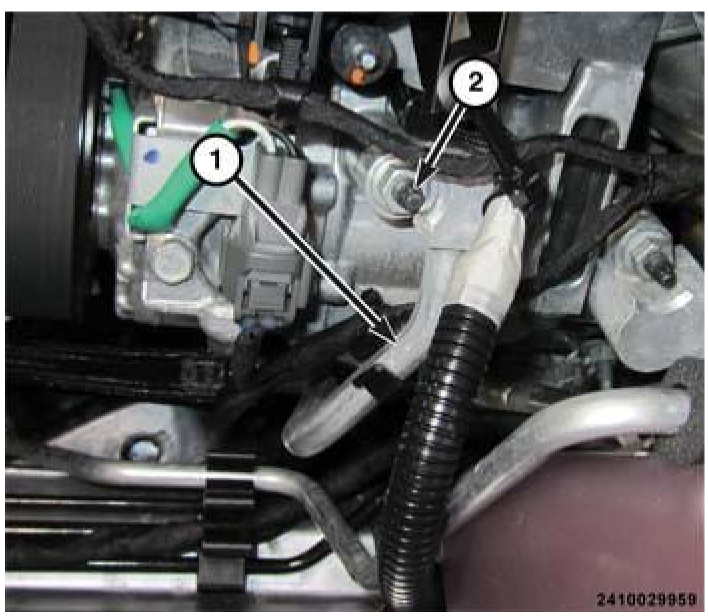

Fig. 142: A/C Discharge Line & Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: **3.6L A/C compressor and refrigerant lines shown in the illustration.**

7. Remove the nut (2) that secures the A/C discharge line (1) to the A/C compressor.
8. Disconnect the A/C discharge line from the A/C compressor and remove and discard the dual plane seal.
9. Install plugs in, or tape over the opened refrigerant line fitting and the compressor port.
10. Remove the A/C discharge line from the engine compartment.

INSTALLATION

INSTALLATION

CAUTION: **Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.**

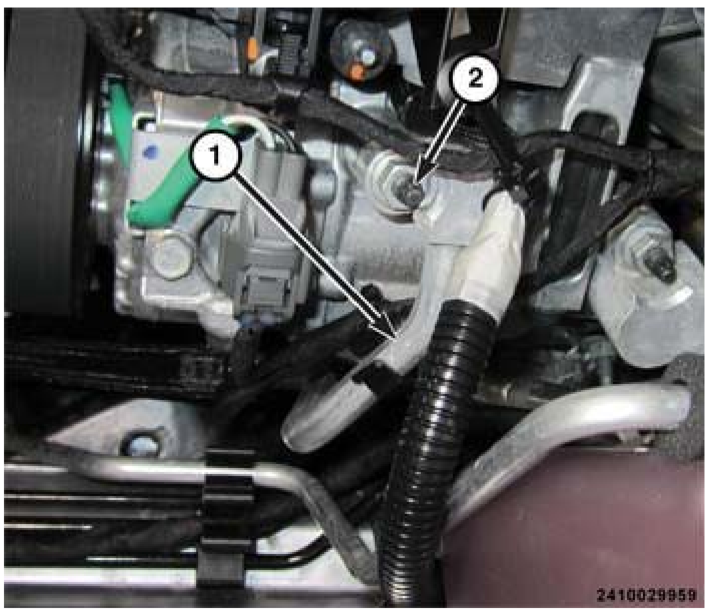

Fig. 143: A/C Discharge Line & Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: **When replacing multiple A/C system components, refer to the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.**

NOTE: **Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.**

1. Position the A/C discharge line (1) into the engine compartment.
2. Remove the tape or plugs from the opened fitting on the A/C discharge line and the outlet port on the A/C

compressor.

3. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the discharge line fitting. Use only the specified seal as it is made of a special material for the specific refrigerant in the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Install the A/C discharge line onto the A/C compressor.
5. Install the nut (2) that secures the A/C discharge line to the A/C compressor and tighten to the proper torque specification. Refer to **TORQUE SPECIFICATIONS** .

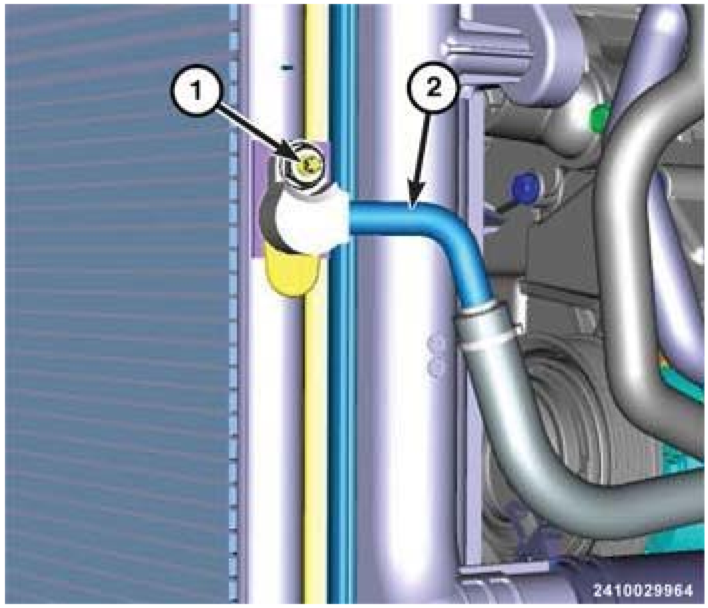

Fig. 144: A/C Discharge Line & Nut
Courtesy of CHRYSLER GROUP, LLC

6. Remove the tape or plugs from the opened discharge line fitting and the inlet port on the A/C condenser.
7. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the discharge line fitting. Use only the specified seal as it is made of a special material for the specific refrigerant in the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
8. Install the A/C discharge line (2) onto the A/C condenser.
9. Reach through the headlamp opening in the upper radiator support and install the nut (1) that secures the A/C discharge line to the A/C condenser and tighten to the proper torque specification. Refer to **TORQUE SPECIFICATIONS** .
10. Install the air cleaner housing. Refer to **BODY, AIR CLEANER, INSTALLATION** for 3.6L, **BODY, AIR CLEANER, INSTALLATION** for 5.7L, **BODY, AIR CLEANER, INSTALLATION** for 6.2L or **BODY, AIR CLEANER, INSTALLATION** for 6.4L.
11. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.
12. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
13. Adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
14. Charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

LINE, A/C LIQUID

REMOVAL

LIQUID LINE

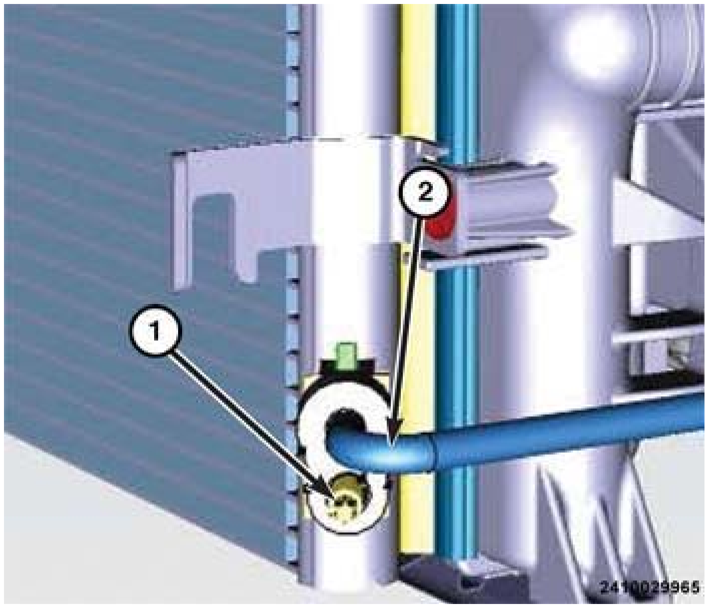

Fig. 145: A/C Liquid Line & Nut
Courtesy of CHRYSLER GROUP, LLC

1. Remove the front belly pan. Refer to **BELLY PAN, REMOVAL** or **BELLY PAN, ENGINE, REMOVAL** .
2. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
3. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
4. Remove the air cleaner housing. Refer to **BODY, AIR CLEANER, REMOVAL** for 3.6L, **BODY, AIR CLEANER, REMOVAL** for 5.7L, **BODY, AIR CLEANER, REMOVAL** for 6.2L or **BODY, AIR CLEANER, REMOVAL** for 6.4L.
5. Raise and support the vehicle.
6. Remove the nut (1) that secures the A/C liquid line (2) to the A/C condenser.
7. Disconnect the A/C liquid line from the A/C condenser and remove and discard the dual plane seal.
8. Install plugs in, or tape over the opened liquid line fitting and condenser outlet port.

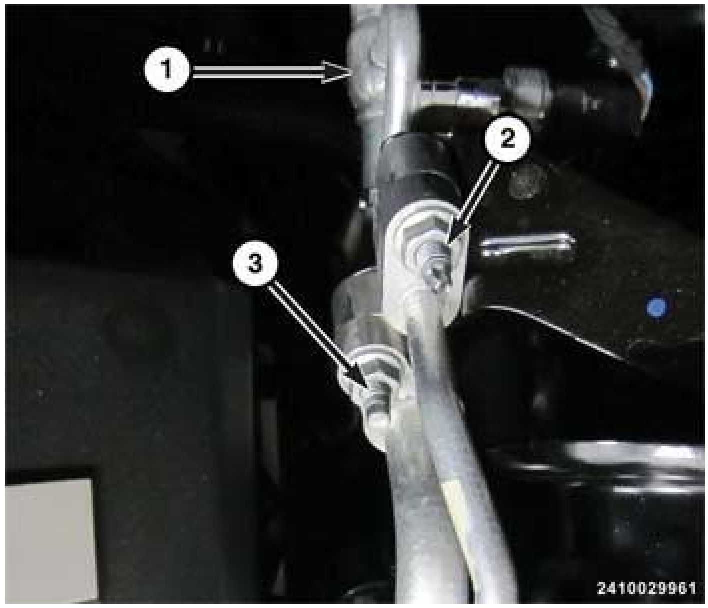

Fig. 146: A/C Suction Line & Nut
Courtesy of CHRYSLER GROUP, LLC

9. Lower the vehicle.
10. Remove the nut (2) that secures the A/C liquid line to the Internal Heat Exchanger (1).

    Disconnect the A/C liquid line from the Internal Heat Exchanger and remove and discard the dual plane seal.

11. Install plugs in, or tape over the opened liquid line fittings.
12. Remove the A/C liquid line from the engine compartment.

INTERNAL HEAT EXCHANGER

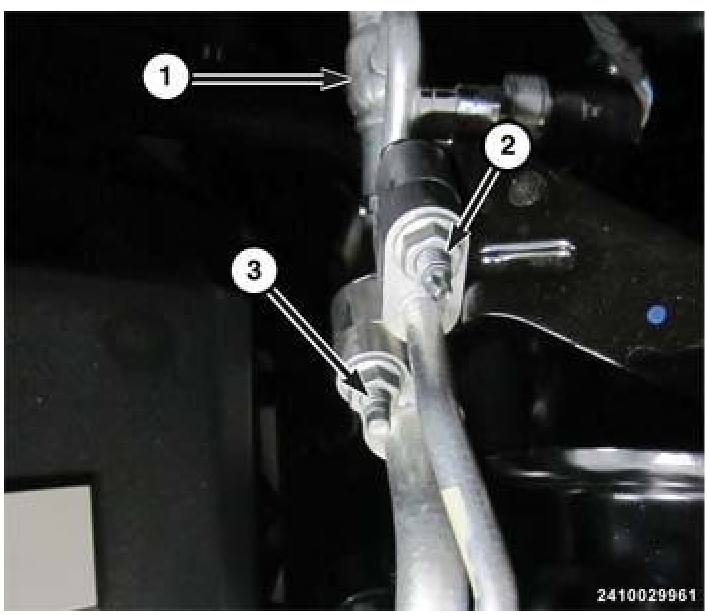

Fig. 147: A/C Suction Line & Nut
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
3. Remove the air cleaner housing. Refer to **BODY, AIR CLEANER, REMOVAL** for 3.6L, **BODY, AIR CLEANER, REMOVAL** for 5.7L, **BODY, AIR CLEANER, REMOVAL** for 6.2L or **BODY, AIR CLEANER, REMOVAL** for 6.4L.
4. Remove the nuts (2 and 3) that secure the suction and liquid lines to the Internal Heat Exchanger (IHX) (1).
5. Disconnect the suction and liquid lines from the IHX and remove and discard the dual plane seal.
6. Install plugs in, or tape over the opened line fittings.

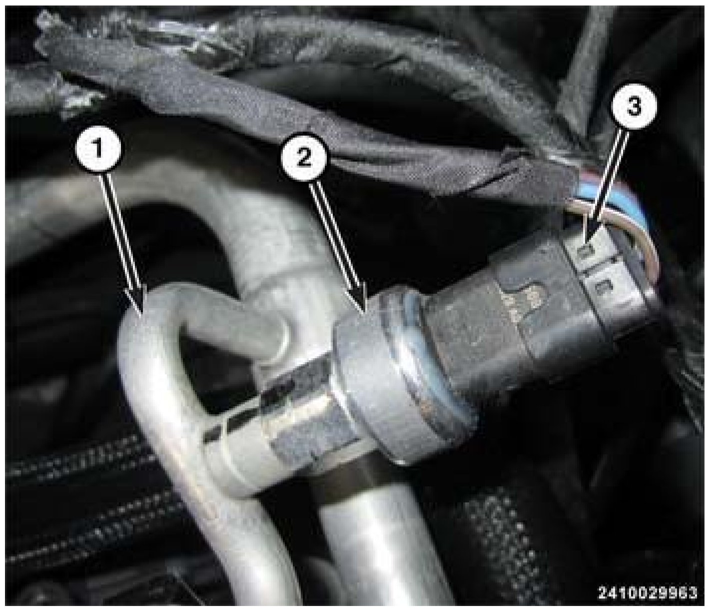

Fig. 148: Internal Heat Exchanger, Pressure Transducer & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect the wire harness (3) from the A/C pressure transducer (2).

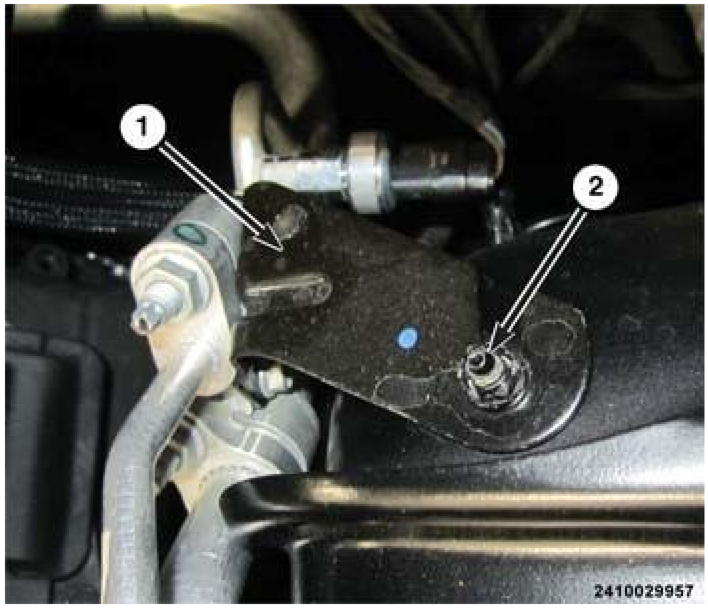

Fig. 149: Refrigerant Line Mounting Bracket & Nut
Courtesy of CHRYSLER GROUP, LLC

8. Remove the nut (2) that secures the refrigerant line mounting bracket (1) to the left front shock tower.

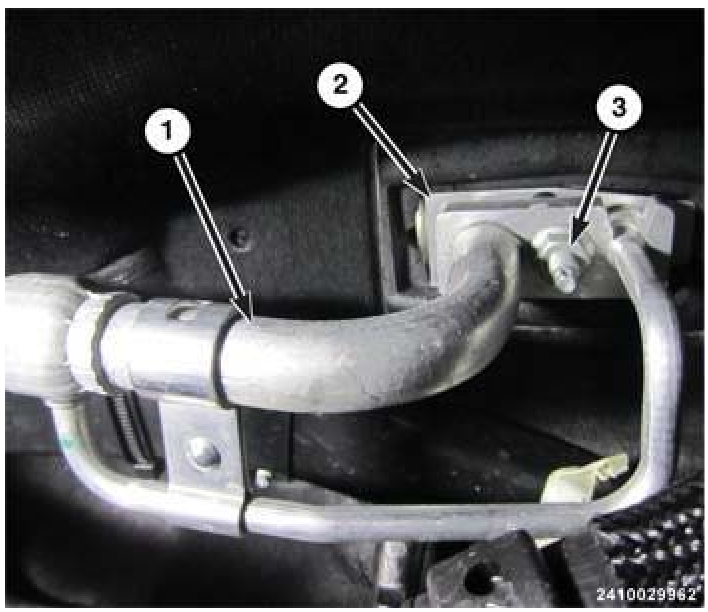

Fig. 150: IHX, A/C Expansion Valve & Nut

9. Remove the nut (3) that secures the IHX (1) to the A/C expansion valve (2).
10. Disconnect the IHX from the A/C expansion valve.
11. Remove the dual plane seal from the suction and liquid line fittings and discard.
12. Install plugs in, or tape over the opened line fittings and the expansion valve ports.
13. Remove the IHX from the engine compartment.
14. If required, remove the A/C pressure transducer from the IHX. Refer to **TRANSDUCER, A/C PRESSURE, REMOVAL**.

INSTALLATION

LIQUID LINE

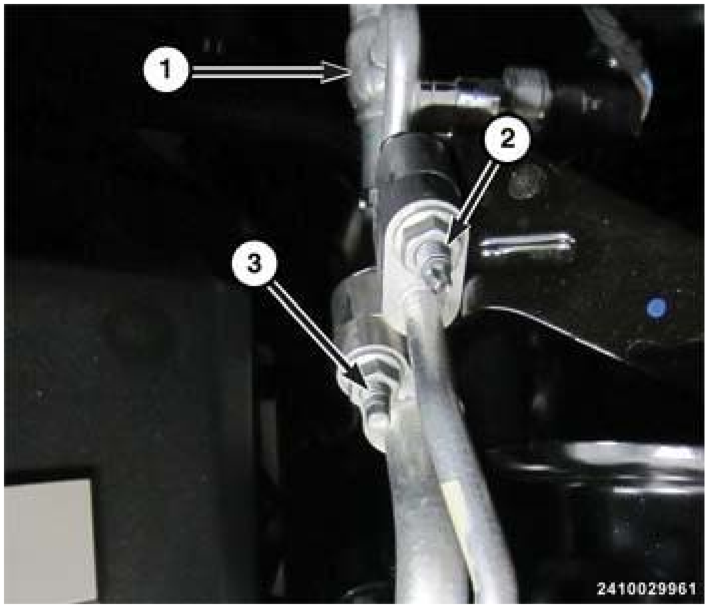

Fig. 151: A/C Suction Line & Nut
Courtesy of CHRYSLER GROUP, LLC

1. Position the liquid line into the engine compartment.
2. Remove the tape or plugs from the fittings that connect the liquid line to the Internal Heat Exchanger (1).
3. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the liquid line fitting. Use only the specified seal as it is made of a special material for the specific refrigerant in the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the A/C liquid line to the Internal Heat Exchanger.
5. Install the nut (2) that secures the A/C liquid line to the Internal Heat Exchanger and tighten to the proper torque specification. Refer to **TORQUE SPECIFICATIONS** .

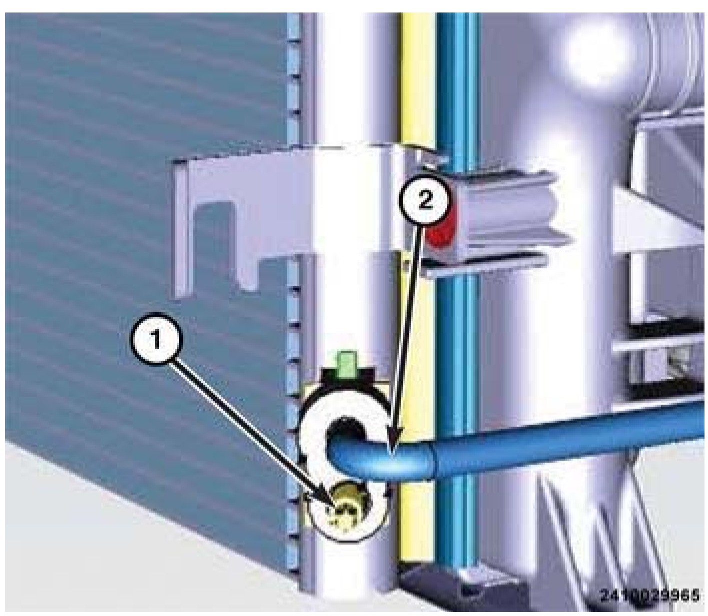

Fig. 152: A/C Liquid Line & Nut
Courtesy of CHRYSLER GROUP, LLC

6. Raise and support the vehicle.
7. Remove the tape or plugs from the fitting on the liquid line (2) and the outlet port of the A/C condenser.
8. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the liquid line fitting. Use only the specified seal as it is made of a special material for the specific refrigerant in the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
9. Connect the A/C liquid line to the A/C condenser.
10. Install the nut (1) that secures the front section of the A/C liquid line to the A/C condenser and tighten to the proper torque specification. Refer to **TORQUE SPECIFICATIONS** .
11. Install the front belly pan. Refer to **BELLY PAN, INSTALLATION** or **BELLY PAN, ENGINE, INSTALLATION** .
12. Lower the vehicle.
13. Install the air cleaner housing. Refer to **BODY, AIR CLEANER, INSTALLATION** for 3.6L, **BODY, AIR CLEANER, INSTALLATION** for 5.7L, **BODY, AIR CLEANER, INSTALLATION** for 6.2L or **BODY, AIR CLEANER, INSTALLATION** for 6.4L.
14. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.
15. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
16. Adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
17. Charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

INTERNAL HEAT EXCHANGER

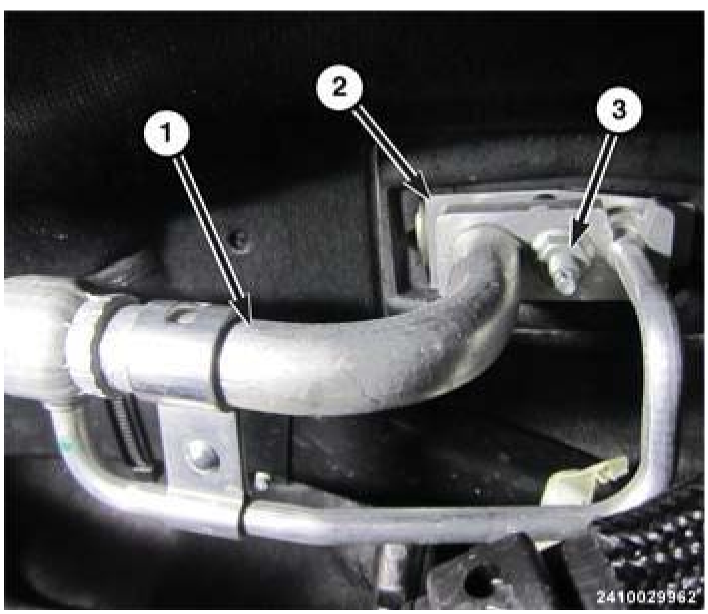

Fig. 153: IHX, A/C Expansion Valve & Nut
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the A/C pressure transducer onto the A/C liquid line. Refer to **TRANSDUCER, A/C PRESSURE, INSTALLATION**.

2. Position the Internal Heat Exchanger (IHX) into the engine compartment.
3. Remove the tape or plugs from the line fittings and the ports in the A/C expansion valve.
4. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the suction and liquid line fittings. Use only the specified seal as it is made of a special material for the specific refrigerant in the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
5. Connect the IHX to the A/C expansion valve.
6. Install the nut (3) that secures the IHX (1) to the A/C expansion valve (2) and tighten to the proper torque specification. Refer to **TORQUE SPECIFICATIONS** .

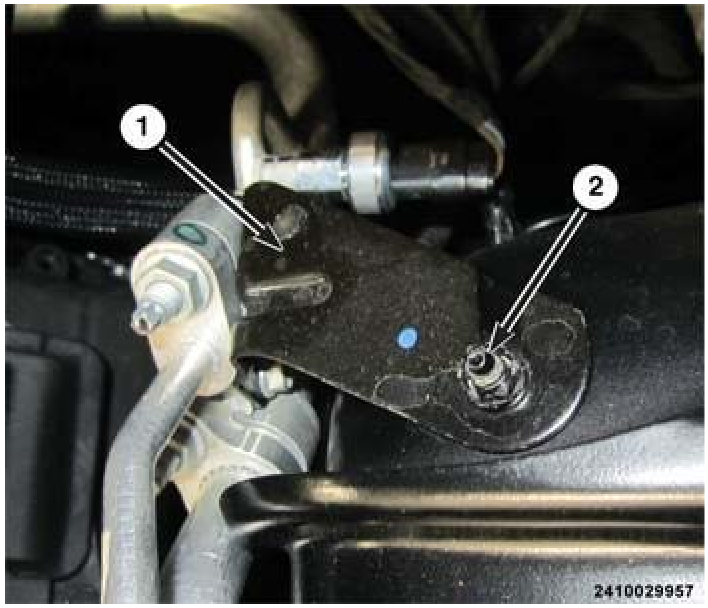

Fig. 154: Refrigerant Line Mounting Bracket & Nut
Courtesy of CHRYSLER GROUP, LLC

7. Install the nut (2) that secures the refrigerant line mounting bracket (1) to the left front shock tower and tighten to the proper torque specification. Refer to **TORQUE SPECIFICATIONS** .

Courtesy of CHRYSLER GROUP, LLC

8. Connect the wire harness (3) to the A/C pressure transducer (2).
9. Remove the tape or plugs from the fittings that connect the suction and liquid lines to the IHX.
10. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the liquid line fitting. Use only the specified seal as it is made of a special material for the specific refrigerant in the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

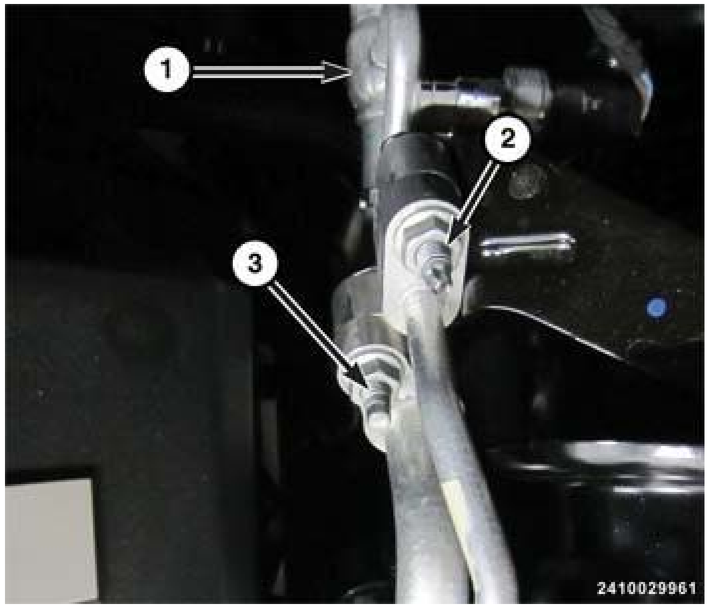

Fig. 156: A/C Suction Line & Nut
Courtesy of CHRYSLER GROUP, LLC

11. Connect the suction and liquid lines to the IHX.
12. Install the nuts (2 and 3) that secure the suction and liquid lines to the IHX and tighten to the proper torque specification. Refer to **TORQUE SPECIFICATIONS** .
13. Install the air cleaner housing. Refer to **BODY, AIR CLEANER, INSTALLATION** for 3.6L, **BODY, AIR CLEANER, INSTALLATION** for 5.7L, **BODY, AIR CLEANER, INSTALLATION** for 6.2L or **BODY, AIR CLEANER, INSTALLATION** for 6.4L.
14. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.
15. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
16. Adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
17. Charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

LINE, A/C SUCTION

REMOVAL

SUCTION LINE

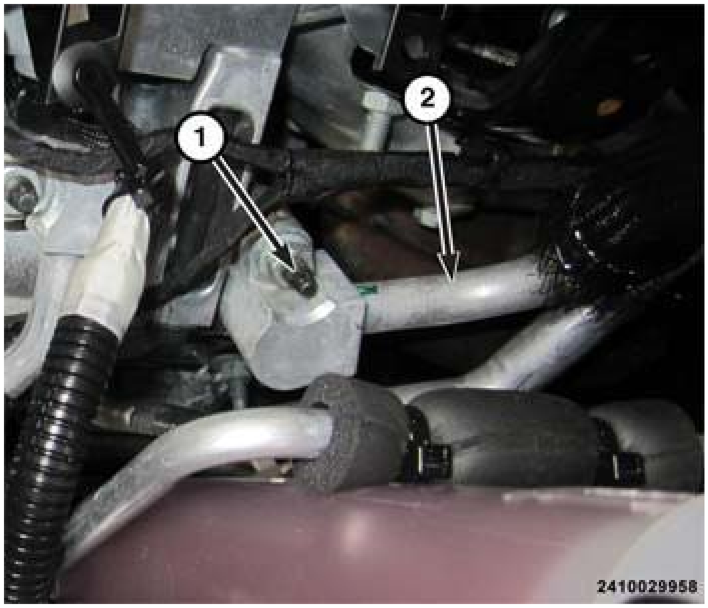

Fig. 157: Suction Line & Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: **3.6L compressor and refrigerant lines shown in the illustration.**

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
3. Remove the air cleaner housing. Refer to **BODY, AIR CLEANER, REMOVAL** for 3.6L, **BODY, AIR CLEANER, REMOVAL** for 5.7L, **BODY, AIR CLEANER, REMOVAL** for 6.2L or **BODY, AIR CLEANER, REMOVAL** for 6.4L.
4. Remove the nut (1) that secures the suction line (2) to the A/C compressor.
5. Disconnect the A/C suction line from the A/C compressor and remove and discard the dual plane seal.
6. Install plugs in, or tape over the opened suction line fitting and compressor inlet port.

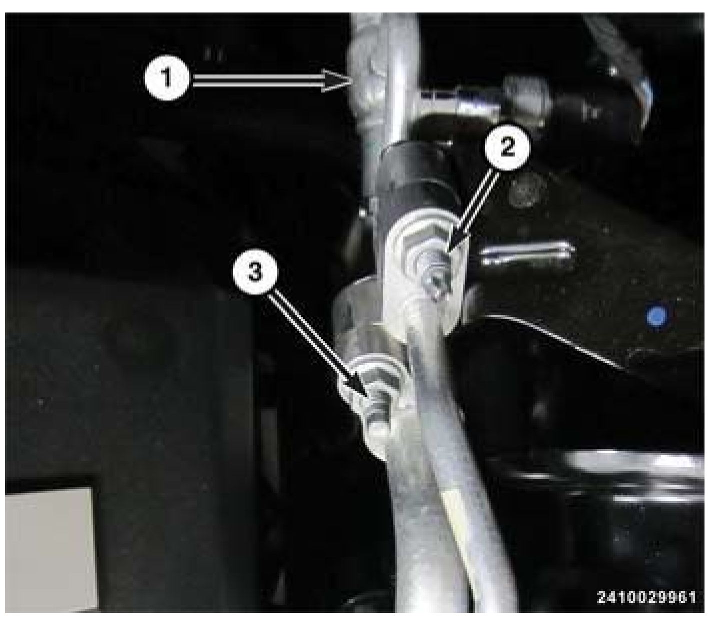

Fig. 158: A/C Suction Line & Nut
Courtesy of CHRYSLER GROUP, LLC

7. Remove the nut (3) that secures the suction line to the Internal Heat Exchanger (IHX) (1).
8. Disconnect the suction line from the IHX and remove and discard the dual plane seal.
9. Install plugs in, or tape over the opened line fittings.
10. Remove the suction line from the engine compartment.

INTERNAL HEAT EXCHANGER

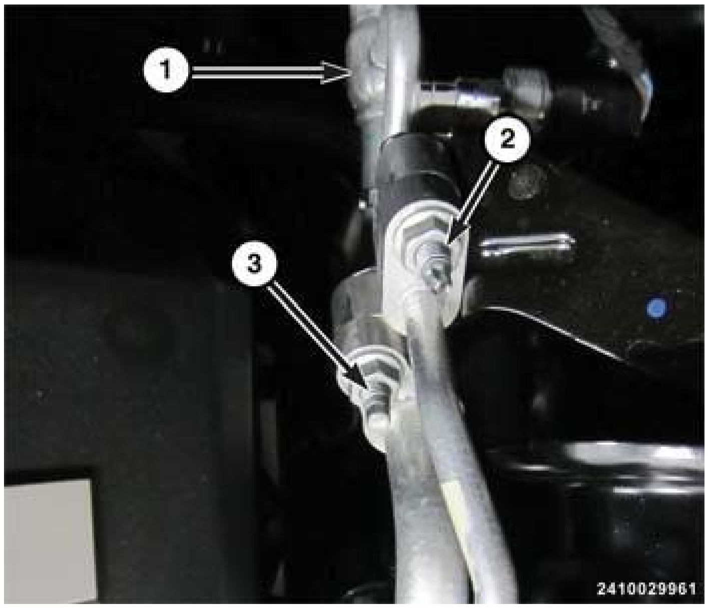

Fig. 159: A/C Suction Line & Nut
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
3. Remove the air cleaner housing. Refer to **BODY, AIR CLEANER, REMOVAL** for 3.6L, **BODY, AIR CLEANER, REMOVAL** for 5.7L, **BODY, AIR CLEANER, REMOVAL** for 6.2L or **BODY, AIR CLEANER, REMOVAL** for 6.4L.
4. Remove the nuts (2 and 3) that secure the suction and liquid lines to the Internal Heat Exchanger (IHX) (1).
5. Disconnect the suction and liquid lines from the IHX and remove and discard the dual plane seal.
6. Install plugs in, or tape over the opened line fittings.

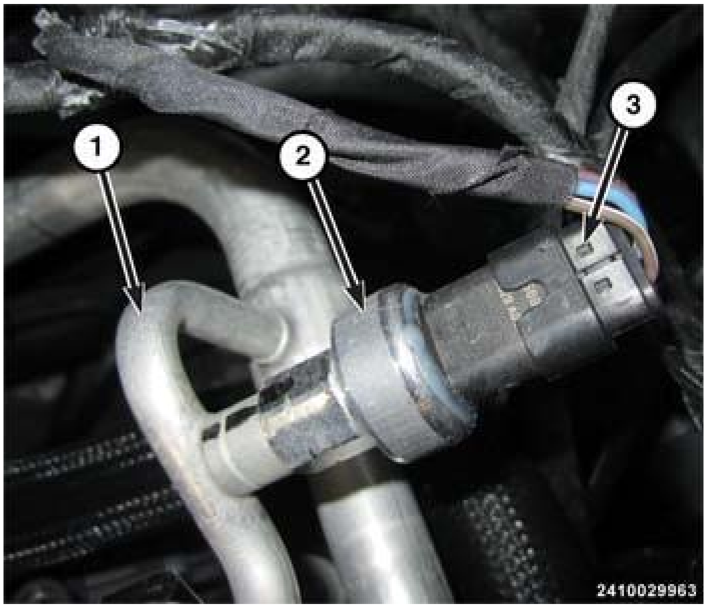

Fig. 160: Internal Heat Exchanger, Pressure Transducer & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect the wire harness (3) from the A/C pressure transducer (2).

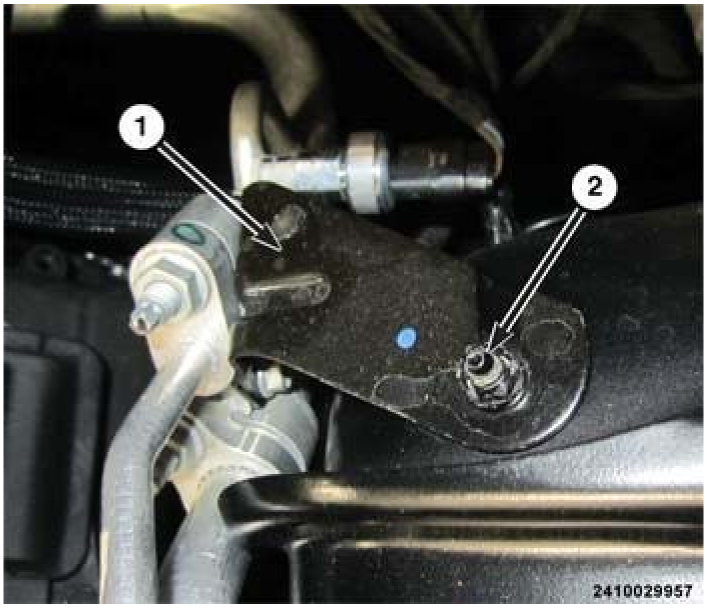

Fig. 161: Refrigerant Line Mounting Bracket & Nut
Courtesy of CHRYSLER GROUP, LLC

8. Remove the nut (2) that secures the refrigerant line mounting bracket (1) to the left front shock tower.

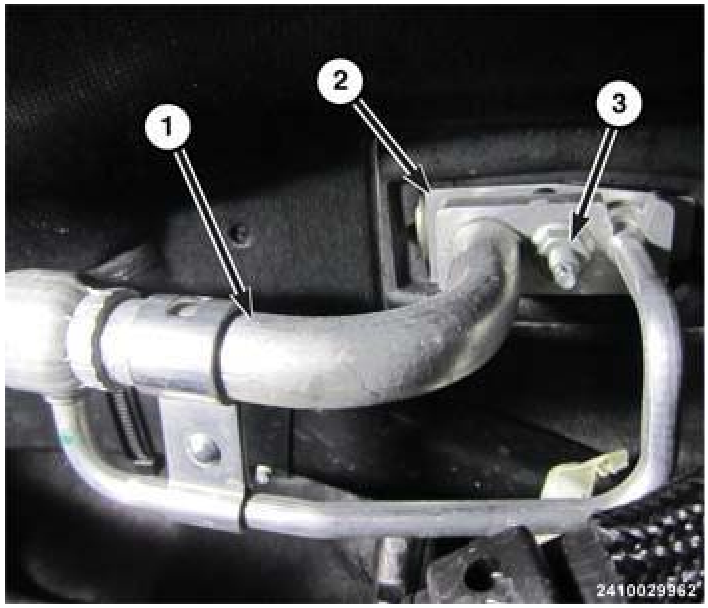

Fig. 162: IHX, A/C Expansion Valve & Nut
Courtesy of CHRYSLER GROUP, LLC

9. Remove the nut (3) that secures the IHX (1) to the A/C expansion valve (2).
10. Disconnect the IHX from the A/C expansion valve.
11. Remove the dual plane seal from the suction and liquid line fittings and discard.
12. Install plugs in, or tape over the opened line fittings and the expansion valve ports.
13. Remove the IHX from the engine compartment.
14. If required, remove the A/C pressure transducer from the IHX. Refer to **TRANSDUCER, A/C PRESSURE, REMOVAL**.

INSTALLATION

SUCTION LINE

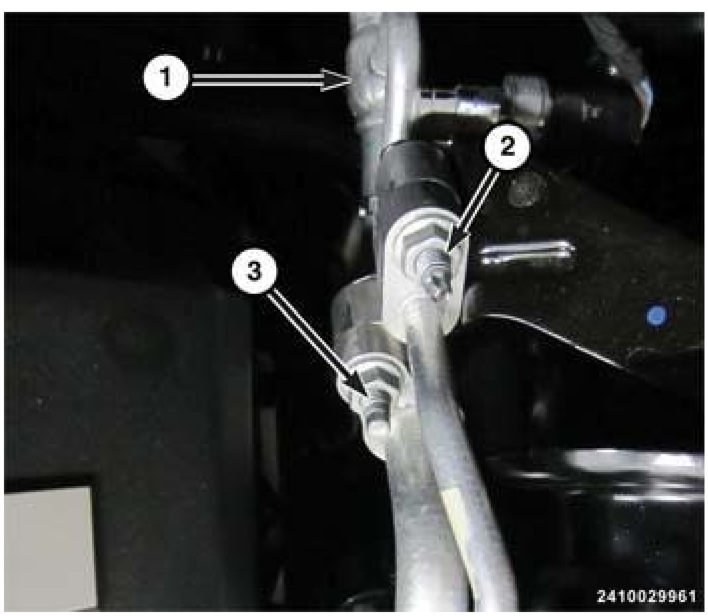

Fig. 163: A/C Suction Line & Nut

Courtesy of CHRYSLER GROUP, LLC

1. Position the front section of the suction line into the engine compartment.
2. Remove the tape or plugs from the fittings that connect the suction line to the Internal Heat Exchanger (IHX).
3. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the suction line fitting. Use only the specified seal as it is made of a special material for the specific refrigerant in the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the suction line to the Internal IHX (1).
5. Install the nut (3) that secures the suction line to the IHX and tighten to the proper torque specification. Refer to **TORQUE SPECIFICATIONS**. .
6. Remove the tape or plugs from the fitting on the suction line and the inlet port of the A/C compressor.
7. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the suction line fitting. Use only the specified seal as it is made of a special material for the specific refrigerant in the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

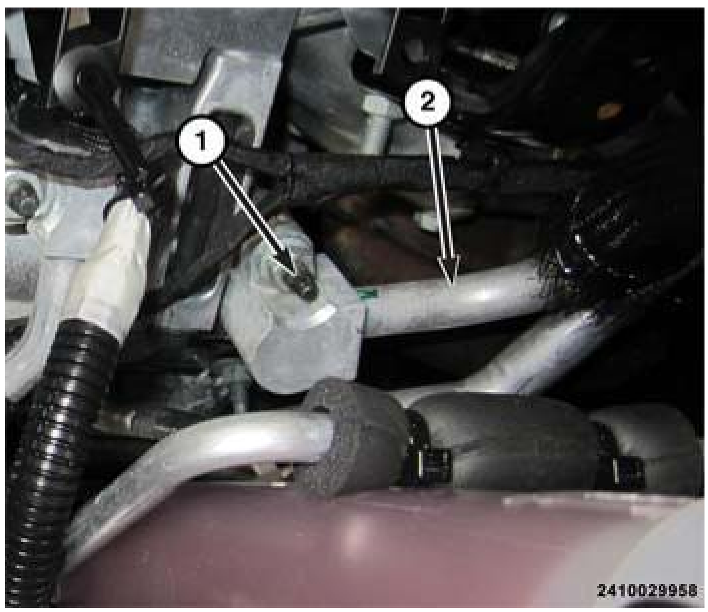

Fig. 164: Suction Line & Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: **3.6L compressor and refrigerant lines shown in the illustration.**

8. Connect the suction line (2) to the A/C compressor.
9. Install the nut (1) that secures the suction line to the A/C compressor and tighten to the proper torque specification. Refer to **TORQUE SPECIFICATIONS** .
10. Install the air cleaner housing. Refer to **BODY, AIR CLEANER, INSTALLATION** for 3.6L, **BODY, AIR CLEANER, INSTALLATION** for 5.7L, **BODY, AIR CLEANER, INSTALLATION** for 6.2L or **BODY, AIR CLEANER, INSTALLATION** for 6.4L.
11. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.
12. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

13. Adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
14. Charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

INTERNAL HEAT EXCHANGER

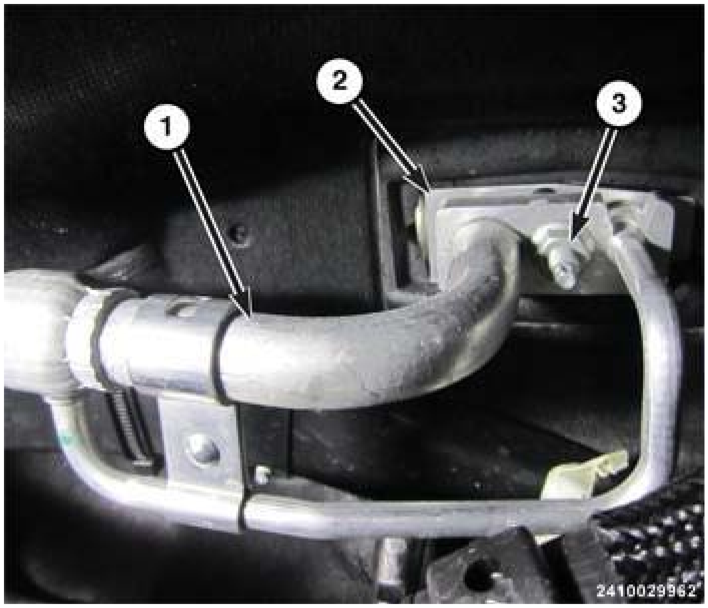

Fig. 165: IHX, A/C Expansion Valve & Nut
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the A/C pressure transducer onto the A/C liquid line. Refer to **TRANSDUCER, A/C PRESSURE, INSTALLATION**.
2. Position the Internal Heat Exchanger (IHX) into the engine compartment.
3. Remove the tape or plugs from the line fittings and the ports in the A/C expansion valve.
4. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the suction and liquid line fittings. Use only the specified seal as it is made of a special material for the specific refrigerant in the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
5. Connect the IHX to the A/C expansion valve.
6. Install the nut (3) that secures the IHX (1) to the A/C expansion valve (2) and tighten to the proper torque specification. Refer to **TORQUE SPECIFICATIONS** .

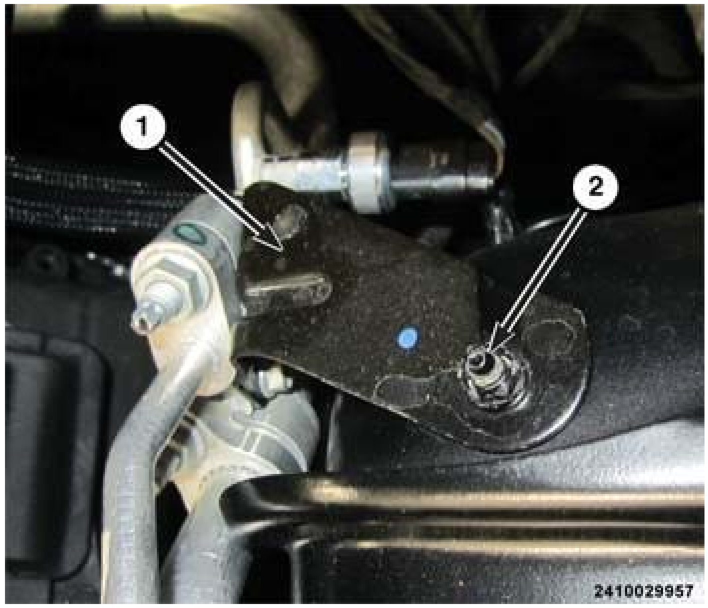

Fig. 166: Refrigerant Line Mounting Bracket & Nut
Courtesy of CHRYSLER GROUP, LLC

7. Install the nut (2) that secures the refrigerant line mounting bracket (1) to the left front shock tower and tighten to the proper torque specification. Refer to **TORQUE SPECIFICATIONS** .

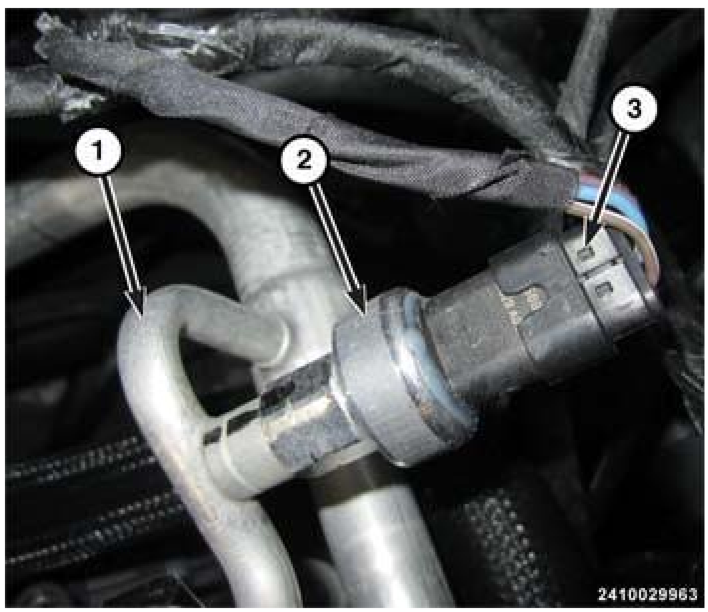

Fig. 167: Internal Heat Exchanger, Pressure Transducer & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

8. Connect the wire harness (3) to the A/C pressure transducer (2).
9. Remove the tape or plugs from the fittings that connect the suction and liquid lines to the IHX.
10. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the liquid line fitting. Use only the specified seal as it is made of a special material for the specific refrigerant in the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

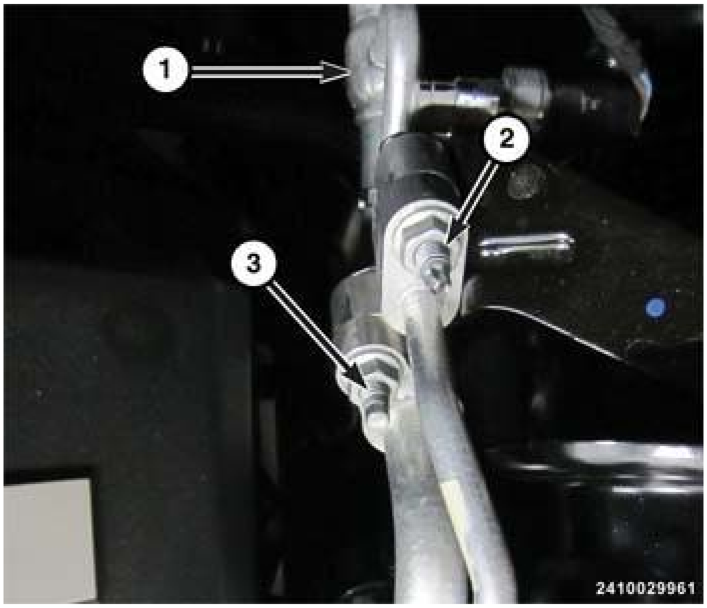

Fig. 168: A/C Suction Line & Nut
Courtesy of CHRYSLER GROUP, LLC

11. Connect the suction and liquid lines to the IHX.
12. Install the nuts (2 and 3) that secure the suction and liquid lines to the IHX and tighten to the proper torque specification. Refer to **TORQUE SPECIFICATIONS** .
13. Install the air cleaner housing. Refer to **BODY, AIR CLEANER, INSTALLATION** for 3.6L, **BODY, AIR CLEANER, INSTALLATION** for 5.7L, **BODY, AIR CLEANER, INSTALLATION** for 6.2L or **BODY, AIR CLEANER, INSTALLATION** for 6.4L.
14. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.
15. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
16. Adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
17. Charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

OIL, REFRIGERANT

STANDARD PROCEDURE

STANDARD PROCEDURE-REFRIGERANT OIL LEVEL

When an A/C system is assembled at the factory, all components except the A/C compressor are refrigerant oil free. After the refrigerant system has been charged and operated, the refrigerant oil in the A/C compressor is dispersed throughout the refrigerant system. The receiver/drier, A/C evaporator, A/C condenser and the A/C compressor will each retain a significant amount of the needed refrigerant oil.

It is important to have the correct amount of refrigerant oil in the A/C system. This ensures proper lubrication of the A/C compressor. Too little oil will result in damage to the A/C compressor, while too much oil will reduce the cooling capacity of the A/C system and consequently result in higher discharge air temperatures.

NOTE: **The refrigerant oil in the A/C system is unique depending on the A/C compressor used. Use only PAG oils that are designed to work with the**

refrigerant type and A/C compressor in the vehicle. Always refer to the A/C Underhood Specification Label for the correct oil designation. The refrigerant oil container should be kept tightly capped until it is ready for use, and then tightly recapped after use to prevent contamination from dirt and moisture. Refrigerant oil will quickly absorb any moisture it comes in contact with, therefore, special effort must be used to keep all system components moisture-free. Moisture in the refrigerant oil is very difficult to remove and will cause a reliability problem with the A/C compressor.

NOTE: **Most reclaim/recycling equipment will measure the lubricant being removed during recovery. This amount of lubricant should be added back into the system. Refer to the reclaim/recycling equipment manufacturers instructions.**

It will not be necessary to check the oil level in the A/C compressor or to add oil, unless there has been an oil loss. An oil loss may occur due to a rupture or leak from a refrigerant line, a connector fitting, a component, or a component seal. If a leak occurs, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system after the repair has been made. Refrigerant oil loss will be evident at the leak point by the presence of a wet, shiny surface around the leak.

Refrigerant oil must be added when an A/C condenser, A/C evaporator or A/C receiver/drier is replaced. See the REFRIGERANT OIL CAPACITIES chart.

The refrigerant oil level in a new A/C compressor must first be adjusted prior to compressor installation. See the COMPRESSOR OIL DRAIN PROCEDURE

REFRIGERANT OIL TYPE

A/C Compressor	Oil Type
Denso Variable Displacement- 3.6L/5.7L/6.4L Engines	* Use only ND-12 PAG oil

* Always use the type of PAG oil listed for the model being serviced. See A/C Underhood Specification Label located in the engine compartment. Do not mix different types of PAG oils.

REFRIGERANT OIL CAPACITIES

COMPONENT	ml.	oz.
A/C Condenser	30	1.0
A/C Evaporator	60	2.0
A/C Receiver/drier	30	1.0
A/C Compressor	Drain and measure the oil from the old compressor (See COMPRESSOR OIL DRAIN PROCEDURE below)	

COMPRESSOR OIL DRAIN PROCEDURE

CAUTION: **Be certain to adjust the refrigerant system oil level when replacing an A/C compressor. Failure to properly drain and measure the refrigerant oil from the A/C compressor can prevent the A/C system from operating as designed and**

cause serious compressor damage.

The A/C compressor is filled with refrigerant oil from the factory. Use the following procedure to drain and measure refrigerant oil from the A/C compressor.

1. Drain all of the refrigerant oil from the old A/C compressor into a clean measured container.
2. Drain all of the refrigerant oil from the new A/C compressor into a clean measured container.
3. Refill the new A/C compressor with the same amount of refrigerant oil that was drained out of the old compressor. Use only clean refrigerant oil of the type specified for the A/C compressor in the vehicle.
4. Install the new A/C compressor onto the engine. Refer to **COMPRESSOR, A/C, INSTALLATION**.

REFRIGERANT

VALVE, A/C EXPANSION

DESCRIPTION

DESCRIPTION

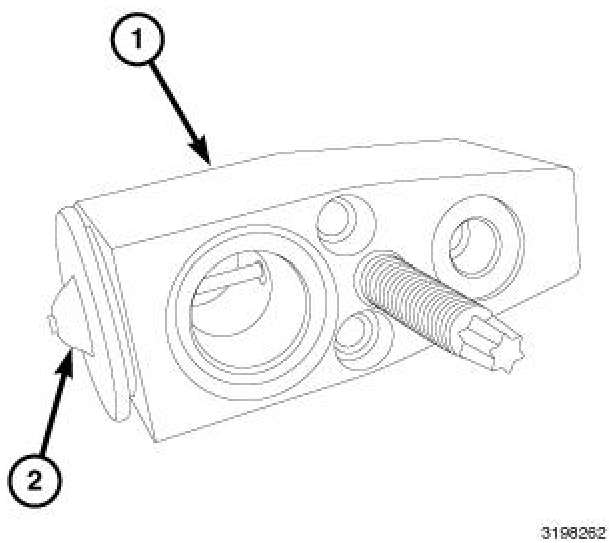

Fig. 169: H-valve Type Body & Thermal Sensor
Courtesy of CHRYSLER GROUP, LLC

The A/C expansion valve controls the amount of refrigerant entering the A/C evaporator. The A/C expansion valve is of a thermostatic expansion valve (TXV) design and consists of an aluminum H-valve type body (1), with an integral thermal sensor (2). The A/C expansion valve is located at the dash panel between the A/C refrigerant lines and the A/C evaporator.

OPERATION

OPERATION

The A/C expansion valve controls the high-pressure, low temperature liquid refrigerant from the A/C liquid line and converts it into a low-pressure, low-temperature mixture of liquid and gas before it enters the A/C evaporator. A mechanical sensor in the A/C expansion valve monitors the temperature and pressure of the refrigerant leaving the A/C evaporator through the A/C suction line, and adjusts the orifice size at the liquid line port to let the proper amount of refrigerant into the evaporator to meet the vehicle A/C cooling requirements. Controlling the refrigerant flow through the A/C evaporator ensures that none of the refrigerant leaving the A/C evaporator is still in a liquid state, which could damage the A/C compressor.

NOTE: **Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line is disconnected from the expansion valve. Failure to replace the rubber O-ring seals could result in a refrigerant system leak.**

The A/C expansion valve is factory calibrated and cannot be adjusted or repaired and must be replaced if inoperative or damaged.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - A/C EXPANSION VALVE

WARNING: **Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.**

NOTE: **The A/C expansion valve should only be tested following testing of the A/C compressor.**

NOTE: **Liquid CO^2 is required to test the A/C expansion valve. This material is available from most welding supply facilities. Liquid CO^2 is also available from companies which service and sell fire extinguishers.**

When testing the A/C expansion valve, the work area and the vehicle temperature must be 21Ā° to 27Ā°C (70Ā° to 85Ā°F). To test the expansion valve:

1. Connect a charging station or manifold gauge set to the refrigerant system service ports. Refer to **PLUMBING, STANDARD PROCEDURE**.
2. Verify the refrigerant system charge level by conducting the A/C Performance Test. Refer to **DIAGNOSIS AND TESTING**.
3. Close all doors, windows and vents to the passenger compartment.
4. Set the A/C-heater controls so that the A/C compressor is operating, the temperature control is in the highest temperature position, the mode-air doors is directing air output to the floor and the blower motor operating is operating at the highest speed.
5. Start the engine and allow it to idle. After the engine has reached normal operating temperature, allow the passenger compartment to heat up. This will create the need for maximum refrigerant flow into the A/C evaporator.

6. If the refrigerant charge is sufficient, the discharge (high pressure) gauge should read 827 kPa to 1655 kPa (120 psi to 240 psi). The suction (low pressure) gauge should read 207 kPa to 345 kPa (30 psi to 50 psi). If OK, go to 7. If not OK, replace the inoperative A/C expansion valve.

WARNING: Protect the skin and eyes from exposure to liquid CO^2 or personal injury can result.

7. If the suction (low pressure) gauge reads within the specified range, freeze the A/C expansion valve for 30 seconds using liquid CO^2 or another suitable super-cold material. **Do not spray R-134a or R-12 refrigerant on the A/C expansion valve for this test.** The suction (low pressure) gauge reading should drop by 69 kPa (10 psi). If OK, go to 8. If not OK, replace the inoperative A/C expansion valve. Refer to **VALVE, A/C EXPANSION, REMOVAL**.
8. Allow the A/C expansion valve to thaw. The suction (low pressure) gauge reading should stabilize at 207 kPa to 345 kPa (30 psi to 50 psi). If not OK, replace the inoperative A/C expansion valve. Refer to **VALVE, A/C EXPANSION, REMOVAL**.

REMOVAL

REMOVAL

WARNING: Review the warnings and cautions for this system before performing the procedure. Failure to follow these instructions may result in serious injury or death.

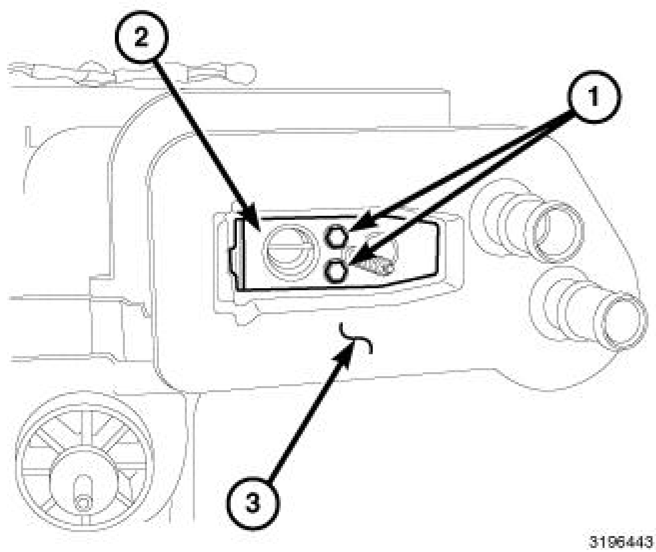

Fig. 170: A/C Expansion Valve, Bolts & Seal
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Recover the refrigerant from the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
3. Remove the Internal Heat Exchanger (IHX). Refer to **LINE, A/C LIQUID, REMOVAL**.
4. Install plugs in, or tape over the opened suction and liquid line fittings.

5. Remove the two bolts (1) that secure the A/C expansion valve (2) to the evaporator tube tapping block located within the seal (3).
6. Remove the A/C expansion valve from the evaporator tube tapping block.
7. Remove the O-ring seals from the evaporator tube fittings and discard.
8. Install plugs in, or tape over the opened evaporator tube fittings.

INSTALLATION

INSTALLATION

CAUTION: **Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.**

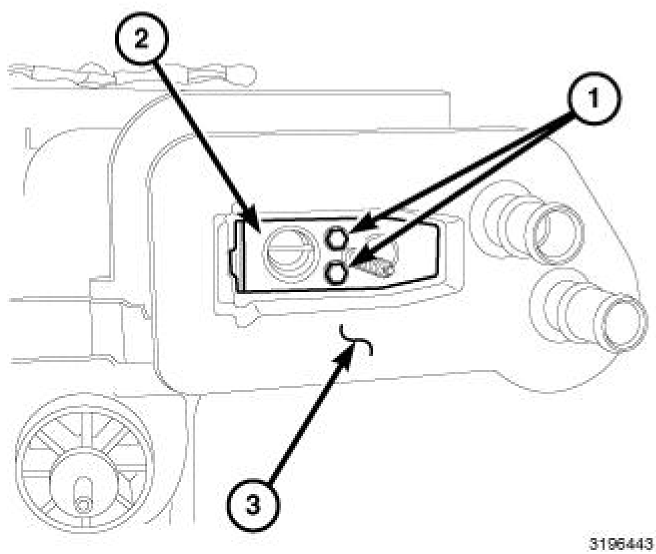

Fig. 171: A/C Expansion Valve, Bolts & Seal
Courtesy of CHRYSLER GROUP, LLC

NOTE: **When replacing multiple A/C system components, see the Refrigerant Oil Capacities chart to determine how much oil should be added to the refrigerant system. Refer to OIL, REFRIGERANT, STANDARD PROCEDURE.**

NOTE: **Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.**

1. Remove the tape or plugs from the evaporator tube fittings and all of the expansion valve ports.
2. Lubricate new O-ring seals with clean refrigerant oil and install them onto the evaporator tube fittings. Use only the specified O-ring seals as they are made of a special material for the specific refrigerant in the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Install the A/C expansion valve (2) onto the evaporator tube tapping block.
4. Install the two bolts (1) that secure the A/C expansion valve to the evaporator tube tapping block and tighten to the proper torque specification. Refer to SPECIFICATIONS.

5. Remove the tape or plugs from the suction and liquid line fittings.
6. Lubricate a new seal with clean refrigerant oil and install onto the suction and liquid line fittings. Use only the specified seal as it is made of a special material for the specific refrigerant in the system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
7. Install the Internal Heat Exchanger (IHX). Refer to **LINE, A/C LIQUID, INSTALLATION**.
8. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.
9. Evacuate the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.
10. Adjust the refrigerant oil level. Refer to **OIL, REFRIGERANT, STANDARD PROCEDURE**.
11. Charge the refrigerant system. Refer to **PLUMBING, STANDARD PROCEDURE**.

Article GUID: A00735863

DESCRIPTION

DESCRIPTION

An electrically-operated horn system is standard factory-installed equipment in this vehicle. Depressing the Driver AirBag (DAB) trim cover in the center of the steering wheel actuates the horn switch contacts, which provides the vehicle operator with a convenient, audible signaling device that can be used to alert pedestrians or the operators of other vehicles in near proximity.

The Body Control Module (BCM) (also known as the Common Body Controller/CBC) serves as the controller for the horn system, which also allows the BCM to utilize the horn system when providing audible outputs to support other vehicle features such as the horn chirp verification of the Remote Keyless Entry (RKE) and Remote Start systems, as well as the pulsing horn deterrent feature of the optional Vehicle Theft Alarm (VTA) and the RKE Panic mode.

The horn system includes the following major components, which are described in further detail elsewhere in this service information:

- **Horn Relay** - The horn relay is an International Standards Organization (ISO) micro relay located within the front Power Distribution Center (PDC). The front PDC is located on the top of the right front wheel house forward of the right strut tower within the engine compartment.
- **Horns** - The horns are each located on an integral mounting bracket secured to the right or left forward-facing surface of the Front End Module (FEM) carrier, just in front of the upper radiator cross member. The front fascia does not need to be removed to gain access to the horns for service.
- **Horn Switch Plate** - The floating horn switch plate is secured to the back of the DAB module within the steering wheel hub cavity and also serves as the mounting bracket between the DAB and the steering wheel.

Certain functions and features of the horn system rely upon resources shared with other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. Other electronic modules in the vehicle that may affect horn system operation are:

- **Body Control Module** - The Body Control Module (BCM) is located on the right cowl side inner (kick) panel within the passenger compartment, where it is concealed behind the cowl side inner trim and the instrument panel. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Radio Frequency Hub Module** - The Radio Frequency Hub Module (RFHM) (also known as the RF Hub) is located near the center of the shelf support behind the rear seat back and is concealed beneath the package tray interior trim. Refer to **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION** .
- **Steering Column Control Module** - The Steering Column Control Module (SCCM) is located near the top of the steering column directly below the steering wheel. Refer to **MODULE, STEERING COLUMN CONTROL, DESCRIPTION** .

The BCM, the RFHM and the SCCM each contain a microcontroller and programming that allow them to

communicate with each other and other electronic modules in the vehicle using the Controller Area Network (CAN) data bus. Refer to **COMMUNICATION, DESCRIPTION** .

Hard wired circuitry connects the various horn system components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other and to the vehicle electrical system through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention as well as pin out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

The horn system components operate on battery current received through non-switched fused B(+) circuits so that the system will remain operational, regardless of the status of the ignition switch (also known as the Keyless Ignition Node/KIN). The Body Control Module (BCM) controls the output of battery current to the horns through a horn relay located within the front Power Distribution Center (PDC). The BCM controls the relay based upon internal programming as well as electronic message inputs received from the Steering Column Control Module (SCCM) or the Radio Frequency Hub Module (RFHM) (also known as the RF Hub) over the Controller Area Network (CAN) data bus.

The vehicle operator can control typical horn system signaling through the horn switch contacts within the hub cavity of the steering wheel. When the Driver AirBag (DAB) trim cover in the center of the steering wheel is depressed, it provides a hard wired analog input to the SCCM. The SCCM then sends an electronic **horn switch status** message to the BCM over the CAN data bus.

In addition, the RFHM sends electronic **horn request** messages to the BCM over the CAN data bus in response to inputs received from the FOB with Integrated Key (FOBIK) Remote Keyless Entry (RKE) transmitter in vehicles with the PEKG system. Lastly, as the Vehicle Theft Security System (VTSS) controller, the BCM can activate the horn system based upon programming and both hard wired and electronic message inputs from the various VTSS components.

The horns can be activated by the BCM to support each of the following features:

- **Remote Keyless Entry System** - Remote Keyless Entry (RKE) system **Lock** request audible verification.
- **Remote Keyless Entry System** - Remote Keyless Entry (RKE) system **Panic** mode audible alert.
- **Remote Start System** - Remote Start System **Start** request audible verification.
- **Vehicle Theft Alarm** - Vehicle Theft Alarm (VTA) audible alarm.

The RKE system **Lock** request audible verification is a customer programmable feature, which allows the feature to be enabled or disabled to suit individual preferences. Refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, OPERATION** .

The hard wired circuits between components related to the horn system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes

wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the horn system or the electronic controls and communication between modules and other devices that provide some features of the horn system. The most reliable, efficient and accurate means to diagnose the horn system or the electronic controls and communication related to horn system operation requires the use of a diagnostic scan tool.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HORN SYSTEM

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

NOTE: **A continuously sounding horn is immediately resolved by removing the horn relay from the front Power Distribution Center (PDC).**

HORN SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
HORNS SOUND CONTINUOUSLY	1. Ineffective horn feed circuit.	1. Test and repair shorted horn feed circuit if required.
	2. Ineffective horn switch return circuit.	2. Test and repair shorted horn switch return circuit if required.
	3. Ineffective horn relay.	3. Test and replace the horn relay in the front Power Distribution Center (PDC), if required.
	4. Ineffective horn switch.	4. Test and replace the shorted horn switch (Driver AirBag/DAB) if required.
	5. Ineffective Body Control Module (BCM) inputs or outputs.	5. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
HORNS SOUND INTERMITTENTLY AS THE STEERING WHEEL IS ROTATED	1. Ineffective horn switch return circuit.	1. Test and repair intermittently shorted horn switch return circuit if required.
	2. Ineffective horn switch.	2. Test and replace the intermittently open or shorted horn switch (Driver AirBag/DAB) if required.
HORNS DO NOT SOUND	1. Ineffective horn ground circuit.	1. Test and repair open horn ground circuit if required.
	2. Ineffective horn feed circuit.	2. Test and repair open horn feed circuit if required.

HORN SYSTEM DIAGNOSIS		
CONDITION	**POSSIBLE CAUSES**	**CORRECTION**
	3. Ineffective horn relay.	3. Test and replace the horn relay, which is integral to the front Power Distribution Center (PDC), if required.
	4. Ineffective horns.	4. Test and replace open horns if required.
	5. Ineffective horn switch feed circuit.	5. Test and repair open horn switch feed circuit if required.
	6. Ineffective horn switch return circuit.	6. Test and repair open horn switch return circuit if required.
	7. Ineffective horn switch.	7. Test and replace the open horn switch (Driver AirBag/DAB) if required.
	8. Ineffective BCM inputs or outputs.	8. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

HORN

DESCRIPTION

DESCRIPTION

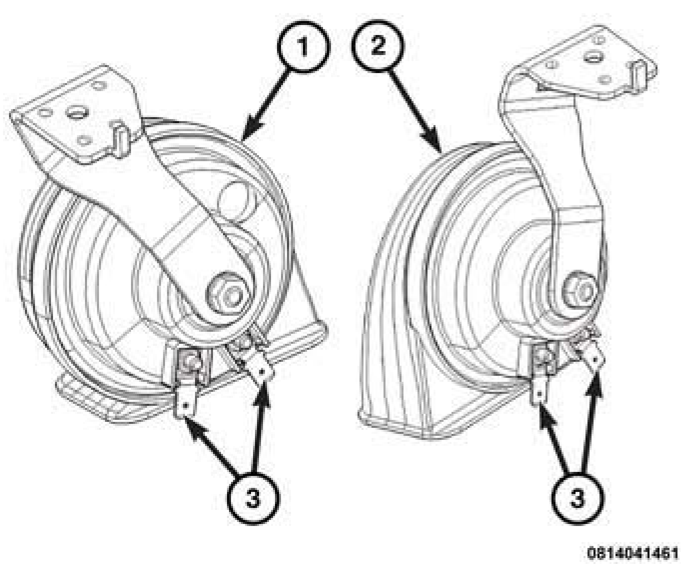

Fig. 1: High Note And Low Note Horns & Terminals
Courtesy of CHRYSLER GROUP, LLC

Dual electromagnetic diaphragm-type horns are standard equipment on this vehicle. A low note (2) and a high note (1) trumpet-style horn are each secured to a dedicated mounting bracket. Each horn and mounting bracket unit is then secured by a single screw to the upper Front End Module (FEM) carrier. The mounting bracket fastening provision is concealed beneath an appearance shield. Internally the two horns are identical in construction and the external horn trumpets are symmetrically opposite.

The two male spade terminals (3) of each horn are connected to the vehicle electrical system through two dedicated take outs and connectors of the headlamp and dash wire harness.

The two horn and the mounting bracket units are each factory-tuned as a unit and; therefore, are serviced only as a unit. These horns cannot be adjusted or repaired. If either horn or mounting bracket is ineffective or damaged, that entire horn and mounting bracket unit must be replaced.

OPERATION

OPERATION

Each horn has a path to ground at all times through its wire harness connection to an eyelet terminal secured to the body sheet metal. The horns are completely controlled by a fused B(+) output received through a relay within the front Power Distribution Center (PDC) and controlled by the Body Control Module (BCM) (also known as the Common Body Controller/CBC).

Within the two halves of the horn housing are a flexible diaphragm, a plunger, an electromagnetic coil and a set of contact points. The diaphragm is secured in suspension around its perimeter by the mating surfaces of the horn housing. The plunger is secured to the center of the diaphragm and extends into the center of the electromagnetic coil. The contact points control the current flow through the windings of the electromagnetic coil.

When the horn is energized, electrical current flows through the closed contact points to the electromagnetic coil. The resulting electromagnetic field draws the plunger and diaphragm toward it until that movement mechanically opens the contact points. When the contact points open, the electromagnetic field collapses allowing the plunger and diaphragm to return to their relaxed positions and closing the contact points again. This cycle continues repeating at a very rapid rate producing the vibration and movement of air that creates the sound that is directed through the horn trumpet outlet.

The horns as well as the hard wired input circuits for the horns may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HORN

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

1. Disconnect the headlamp and dash wire harness connectors from the two horn terminals. Check for continuity between the horn ground circuit connector and a good ground. There should be continuity. If

OK, go to Step 2. If not OK, repair the open ground circuit to ground as required.

2. Check for battery voltage at the horn circuit connector of the headlamp and dash wire harness connector for the horn. There should be zero volts. If OK, go to Step 3. If not OK, repair the shorted horn circuit between the horn and the front Power Distribution Center (PDC) as required.
3. Depress the horn switch. There should now be battery voltage at the horn circuit connector of the headlamp and dash wire harness wire harness. If OK, replace the ineffective horn and mounting bracket unit. If not OK, use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis of the Body Control Module (BCM) (also known as the Common Body Controller/CBC), the front PDC, the Controller Area Network (CAN) data bus and the horn switch.

REMOVAL

REMOVAL

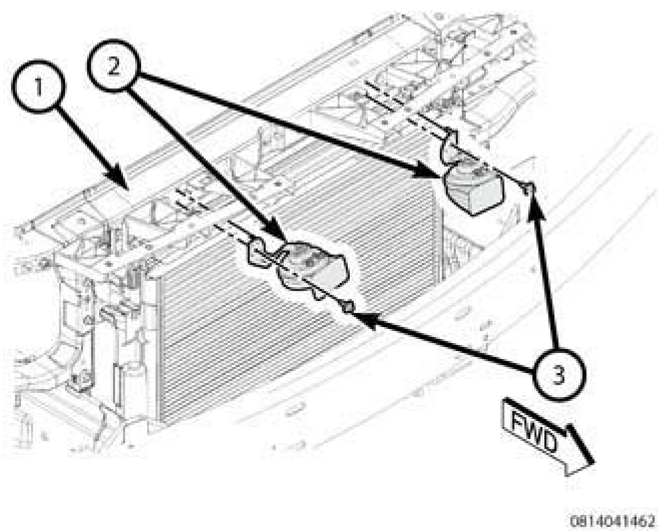

Fig. 2: Front End Module, Horns & Screws
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery.
2. Remove the front fascia from the vehicle. Refer to **FASCIA, FRONT, REMOVAL** .
3. Disconnect the headlamp and dash wire harness connectors from the terminals on the horn (2).
4. Remove the screw (3) that secures the horn mounting bracket to the Front End Module (FEM) (1) carrier.
5. Remove the horn and mounting bracket from the vehicle as a unit.

INSTALLATION

INSTALLATION

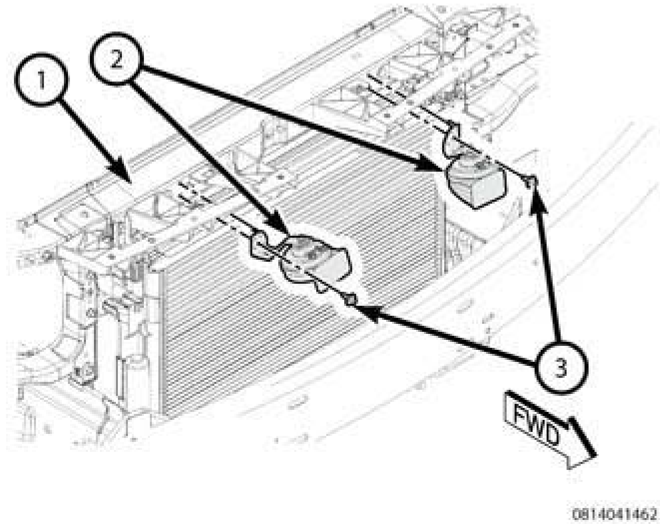

Fig. 3: Front End Module, Horns & Screws
Courtesy of CHRYSLER GROUP, LLC

1. Position the horn (2) and mounting bracket as a unit to the Front End Module (FEM) carrier (1).
2. Install and tighten the screw (3) that secures the horn mounting bracket to the FEM carrier. Tighten the screw to specification. Refer to **SPECIFICATIONS**.
3. Reconnect the headlamp and dash wire harness connectors to the terminals on the horn.
4. Reinstall the front fascia assembly onto the vehicle. Refer to **FASCIA, FRONT, INSTALLATION** .
5. Reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), reconnect the IBS connector.

RELAY, HORN

DESCRIPTION

DESCRIPTION

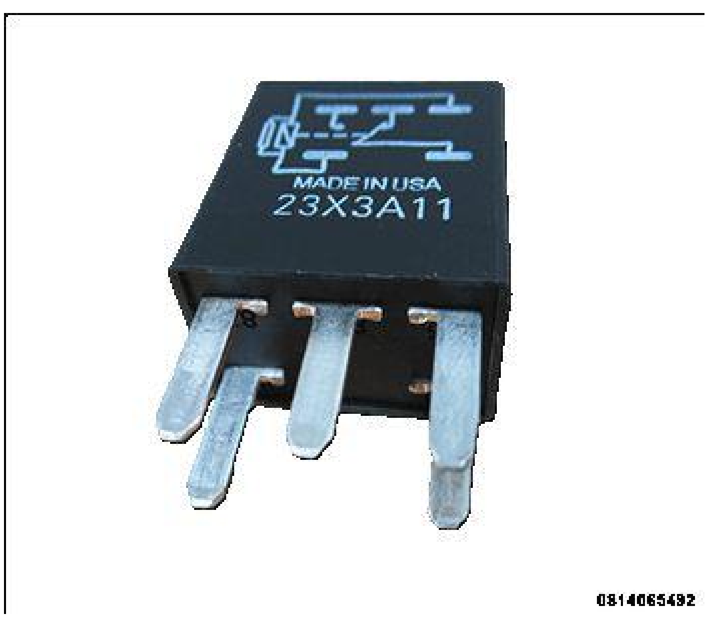

Fig. 4: Horn Relay
Courtesy of CHRYSLER GROUP, LLC

The horn relay is a conventional International Standards Organization (ISO) micro relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal patterns and terminal functions. This relay is contained within a small, rectangular, molded plastic housing and is connected to all of the required inputs and outputs through five integral male terminals that extend from the relay base plate.

Internally, the horn relay is a electromechanical device that consists of an electromagnetic coil, a resistor and a pair of normally open electrical contacts. One of the two electrical contacts is fixed, while the other contact is movable. The movable relay contact is held away from the fixed contact by spring pressure. The horn relay for this vehicle is installed in a cavity within the front Power Distribution Center (PDC), which is located on the top of the right front wheel house ahead of the strut tower within the engine compartment. Refer to the layout label on the underside of the PDC cover for specific relay cavity assignment information.

The horn relay cannot be repaired or adjusted and, if ineffective or damaged, the relay unit must be replaced.

OPERATION

OPERATION

The horn relay within the front Power Distribution Center (PDC) switches battery current to the horns when the Body Control Module (BCM) (also known as the Common Body Controller/CBC) energizes the electromagnetic coil of the relay. When the electromagnetic relay coil is energized, it draws and holds the normally open movable contact of the relay against the fixed relay contact. The closed relay contacts supply fused battery current from the front PDC to energize the horns.

When the BCM de-energizes the electromagnetic relay coil, spring pressure returns the movable contact to the normally open position, which de-energizes the horns. The resistor within the relay is connected in parallel with the electromagnetic coil, and helps to dissipate voltage spikes that are produced when the coil is de-energized.

The hard wired inputs and outputs of the horn relay within the front PDC may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the BCM or the electronic controls and communication between modules and other devices that provide some features of the BCM-controlled horn relay. The most reliable, efficient and accurate means to diagnose the BCM or the electronic controls and communication related to BCM-controlled horn relay operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HORN RELAY

The hard wired inputs and outputs of the horn relay within the front Power Distribution Center (PDC) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the Body Control Module (BCM) (also known as the Common Body Controller/CBC) or the electronic controls and communication between modules and other devices that provide some features of the BCM-controlled horn relay. The most reliable, efficient and accurate means to diagnose the BCM or the electronic controls and communication related to BCM-controlled horn relay operation requires the use of a diagnostic scan tool. Refer

to the appropriate diagnostic information.

REMOVAL

REMOVAL

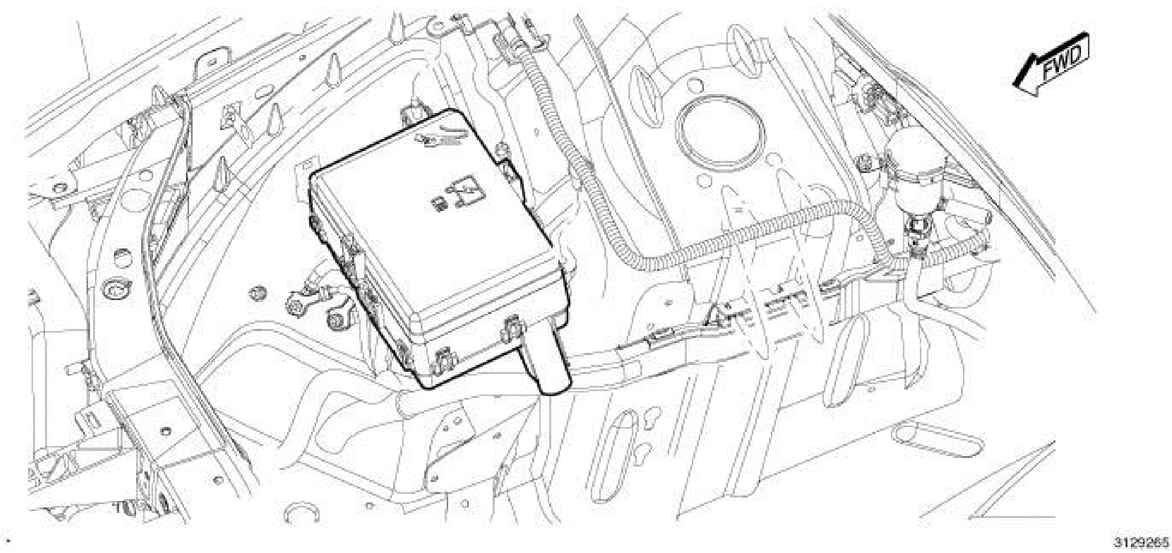

Fig. 5: Identifying Front PDC
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery.
2. Remove the cover from the front Power Distribution Center (PDC) located ahead of the right strut tower on the right front wheel house splash shield in the engine compartment.
3. Refer to the fuse and relay layout map on the underside of the PDC cover for horn relay identification and cavity location.
4. Remove the horn relay by grasping it firmly and pulling it straight out from the cavity within the front PDC.

INSTALLATION

INSTALLATION

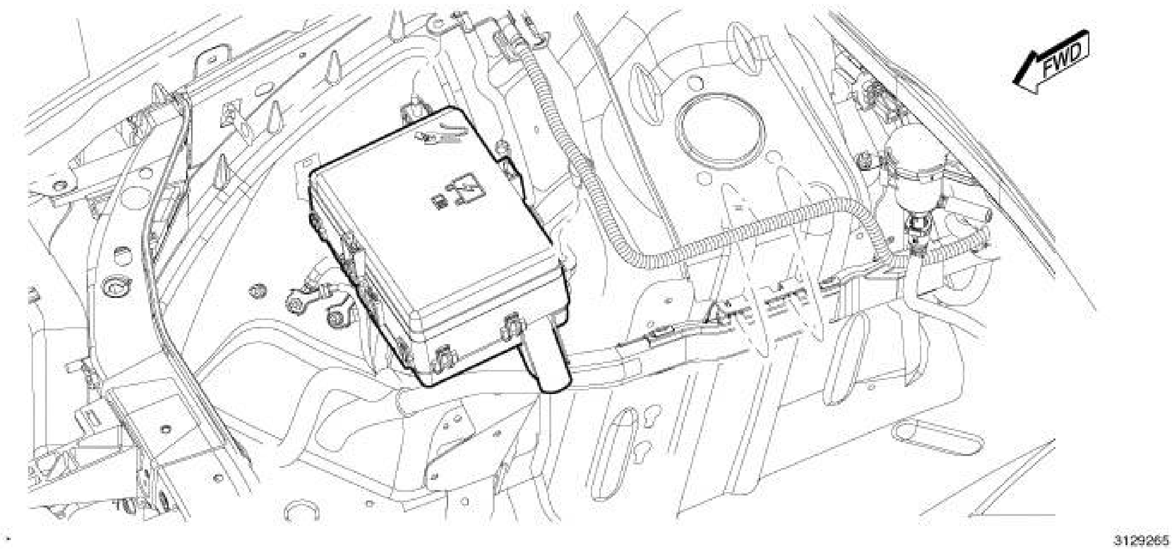

Fig. 6: Identifying Front PDC
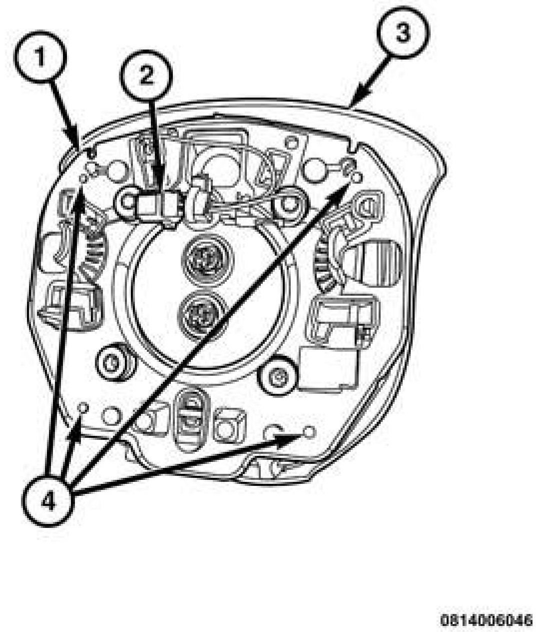
Courtesy of CHRYSLER GROUP, LLC

1. Refer to the fuse and relay layout map on the underside of the front Power Distribution Center (PDC) cover for the proper horn relay identification and cavity location.
2. Position the horn relay in the proper cavity within the front PDC.
3. Align the relay terminals with the terminal cavities in the PDC.
4. Push firmly and evenly on the top of the relay until the terminals are fully seated in the terminal cavities in the PDC.
5. Reinstall the cover onto the front PDC.
6. Reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), reconnect the IBS connector.

SWITCH, HORN

DESCRIPTION

DESCRIPTION



[Fig. 7: Horn Switch & Driver Airbag](#)
Courtesy of CHRYSLER GROUP, LLC

The horn switch for this vehicle consists of four individual sets of normally open contacts wired in parallel so that all four sets of contacts operate as one switch. The horn switch contacts (4) are secured to, but insulated from a stamped metal floating horn switch plate (1) that also serves as the mounting plate for the Driver AirBag (DAB) (3). The horn switch plate is over-molded with integral plastic insulators for the horn contacts and routing clips for the contact wiring.

The horn switch plate is secured to but isolated from the DAB housing with four sleeved screws and insulating washers. Each sleeved screw passes through a small coiled spring retained by an interference fit within an isolator on the switch plate. A dedicated take out and connector of the steering wheel wire harness connects the horn switch plate to the vehicle electrical system through a connector (2) on the upper edge of the switch plate. A mounting spring on each outboard side of the horn switch plate is secured within the hub of the steering wheel under a hook formation in the steering wheel hub armature adjacent to each horizontal steering wheel spoke.

The components that make up the horn switch plate cannot be adjusted or repaired. If damaged or ineffective, the entire DAB and horn switch plate must be replaced as a unit.

OPERATION

OPERATION

The floating horn switch allows the vehicle operator to actuate the horns by depressing anywhere on the upper surface of the Driver AirBag (DAB) trim cover in the center of the steering wheel. When the DAB trim cover is depressed, the DAB housing compresses the coil springs isolating one or more of the horn switch contact sets causing at least one of the four pairs of electrically conductive contacts to close. When the DAB trim cover is released, the coil springs on the switch plate return the DAB to its at rest position and open the horn switch contacts, which opens the horn switch circuit.

The four sets of horn switch contacts are wired in parallel so they perform as a single switch. One contact from each switch receives source current through an internal pull-up of the microcontroller within the Steering Column Control Module (SCCM). When the switch contacts are closed the SCCM input is pulled down to ground. The SCCM microcontroller then sends an electronic **horn switch status** message to the Body Control Module (BCM) over the Controller Area Network (CAN) data bus. The BCM then controls the output to the horn relay within the front Power Distribution Center (PDC) accordingly.

The hard wired circuits between components related to the horn switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HORN SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

1. Remove the Driver AirBag (DAB) from the steering wheel. Refer to **AIR BAG, DRIVER, REMOVAL** .
2. Disconnect the steering wheel wire harness connector from the horn switch wire harness connector.
3. With the horn switch plate released, check for continuity between the two terminals in the horn switch pigtail wire harness connector. There should be no continuity. If OK, go to Step 4. If not OK, replace the ineffective horn switch plate (DAB) unit.
4. With the horn switch plate depressed, check for continuity between the two terminals in the horn switch pigtail wire harness connector. There should now be continuity. If OK, go to Step 5. If not OK, replace the ineffective horn switch plate (DAB) unit.
5. Check the steering wheel wire harness for shorts or opens between the horn switch connector and the clockspring connector. If not OK, repair or replace the steering wheel wire harness as required.

REMOVAL

REMOVAL

The horn switch is serviced only as a unit with the Driver AirBag (DAB). Refer to **AIR BAG, DRIVER, REMOVAL** .

INSTALLATION

INSTALLATION

The horn switch is serviced only as a unit with the Driver AirBag (DAB). Refer to **AIR BAG, DRIVER, INSTALLATION** .

Article GUID: A00735982

2015-16 ENGINE

Ignition System - Service Information - Challenger

DESCRIPTION

DESCRIPTION

NOTE: **All engines use a fixed ignition timing system. Basic ignition timing is not adjustable. All spark advance is determined by the Powertrain Control Module (PCM).**

The ignition system used on these engines is referred to as coil on plug. The system's four main components are the coils, spark plugs, camshaft position sensors, and the crankshaft position sensor. Refer to **SENSOR, CRANKSHAFT POSITION** . The coil on plug ignition system utilizes an ignition coil for every cylinder. The ignition coils are mounted directly over the each spark plug.

OPERATION

OPERATION

The crankshaft position sensor and camshaft position sensor are hall effect devices. The camshaft position sensor and crankshaft position sensor generate square wave pulses that are inputs to the Powertrain Control Module (PCM). The PCM determines engine position from these sensors. The PCM calculates injector sequence and ignition timing from crankshaft AND camshaft position.

2. Install the ignition coil into cylinder head and push both spark plug boots onto each spark plug.
3. Install the two coil mounting bolts (3) and tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
4. Connect the ignition coil wire harness connector (1) to the coil and lock the connector.
5. Install the engine cover.
6. Connect the negative battery cable.

SENSOR, CAMSHAFT POSITION

DESCRIPTION

3.6L

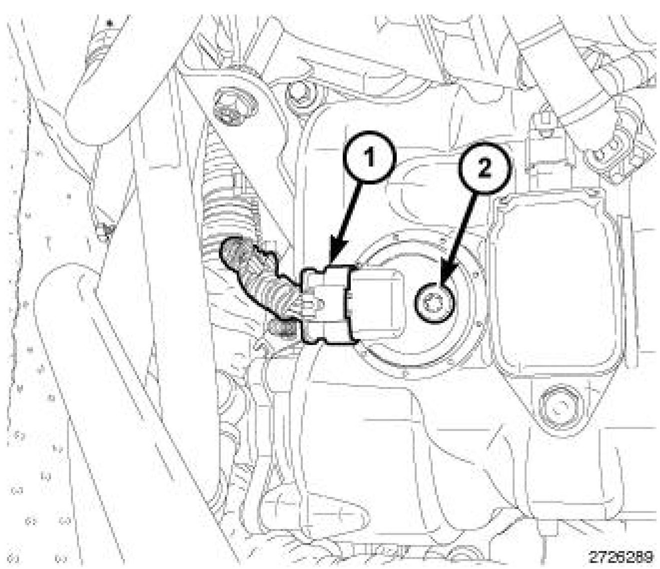

Fig. 28: CMP Sensor Connector & Bolt

Courtesy of CHRYSLER GROUP, LLC

The two Camshaft Position (CMP) sensors are located at the rear of the cylinder head covers. The sensors are bolted to the cylinder head and utilize a radial lip seal where they protrude through the covers. The attaching bolt (2) has an O-ring seal and is captured in the sensor.

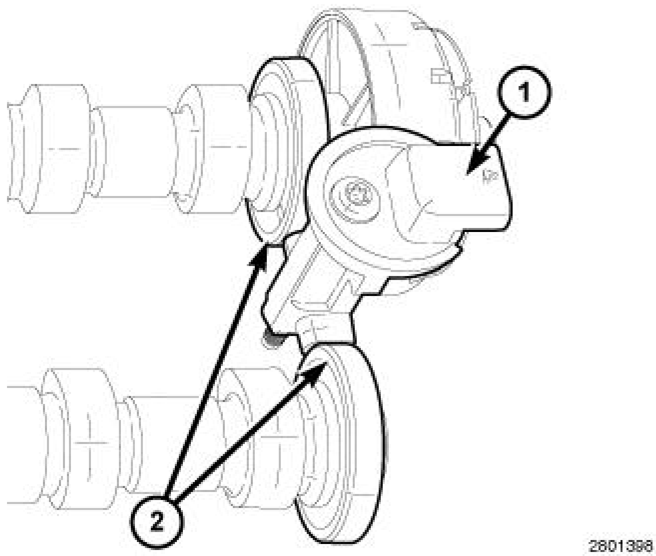

Fig. 29: Camshaft Position Sensors (CMP) Sensors & Encoded Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

The Camshaft Position Sensors (CMP) sensors (1) are dual read, single element hall effect sensors mounted between the magnetic encoded timing wheels. The magnetic timing wheels are used because of their small diameter allowing for a compact cylinder head design.

6.2L

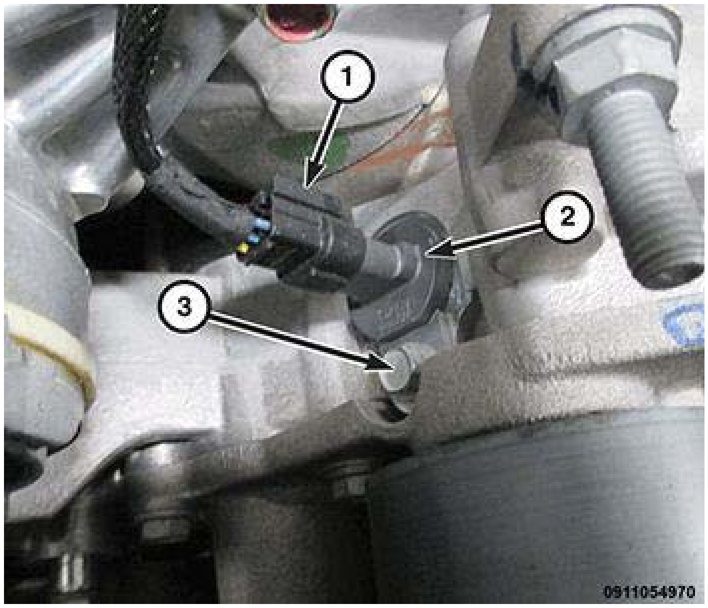

Fig. 30: Camshaft Position Sensor (CMP), Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

The Camshaft Position Sensor (CMP) (2) is located in the timing cover near the supercharger belt tensioner.

5.7L/6.4L

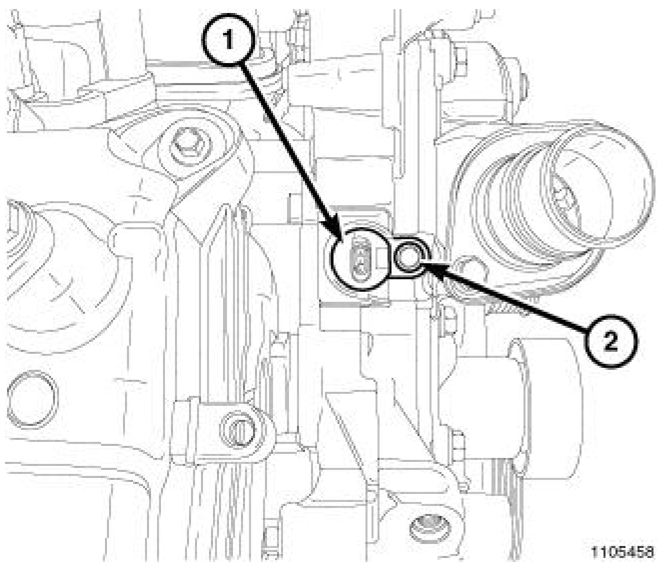

Fig. 31: Camshaft Position Sensor & Bolt
Courtesy of CHRYSLER GROUP, LLC

The Camshaft Position Sensor (CMP) (1) is located in the timing cover near the thermostat housing.

OPERATION

3.6L

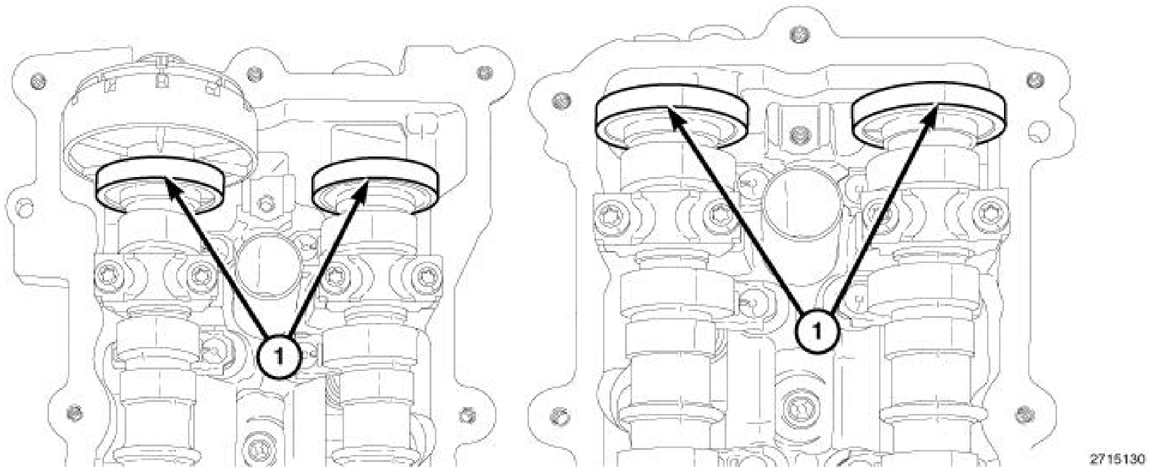

Fig. 32: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

The 3.6 liter engine uses a Dual Over Head Camshaft (DOHC) configuration. The camshafts are a nodular cast iron design and have two pressed on magnetic timing wheels (1) that are magnetically encoded.

The Camshaft Position Sensors (CMP) are mounted between the timing wheels (1).

6.2L

The Camshaft Position (CMP) sensor is used in conjunction with the Crankshaft Position (CKP) sensor to differentiate between fuel injection and spark events. It is also used to synchronize the fuel injectors with their respective cylinders. The sensor generates electrical pulses. These pulses (signals) are sent to the Powertrain Control Module (PCM). The PCM will then determine crankshaft position from both the CMP sensor and CKP sensor.

The tone wheel is located at the front of the camshaft. As the tone wheel rotates, notches pass through the sync signal generator.

When the cam gear is rotating, the sensor will detect the notches. Input voltage from the sensor to the PCM will then switch from a low (approximately 0.3 volts) to a high (approximately 5 volts). When the sensor detects a notch has passed, the input voltage switches back low to approximately 0.3 volts.

5.7L/6.4L

The Camshaft Position (CMP) sensor is used in conjunction with the crankshaft position sensor to differentiate between fuel injection and spark events. It is also used to synchronize the fuel injectors with their respective cylinders. The sensor generates electrical pulses. These pulses (signals) are sent to the Powertrain Control Module (PCM). The PCM will then determine crankshaft position from both the CMP sensor and Crankshaft Position (CKP) sensor.

The tone wheel is located at the front of the camshaft. As the tone wheel rotates, notches pass through the sync

signal generator.

When the cam gear is rotating, the sensor will detect the notches. Input voltage from the sensor to the PCM will then switch from a low (approximately 0.3 volts) to a high (approximately 5 volts). When the sensor detects a notch has passed, the input voltage switches back low to approximately 0.3 volts.

1. Clean out the camshaft position (CMP) sensor mounting bolt hole (2) in cylinder head.
2. The CMP sensor seal (1) can be reused if not damaged.

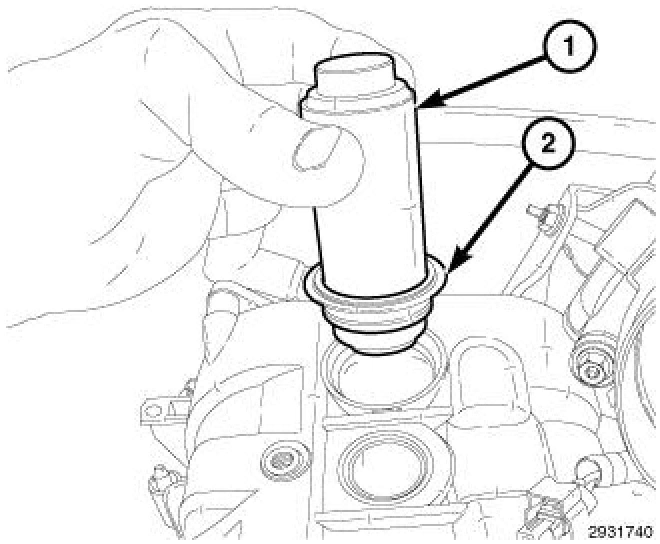

Fig. 41: Installing CMP Sensor Seal
Courtesy of CHRYSLER GROUP, LLC

3. If required, install a new CMP sensor seal (2) in the cylinder head cover:
   - Lubricate the CMP sensor seal inner and outer diameters with clean engine oil.
   - Place the CMP sensor seal (2) on the Cam Sensor/Spark Plug Tube Seal Installer (special tool #10256, Installer, Cam Installer, Cam Sensor/ Spark Plug Tube Seal) (1).
   - Push the seal into the cylinder head cover until the base of the seal is seated.
   - Remove the tool (1).

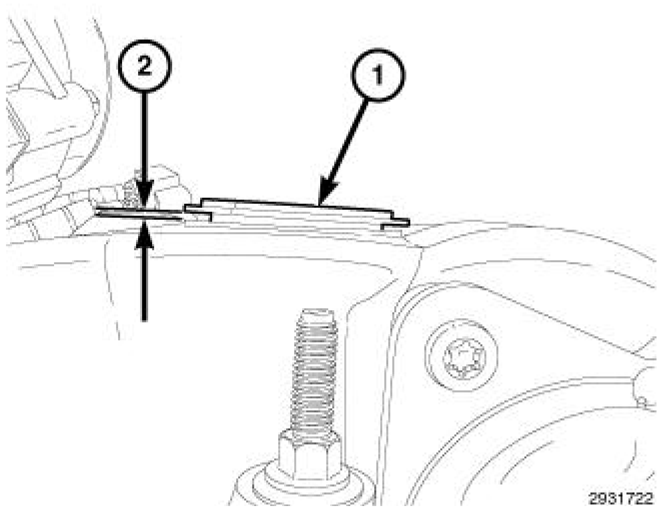

Fig. 42: Gap & CMP Sensor Seal
Courtesy of CHRYSLER GROUP, LLC

NOTE: **A properly installed CMP sensor seal (1) will have a 1.5 - 2.0 mm (0.06 - 0.08 in.) gap (2) between the cylinder head cover and the seal upper flange.**

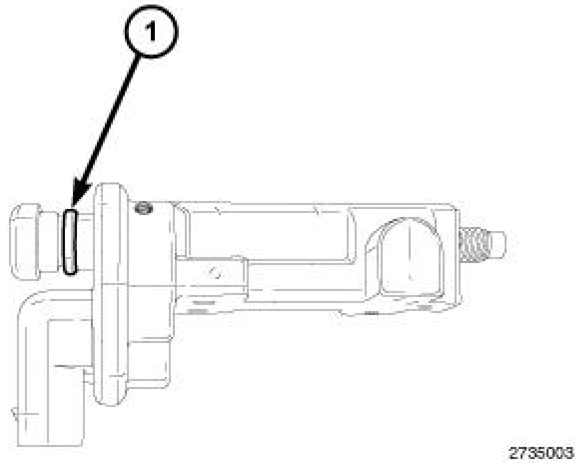

Fig. 43: O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

4. The sensor mounting bolt O-ring (1) can be reused if not damaged.
5. Apply a small amount of engine oil to the sensor mounting bolt O-ring (1).

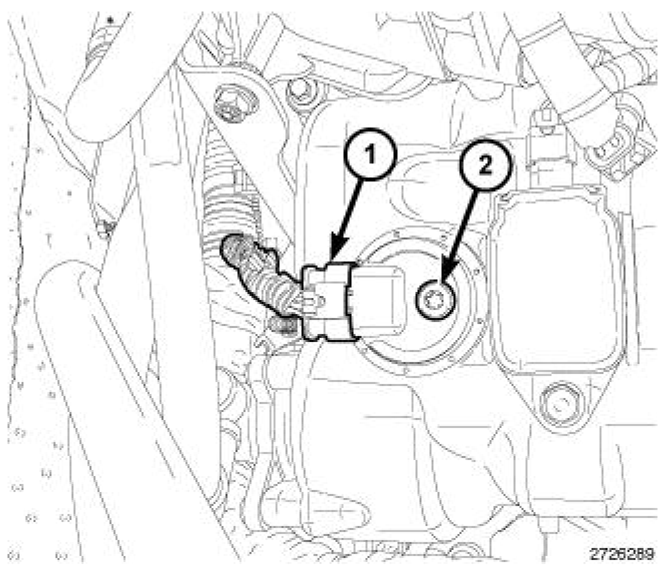

Fig. 44: CMP Sensor Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The right CMP sensor is shown in the illustration, the left CMP sensor is similar. If both right and left CMP sensors where removed, install them into their original locations.**

6. Install the CMP sensor to the cylinder head. Tighten the mounting bolt (2) to the proper torque specification. Refer to **SPECIFICATIONS**.

7. Connect the CMP sensor wire harness connector (1).

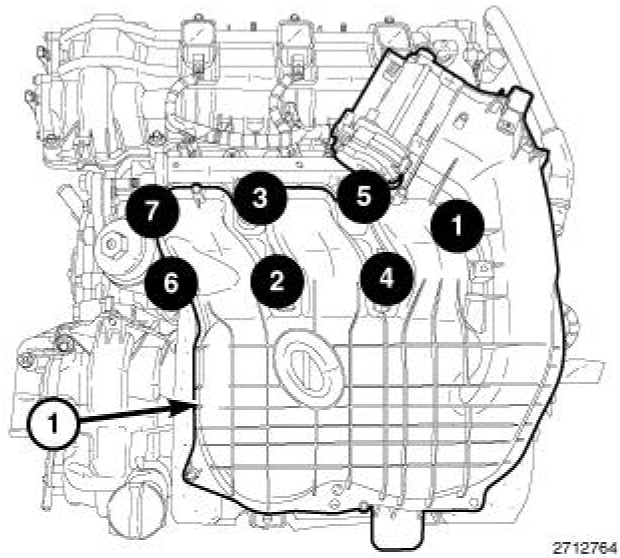

Fig. 45: Upper Intake Manifold Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

8. If required, install the upper intake manifold (1) and air inlet hose. Refer to **MANIFOLD, INTAKE, INSTALLATION** .
9. Install the engine cover.
10. Connect the negative battery cable.

NOTE: **The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.**

6.2L

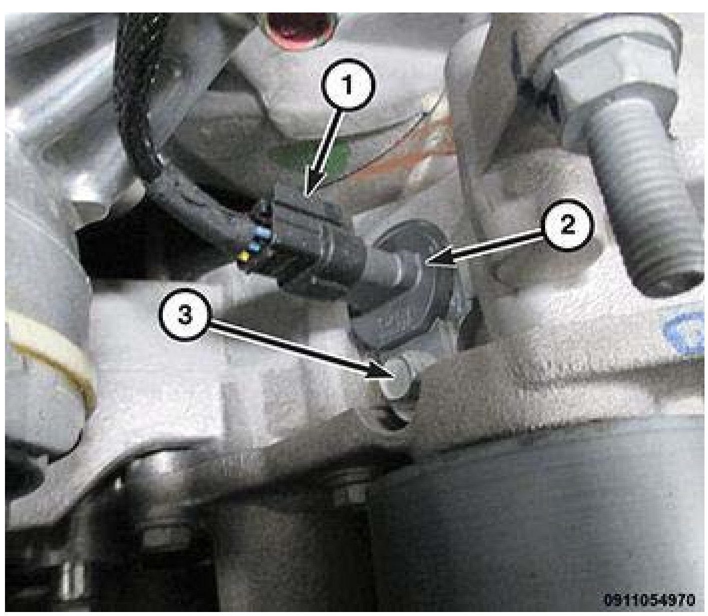

Fig. 46: Camshaft Position Sensor (CMP), Connector & Bolt

Courtesy of CHRYSLER GROUP, LLC

CAUTION: Before tightening the sensor mounting bolt, be sure the sensor is completely flush to the timing cover. If the sensor is not flush, damage to the sensor mounting tang may result.

1. Check the condition of the Camshaft Position (CMP) sensor O-ring seal.
2. Install the CMP sensor (2) into the timing cover.
3. Tighten the retaining bolt (3) to the proper torque specification. Refer to SPECIFICATIONS.
4. Connect the CMP sensor wire harness connector (1).
5. Connect the negative battery cable.

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

5.7L/6.4L

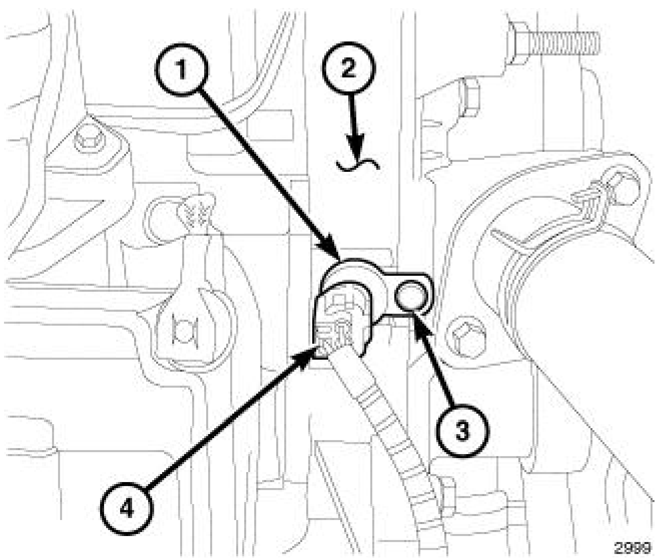

Fig. 47: Camshaft Position Sensor, Connector, Bolt & Timing Cover
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Install the Camshaft Position (CMP) sensor using a slight rotating motion (side to side). Make sure the CMP sensor is fully seated. Do not drive the CMP sensor into the bore with the mounting screw. This may cause the CMP sensor to be incorrectly seated causing a faulty signal or no signal at all.

CAUTION: Before tightening the sensor mounting bolt, be sure the sensor is completely flush to the timing cover. If the sensor is not flush, damage to the sensor mounting tang may result.

1. Check the condition of the CMP sensor O-ring.
2. Using a slight rotating motion, carefully install the CMP sensor (1) into the timing cover (2). Tighten bolt

(3) to the proper torque specification. Refer to **SPECIFICATIONS**.

3. Connect the CMP sensor wire harness connector (4).
4. Install the engine cover.
5. Connect the negative battery cable.

NOTE: **The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.**

SENSOR, KNOCK

DESCRIPTION

3.6L

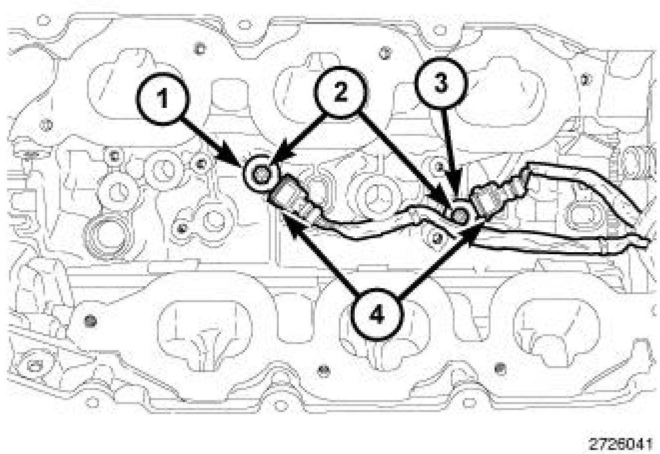

Fig. 48: Forward Knock Sensor & Rear Knock Sensor
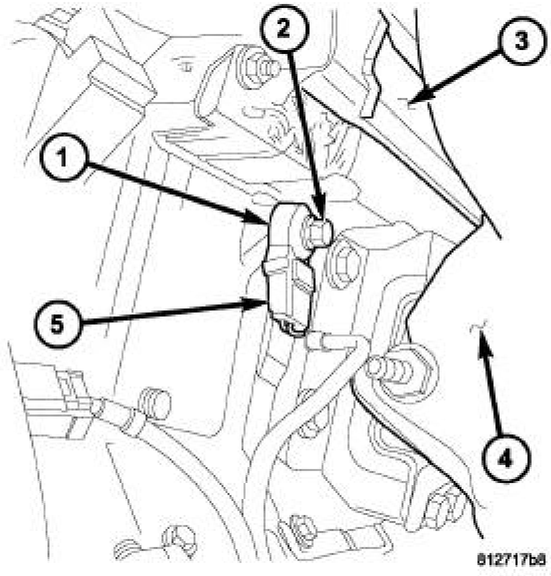
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The forward knock sensor (1) is known to the Powertrain Control Module (PCM) as Knock Sensor 1. The rear knock sensor (3) is known to the PCM as Knock Sensor 2.**

The 3.6L engine uses two knock sensors (1, 3) and are bolted to the cylinder block under the intake manifold.

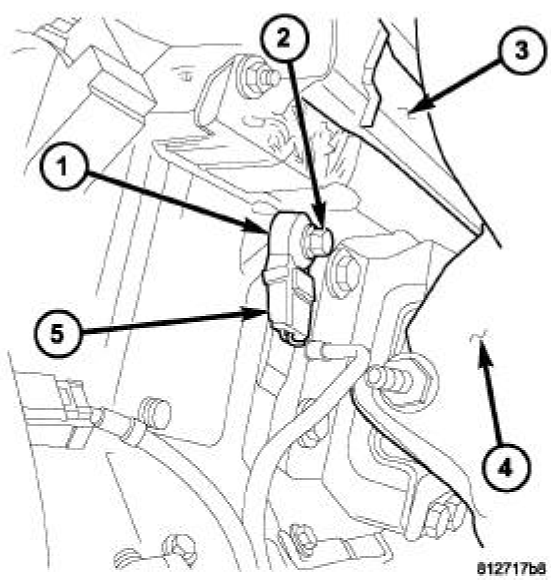
6.2L



[Fig. 49: Locating Knock Sensor]
Courtesy of CHRYSLER GROUP, LLC

The 6.2L engines use two knock sensors (1) and are bolted to each side of the cylinder block (outside) under each exhaust manifold (3).

5.7L/6.4L



[Fig. 50: Locating Knock Sensor]
Courtesy of CHRYSLER GROUP, LLC

The 5.7L and 6.4L engines use two knock sensors (1) and are bolted to each side of the cylinder block (outside)

under each exhaust manifold (3).

OPERATION

OPERATION

When the knock sensor detects a knock in one of the cylinders on the corresponding bank, it sends an input signal to the Powertrain Control Module (PCM). In response, the PCM retards ignition timing for all cylinders by a scheduled amount.

Knock sensors contain a piezoelectric crystal which constantly vibrates and sends an input voltage (signal) to the PCM while the engine operates. As the intensity of the crystal's vibration increases, the knock sensor output voltage also increases.

The voltage signal produced by the knock sensor increases with the amplitude of vibration. The PCM receives the knock sensor voltage signal as an input. If the signal rises above a predetermined level, the PCM will store that value in memory and retard ignition timing to reduce engine knock. If the knock sensor voltage exceeds a preset value, the PCM retards ignition timing for all cylinders. It is not a selective cylinder retard.

The PCM ignores knock sensor input during engine idle conditions. Once the engine speed exceeds a specified value, knock retard is allowed.

Knock retard uses its own short term and long term memory program.

Long term memory stores previous detonation information in its battery-backed RAM. The maximum authority that long term memory has over timing retard can be calibrated.

Short term memory is allowed to retard timing up to a preset amount under all operating conditions (as long as rpm is above the minimum rpm) except at Wide Open Throttle (WOT). The PCM, using short term memory, can respond quickly to retard timing when engine knock is detected. Short term memory is lost any time the ignition key is turned off.

NOTE: **Over or under tightening the sensor mounting bolts will affect knock sensor performance, possibly causing improper spark control. Always use the specified torque when installing the knock sensors.**

REMOVAL

3.6L

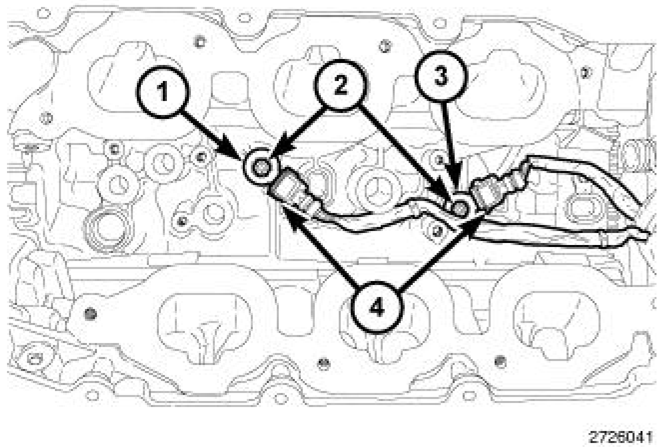


Fig. 51: Forward Knock Sensor & Rear Knock Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The forward sensor (1) is known to the powertrain control module (PCM) as knock sensor 1. The rear sensor (3) is known to the PCM as knock sensor 2.**

1. Perform the fuel pressure release procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE** .
2. Disconnect and isolate the negative battery cable.
3. Remove the oil filter housing. Refer to **HOUSING, OIL FILTER, REMOVAL** .
4. Disconnect the knock sensor wire harness connector (4).

NOTE: **There may be a foam strip on the bolt threads. This foam is used only to retain the bolts to the sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.**

5. Remove bolt (2) and knock sensor 1 (1) or knock sensor 2 (3).

6.2L

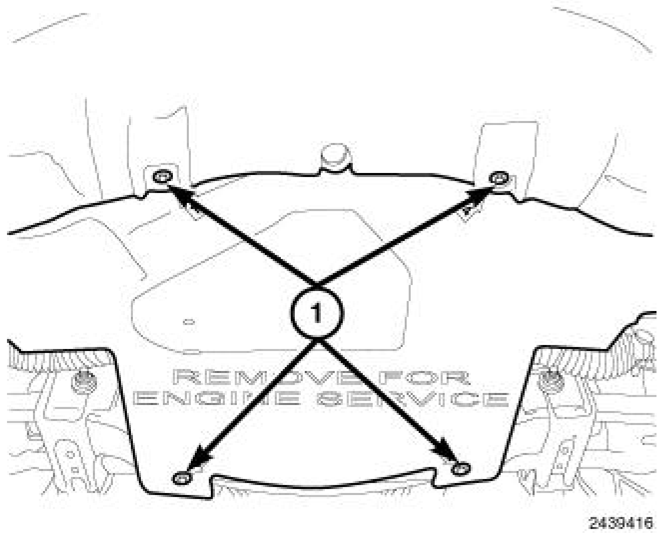

Fig. 52: Belly Pan & Fasteners
Courtesy of CHRYSLER GROUP, LLC

Two knock sensors are used. Each sensor is bolted to the outside of cylinder block below the exhaust manifold.

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the fasteners (1) and the belly pan.

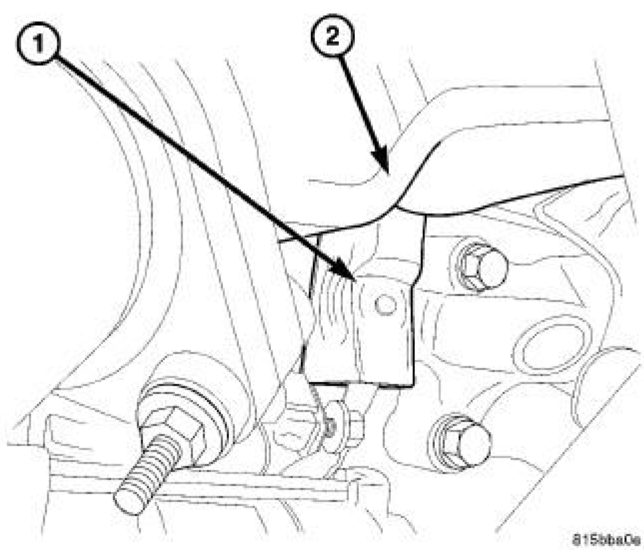

Fig. 53: Knock Sensor Heat Shield
Courtesy of CHRYSLER GROUP, LLC

4. Remove the heat shield (1) from knock sensor (shield snaps onto sensor).

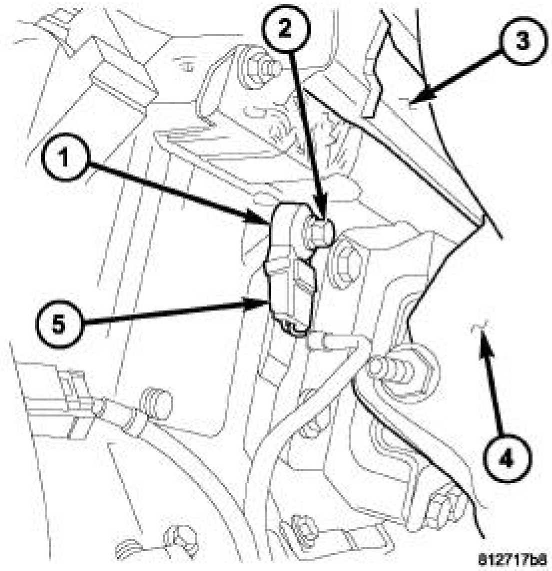

Fig. 54: Locating Knock Sensor
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the knock sensor wire harness connector (5).

NOTE: **Note the foam strip on the knock sensor retaining bolt threads. This foam is only used to retain the bolts to the knock sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.**

6. Remove bolt (2) and the knock sensor from the cylinder block.

5.7L/6.4L

Courtesy of CHRYSLER GROUP, LLC

4. Remove the heat shield (1) from knock sensor (shield snaps onto sensor).

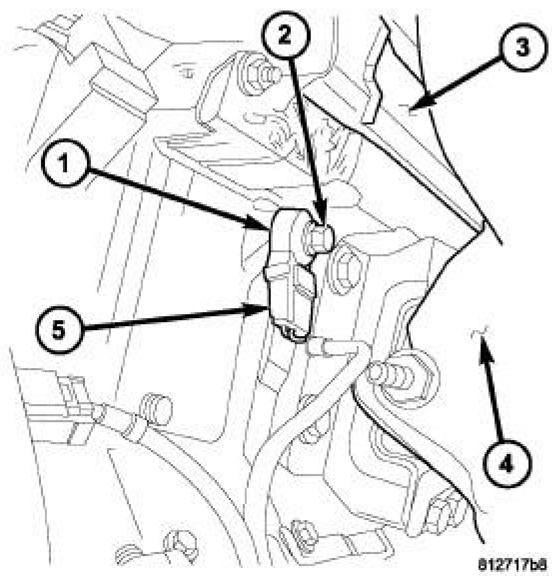

Fig. 57: Locating Knock Sensor
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the knock sensor wire harness connector (5).

NOTE: Note the foam strip on the knock sensor retaining bolt threads. This foam is only used to retain the bolts to the knock sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.

6. Remove bolt (2) and the knock sensor from the cylinder block.

INSTALLATION

3.6L

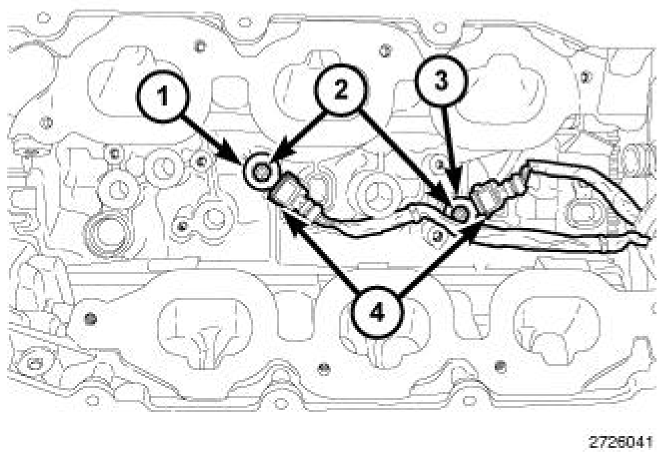

Fig. 58: Forward Knock Sensor & Rear Knock Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: The forward sensor (1) is known to the powertrain control module (PCM) as knock sensor 1. The rear sensor (3) is known to the PCM as knock sensor 2.

1. Thoroughly clean the knock sensor mounting holes.

NOTE: Over or under tightening the sensor mounting bolts will affect knock sensor performance, possibly causing improper spark control. Always use the specified torque when installing the knock sensors. The torque specification for the knock sensor bolt is less than the typical 8 mm bolt.

NOTE: There may be a foam strip on the bolt threads. This foam is used only to retain the bolts to the sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.

2. Install knock sensor 1 (1) or knock sensor 2 (3). Tighten bolt (2) to the proper torque specification. Refer to SPECIFICATIONS.
3. Connect the knock sensor wire harness connector (4).

4. Install the oil filter housing. Refer to **HOUSING, OIL FILTER, INSTALLATION** .
5. Connect the negative battery cable.
6. Operate the engine until it reaches normal operating temperature. Check cooling system for correct fluid level or leaks. Refer to **STANDARD PROCEDURE** .

6.2L

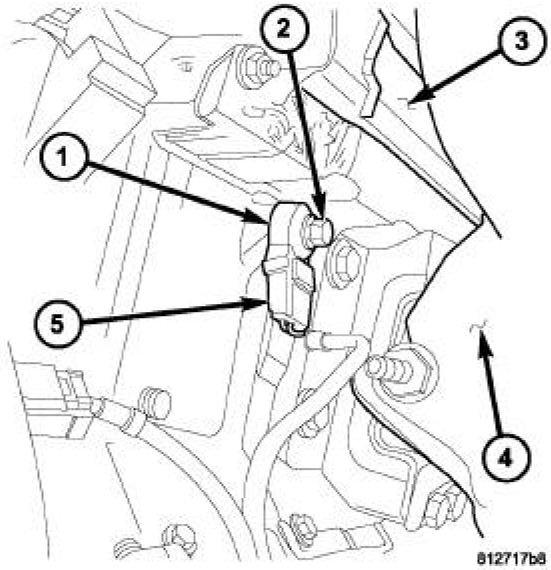

Fig. 59: Locating Knock Sensor
Courtesy of CHRYSLER GROUP, LLC

CAUTION: **Over or under tightening the knock sensor mounting bolts will affect knock sensor performance, possibly causing improper spark control.**

1. Install the knock sensor (1) onto the cylinder block.
2. Tighten the bolt (2) to the proper torque specification. Refer to **SPECIFICATIONS**.
3. Connect the knock sensor wire harness connector (5).

SOLENOID, VARIABLE VALVE TIMING

DESCRIPTION

DESCRIPTION

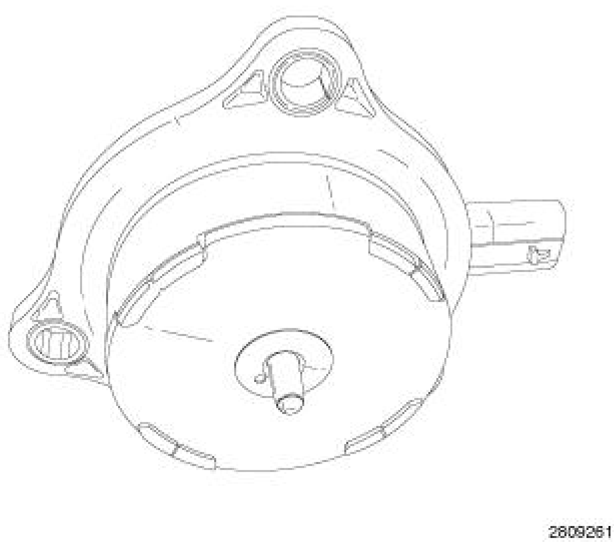

Fig. 65: Variable Valve Timing Solenoid
Courtesy of CHRYSLER GROUP, LLC

The 3.6L engine is equipped with Variable Valve Timing (VVT). This system adjusts the timing of all four camshafts independently using solenoids and oil control valves to direct oil pressure into the camshaft phaser assemblies. The camshaft phaser assembly advances and/or retards camshaft timing to improve engine performance, mid-range torque, idle quality, fuel economy, and reduce emissions. The four VVT solenoids are located on the front of the cylinder head covers. The pintle should move freely within the solenoid body. Do not attempt to disassemble the solenoids, they are not serviceable. The solenoids are identical but should be installed in the same location as removed.

OPERATION

OPERATION

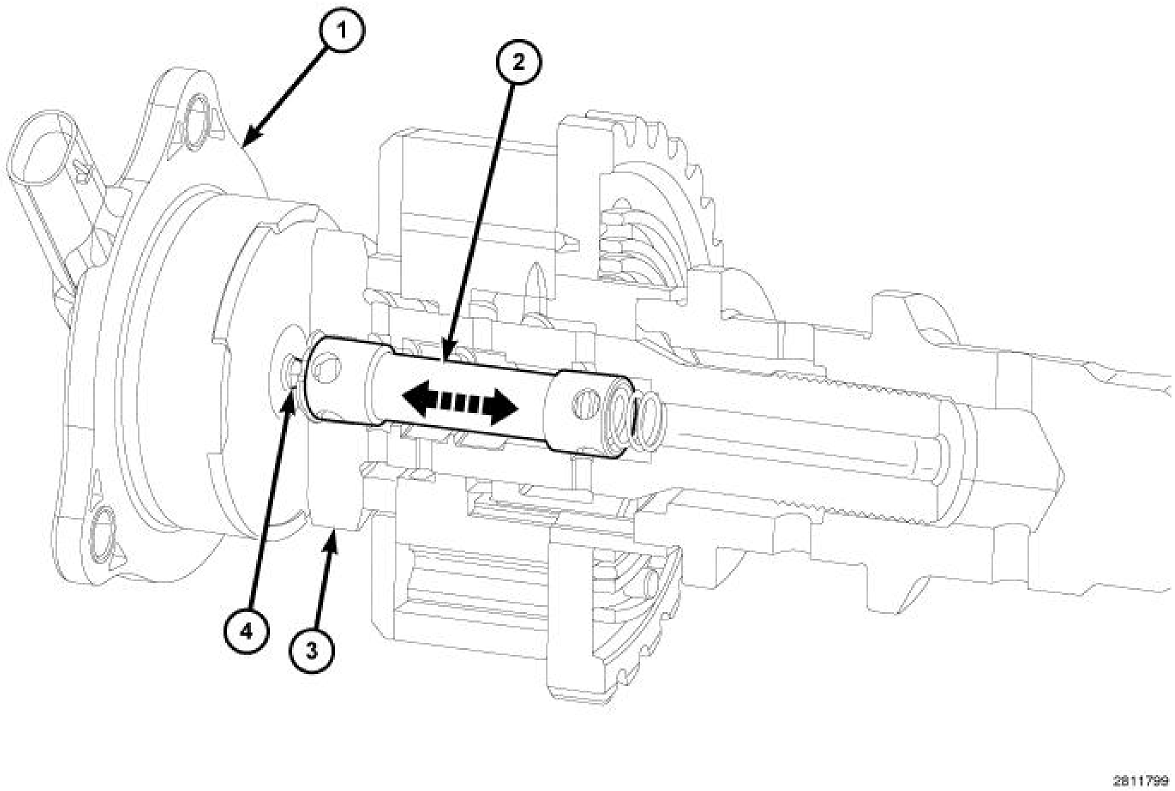

Fig. 66: Oil Control Valve (OCV), VVT Solenoid, Solenoid Pintle & Internal Spool Valve
Courtesy of CHRYSLER GROUP, LLC

Camshaft phaser position is adjusted using regulated oil pressure through an Oil Control Valve (OCV) (3). To begin Phaser movement, the Powertrain Control Module (PCM) applies a pulse-width modulated voltage signal to the VVT solenoid (1) to extend or retract the solenoid pintle (4). The pintle pushes against an internal spool valve (2) within the OCV moving the valve forwards and backwards to direct oil flow. The position of the spool inside the OCV determines which ports and chambers inside the phaser are being fed, either to advance the timing of the phaser sprocket relative to the camshaft, retard it, or hold a desired position. Refer to **ASSEMBLY, VARIABLE VALVE TIMING, PHASER / OIL CONTROL VALVE, OPERATION** .

The Camshaft Position (CMP) sensor monitors the position of the camshaft with respect to the crankshaft and provides feedback to the PCM.

The debris crush mode will only occur with the key on and the engine off (KOEO). If the ignition is cycled to the start position without a momentary pause (immediate crank), the debris crush mode will not occur. In this

instance the procedure will be performed at the next key off cycle.

REMOVAL

LEFT

1. Disconnect and isolate the negative battery cable.

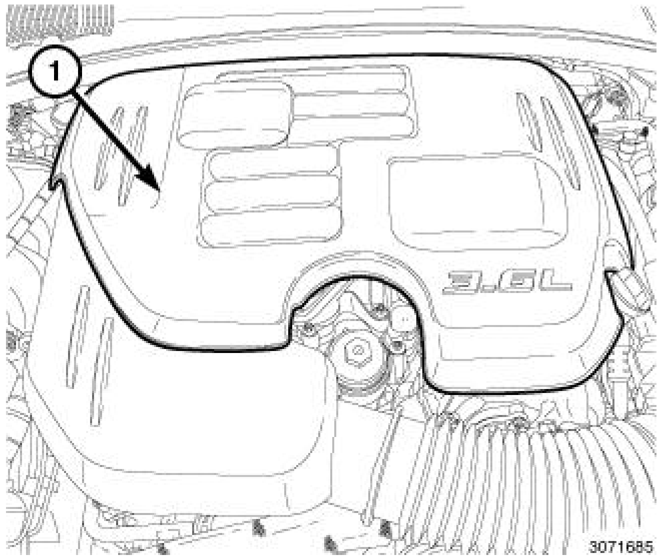

Fig. 67: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

2. Remove the engine cover (1).
3. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL** for 3.6L, **BODY, AIR CLEANER, REMOVAL** for 5.7L, **BODY, AIR CLEANER, REMOVAL** for 6.2L or **BODY, AIR CLEANER, REMOVAL** for 6.4L.

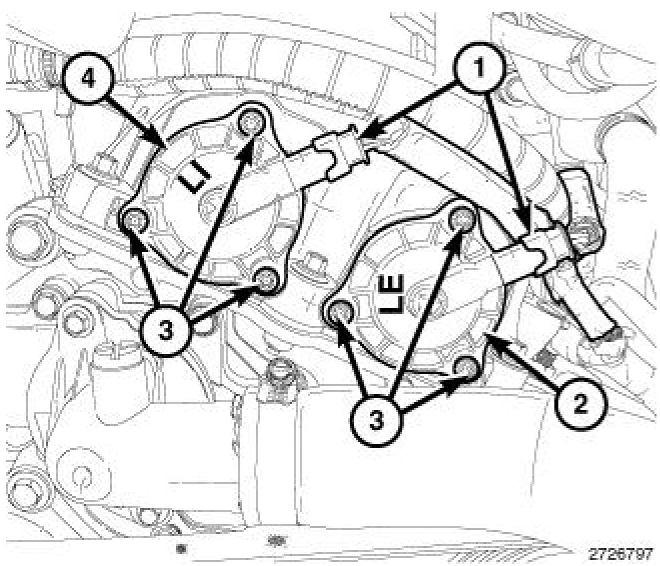

Fig. 68: Variable Valve Timing Solenoids, Connectors & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Mark the Variable Valve Timing Solenoid (VVTS) wire harness connectors**

(1) with a paint pen or equivalent so that they may be reinstalled in their original locations.

4. Mark the intake VVTS (4) and the VVTS (2) with a paint pen or equivalent so that they may be reinstalled in their original locations.
5. Disconnect the VVTS wire harness connector (1).
6. Remove the bolts (3) and pull the VVTS from the cylinder head cover.

SPARK PLUG

DESCRIPTION

DESCRIPTION

CAUTION: **Cleaning platinum plugs may damage the platinum center electrode or the thin platinum pad.**

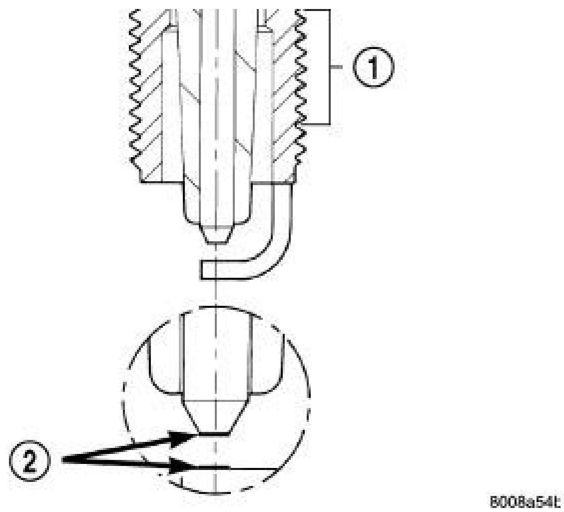

Fig. 79: Platinum Pads
Courtesy of CHRYSLER GROUP, LLC

1 - APPLY ANTI-SEIZE COMPOUND HERE ONLY	
2 - PLATINUM SPARK SURFACE	

The spark plugs are platinum resistor design. They have resistance values of 3, 500 to 20, 000 ohms when checked with at least a 1000 volt tester. For spark plug identification and specifications. Refer to SPECIFICATIONS.

Do not use an ohm meter to check the resistance of the spark plugs. This will give an inaccurate reading.

A thin platinum pad (2) is welded to both or just the center electrode end(s). Extreme care must be used to prevent spark plug cross threading, incorrect gapping and ceramic insulator damage during plug removal and installation.

MoparĀ® Nickel-Graphite Anti-Seize compound is applied to the thread area (1) to prevent damage to the spark plug during removal and installation.

REMOVAL

3.6L

NOTE: The left side ignition coils are shown in the illustration, the right side ignition coils are similar.

1. Remove the ignition coil(s). Refer to COIL, IGNITION, REMOVAL.

CAUTION: The spark plug tubes (1) are a thin wall design. Avoid damaging the spark plug tubes. Damage to the spark plug tube can result in oil leaks.

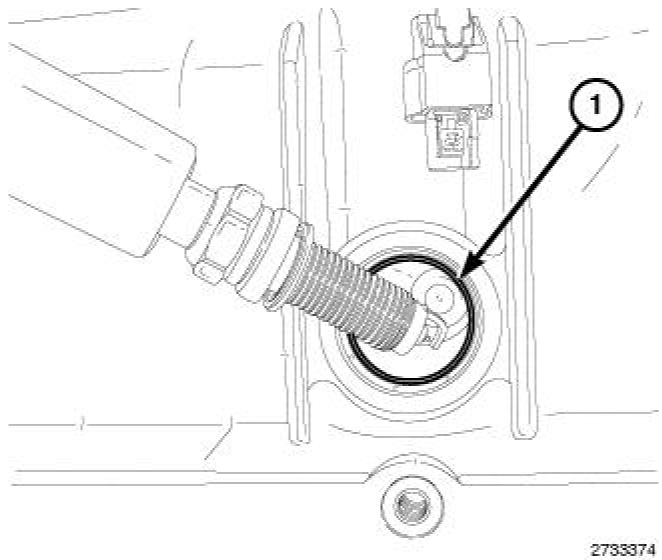

Fig. 80: Spark Plug Tubes
Courtesy of CHRYSLER GROUP, LLC

2. Prior to removing the spark plug, spray compressed air into the cylinder head opening. This will help prevent foreign material from entering combustion chamber.
3. Remove the spark plug(s) from the cylinder head.
4. Inspect the spark plug condition.

6.2L

1. Disconnect and isolate the negative battery cable.
2. Remove the engine cover.
3. Remove the ignition coil(s). Refer to COIL, IGNITION, REMOVAL.
4. Remove the spark plug(s) from the cylinder head.

5.7L/6.4L

1. Disconnect and isolate the negative battery cable.
2. Remove the engine cover.
3. Remove the ignition coil(s). Refer to COIL, IGNITION, REMOVAL.
4. Remove the spark plug(s) from the cylinder head.

INSTALLATION

3.6L

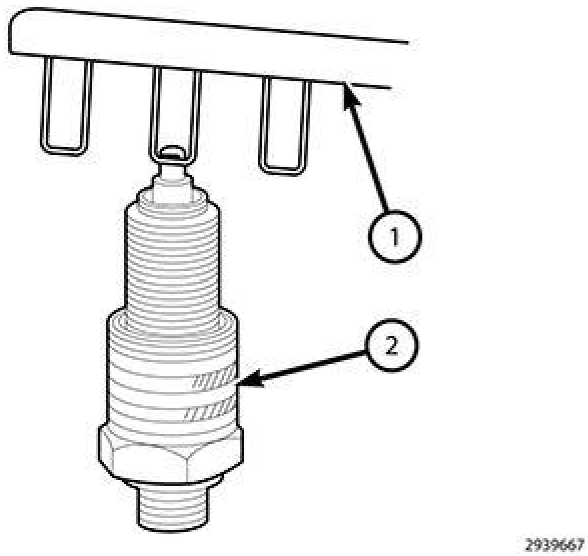

Fig. 81: Setting Spark Plug Gap - Typical
Courtesy of CHRYSLER GROUP, LLC

1. Check and adjust the spark plug gap with a gap gauging tool (1). Refer to SPECIFICATIONS.

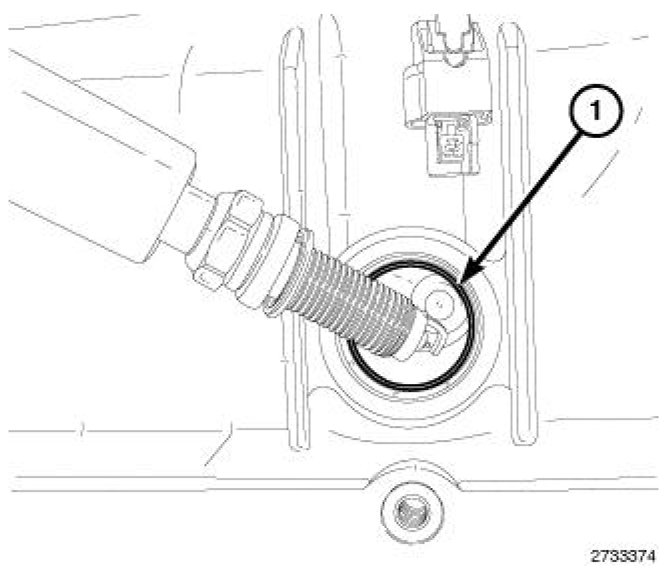

Fig. 82: Spark Plug Tubes
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Special care should be taken when installing spark plugs into the cylinder head spark plug wells. Be sure the plugs do not drop into the plug wells as electrodes can be damaged.

CAUTION: The spark plug tubes (1) are a thin wall design. Avoid damaging the spark plug tubes. Damage to the spark plug tube can result in oil leaks.

2. Start the spark plug into the cylinder head by hand to avoid cross threading.

CAUTION: Spark plug torque is critical and must not exceed the specified value. Overtightening stretches the spark plug shell reducing its heat transfer

capability resulting in possible catastrophic engine failure.

3. Tighten the spark plugs to the proper torque specification. Refer to SPECIFICATIONS.

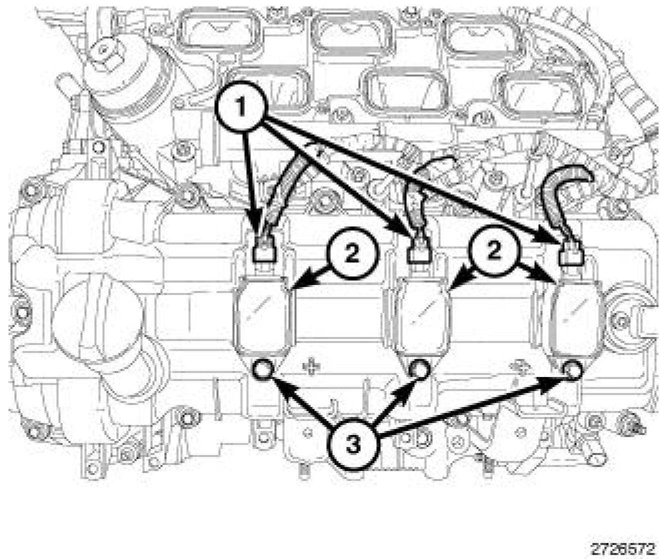

Fig. 83: Electrical Connector, Ignition Coils & Ignition Coil Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The left side ignition coils are shown in the illustration, the right side ignition coils are similar.**

4. Install the ignition coil (2). Refer to COIL, IGNITION, INSTALLATION.

6.2L

CAUTION: **Handle the spark plugs with care. Do not drop or force the spark plugs into the wells, damage to the electrodes and/or porcelain body may occur. Always start each spark plug by hand in order to avoid cross-threading the spark plug in the cylinder head.**

Always tighten spark plugs to the specified torque. Too much or not enough torque will cause damage to the cylinder head and/or spark plug and may lead to poor engine performance.

1. To avoid cross threading, start the spark plug(s) into the cylinder head by hand.
2. Tighten the spark plugs to the proper torque specification. Refer to TORQUE SPECIFICATIONS .
3. Install the ignition coil(s). Refer to COIL, IGNITION, INSTALLATION.
4. Install the engine cover.
5. Connect negative battery cable.

5.7L/6.4L

CAUTION: **Handle the spark plugs with care. Do not drop or force the spark plugs into the wells, damage to the electrodes and/or porcelain body may occur. Always start**

..

each spark plug by hand in order to avoid cross-threading the spark plug in the cylinder head.

Always tighten spark plugs to the specified torque. Too much or not enough torque will cause damage to the cylinder head and/or spark plug and may lead to poor engine performance.

1. To avoid cross threading, start the spark plug(s) into the cylinder head by hand.
2. Tighten the spark plugs as follows:
   - 5.7L Tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
   - 6.4L Tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
3. Install the ignition coil(s). Refer to **COIL, IGNITION, INSTALLATION**.
4. Install the engine cover.
5. Connect negative battery cable.

SWITCH, IGNITION

Article GUID: A00735936

2015-16 ACCESSORIES AND EQUIPMENT

Instrument Cluster - Service Information - Challenger

DESCRIPTION

DESCRIPTION

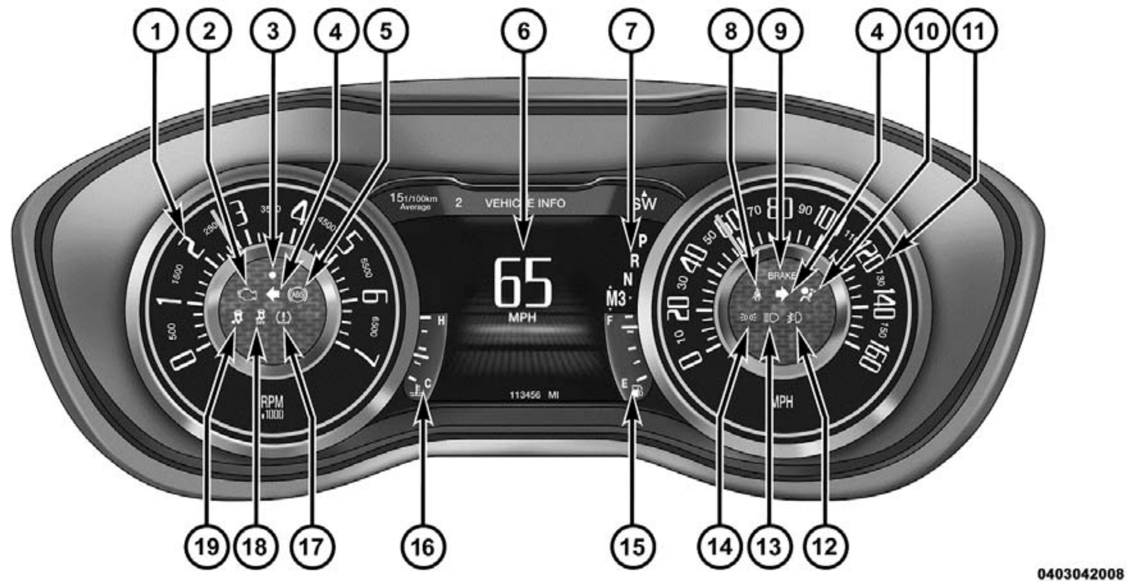

Fig. 1: Instrument Cluster
Courtesy of CHRYSLER GROUP, LLC

The Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) for this vehicle is located directly in front of the driver, above the steering column opening. Only the face of the IC is visible. The remainder of the IC including the mounting provisions and electrical connections are concealed within the instrument panel behind the IC housing and the instrument panel cluster bezel.

The IC gauges and indicators are visible through a dedicated opening in the instrument panel below the cluster hood and are protected by a clear plastic cluster lens. A cluster hood and mask serves as a visor and shields the face of the cluster from ambient light and reflections to reduce glare. The IC has two integral mounting tabs on the sides near the top of the unit as well as two on the bottom which are used to secure the IC to the molded plastic instrument panel cluster carrier with screws.

Besides analog gauges and Light Emitting Diode (LED) unit indicators, the IC incorporates a multicolor Thin Film Transistor (TFT) display unit. The TFT will display odometer information and automatic transmission gear selection. The TFT may also display numerous indications, textual messages, both static and animated graphics and certain diagnostic information, some of which are model and equipment dependent. Refer to **CENTER, ELECTRONIC VEHICLE INFORMATION, DESCRIPTION** .

Several versions of the IC module are offered for this vehicle. These versions accommodate all of the variations of optional equipment and regulatory requirements for the various markets in which the vehicle is offered. The microcontroller-based IC utilizes integrated circuitry and information carried on the Controller Area Network (CAN) data bus along with several hard wired analog and multiplexed inputs to monitor sensors and switches

throughout the vehicle. Refer to **COMMUNICATION, DESCRIPTION** .

The IC gauges, indicators and electronic circuitry along with the cluster housing are only serviced as an assembly, and cannot be adjusted or repaired. If a gauge, a LED unit, the TFT display unit, the electronic circuit board and hardware, the cluster overlay or the cluster housing is damaged or ineffective, the entire IC unit must be replaced. The cluster lens and the cluster hood and mask are available for separate service replacement.

OPERATION

OPERATION

The Instrument Panel Cluster (IPC) is designed to allow the vehicle operator to monitor the conditions of many of the vehicle components and operating systems. The gauges and indicators in the IPC provide valuable information about the various standard and optional power trains, fuel and emissions systems, cooling systems, lighting systems, safety systems and many other convenience items. The IPC is installed in the instrument panel so that the operator of the vehicle can view all of these monitors easily, yet still allow relative ease of access for service.

The microcontroller-based IPC hardware and software uses various inputs to control the gauges and indicators visible on the face of the cluster. Some of these inputs are hard wired, but most are in the form of electronic messages that are transmitted by other electronic modules over the Controller Area Network (CAN) data bus. Refer to **COMMUNICATION, OPERATION** .

The IPC microcontroller smooths the input data using algorithms to provide gauge readings that are accurate, stable and responsive to operating conditions. These algorithms are designed to provide gauge readings during normal operation that are consistent with customer expectations. However, when abnormal conditions exist such as high coolant temperature, the algorithm can drive the gauge pointer to an extreme position and the microcontroller can sound a chime warning to provide distinct visual and audible indications of a problem to the vehicle operator. The IPC may also produce audible warnings for other electronic modules in the vehicle based upon electronic chime request messages received over the CAN data bus. Each audible warning is intended to provide the vehicle operator with an audible alert to supplement a visual indication.

The IPC circuitry operates on battery current received through a fused B(+) fuse on a non-switched fused B(+) circuit, and on battery current received through a fused ignition switch output (run-start) fuse on a fused ignition switch output (run-start) circuit. This arrangement allows the IPC to provide some features regardless of the ignition switch position, while other features will operate only with the ignition switch in the ON or START positions. The circuitry is grounded through a ground circuit of the instrument panel wire harness.

The IPC also has a self-diagnostic test capability that tests each of the CAN bus message-controlled functions of the cluster. This test illuminates the appropriate indicators, positions the gauge needles at several predetermined calibration points across the gauge faces and illuminates all segments of the Electronic Vehicle Information Center (EVIC). The EVIC will display the hardware/software version and the CAN Vehicle Maintenance Monitor (VMM) used in the IPC within the Thin Film Transistor (TFT) display unit. Refer to **DIAGNOSIS AND TESTING**.

Cluster Illumination

Instrument cluster illumination is supplied by several Light Emitting Diode (LED) units controlled by the IPC. The illumination intensity of these LED units can be adjusted only when the exterior lighting is turned ON by

rotating the panel dimmer switch thumbwheel (down to dim, up to brighten) of the dimmer module to one of five available minor detent positions. The illumination intensity of the LED units is controlled by the IPC circuitry based upon electronic **dimming level** messages received from the Body Control Module (BCM) (also known as the Common Body Controller/CBC) over the Controller Area Network (CAN) data bus. The BCM monitors an input from the headlamp switch and a dimming level input received from the panel dimmer switch of the dimmer module.

The hard-wired headlamp switch and dimmer module inputs to the BCM may be diagnosed using conventional diagnostic methods. However, proper testing of the electronic communication and processing of the IPC and the electronic **dimming level** messages sent by the BCM over the CAN data bus requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

Thin Film Transistor Display

The Thin Film Transistor (TFT) display unit is soldered to the IPC electronic circuit board. With the ignition switch in the OFF or ACCESSORY positions, the TFT display is activated when the driver door is opened (Rental Car mode) and deactivated when the driver door is closed.

The illumination intensity of the TFT unit is controlled by the IPC circuitry based upon electronic **dimming level** messages received from the Body Control Module (BCM) (also known as the Common Body Controller/CBC) over the Controller Area Network (CAN) data bus. The BCM monitors an input from the headlamp switch and a dimming level input received from the panel dimmer switch of the dimmer module. The BCM synchronizes the illumination intensity of other display units with that of the unit in the IPC by sending electronic **dimming level** messages to other electronic modules in the vehicle over the CAN data bus.

The IPC TFT display unit has several display capabilities. The TFT unit displays odometer, trip odometer, gear selector indication (PRNDL) for models with an automatic transmission, both static and animated graphics, several warning or reminder indications and various diagnostic information when certain fault conditions exist. Steering wheel mounted switches are used to control some of the display modes of the TFT. For more information, refer to CENTER, ELECTRONIC VEHICLE INFORMATION, OPERATION .

The TFT display unit is diagnosed using the IPC self-diagnostic actuator test. Refer to DIAGNOSIS AND TESTING. Proper testing of the CAN data bus and the electronic data bus message inputs to the IPC that control some of the TFT display functions requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information. Specific operation details for the odometer, the trip odometer, the gear selector indicator and the various warning and reminder indicator functions of the TFT display unit may be found elsewhere in this service information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - INSTRUMENT CLUSTER

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Refer to WARNING . Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions

could result in accidental airbag deployment.

If all of the Instrument Cluster (IC) (also known as Common Instrument Cluster/CIC) gauges and indicators are ineffective, be certain to check the IC fused B(+) fuse and the IC fused B(+) and ground circuits for shorts or opens. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

If an individual hard-wired gauge or indicator is ineffective, refer to the appropriate diagnosis and testing service information for that specific gauge or indicator. If an individual Controller Area Network (CAN) data bus message-controlled gauge or indicator is ineffective, perform the Self-Diagnostic Test.

CAUTION: **Instrument clusters used in this vehicle automatically configure themselves for compatibility with the features and optional equipment in the vehicle in which they are initially installed. The instrument cluster is programmed to do this by embedding the Vehicle Identification Number (VIN) and other information critical to proper cluster operation into electronic memory. This embedded information is learned through electronic messages received from other electronic modules in the vehicle over the Controller Area Network (CAN) data bus and through certain hard-wired inputs received when the cluster is connected to the vehicle electrically. Once configured, the instrument cluster memory may be irreparably damaged and certain irreversible configuration errors may occur if the cluster is connected electrically to another vehicle; or, if an electronic module from another vehicle is connected that provides data to the instrument cluster (including odometer values) that conflicts with that which was previously learned and stored. Therefore, the practice of exchanging (swapping) instrument clusters and other electronic modules in this vehicle with those removed from another vehicle must always be avoided. Failure to observe this caution may result in instrument cluster damage, which is not reimbursable under the terms of the product warranty. Service replacement instrument clusters are provided with the correct VIN and the certified odometer values embedded into cluster memory, but will otherwise be automatically configured for compatibility with the features and optional equipment in the vehicle in which they are initially installed.**

NOTE: **Certain indicators in this instrument cluster are automatically configured. This feature allows those indicators to be activated or deactivated for compatibility with certain optional equipment. If the problem being diagnosed involves improper illumination of an indicator for equipment options the vehicle does not have, disconnect and isolate the battery negative cable. After about five minutes, reconnect the battery negative cable and turn the ignition switch to the ON position. The instrument cluster should automatically relearn the equipment in the vehicle and properly configure the indicators accordingly.**

SELF TEST

The self-diagnostic test will put the IC into its test mode. In this mode the IC can perform an actuator test that will confirm that the circuitry, the gauges and the indicators are capable of operating as designed. During the test the IC circuitry will position each of the gauge needles at various calibration points, illuminate each of the

segments in the Thin Film Transistor (TFT) display unit and turn all of the indicators ON and OFF again.

Successful completion of the self-diagnostic test will confirm that the IC is operational. However, there may still be a problem with the Controller Area Network (CAN) data bus or another electronic control module that provides electronic message inputs to the IC, or the inputs to one of these electronic control modules. Use a diagnostic scan tool to diagnose these components. Refer to the appropriate diagnostic information.

1. Begin the test with the ignition switch in the OFF position.
2. Depress the Electronic Vehicle Information Center (EVIC) **Down / Scroll** switch button on the left steering wheel spoke.
3. While still holding the **Down / Scroll** switch button depressed, turn the ignition switch to the ON position, but do not start the engine.
4. Release the **Down / Scroll** switch button.
5. The IC will simultaneously begin to illuminate all of the operational segments in the TFT display unit and perform a bulb check of each operational LED unit indicator. The TFT display segments and LED unit indicators remain illuminated as each gauge needle is swept to several calibration points and back. If a TFT display segment or an LED unit indicator fails to illuminate, or if a gauge needle fails to sweep through the calibration points and back during this test, the IC must be replaced.
6. The self-diagnostic test is now complete. The IC will automatically exit the self-diagnostic test mode and return to normal operation at the completion of the test. The self-diagnostic test will be aborted if the ignition switch is turned to the OFF position, or if an electronic **vehicle speed** message indicating that the vehicle is moving is received over the CAN data bus during the test.
7. Repeat the test, if necessary.

STANDARD PROCEDURE

STANDARD PROCEDURE - ENHANCED SEATBELT REMINDER PROGRAMMING

The seatbelt indicator also includes a programmable enhanced seatbelt reminder or "BeltAlertÂ®" feature that is enabled when the vehicle is shipped from the factory. This BeltAlertÂ® feature provides extended, and modified visual seatbelt indicator, and audible chime warning responses to an unbuckled driver, or front passenger seat belt. For front passenger seats equipped with the BeltAlertÂ® feature, the warning system may be triggered when an animal or heavy object is on the front passenger seat, or when the seat is folded flat (if equipped). The beltminder feature may be disabled or enabled by the customer using the programming sequence that follows, or by the dealer using a diagnostic scan tool. The following sequence of events must occur within sixty (60) seconds of the ignition switch being placed in the On position in order for the programming to be completed successfully.

1. With the ignition switch in any position except On or Start, buckle the driver side front seat belt.
2. Turn the ignition switch to the On position and wait for the seatbelt indicator reminder function to conclude (about six seconds).
3. Unbuckle and buckle the driver side front seat belt three or more times, ending with the belt buckled.
4. Turn the ignition switch to any position except On or Start to toggle the BeltAlertÂ® feature from its current setting (from active to inactive, or from inactive to active). A single chime tone will provide an audible confirmation that the programming sequence has been successfully completed.

REMOVAL

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the instrument cluster bezel. Refer to **BEZEL, INSTRUMENT CLUSTER, REMOVAL** .

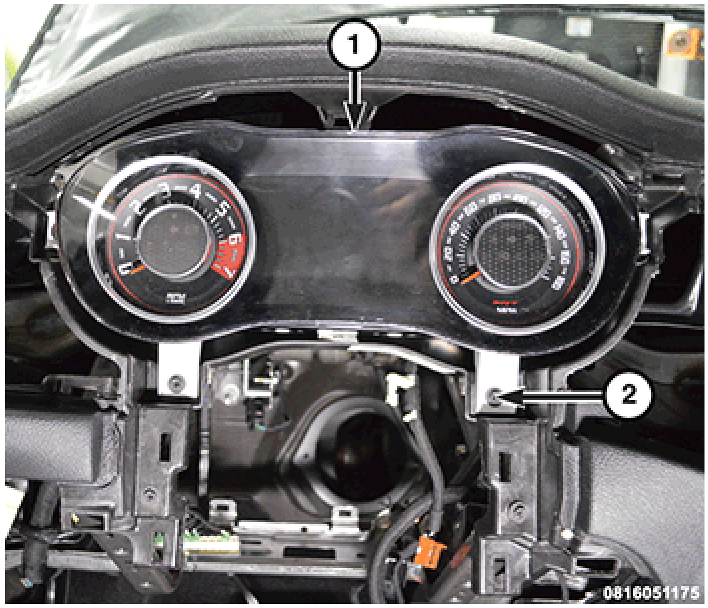

Fig. 2: Instrument Cluster & Screws
Courtesy of CHRYSLER GROUP, LLC

3. Remove the four (2) screws securing the instrument cluster (1) to the instrument panel.
4. Tilt the cluster forward, and disconnect the electrical connector.

INSTALLATION

INSTALLATION

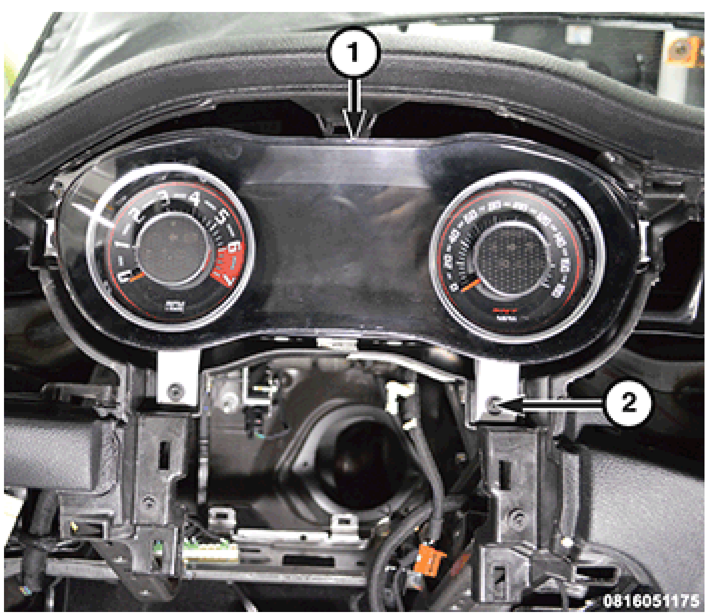

Fig. 3: Instrument Cluster & Screws

Courtesy of CHRYSLER GROUP, LLC

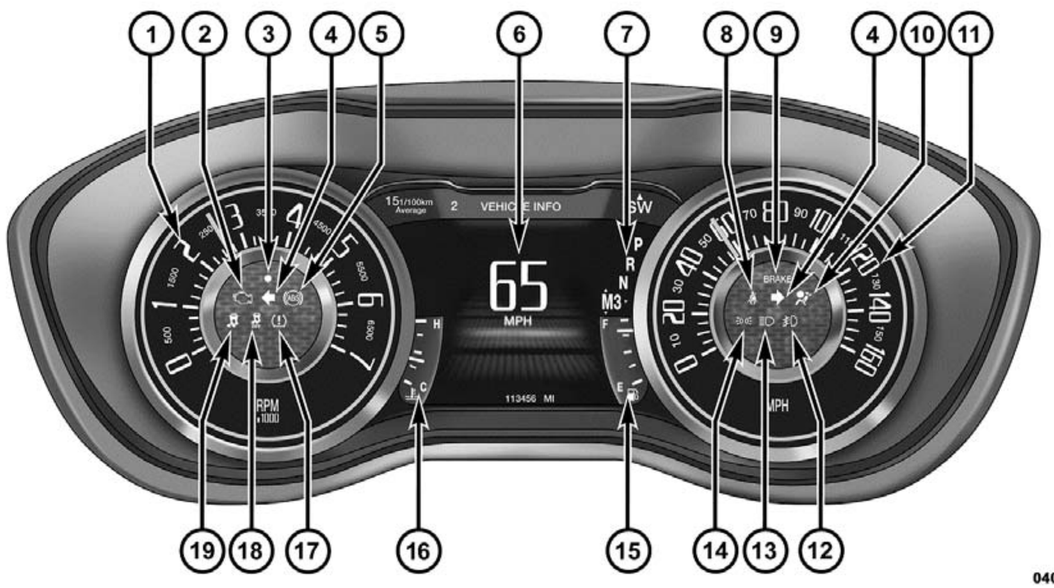
1. Position the cluster (1) into instrument panel opening and connect the electrical connector.
2. Install the four (2) screws that secure the instrument cluster (1) to the instrument panel.
3. Install the instrument cluster bezel. Refer to **BEZEL, INSTRUMENT CLUSTER, INSTALLATION** .
4. Connect the negative battery cable.

NOTE: **If the cluster has been replaced, the replacement cluster should be programmed with the correct mileage. Verify the correct mileage via Scan Tool.**

GAUGE PACK, INSTRUMENT CLUSTER

DESCRIPTION

DESCRIPTION



0403042008

Fig. 4: Instrument Cluster

Courtesy of CHRYSLER GROUP, LLC

The gauge pack found within the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) for this vehicle houses 2 analog gauges that are each controlled by the IC electronic circuitry.

Gauge illumination is provided by dimmer controlled Light Emitting Diode (LED) units soldered onto the IC circuit board. The gauge pack is an integral part of the IC unit. If any gauge is damaged or ineffective, the entire IC must be replaced with a new unit.

The IC includes the following analog gauges:

- **Speedometer (11)**
- **Tachometer (1)**

SPEEDOMETER

The standard equipment speedometer is the gauge located on the right side of the IC. The speedometer consists of a movable gauge needle or pointer controlled by the IC circuitry and reads clockwise from left-to-right either from 0 to an upper numerical value that varies by model in either miles-per-hour or kilometers-per-hour, depending upon the market destination. MPH or km/h text appears on the cluster overlay.

TACHOMETER

The standard equipment tachometer is the gauge located on the left side of the IC. The tachometer consists of a movable gauge needle or pointer controlled by the IC circuitry and a gauge dial face that reads clockwise from left-to-right. The text **RPM X 1000** is imprinted on the cluster overlay near the bottom of the gauge scale and identifies that each number on the tachometer scale is to be multiplied by 1000 Revolutions-Per-Minute

OPERATION

OPERATION

All analog gauges in the Instrument Panel Cluster (IPC) receive battery current on the IPC printed circuit board only when the status of the ignition switch is ON. When the status of the ignition switch is OFF, battery current is not supplied to any gauges and the IPC is programmed to move all of the gauge needles back to the low end of their respective scales. Therefore, the gauges do not accurately indicate any vehicle condition unless the status of the ignition switch is ON.

Each of the analog IPC gauges contains an electronically controlled stepper motor unit. The IPC circuitry completely controls the activation and deactivation of these stepper motors to position each gauge needle in the appropriate position based upon IPC programming and electronic messages received from other electronic modules in the vehicle over the Controller Area Network (CAN) data bus.

The analog gauges are diagnosed using the self-diagnostic IPC actuator test. Proper testing of the CAN data bus and the electronic message inputs that the IPC uses to control each gauge requires the use of a diagnostic scan tool. Refer to DIAGNOSIS AND TESTING .

INDICATORS, INSTRUMENT CLUSTER

DESCRIPTION

DESCRIPTION

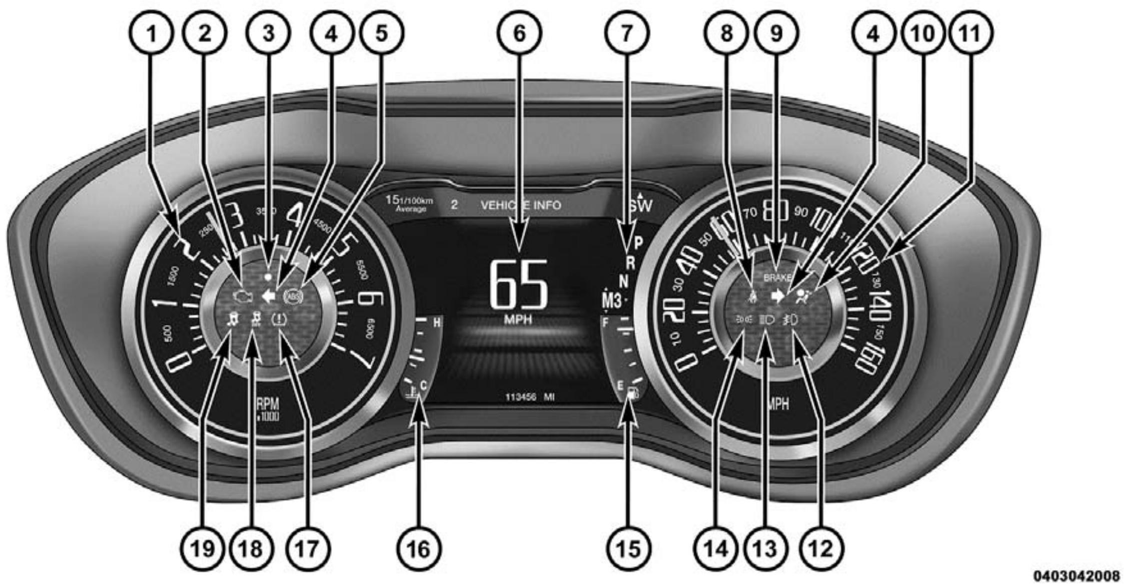


Fig. 5: Instrument Cluster
Courtesy of CHRYSLER GROUP, LLC

The Instrument Panel Cluster (IPC) has provisions for International Control and Display Symbol icon indicators, as well as two analog gauges standard on all models. Refer to **GAUGE PACK, INSTRUMENT CLUSTER, DESCRIPTION**. Some of the indicators are automatically configured when connected to the vehicle electrical system for compatibility with certain optional equipment or equipment required for regulatory purposes in certain markets. While each IPC may have provisions for indicators to support every available option, the configurable indicators will not function in vehicles that do not have the equipment that an indicator supports.

The IPC includes provisions for the following indicators:

- **Airbag Warning Light** - (10). Refer to **DESCRIPTION** .
- **Antilock Brake System (ABS)** - service required if light remains on beyond four seconds (5). Refer to **DESCRIPTION** .
- **Brake Warning Light** - (9). Refer to **DESCRIPTION** .
- **Electronic Stability Control (ESC) Activation/Malfunction** - indicates system activated or malfunction (19). Refer to **DESCRIPTION** .
- **Electronic Stability Control (ESC) OFF** - light on when system is off (if equipped) (18).
- **Engine Temperature** indicates high engine temperature (16).
- **Electronic Vehicle Information Center** - features an interactive display (6).
- **Front Fog Lamp Indicator** - indicates that the fog lamps are on (if equipped) (12).
- **Fuel Gauge** - fuel tank level (15).
- **Gear Status Indicator** - displays the gear position of the automatic transmission. Automatic Transmission Only (7).
- **High Beam Indicator** - indicates that headlights are on high beam (13).
- **Malfunction Indicator Lamp (MIL)** - indicates service required (2).
- **Park/Headlight ON** - (position lights) indicates when the park lights or headlights are turned on (if

equipped) (14).

- **Seat Belt Reminder Light** - (8). Refer to **DESCRIPTION** .
- **Speedometer** - Indicates vehicle speed (11).
- **Tachometer** - indicates the engine speed in revolutions per minute (RPM x 1000) (1).
- **Temperature Gauge** - indicates engine coolant temperature (16).
- **Tire Pressure Monitor (TPM)** - (17). Refer to **TIRE PRESSURE MONITORING, DESCRIPTION** .
- **Turn Signal** - may also include icon and **TURN SIGNAL ON** reminder textual message in electronic display (4).
- **Vehicle Security Light** - (3). Refer to **DESCRIPTION** .

Each indicator in the IPC, except those located within an electronic display unit, is illuminated by a dedicated Light Emitting Diode (LED) that is soldered onto the electronic circuit board. IPC illumination is accomplished by several dimmable LED units, which illuminate each of the gauge dial faces for visibility when the exterior lighting is turned ON. These LED units are serviced only as a complete unit with the IPC, and if damaged or ineffective, the entire IPC assembly must be replaced. The IPC lens is the only component of the instrument cluster assembly that can be serviced separately.

OPERATION

OPERATION

Indicators are located in various positions within the Instrument Panel Cluster (IPC) and are all connected to the electronic circuit board of the IPC. Some indicators operate based upon hard-wired inputs to the IPC, but most are controlled by Controller Area Network (CAN) data bus messages from other electronic modules in the vehicle. If the IPC loses CAN data bus communication, the IPC circuitry will automatically turn on the Malfunction Indicator Lamp (MIL) until CAN data bus communication is restored.

The various IPC indicators are controlled by different strategies; some require fused ignition output to the IPC circuitry and have a switched ground, while others are grounded through the IPC circuitry and have a switched battery feed. However, all indicators are completely controlled by the IPC microcontroller based upon various hard-wired and electronic message inputs. A few, non-critical indicators are dimmable, but most indicators are illuminated at a fixed intensity, which is not affected by the selected illumination intensity of the IPC general illumination Light Emitting Diode (LED) units. The illumination intensity of the dimmable indicators is synchronized with that of the general illumination lighting.

In addition, certain indicators in this IPC are automatically or self-configured. This feature allows the configurable indicators to be enabled by the IPC circuitry for compatibility with certain optional equipment. These indicators are enabled or disabled by an electronic configuration message sent to the IPC by the Body Control Module (BCM). The defaults for some indicators may be enabled, and these configuration settings must be programmatically disabled in the BCM using a diagnostic scan tool for vehicles that do not have the equipment the indicator supports. The automatically or self-configured indicators remain latent in each IPC at all times and will be active only when the IPC receives the appropriate CAN bus message inputs for that optional system or equipment.

The hard-wired indicator inputs may be diagnosed using conventional diagnostic tools and procedures. However, the IPC circuitry and electronic CAN data bus message controlled indicators are diagnosed using the self-diagnostic test. Proper testing of the CAN data bus and the electronic data bus message inputs to the IPC

that control each indicator requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information. Specific details of the operation for each indicator may be found elsewhere in this service information.

POD, SWITCH BANK

DESCRIPTION

DESCRIPTION

Fig. 6: Floor Console Panel & Center Stack
Courtesy of CHRYSLER GROUP, LLC

The vehicle feature controls center stack (2) is located on the floor console panel (1). This switch is available in multiple configurations, which vary depending upon the equipment in the vehicle. However, every available configuration includes the hazard warning push button switch.

The switch housing and the push buttons are constructed of molded plastic. Each push button has a smooth finish and is clearly identified with the appropriate text and International Control and Display Symbol icons. Refer to **INTERNATIONAL VEHICLE CONTROL AND DISPLAY SYMBOLS, DESCRIPTION** . Several of the push buttons feature Light Emitting Diode (LED) units to give the vehicle operator an indication when the function of that switch is currently active. The back of the switch housing has an integral connector receptacle containing terminal pins that connect the switch to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness. Panel lamps dimmer controlled illumination lamps integral to the circuit board within the switch provide back lighting for visibility at night, but these lamps are not serviceable. The individual switches cannot be repaired and are not serviced individually. If any component within the switch pod is ineffective or damaged, the entire switch pod must be replaced.

OPERATION

OPERATION

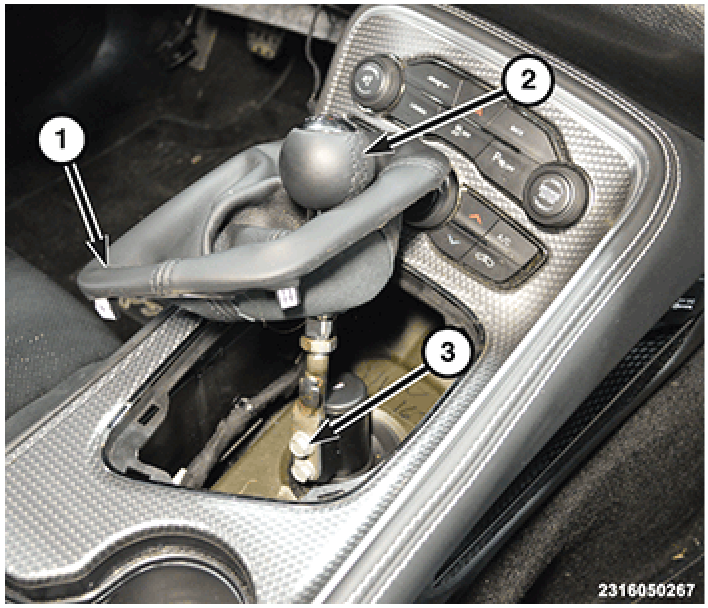
For information covering details of operation for the individual switches or indicator contained within the vehicle feature controls center stack, refer to the specific service information covering the system to which that

switch or indicator belongs.

REMOVAL

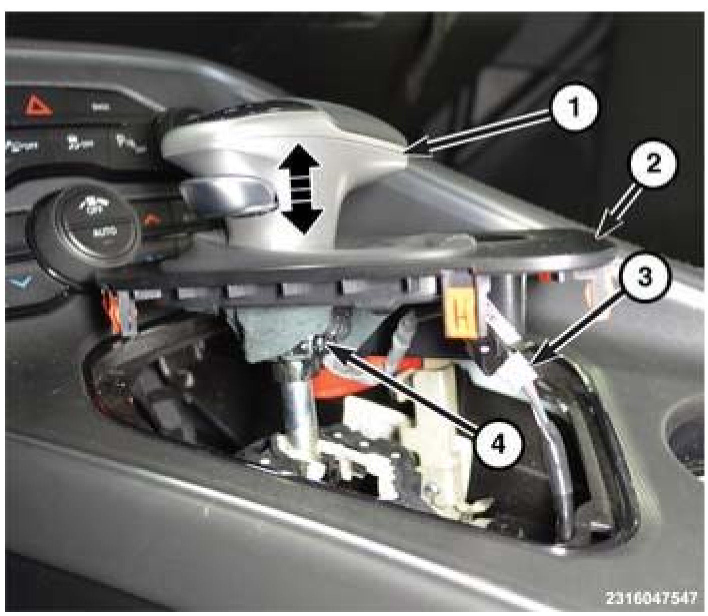
REMOVAL

1. Disconnect and isolate the negative battery cable.



[Fig. 7: Shifter Boot, Shift Lever & Bolts]
Courtesy of CHRYSLER GROUP, LLC

2. For manual shifter using a trim stick or equivalent, carefully release the retaining clips and lift the shifter boot (1).
3. Remove the bolts (3) then the shift lever (2).



[Fig. 8: Shifter Knob, Shifter Bezel, Wire Harness Connector & Screw]
Courtesy of CHRYSLER GROUP, LLC

4. For automatic shifter, place the shifter in the Neutral position.
5. Using a trim stick or equivalent, carefully release the retaining clips and lift the shifter bezel (2).
6. Remove the screw (4) then lift the shifter knob (1) and remove.

Fig. 9: Removing/Install Console Bezel Panel
Courtesy of CHRYSLER GROUP, LLC

7. Using a trim stick or equivalent, starting at the rear carefully release the retaining clip and lift the shifter bezel panel (1). Disconnect the wire harness connectors and remove.

Fig. 10: Instrument Panel Switch Pod & Screws
Courtesy of CHRYSLER GROUP, LLC

8. Remove the four screws (2) from the instrument panel switch pod (1) to the shifter bezel panel.

INSTALLATION

INSTALLATION

Courtesy of CHRYSLER GROUP, LLC

3. For automatic shifter, install the shifter knob and install the screw (4). Tighten the screw securely.
4. Connect the wire harness connector (3).
5. Position the shifter bezel (2) and engage the retaining clips.

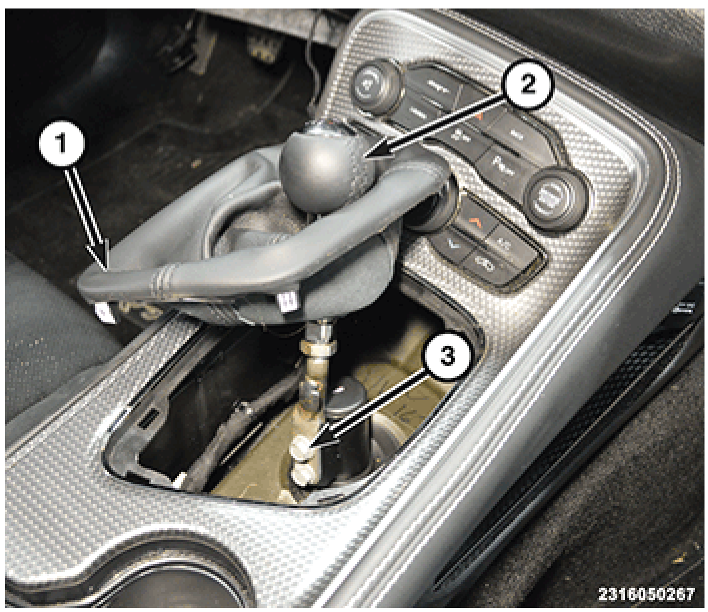

Fig. 14: Shifter Boot, Shift Lever & Bolts
Courtesy of CHRYSLER GROUP, LLC

6. For manual shifter, install the shift lever (2) and the bolts (3). Tighten the shift lever bolts to the proper specification. For 5.7L & 6.4L, refer to **SPECIFICATIONS** . For 6.2L, refer to **SPECIFICATIONS** . .
7. Position the shifter boot (1) and engage the retaining clips.
8. Connect the battery negative cable.

Article GUID: A00735851

WARNING

USE OF HEAT DURING REPAIR

WARNING: **Chrysler Group LLC engineering's position on the use of heat during collision repair is as follows:**

- **Any body panel or frame component damaged which is to be repaired and reused, must be repaired using the "cold straightening" method. No heat may be used during the straightening process.**
- **During rough straightening prior to panel replacement, damaged panels or frame components may be heated to assist in body/frame realignment. The application of heat must be constrained to the parts which will be replaced and not allowed to affect any other components.**

This "no heat" recommendation is due to the extensive use of high strength and advanced high strength steels in Chrysler Group LLC products. High-strength materials can be substantially and negatively affected from heat input which will not be obviously known to the repairer or consumer.

Ignoring these recommendations may lead to serious compromises in the ability to protect occupants in a future collision event, reduce the engineered qualities and attributes, or decrease the durability and reliability of the vehicle.

This statement supersedes any previously released information by the Chrysler Group LLC.

Failure to follow these instructions may result in serious or fatal injury.

WARNINGS

WARNING: **Use an Occupational Safety and Health Administration (OSHA) approved breathing filter, when spraying paint or solvents in a confined area. Failure to follow these instructions may result in possible serious or fatal injury.**

- **avoid prolonged skin contact with petroleum or alcohol based cleaning solvents.**
- **do not stand under a hoisted vehicle that is not properly supported on safety stands. Failure to follow these instructions may result in possible serious or fatal injury.**

CAUTION: **When holes are drilled or punched in an inner body panel, verify the depth of space to the outer body panel, electrical wiring or other components. Damage to the vehicle can result.**

- **do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.**
- **always have a fire extinguisher ready for use when welding.**
- **disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is off. Damage to electrical system can result.**
- **do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.**
- **do not use harsh alkaline based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.**
- **do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.**

RESTRAINT WARNINGS

WARNING: To avoid serious or fatal injury on vehicles equipped with the Supplemental Restraint System (SRS), never attempt to repair the electrically conductive circuits or wiring components related to the SRS for which there is no MoparÃ® wiring repair kit. It is important to use ONLY the recommended splicing kit and procedure. For applicable and available MoparÃ® wiring repair kits, please visit the MoparÃ® Connector Web Site at the following address on the Internet: (http://dto.vftis.com/mopar/disclaimer.asp). Inappropriate repairs can compromise the conductivity and current carrying capacity of those critical electrical circuits, which may cause SRS components not to deploy when required, or to deploy when not required. Only minor cuts or abrasions of wire and terminal insulation where the conductive material has not been damaged, or connector insulators where the integrity of the latching and locking mechanisms have not been compromised may be repaired using appropriate methods.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler MoparÃ® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel,

steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid potential physical injury or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the Occupant Restraint Controller (ORC) capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 12 inches (30 centimeters) of an electronic module or wiring harness, then that module or harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens.

WARNING: To avoid serious or fatal injury, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate or bring into contact with electricity. Do not store at temperatures exceeding 93Â° C (200Â° F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 17.24 kPa (2500 psi). Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury when handling a seat belt tensioner retractor. Exercise proper care to keep fingers out from under the retractor cover and away from the seat belt webbing where it exits from the retractor cover. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury, replace all Supplemental Restraint System (SRS) components only with parts specified in the Chrysler MoparÂ® Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.

WARNING: To avoid serious or fatal injury, the fasteners, screws, and bolts originally used for the Supplemental Restraint System (SRS) components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the SRS. Anytime a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the Chrysler MoparÂ® Parts Catalog.

WARNING: To avoid serious or fatal injury when a steering column has an airbag unit

attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down. Failure to follow these instructions may result in possible serious or fatal injury.

DIAGNOSIS AND TESTING

WATER LEAKS

Water leaks can be caused by poor sealing, improper body component alignment, body seam porosity, missing plugs, or blocked drain holes. Centrifugal and gravitational force can cause water to drip from a location away from the actual leak point, making leak detection difficult. All body sealing points should be water tight in normal wet-driving conditions. Water flowing downward from the front of the vehicle should not enter the passenger or luggage compartment. Moving sealing surfaces will not always seal water tight under all conditions. At times, side glass or door seals will allow water to enter the passenger compartment during high pressure washing or hard driving rain (severe) conditions. Overcompensating on door or glass adjustments to stop a water leak that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After completing a repair, water test vehicle to verify leak has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE WATER LEAK TESTS

Verify that floor and body plugs are in place, body drains are clear, and body components are properly aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate Service Information for proper procedures.

WATER LEAK TESTS

WARNING: Do not use electric shop lights or tools in water test area. Personal injury can result.

When the conditions causing a water leak have been determined, simulate the conditions as closely as possible.

- If a leak occurs with the vehicle parked in a steady light rain, flood the leak area with an open-ended garden hose.
- If a leak occurs while driving at highway speeds in a steady rain, test the leak area with a reasonable velocity stream or fan spray of water. Direct the spray in a direction comparable to actual conditions.
- If a leak occurs when the vehicle is parked on an incline, hoist the end or side of the vehicle to simulate this condition. This method can be used when the leak occurs when the vehicle accelerates, stops or turns. If the leak occurs on acceleration, hoist the front of the vehicle. If the leak occurs when braking, hoist the back of the vehicle. If the leak occurs on left turns, hoist the left side of the vehicle. If the leak occurs on right turns, hoist the right side of the vehicle. For hoisting recommendations. Refer to **HOISTING, STANDARD PROCEDURE** .

WATER LEAK DETECTION

To detect a water leak point-of-entry, do a water test and watch for water tracks or droplets forming on the inside of the vehicle. If necessary, remove interior trim covers or panels to gain visual access to the leak area. If the hose cannot be positioned without being held, have someone help do the water test.

Some water leaks must be tested for a considerable length of time to become apparent. When a leak appears, find the highest point of the water track or drop. The highest point usually will show the point of entry. After leak point has been found, repair the leak and water test to verify that the leak has stopped.

Locating the entry point of water that is leaking into a cavity between panels can be difficult. The trapped water may splash or run from the cavity, often at a distance from the entry point. Most water leaks of this type become apparent after accelerating, stopping, turning, or when on an incline.

MIRROR INSPECTION METHOD

When a leak point area is visually obstructed, use a suitable mirror to gain visual access. A mirror can also be used to deflect light to a limited-access area to assist in locating a leak point.

BRIGHT LIGHT LEAK TEST METHOD

Some water leaks in the luggage compartment can be detected without water testing. Position the vehicle in a brightly lit area. From inside the darkened luggage compartment inspect around seals and body seams. If necessary, have a helper direct a drop light over the suspected leak areas around the luggage compartment. If light is visible through a normally sealed location, water could enter through the opening.

PRESSURIZED LEAK TEST METHOD

When a water leak into the passenger compartment cannot be detected by water testing, pressurize the passenger compartment and soap test exterior of the vehicle. To pressurize the passenger compartment, close all doors and windows, start engine, and set heater control to high blower in HEAT position. If engine can not be started, connect a charger to the battery to ensure adequate voltage to the blower. With interior pressurized, apply dish detergent solution to suspected leak area on the exterior of the vehicle. Apply detergent solution with spray device or soft bristle brush. If soap bubbles occur at a body seam, joint, seal or gasket, the leak entry point could be at that location.

WIND NOISE

Wind noise is the result of most air leaks. Air leaks can be caused by poor sealing, improper body component alignment, body seam porosity, or missing plugs in the engine compartment or door hinge pillar areas. All body sealing points should be airtight in normal driving conditions. Moving sealing surfaces will not always seal airtight under all conditions. At times, side glass or door seals will allow wind noise to be noticed in the passenger compartment during high cross winds. Over compensating on door or glass adjustments to stop wind noise that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After a repair procedure has been performed, test vehicle to verify noise has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE TESTS

Verify that floor and body plugs are in place, body drains are clear, and body components are properly aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate Service Information for proper procedures.

ROAD TESTING WIND NOISE

1. Drive the vehicle to verify the general location of the wind noise.
2. Apply 50 mm (2 in.) masking tape in 150 mm (6 in.) lengths along weatherstrips, weld seams or

moldings. After each length is applied, drive the vehicle. If noise goes away after a piece of tape is applied, remove tape, locate, and repair defect.

POSSIBLE CAUSE OF WIND NOISE

- Moldings standing away from body surface can catch wind and whistle.
- Gaps in sealed areas behind overhanging body flanges can cause wind-rushing sounds.
- Misaligned movable components.
- Missing or improperly installed plugs in pillars.
- Weld burn through holes.

STANDARD PROCEDURE

BODY LUBRICATION

LUBRICATION REQUIREMENTS

Locks and all body pivot points, including such items as seat tracks, door hinge pivot points and rollers, liftgate, tailgate, sliding doors and hood hinges, should be lubricated periodically with a lithium based grease such as MoparÃ® Spray White Lube to ensure quiet, easy operation and to protect against rust and wear. Prior to the application of any lubricant, wipe the parts clean, to remove dust and grit. After lubricating, excess oil and grease should be removed. Particular attention should also be given to hood latching components to make sure they function properly. When performing other underhood services, clean and lubricate the hood latch release mechanism and safety catch.

The external lock cylinders should be lubricated twice a year, preferably in the fall and spring. Apply a small amount of a high quality lubricant such as MoparÃ® Lock Cylinder Lubricant directly into the lock cylinder.

LUBRICANT APPLICATION

DOOR LOCK CYLINDERS

1. Apply a small amount of lubricant directly into the lock cylinder.
2. Apply a small amount of lubricant to the key.
3. Insert key into lock cylinder and cycle the mechanism from the locked to the unlocked position.

NOTE: Do not add more lubricant.

4. Cycle the lock cylinder mechanism several times to allow the lubricant to flow throughout the cylinder.
5. Wipe all lubricant from exterior of lock cylinder and key.

ALL OTHER BODY MECHANISMS

1. Clean component as described above.
2. Apply specified lubricant to all pivoting and sliding contact areas of component.

LUBRICANT USAGE

Engine Oil

- door hinges - hinge pin and pivot contact areas
- hood hinges - pivot points
- liftgate hinges

MoparÂ® Spray White Lube or Equivalent

- door check straps
- liftgate latches
- liftgate prop pivots
- ash receiver
- fuel filler door remote control latch mechanism
- parking brake mechanism
- sliding seat tracks
- liftgate latch

MoparÂ® Multipurpose Grease or Equivalent

- all other hood mechanisms

MoparÂ® Lock Cylinder Lubricant or Equivalent

- door lock cylinders
- liftgate lock cylinder

BUZZ, SQUEAKS AND RATTLES

Buzz, Squeaks and Rattles (BSRs) may be caused by any one or more of the following and may be corrected as indicated:

- Loose fasteners should be tightened to specifications.
- Damaged or missing clips should be replaced.
- Damaged trim panels should be replaced.
- Incorrectly installed trim panels should be reinstalled properly.

Many BSR complaints such as loose trim, can be serviced using various tapes or lubricants. Tapes including foam, flock and anti-squeak, can be used to eliminate noises caused by metal, plastic and vinyl components. Long life lubricants and greases can also be used on a variety of components. Refer to the table for materials and usage. Refer to BUZZ, SQUEAKS AND RATTLES.

BUZZ, SQUEAKS AND RATTLES

ITEM	FEATURES	APPLICATIONS	SERVICE TEMP
ITCH AND SQUEAK TAPE	An abrasion resistant material thin enough to conform to most irregular surfaces. Stops most itches and squeaks.	Between metal and metal, metal and plastic, metal and vinyl, vinyl and plastic. Interior. Examples: Trim panels and bezels.	-40Â° to 107Â°C (-40Â° to 225Â°F)

ITEM	FEATURES	APPLICATIONS	SERVICE TEMP
BLACK NYLON FLOCK	Nylon Flock with an aggressive acrylic adhesive. Provides for cushioning and compression fit, also isolates components. Water-resistant.	Between metal and metal, metal and plastic, vinyl and plastic. Examples: Pull cups, bezels, clips, ducts, top cover to glass, cowl panel.	-40Â° to 82Â°C (-40Â° to 180Â°F)
HIGH DENSITY URETHANE FOAM	Tear resistant, highly resilient and durable.	Between metal and metal, metal and plastic. Water-resistant. Examples: I/P, heavy metal rattles, isolating brackets.	-40Â° to 82Â°C (-40Â° to 180Â°F)
OPEN CELL FOAM TAPE	Soft foam conforms to irregular surfaces.	Wire harness and connector wrap. Examples: Seals, gasket, wiring, heat ducts.	-40Â° to 82Â°C (-40Â° to 180Â°F)
CLOSED CELL LOW DENSITY FOAM TAPE	Soft, conformable. Water-resistant.	Wherever bulk is needed. Prevents closing flutters and rattles when applied to door watershield. Examples: Door, I/P.	-40Â° to 82Â°C (-40Â° to 180Â°F)
NYEÂ® GREASE 880	Long life.	Suspensions. Examples: Strut bushings, sway bars.	-40Â° to 200Â°C (-40Â° to 390Â°F)
KRYTOXÂ® OIL	Long life. Will not dry out or harm plastics or rubber.	When access is not possible, oil will migrate to condition. Vinyl, rubber, plastic, metal. Examples: Convertible top bushings, pull cups trim panel inserts.	-34Â° to 205Â°C (-30Â° to 400Â°F)
KRYTOXÂ® GREASE	Long life. Will not dry out or harm plastics or rubber.	Vinyl, rubber, plastic, metal, glass. Examples: Weather-strips, backlite and windshield moldings.	-34Â° to 205Â°C (-30Â° to 400Â°F)

HEAT STAKING

1. Remove the trim panel.
2. Bend or move the trim panel components at the heat staked joints. Observe the heat staked locations and/or component seams for looseness.
3. Heat stake the components.
    a. If the heat staked or component seam location is loose, hold the two components tightly together and using a soldering gun with a flat tip, melt the material securing the components together. Do not overly heat the affected area, damage to the exterior of the trim panel may occur.
    b. If the heat staked material is broken or missing, use a hot glue gun to apply new material to the area to be repaired. The panels that are being heat staked must be held together while applying the glue. Once the new material is in place, it may be necessary to use a soldering gun to melt the newly

applied material. Do not overly heat the affected area, damage to the exterior of the trim panel may occur.

4. Allow the repaired area to cool and verify the repair.
5. Install the trim panel.

NET, FORM AND PIERCE REPAIR

CAUTION: Failure to follow these recommendations could result in damage or failure to the part and the related parts.

Net, form and pierce is a manufacturing process which takes place during the original build of the vehicle. The original part will have a beveled platform that will decrease toward the fastener location mounting hole. Replacement parts in these areas may not include bevel (form) or fastener hole (pierce) and will need to be adapted for proper fit and finish.

The primary locations which may utilize net, form and pierce are:

- fender reinforcement (at front end module mount)
- fender tower mounts
- hood hinge (lower half)
- rear body header (liftgate hinge mounts)
- strut tower (at upper control arm mount)

NOTE: Shock tower is net, pierce only.

NOTE: The thickness of shims is not to exceed the original thickness of the factory bevel. If more shims are needed damage is still present and must be repaired properly.

If the replacement part did not come with a fastener hole, one of equal size and location will have to be drilled. Body shims should be used in the fender reinforcement to front end module. The hood hinge area, fender tower mounts, and rear body header will utilize washers as spacers where a specific spacer does not exist. The shims and spacers should be sealed between each other and to the stationary surface. Care should be taken when smoothing sealer around washers to give an undetectable repair. Refinish the repair area per the paint manufacturer's recommendations for corrosion resistance and appearance purposes.

PLASTIC BODY PANEL REPAIR

There are many different types of plastics used in today's automotive environment. We group plastics in three different categories: Rigid, Semi-Rigid, and Flexible. Any of these plastics may require the use of an adhesion promoter for repair. These types of plastic are used extensively on Chrysler Group LLC vehicles. Always follow repair material manufacturer's plastic identification and repair procedures.

RIGID PLASTICS:

Examples of rigid plastic use: Fascias, Hoods, Doors, and other Body Panels, which include Sheet Moulding Compound (SMC), Acrylonitrile Butadiene Styrene (ABS), and Polycarbonates.

SEMI-RIGID PLASTICS:

Examples of semi-rigid plastic use: Interior Panels, Under Hood Panels, and other Body Trim Panels.

FLEXIBLE PLASTICS:

Examples of flexible plastic use: Fascias, Body Moldings, and upper and lower Fascia Covers.

REPAIR PROCEDURE:

The repair procedure for all three categories of plastics is basically the same. The one difference is the material used for the repair. The materials must be specific for each substrate: rigid repair material for rigid plastic repair, semi-rigid repair material for semi-rigid plastic repair and flexible repair material for flexible plastic repair.

ADHESION PROMOTER/SURFACE MODIFIER:

Adhesion Promoters/Surface Modifiers are required for certain plastics. All three categories may have plastics that require the use of adhesion promoter/surface modifiers. Always follow repair material manufacturer's plastic identification and repair procedures.

SAFETY PRECAUTION AND WARNINGS

WARNING:

- **Eye protection should be used when servicing components. Personal injury can result.**
- **Use an OSHA approved breathing mask when mixing epoxy, grinding, and spraying paint or solvents in a confined area. Personal injury can result.**
- **Avoid prolonged skin contact with resin, petroleum, or alcohol based solvents. Personal injury can result.**
- **Do not venture under a hoisted vehicle that is not properly supported on safety stands. Personal injury can result.**

NOTE:

- **When holes must be drilled or cut in body panels, verify locations of internal body components and electrical wiring. Damage to vehicle can result.**
- **Do not use abrasive chemicals or compounds on undamaged painted surfaces around repair areas. Damage to finish can result.**

RIGID, SEMI-RIGID, AND FLEXIBLE PLASTIC PARTS TYPES

CODE	FAMILY NAME	COMMON TRADE NAME	TYPICAL APPLICATION
ASA	ACRYLONITRILE STYRENE ACRYLITE	LURAN S	CONSOLES, GRILLES
ABS	ACRYLONITRILE BUTADIENE STYRENE	TERLURAN	"A" PILLARS, CONSOLES, GRILLES

CODE	FAMILY NAME	COMMON TRADE NAME	TYPICAL APPLICATION
ABS/PC	ABS/PC ALLOY	PULSE, PROLOY, BAYBLEND	DOORS, INSTRUMENT PANELS
ABS/PVC	ABS/PV ALLOY	PROLOY, PULSE, LUSTRAN, CYCLOVIN	DOOR PANELS, GRILLES, TRIM
BMC	BULK MOLDING COMPOUND	BMC	FENDER EXTENSIONS
EMA	EHTYLENE METHYL ACRYLATE/IONOMER	SURLYN, EMA, IONOMER	BUMPER GUARDS, PADS
METTON	METTON	METTON	GRILLES, KICK PANELS, RUNNING BOARDS
MPPO	MODIFIED POLYPHENYLENE OXIDE	MPPO	SPOILER ASSEMBLY
PA	POLYAMID	ZYTEL, VYDYNE, PA, MINLON	FENDERS, QUARTER PANELS
PET	THERMOPLASTIC POLYESTER	RYNITE	TRIM
PBT/PPO	PBT/PPO ALLOY	GERMAX	CLADDINGS
PBTP	POLYBUTYLENE THEREPTHALATE	PBT, PBTP, POCAN, VALOX	WHEEL COVERS, FENDERS, GRILLES

TPU	THERMOPOLYURETHANE, POLYESTER	TPU, HYTREL, TEXIN, ESTANE	BUMPERS, BODY SIDE, MOLDINGS, FENDERS, FASCIAS

PANEL SECTIONING

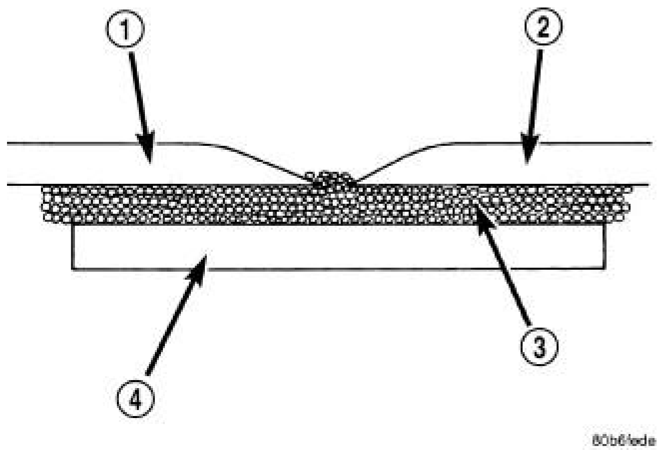

Fig. 1: Identifying Panel Sectioning
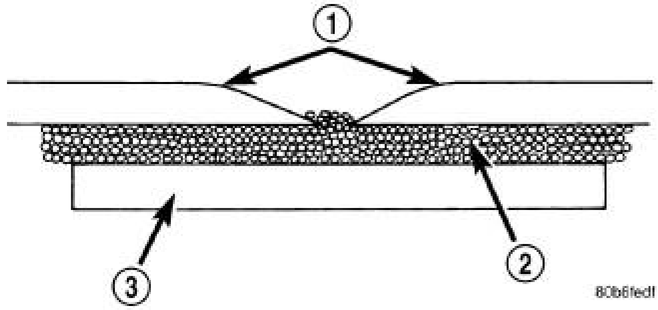
Courtesy of CHRYSLER GROUP, LLC

1 - EXISTING PANEL
2 - NEW PANEL
3 - PANEL ADHESIVE
4 - BONDING STRIP

If it is required to section a large panel for a plastic repair, it will be necessary to reinforce the panel. To bond two plastic panels together, a reinforcement must overlap both panels. The edges of the panels to be joined must be beveled to a 20 degree angle to form a V-shaped seam. The area to be reinforced should be washed, then sanded. Be sure to wipe off any excess soap and water when finished. Lightly sand or abrade the plastic with an abrasive pad or sandpaper. Blow off any dust with compressed air or wipe with a clean dry rag.

When bonding plastic panels, follow repair material manufacturers recommendations. Be sure that enough adhesive has been applied to allow squeeze out and to fill the full bond line. Once the pieces have been brought together, do not move them until the adhesive is cured. The assembly can be held together with clamps, rivets, etc. A faster cure can be obtained by heating with a heat lamp or heat gun. After the parts have been bonded and have had time to cure, rough sand the seam and apply the final adhesive filler to the area being repaired. Smooth the filler with a spreader, wooden tongue depressor, or squeegee. For fine texturing, a small amount of water can be applied to the filler surface while smoothing. The cured filler can be sanded as necessary and, as a final step, cleanup can be done with soapy water. Wipe the surface clean with a dry cloth allowing time for the panel to dry before moving on with the repair.

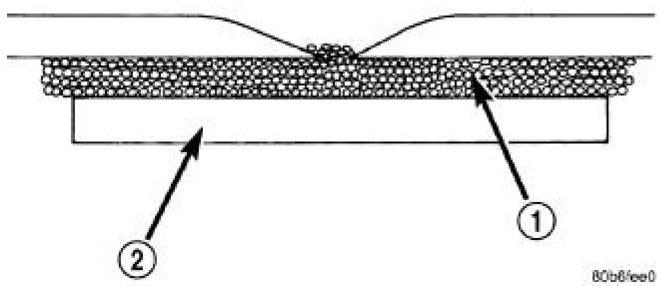
PANEL REINFORCEMENT



[Fig. 2: Identifying Panel Reinforcement]
Courtesy of CHRYSLER GROUP, LLC

1 - SOFTENED EDGES
2 - PANEL ADHESIVE
3 - BONDING STRIP

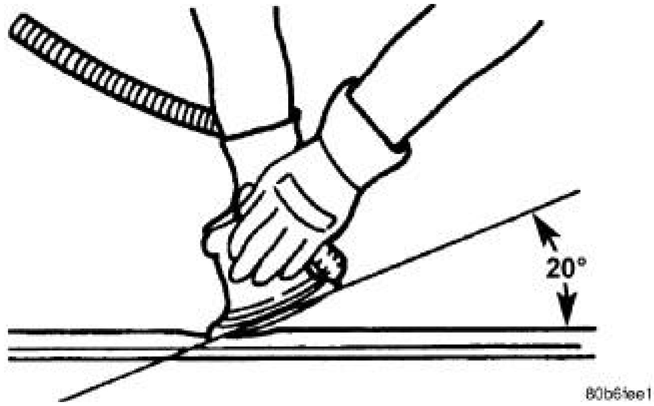
Structural repair procedures for rigid panels with large cracks and holes will require a reinforcement backing. Reinforcements can be made with several applications of glass cloth saturated with structural adhesive. Semi-rigid or flexible repair materials should be used for semi-rigid or flexible backing reinforcement and open meshed fiberglass drywall tape can be used to form a reinforcement. The drywall tape allows the resin to penetrate through and make a good bond between the panel and the adhesive. Structurally, the more drywall tape used, the stronger the repair.



[Fig. 3: Identifying Panel Reinforcement]
Courtesy of CHRYSLER GROUP, LLC

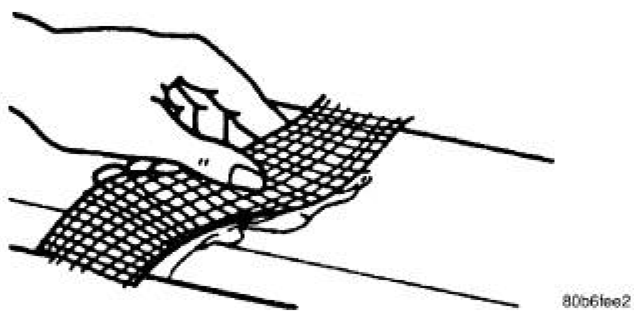
1 - PANEL ADHESIVE
2 - REINFORCEMENT

Another kind of repair that can be done to repair large cracks and holes is to use a scrap piece of similar plastic and bond with structural adhesive. The reinforcement should cover the entire break and should have a generous amount of overlap on either side of the cracked or broken area.



[Fig. 4: Beveling Area Around Crack At 20 Degree Angle](#)
Courtesy of CHRYSLER GROUP, LLC

When repairing plastic, the edges of the panels to be joined must be beveled to a 20 degree angle to form a V-shaped seam. Large bonding areas are desirable when repairing plastic because small repairs are less likely to hold permanently. Beveling the area around a crack at a 20Â° angle will increase the bonding surface for a repair. It is recommended that sharp edges be avoided because the joint may show through after the panel is refinished.



[Fig. 5: Identifying Bonding Surface Repair Area](#)
Courtesy of CHRYSLER GROUP, LLC

- Panel repair for both flexible and rigid panels are basically the same. The primary difference between flexible panel repair and rigid panel repair is in the adhesive materials used.
- The technician should first decide what needs to be done when working on any type of body panel. One should determine if it is possible to return the damage part to its original strength and appearance without exceeding the value of the replacement part.
- When plastic repairs are required, it is recommended that the part be left on the vehicle when ever possible. That will save time, and the panel will remain stationary during the repair. Misalignment can cause stress in the repair areas and can result in future failure.

VISUAL INSPECTION

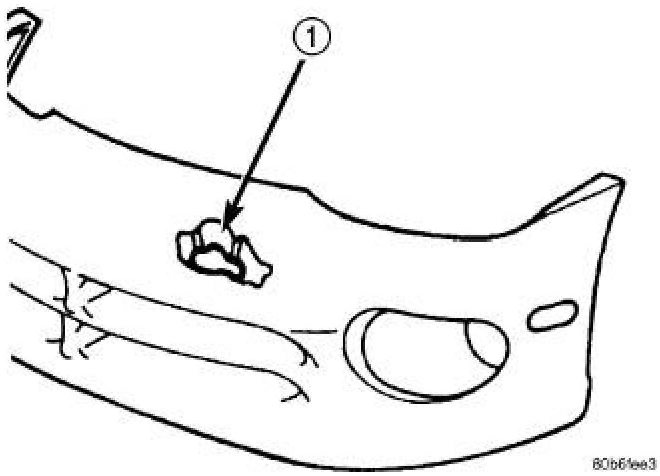


Fig. 6: Identifying Damaged Component
Courtesy of CHRYSLER GROUP, LLC

1 - PUNCTURE

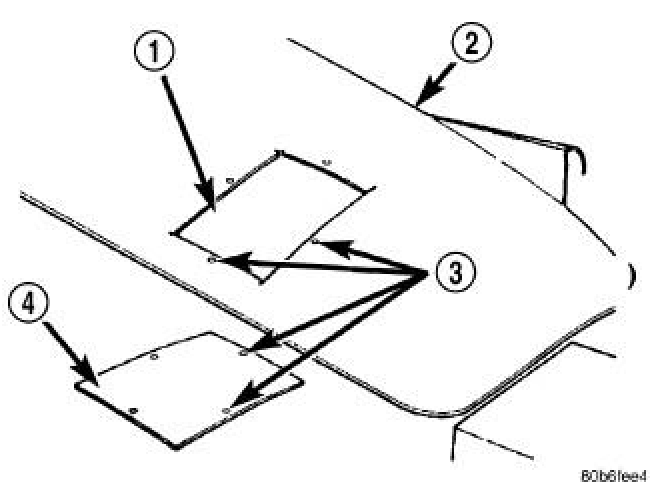
Composite materials can mask the severity of an accident. Adhesive bond lines, interior structure of the doors, and steel structures need to be inspected carefully to get a true damage assessment. Close inspection may require partial removal of interior trim or inner panels.

Identify the type of repair: Puncture or Crack - Damage that has penetrated completely through the panel. Damage is confined to one general area; a panel section is not required. However, a backer panel, open fiberglass tape, or matted material must be bonded from behind.

PANEL SURFACE PREPARATION

If a body panel has been punctured, cracked, or crushed, the damaged area must be removed from the panel to achieve a successful repair. All spider web cracks leading away from a damaged area must be stopped or removed. To stop a running crack in a panel, drill a 6 mm (0.250 in.) hole at the end of the crack farthest away from the damage. If spider web cracks can not be stopped, the panel would require replacement. The surfaces around the damaged area should be stripped of paint and freed from wax and oil. Scuff surfaces around repair area with 360 grit wet/dry sandpaper, or equivalent, to assure adhesion of repair materials.

PATCHING PANELS



[Fig. 7: Identifying Damaged Panel Cutout And Patch]
Courtesy of CHRYSLER GROUP, LLC

1 - CUTOUT
2 - DAMAGED BODY PANEL
3 - 4 MM (0.160 IN.) HOLES
4 - PATCH CUT TO SIZE

A panel that has extensive puncture type damage can be repaired by cutting out the damaged material. Use a suitable reciprocating saw or cut off wheel to remove the section of the panel that is damaged. The piece cut out can be used as a template to shape the new patch. It is not necessary to have access to the back of the panel to install a patch. Bevel edges of cutout at 20Â° to expose a larger bonding area on the outer side. This will allow for an increased reinforcement areas.

PANEL PATCH FABRICATIONS

3 - WIDTH OF V-GROOVE
4 - WAXED PAPER

A patch can be fabricated from any rigid fiberglass panel that has comparable contour with the repair area. Lift gates and fenders can be used to supply patch material. If existing material is not available or compatible, a patch can be constructed with adhesive and reinforcement mesh (drywall tape). Perform the following operation if required:

1. Cover waxed paper or plastic with adhesive backed nylon mesh (drywall tape) larger than the patch required.
2. Tape waxed paper or plastic sheet with mesh to a surface that has a compatible contour to the repair area.
3. Apply a liberal coat of adhesive over the reinforcement mesh. If necessary apply a second or third coat of adhesive and mesh after first coat has cured. The thickness of the patch should be the same as the repair area.

4. After patch has cured, peel waxed paper or plastic from the back of the patch.
5. If desired, a thin film coat of adhesive can be applied to the back of the patch to cover mesh for added strength.

PANEL PATCH INSTALLATION

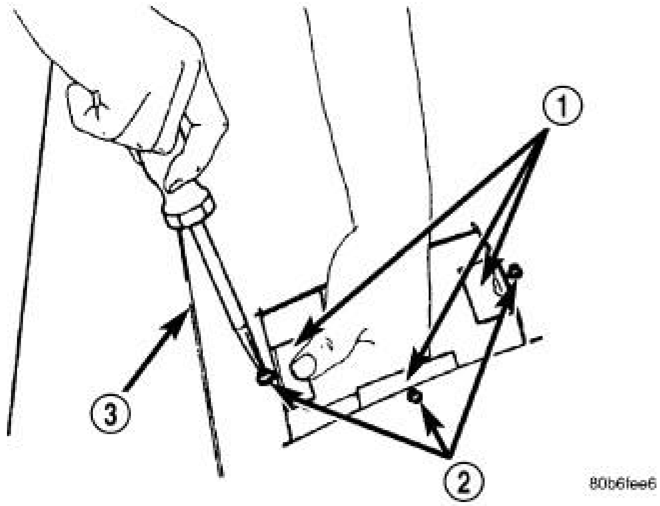

Fig. 9: Securing Support Squares To Body Panel
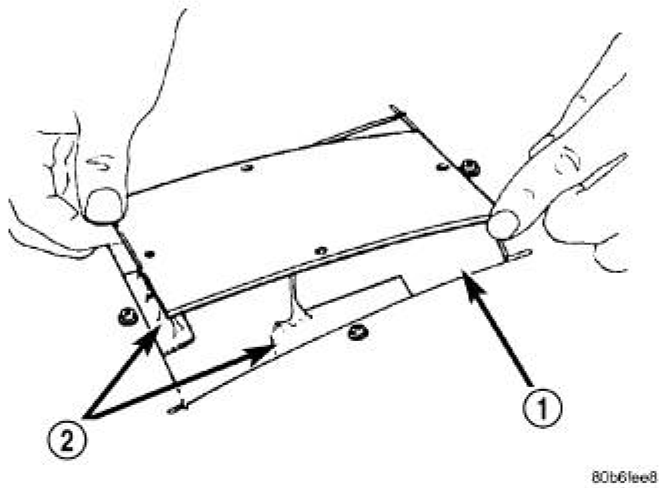
Courtesy of CHRYSLER GROUP, LLC

1 - SUPPORT SQUARES
2 - SCREWS
3 - DAMAGED BODY PANEL

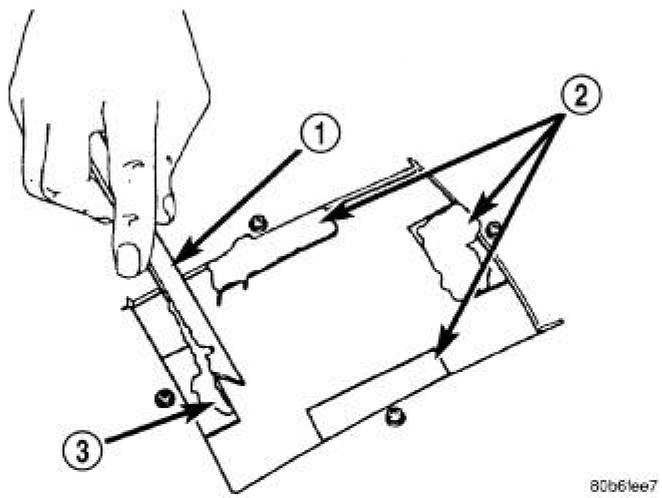
1. Make a paper or cardboard pattern the size and shape of the cutout hole in the panel.
2. Trim 3 mm (0.125 in.) from edges of pattern so patch will have a gap between connecting surfaces.
3. Using the pattern as a guide, cut the patch to size.
4. Cut scrap pieces of patch material into 50 mm (2 in.) squares to use as patch supports to sustain the patch in the cutout.
5. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) in from edge of cutout hole.
6. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) away from edge of patch across from holes drilled around cutout.
7. Drill 3 mm (0.125 in.) holes in the support squares 13 mm (0.5 in.) from the edge in the center of one side.
8. Scuff the backside of the body panel around the cutout hole with a scuff pad or sandpaper.
9. Mix enough adhesive to cover one side of all support squares.
10. Apply adhesive to cover one side of all support squares.
11. Using number 8 sheet metal screws, secure support squares to back side of body panel with adhesive sandwiched between the panel and squares.



[Fig. 10: Identifying Cutout And Support Squares](#)
Courtesy of CHRYSLER GROUP, LLC

1 - CUTOUT
2 - SUPPORT SQUARES

12. Position patch in cutout against support squares and adjust patch until the gap is equal along all sides.
13. Drill 3 mm (0.125 in.) holes in the support squares through the pre-drilled holes in the patch.



[Fig. 11: Applying Adhesive](#)
Courtesy of CHRYSLER GROUP, LLC

1 - APPLICATOR
2 - SUPPORT SQUARES
3 - ADHESIVE

14. Apply a coat of adhesive to the exposed ends of the support squares.

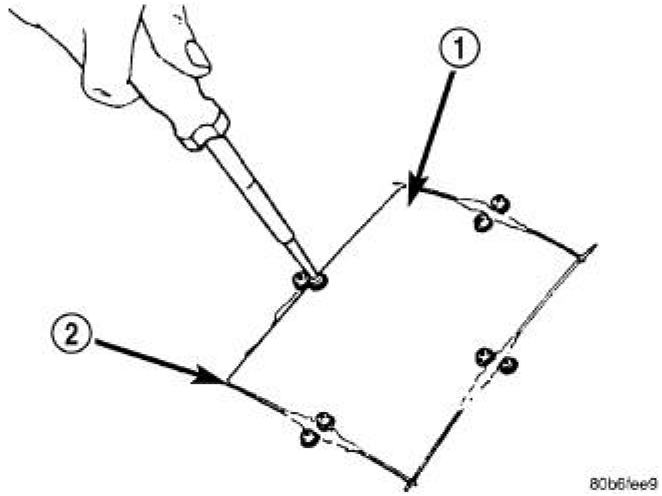


Fig. 12: Applying Coat Of Adhesive To Exposed Ends Of Support Squares
Courtesy of CHRYSLER GROUP, LLC

1 - PATCH	
2 - GAP	

15. Install screws to hold the patch to support squares. Tighten screws until patch surface is flush with panel surface.
16. Allow adhesive to cure, and remove all screws.

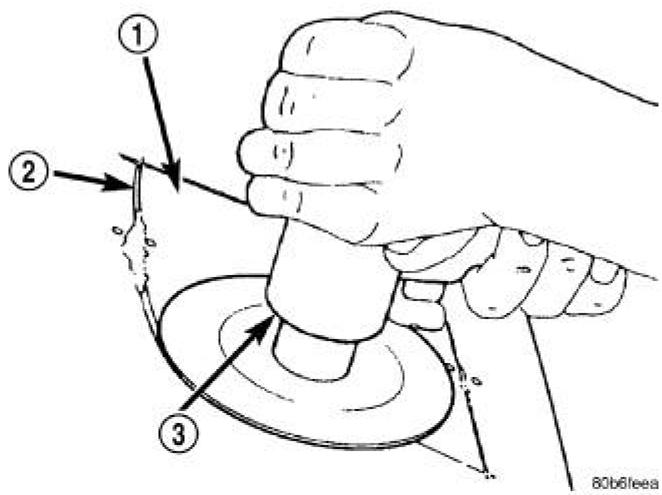

Fig. 13: Grinding Surface
Courtesy of CHRYSLER GROUP, LLC

1 - PATCH	
2 - GAP	
3 - DISC GRINDER	

17. Using a 125 mm (5 in.) 24 grit disc grinder, grind a 50 mm (2 in.) to 75 mm (3 in.) wide and 2 mm (0.080 in.) deep path across the gaps around the patch. With compressed air, blow dust from around patch.

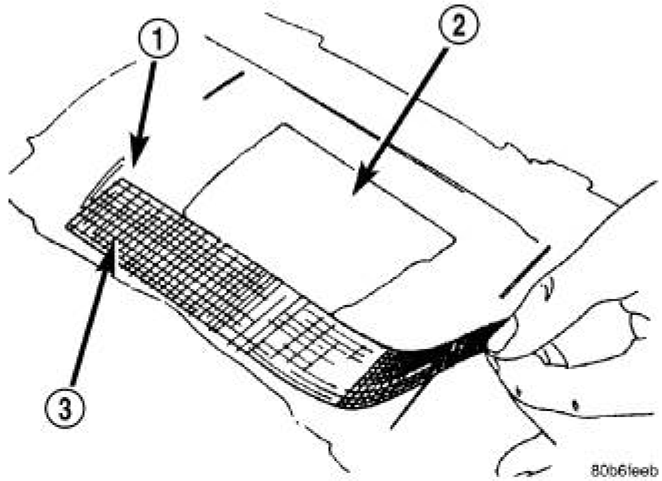

Fig. 14: Covering Gaps With Mesh
Courtesy of CHRYSLER GROUP, LLC

1 - GROUND DOWN AREA
2 - PATCH
3 - MESH

18. Apply adhesive backed nylon mesh (drywall tape) over gaps around patch.
19. Mix enough adhesive to cover the entire patch area.

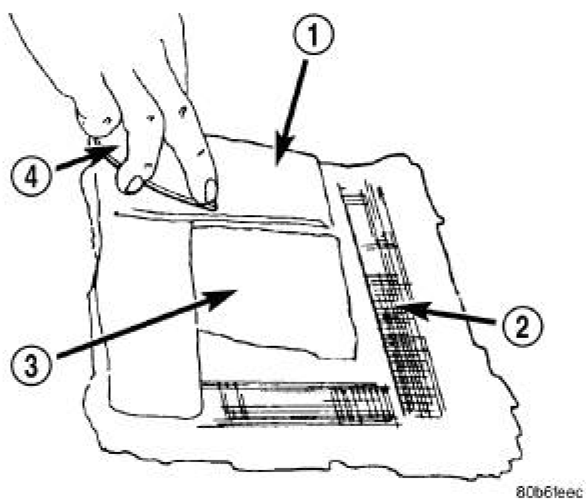

Fig. 15: Applying Adhesive Over Mesh Around Patch
Courtesy of CHRYSLER GROUP, LLC

1 - ADHESIVE
2 - MESH
3 - PATCH
4 - SPREADER

20. Apply adhesive over the mesh around patch, and smooth epoxy with a wide spreader to reduce finish grinding. Use two to three layers of mesh and adhesive to create a stronger repair.

PATCHED PANEL SURFACING

After patch panel is installed, the patch area can be finished using the same methods as finishing other types of body panels. If mesh material is exposed in the patched area, grind surface down, and apply a coat of high quality rigid plastic body filler. Prime, block sand, and paint as required.

DECKLID/HATCH/LIFTGATE/TAILGATE

DECKLID

REMOVAL

REMOVAL

Fig. 17: Decklid Trim Cover & Push Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the push fasteners (2) and the decklid trim cover (1).
3. Remove the inner combination lamp. Refer to **LAMP, REAR COMBINATION, REMOVAL** .
4. Unclip the wire harness from the decklid and disconnect all harness connectors.

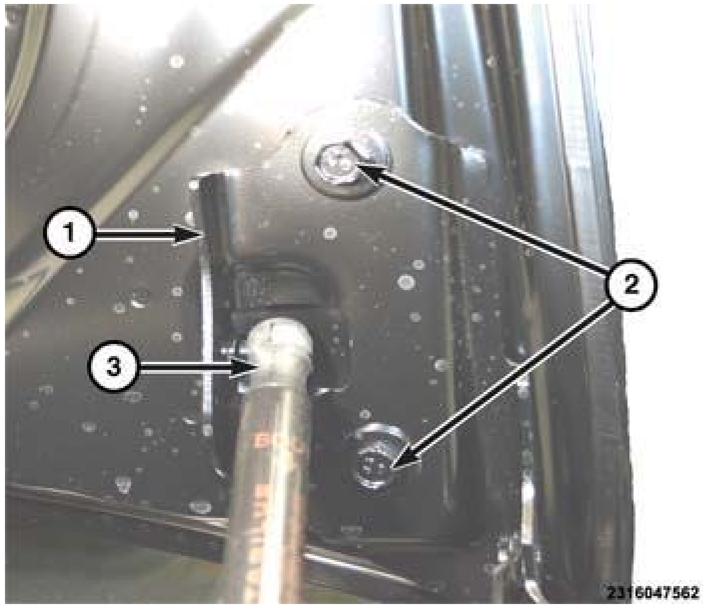

Fig. 18: Hinge, Bolts & Gas Prop
Courtesy of CHRYSLER GROUP, LLC

5. Using a grease pencil or equivalent, mark the position of the hinge (1) on the decklid to aid in installation.
6. With the aid of an assistant supporting the decklid, remove the bolts (2) and the decklid.

INSTALLATION

INSTALLATION

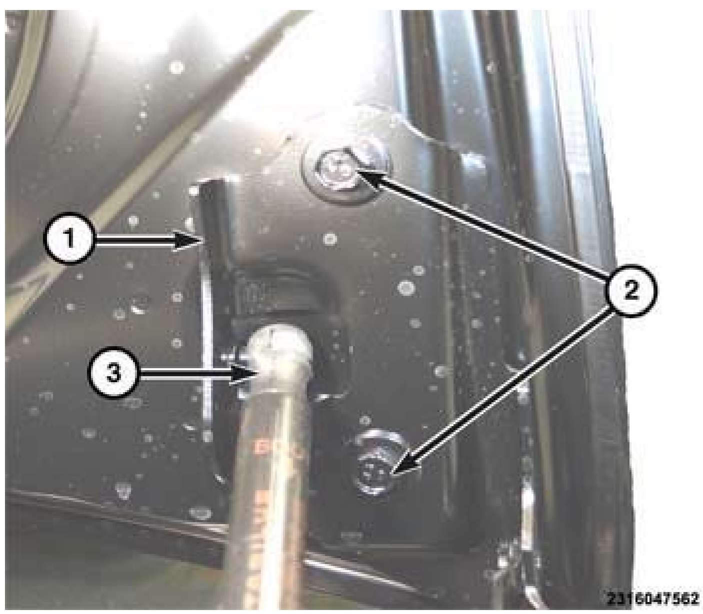

Fig. 19: Hinge, Bolts & Gas Prop
Courtesy of CHRYSLER GROUP, LLC

1. With aid of an assistant holding the decklid, position the decklid and loosely install the bolts (2).
2. Align the decklid hinge (1) with the reference mark made previously and tighten the decklid hinge to decklid bolts to the proper specification. Refer to SPECIFICATIONS.
3. Clip the wire harness to the decklid and connect all harness connectors.

4. Install the inner combination lamp. Refer to **LAMP, REAR COMBINATION, INSTALLATION** .
5. Connect the negative battery cable.
6. Verify fit of decklid and adjust if necessary. Refer to **GAP AND FLUSH, SPECIFICATIONS**.

Fig. 20: Decklid Trim Cover & Push Fasteners

Courtesy of CHRYSLER GROUP, LLC

5. Position the decklid trim cover (1) and install the push fasteners (2).

PROP, GAS

REMOVAL

REMOVAL

CAUTION: Do not use any type of pliers on the machined surface of the gas prop to assist in supporting the hood or decklid. Use a proper device for support, or the help of an assistant.

Fig. 29: Incorrect Way To Prop Hood
Courtesy of CHRYSLER GROUP, LLC

1. Open and support the decklid with a suitable prop or block.

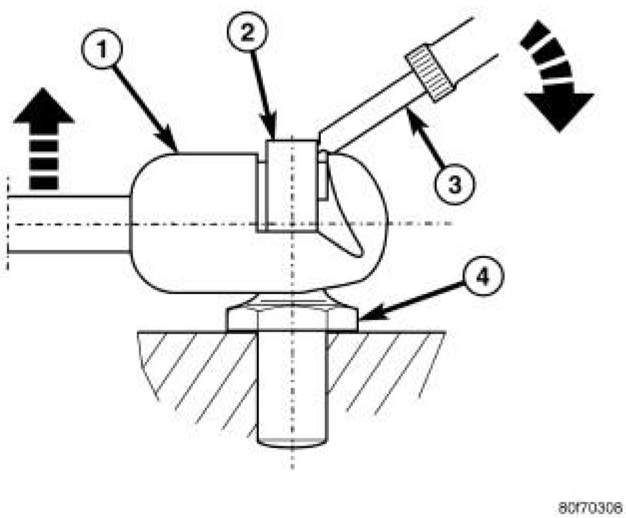

Fig. 30: Prying Retaining Clip Outward
Courtesy of CHRYSLER GROUP, LLC

2. Insert a small flat-bladed tool (3) into the notch on the outer face of one ball socket end (1) of the gas

prop and carefully pry the retaining clip (2) outward while pulling the ball socket away from the ball stud (4) on the decklid hinge.

WARNING: During service lift the ball socket end retaining clip only far enough to release the socket from the ball stud. Excessive prying or removal of the clip may result in improper clip spring tension. Improper clip tension may result in the support cylinder separating from the ball stud causing sudden, unexpected loss of decklid support. Failure to do so may result in serious or fatal injury.

3. Release the retaining clip to its installed position.

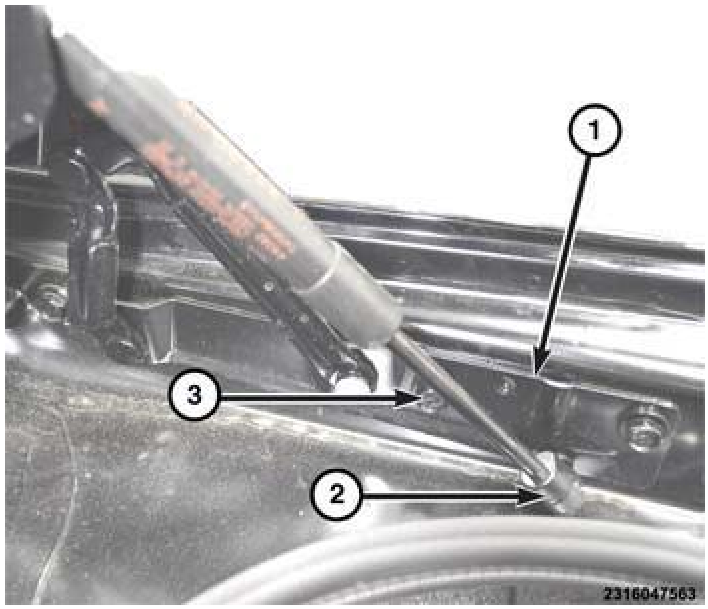

Fig. 31: Hood Hinge, Gas Prop & Bolts
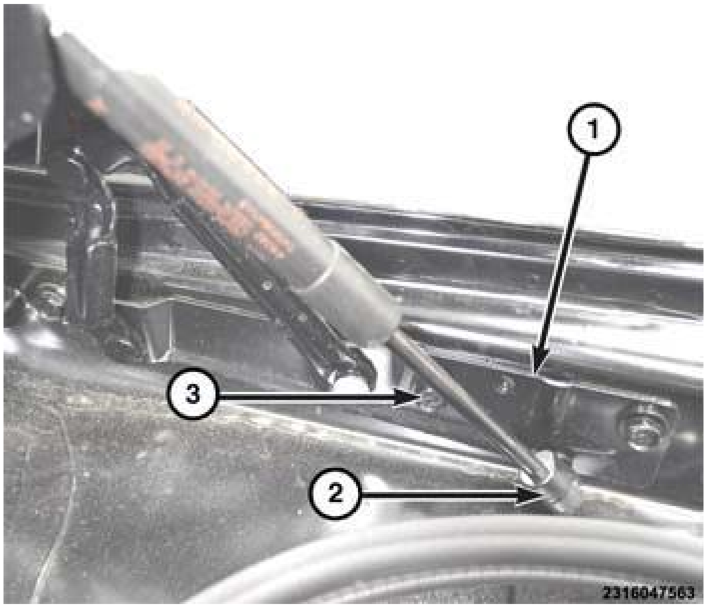
Courtesy of CHRYSLER GROUP, LLC

4. Repeat for the opposite end of the gas prop (2) and remove.

INSTALLATION

INSTALLATION



[Fig. 32: Hood Hinge, Gas Prop & Bolts]
Courtesy of CHRYSLER GROUP, LLC

1. Position the ball socket of the gas prop (2) onto the ball stud on the decklid hinge (1).
2. Using hand pressure, press the gas prop onto the ball stud until the retainer clip snaps into place.
3. Repeat for the opposite end of the gas prop.

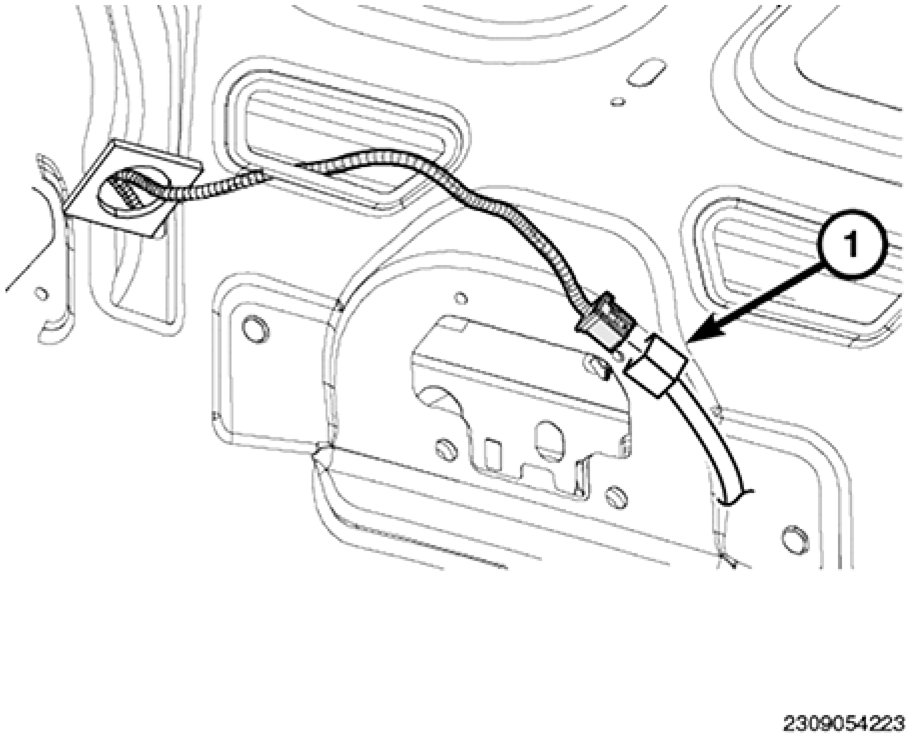
SPOILER, DECKLID

REMOVAL

REMOVAL

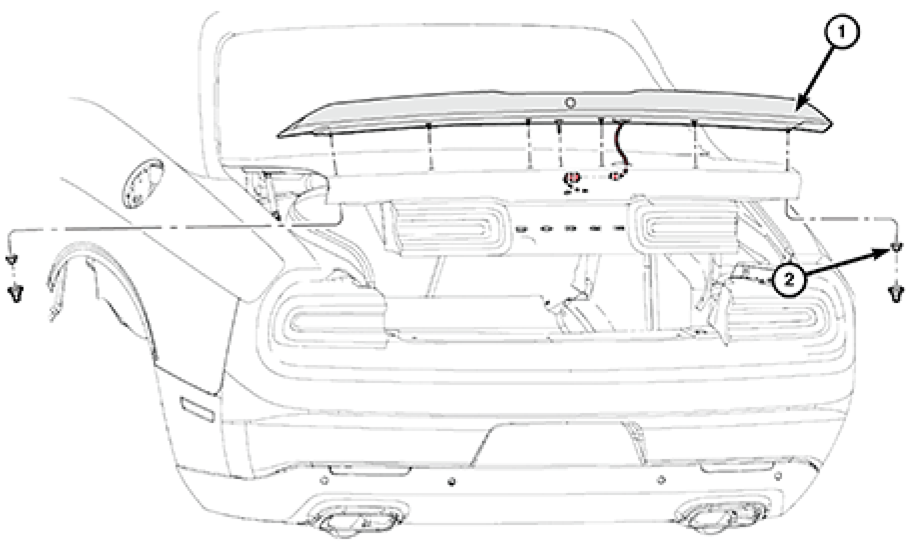
[Fig. 33: Decklid Trim Cover & Push Fasteners]
Courtesy of CHRYSLER GROUP, LLC

1. Remove the push fasteners (2) and the decklid trim cover (1).



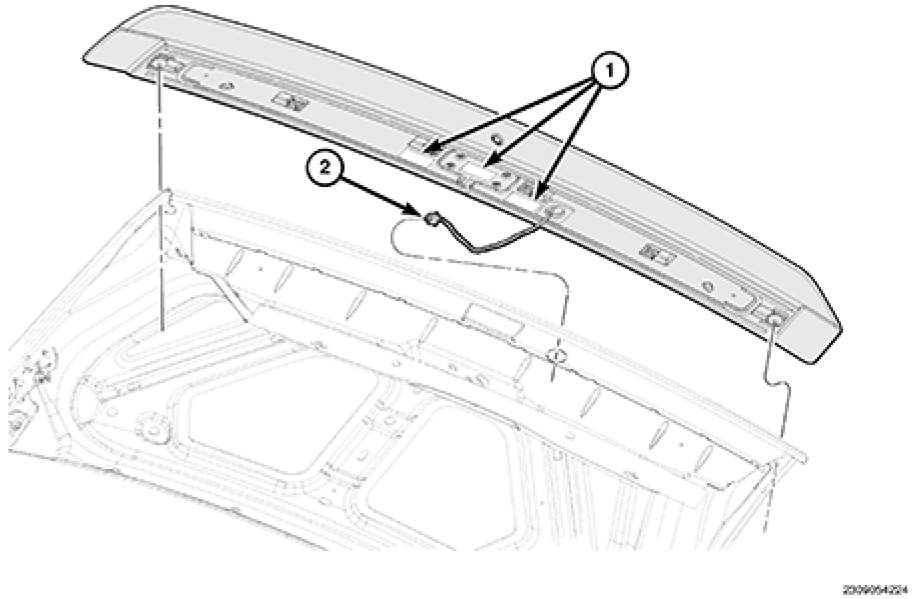
[Fig. 34: Rear Camera Electrical Connector]
Courtesy of CHRYSLER GROUP, LLC

2. Disconnect the rear camera electrical connector (1), if equipped.



[Fig. 35: Cover & Nut]
Courtesy of CHRYSLER GROUP, LLC

3. Remove the covers and remove the nuts (2) securing the spoiler to the decklid.

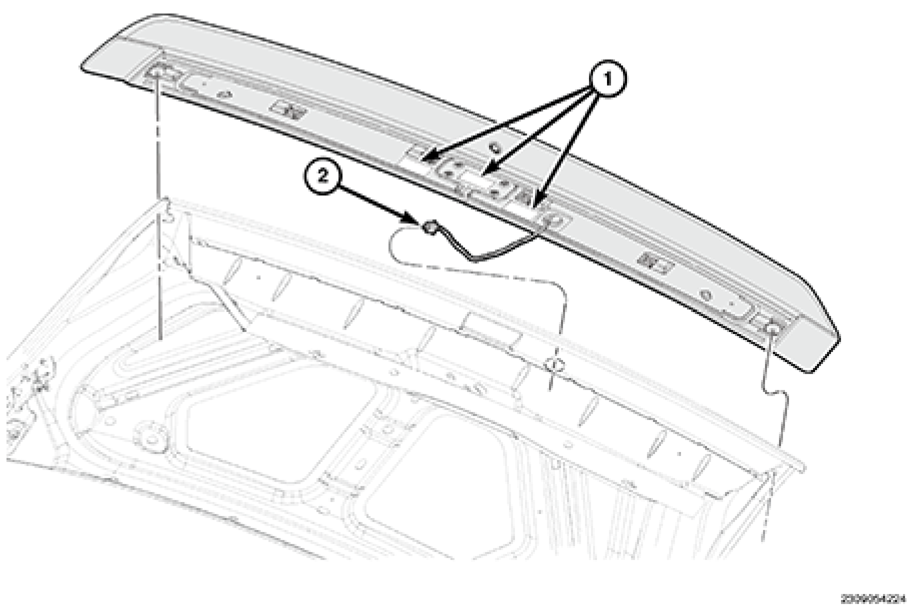


[Fig. 36: Two Way Tape & Wire Harness](#)
Courtesy of CHRYSLER GROUP, LLC

4. Carefully separate the two sided tape (1) and remove the spoiler.

INSTALLATION

INSTALLATION



[Fig. 37: Two Way Tape & Wire Harness](#)
Courtesy of CHRYSLER GROUP, LLC

1. After the spoiler has been removed, **remove any tape residue off the sheet metal by using 3M General Purpose Adhesive Cleaner #08984 or equivalent.**
2. Wipe the attachment area with a clean, lint-free cloth, moistened with a 50% solution of water and isopropylic alcohol.
3. Wait 30 seconds for the alcohol to flash off.

4. Install new two way tape (1) if required.
5. Remove the paper backing from the two way tape (1) and position the spoiler onto the decklid.
6. Position the wire harness (2) back through the hole in the decklid, if equipped.
7. Seat the retainer clips and tape (1) fully.

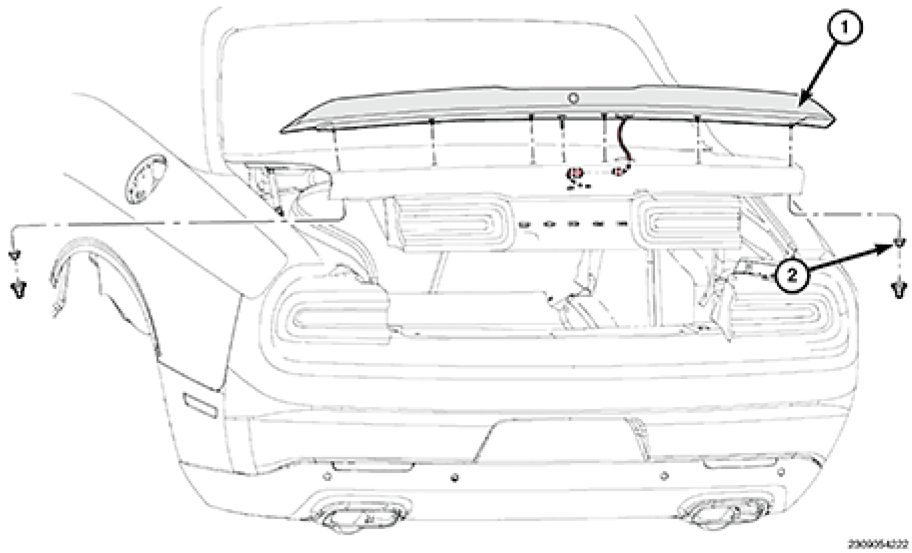


Fig. 38: Cover & Nut
Courtesy of CHRYSLER GROUP, LLC

8. Install the nuts (2) and tighten securely.
9. Install the covers over the attachment nuts.

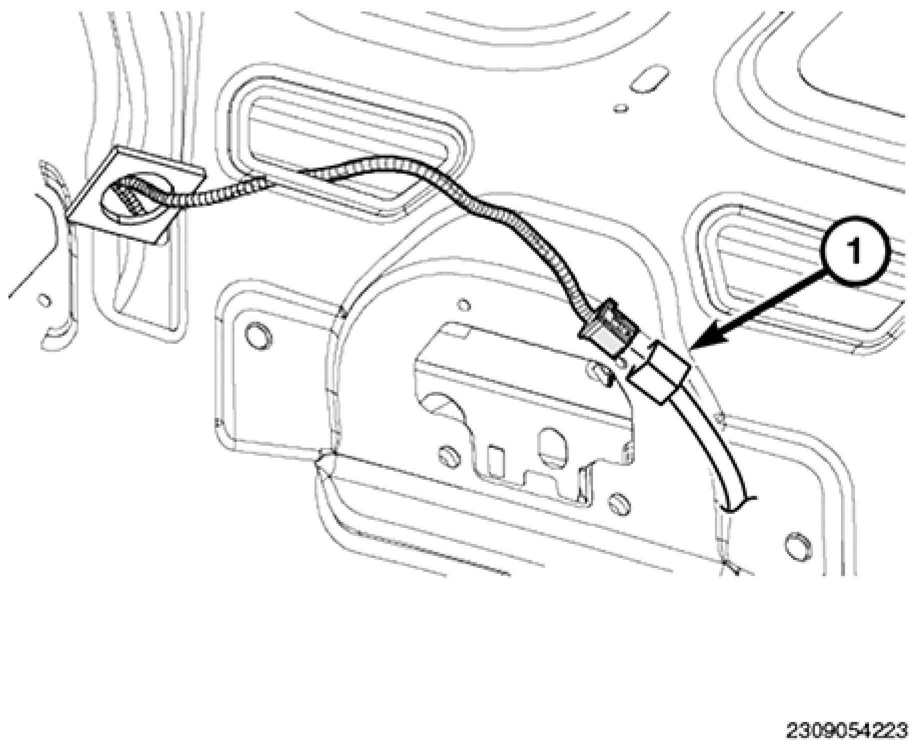

Fig. 39: Rear Camera Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

10. Connect the rear camera electrical connector (1), if equipped.

[Fig. 40: Decklid Trim Cover & Push Fasteners](#)
Courtesy of CHRYSLER GROUP, LLC

11. Install the decklid trim cover (1) and install the push pin fasteners (2).
12. Seat the fasteners fully.

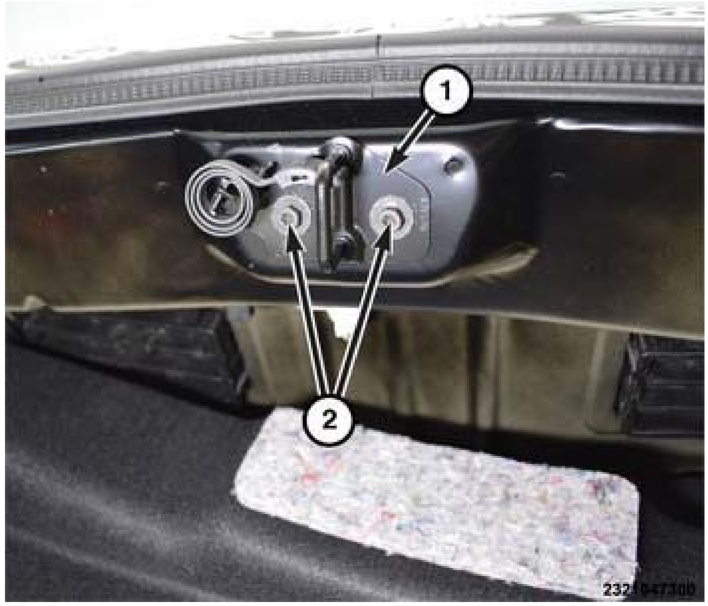
STRIKER, LATCH

REMOVAL

REMOVAL

[Fig. 41: Push Fasteners & Trunk Carpet](#)
Courtesy of CHRYSLER GROUP, LLC

1. Remove the push fasteners (1) and the trunk carpet (2).

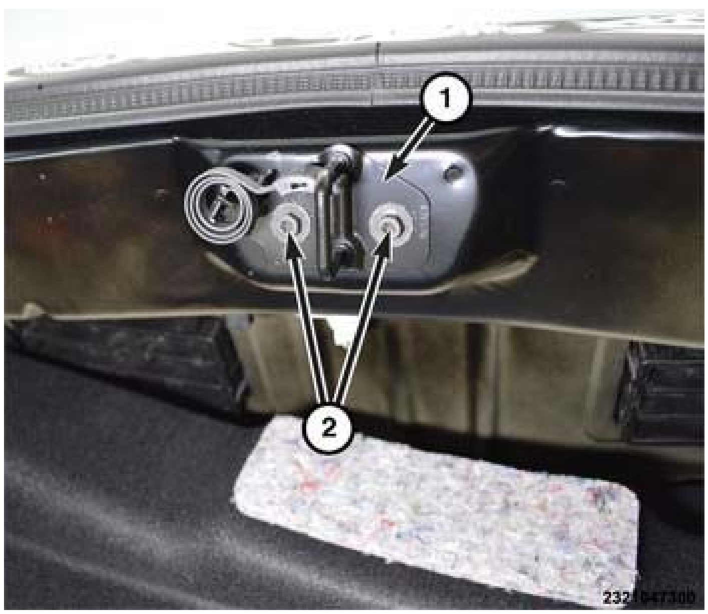


[Fig. 42: Decklid Latch Striker & Bolts](#)
Courtesy of CHRYSLER GROUP, LLC

2. Using a grease pencil or equivalent, mark the position of the decklid latch striker (1) to aid in installation.
3. Remove the bolts (2) and the decklid latch striker.

INSTALLATION

INSTALLATION



[Fig. 43: Decklid Latch Striker & Bolts](#)
Courtesy of CHRYSLER GROUP, LLC

1. Position the decklid latch striker (1) and loosely install the bolts (2).
2. Align the decklid latch striker with the reference mark made previously and tighten the decklid striker bolts to the proper specification. Refer to **SPECIFICATIONS**.
3. Verify the decklid fit, and operation of the decklid latch. Adjust the decklid latch striker if necessary.

Refer to GAP AND FLUSH, SPECIFICATIONS.

Fig. 44: Push Fasteners & Trunk Carpet
Courtesy of CHRYSLER GROUP, LLC

4. Position the trunk carpet (2) and install the push fasteners (1).

DOOR - FRONT

STANDARD PROCEDURE

STANDARD PROCEDURE

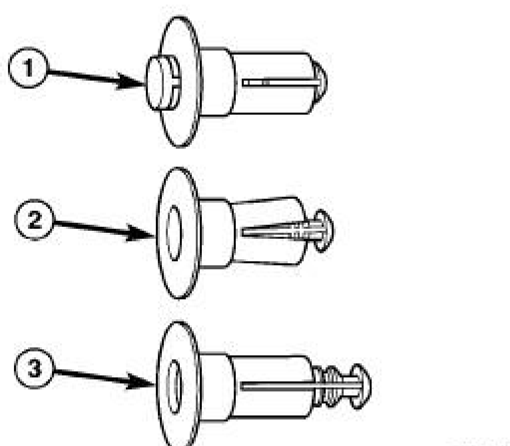


Fig. 45: Push Pin Fastener
Courtesy of CHRYSLER GROUP, LLC

1 - OPEN POSITION	
2 - LOCK POSITION	
3 - RELEASE POSITION	

1. The push pin fastener is in the open position (1) when the center pin is pull outward approximately 2 mm. Then the push pin fastener is ready to be used.
2. To install push pin place it into position, and push the center pin in flush with the head of the push pin to lock it into position (2).
3. To remove the push pin fastener, push the center pin inward approximately 2 mm to release push pin fastener (3).

CYLINDER, DOOR LOCK

REMOVAL

REMOVAL

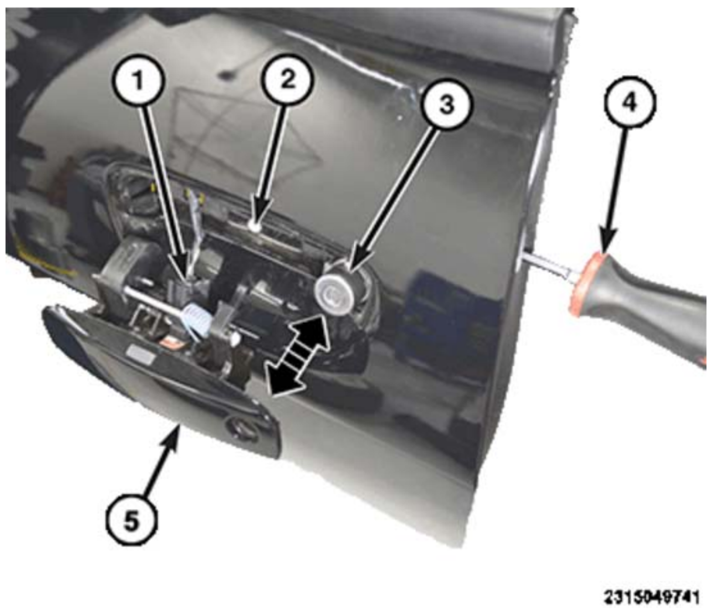

Fig. 46: Wire Harness Connector, Screw, Lock Cylinder, Suitable Tool & Exterior Door Handle
Courtesy of CHRYSLER GROUP, LLC

1. Remove the exterior door handle (5). Refer to HANDLE, EXTERIOR, REMOVAL.
2. Pull the lock cylinder (3) out of the door handle bracket.

INSTALLATION

INSTALLATION

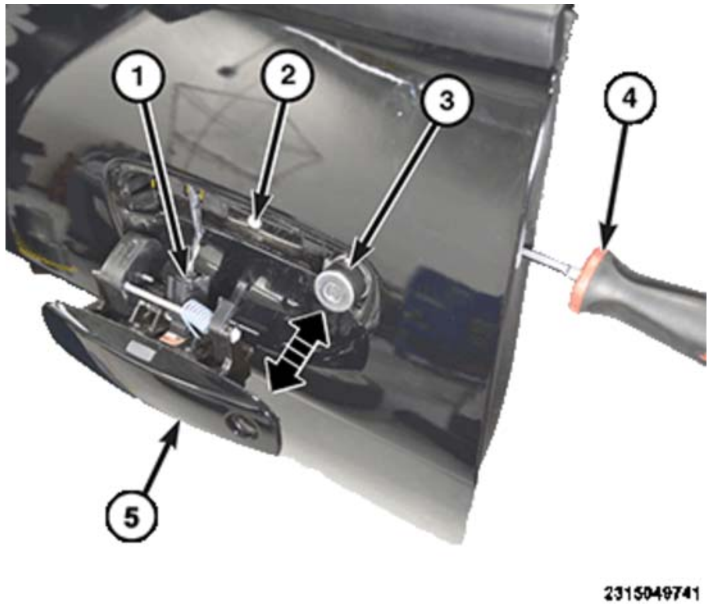

Fig. 47: Wire Harness Connector, Screw, Lock Cylinder, Suitable Tool & Exterior Door Handle
Courtesy of CHRYSLER GROUP, LLC

1. Insert the lock cylinder (3) into the door handle bracket.
2. Install the exterior door handle (5). Refer to **HANDLE, EXTERIOR, INSTALLATION**.

DOOR

ADJUSTMENTS

ADJUSTMENTS

NOTE:

- **Door adjustment measurements should be taken from stationary or welded body panels like the roof, rocker or quarter panels.**
- **During adjustment procedures, it is recommended that all the hinge fasteners be loosened except for the upper most fasteners. Adjustments can be made using the upper bolts to hold the door with final torque of the fasteners occurring after correct door positioning is achieved.**
- **A suitable body sealant should be used when removing or moving the hinges.**

FORE/AFT

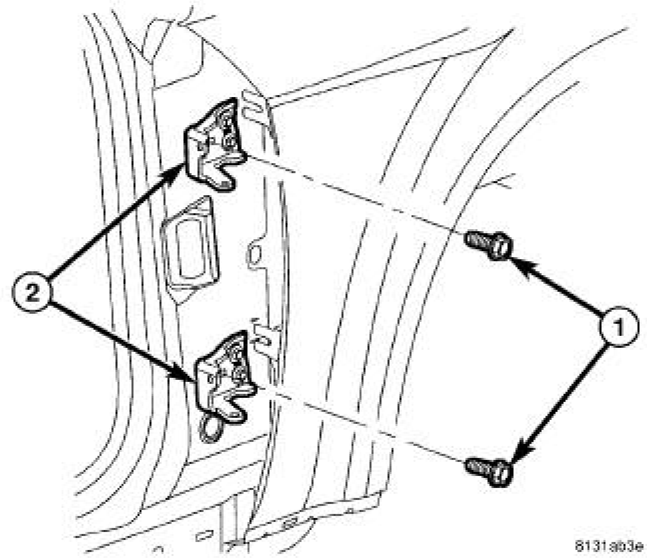

Fig. 48: Hinge Bracket
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Fore/aft (lateral) door adjustment is done by loosening the door hinge to the body bolts one door hinge at a time and moving the door to the correct position.**

1. Support the door with a suitable lifting device.
2. Loosen the upper and lower hinge to body bolts (1).
3. Adjust the door to the correct specifications. Refer to **GAP AND FLUSH, SPECIFICATIONS**.
4. Tighten the upper door hinge to body bolt to the proper specification. Refer to **SPECIFICATIONS**.
5. Tighten the lower door hinge to body bolt to the proper specification. Refer to **SPECIFICATIONS**.
6. Tighten the remaining door hinge to body bolts to the proper specification. Refer to **SPECIFICATIONS**.

UP/DOWN

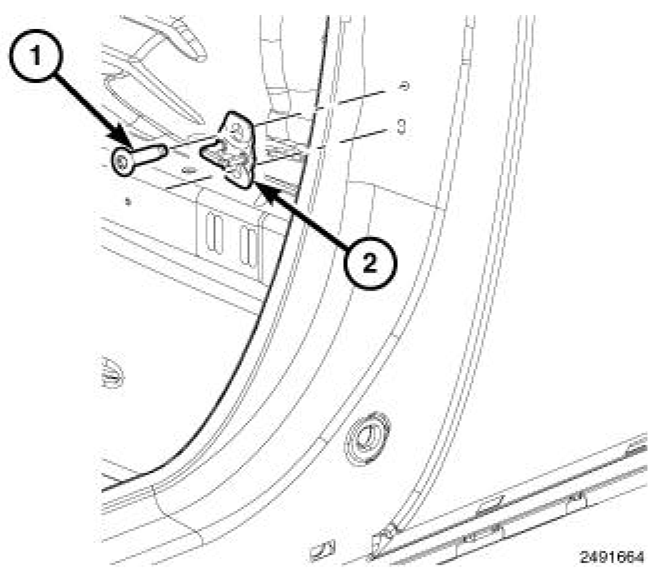

Fig. 49: Door Latch Striker

Courtesy of CHRYSLER GROUP, LLC

NOTE: **Up/down door adjustment is done by loosening either the hinge to body bolts or the hinge to door nuts and moving the door to the correct position.**

1. Support the door with a suitable lifting device.
2. Loosen the door latch striker bolts (1)

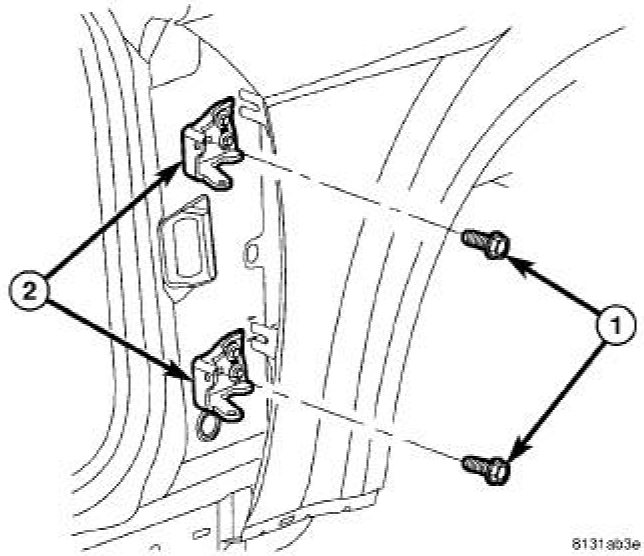

Fig. 50: Hinge Bracket
Courtesy of CHRYSLER GROUP, LLC

3. If necessary, loosen the door hinge to body bolts (1).

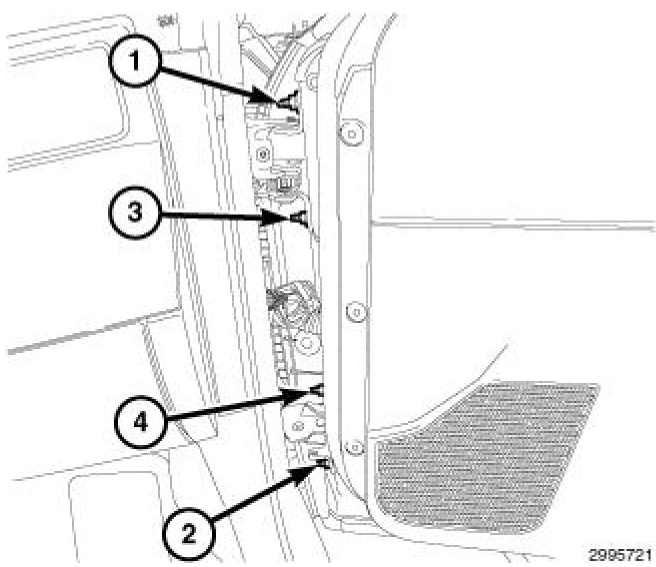

Fig. 51: Hinge Door Nuts
Courtesy of CHRYSLER GROUP, LLC

4. If necessary, loosen the door hinge to door nuts (1). Refer to **DOOR, REMOVAL**.
5. Adjust the door to the correct position. Refer to **GAP AND FLUSH, SPECIFICATIONS**.

6. Tighten the door hinge to door nuts to the proper specification. Refer to **SPECIFICATIONS**.

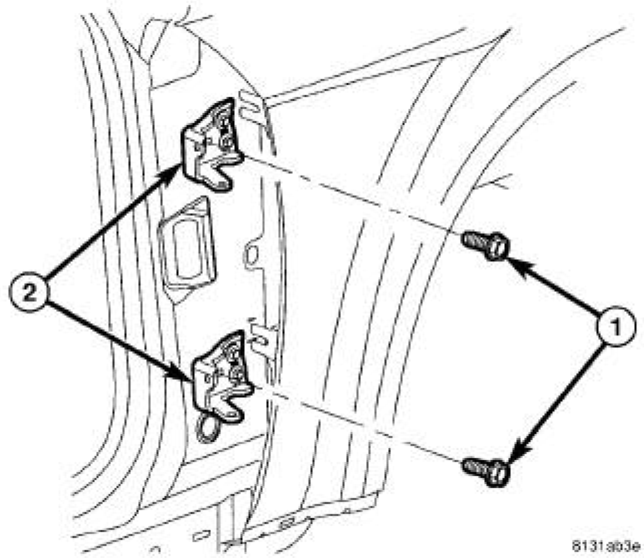

Fig. 52: Hinge Bracket
Courtesy of CHRYSLER GROUP, LLC

7. Tighten the upper door hinge to body bolt (1) to the proper specification. Refer to **SPECIFICATIONS**.
8. Tighten the lower door hinge to body bolt to the proper specification. Refer to **SPECIFICATIONS**.
9. Tighten the remaining door hinge to body bolts to the proper specification. Refer to **SPECIFICATIONS**.

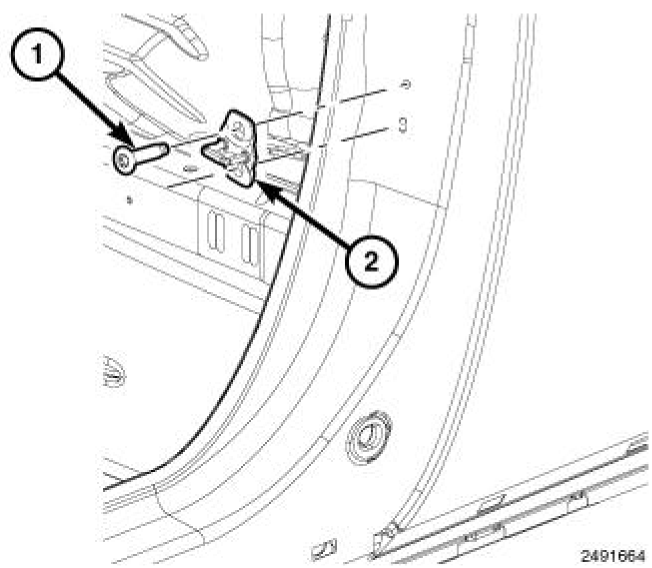

Fig. 53: Door Latch Striker
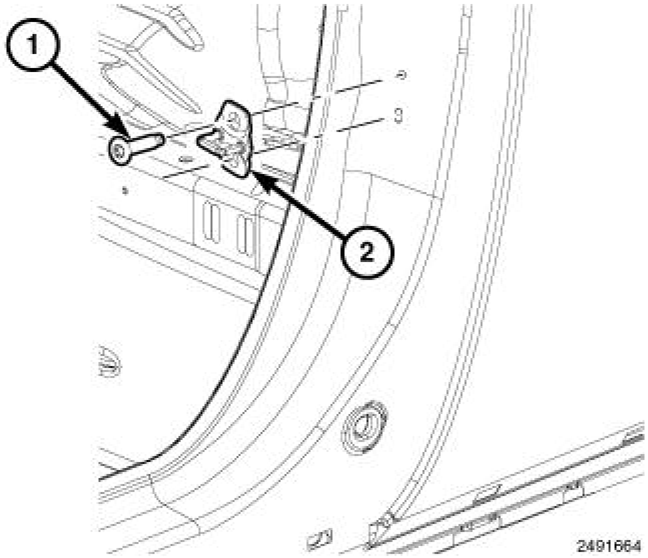
Courtesy of CHRYSLER GROUP, LLC

10. Tighten the door latch striker bolts to the proper specification. Refer to **SPECIFICATIONS**.

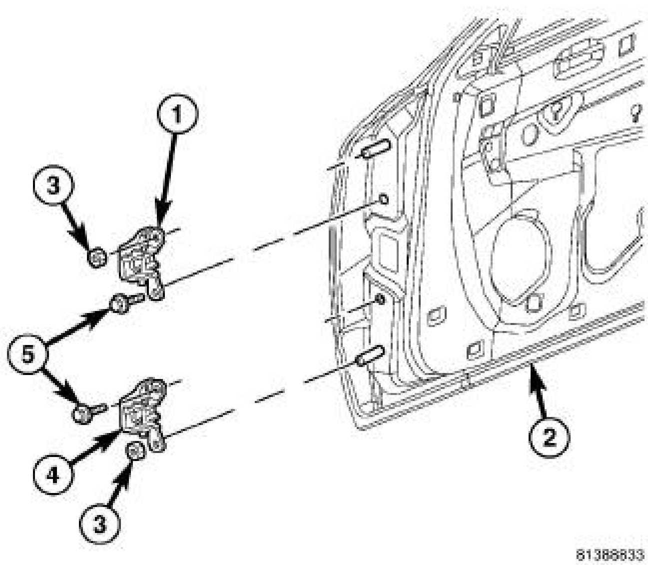
IN/OUT



[Fig. 54: Door Latch Striker]
Courtesy of CHRYSLER GROUP, LLC

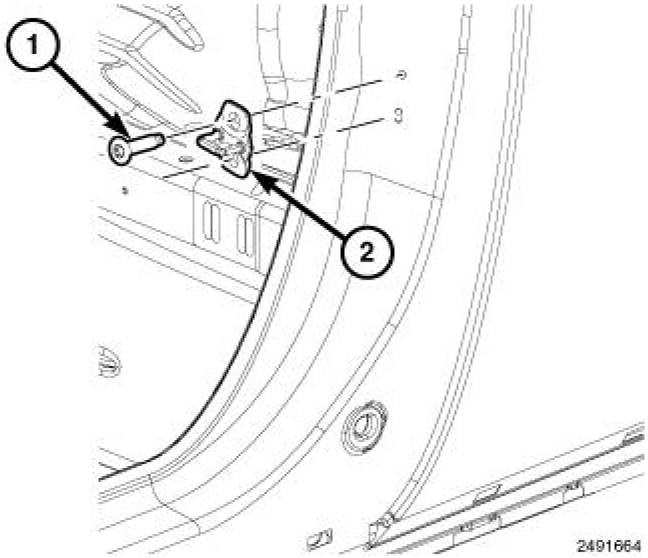
NOTE: **In/out door adjustment is done by loosening the hinge to door fasteners one hinge at a time and moving the door to the correct position.**

1. Support the door with a suitable lifting device.
2. Loosen the door latch striker bolts (2).



[Fig. 55: Door Hinge]
Courtesy of CHRYSLER GROUP, LLC

3. Loosen the door hinge to door fasteners.
4. Adjust the door to the correct position. Refer to GAP AND FLUSH, SPECIFICATIONS.
5. Tighten the door hinge to door nuts to the proper specification. Refer to SPECIFICATIONS.



[Fig. 56: Door Latch Striker](#)
Courtesy of CHRYSLER GROUP, LLC

6. Tighten the door latch striker bolts to the proper specification. Refer to **SPECIFICATIONS**.

REMOVAL

REMOVAL

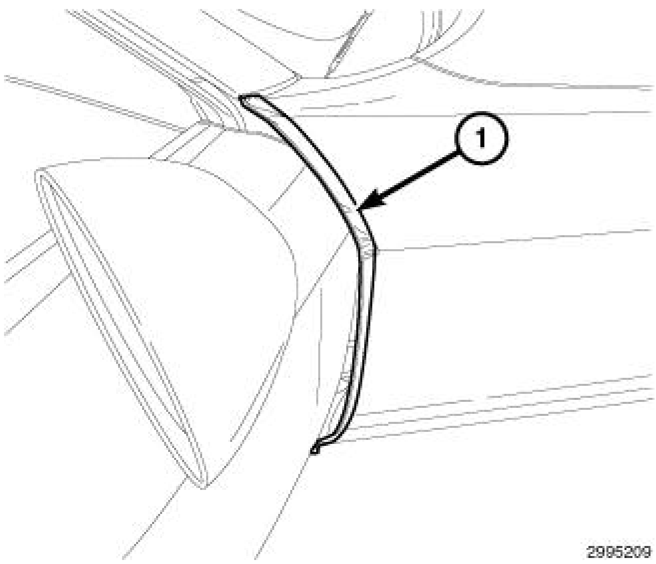


Fig. 57: Strip Of Tape On Rear Fender Edge
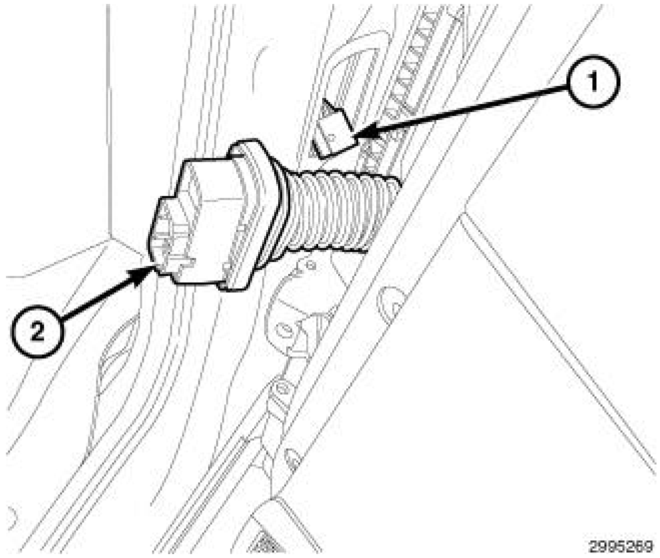
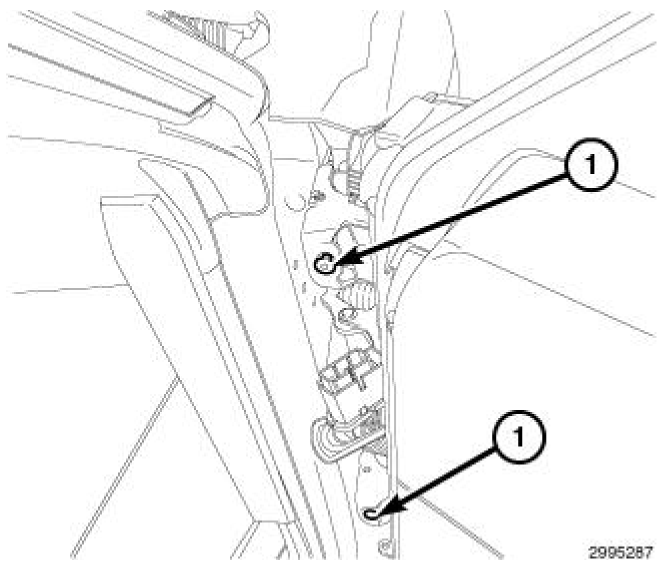
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Using masking tape or equivalent, apply a strip of tape (1) to the rear fender edge near the door for protection.
3. Support the door with a suitable lifting device.



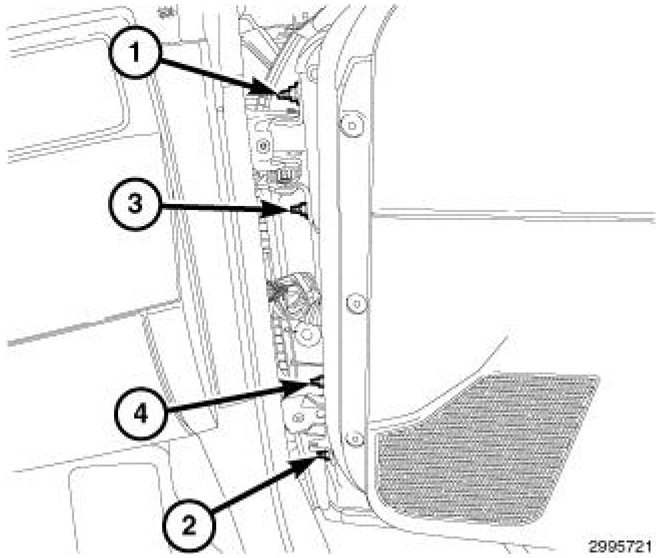
[Fig. 58: Body Wire Harness Connectors]
Courtesy of CHRYSLER GROUP, LLC

4. Disengage the front door wire harness boot and connector (1) from the outside of the lower A-pillar.
5. Carefully pull the door wire harness boot and connector out from the A-pillar far enough to access and disconnect the body wire harness connectors (1 & 2).



[Fig. 59: Hinge Swing Stop Bolts]
Courtesy of CHRYSLER GROUP, LLC

6. Remove the hinge swing stop bolts (1) from both the upper and lower front door hinges.

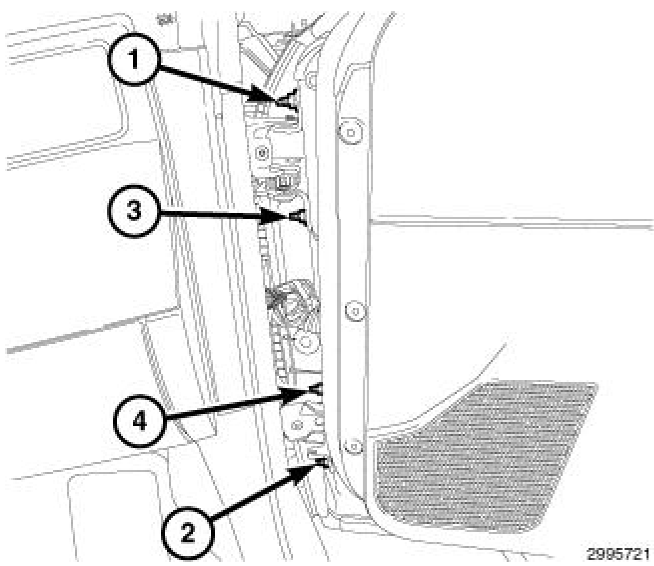


[Fig. 60: Hinge Door Nuts]
Courtesy of CHRYSLER GROUP, LLC

7. Using a grease pencil or equivalent, mark the position of the door hinge on the door to aid installation.
8. Remove the hinge to door nuts (1, 2) from the door.
9. Remove the hinge to door nuts (3, 4) from the door.
10. Remove the door from the hinges by pulling straight out.

INSTALLATION

INSTALLATION



[Fig. 61: Hinge Door Nuts]
Courtesy of CHRYSLER GROUP, LLC

1. Support the door with a suitable lifting device.
2. Position the door onto the door hinges and loosely install the nuts (1).
3. Align the door hinge to the reference marks made previously and tighten the door hinge to door nuts (3 and 4) to the proper specification. Refer to **SPECIFICATIONS**.

4. Align the door hinge to the reference marks made previously and tighten the door hinge to door nuts (1 and 2) to the proper specification. Refer to **SPECIFICATIONS**.
5. Remove the lifting device supporting the door.

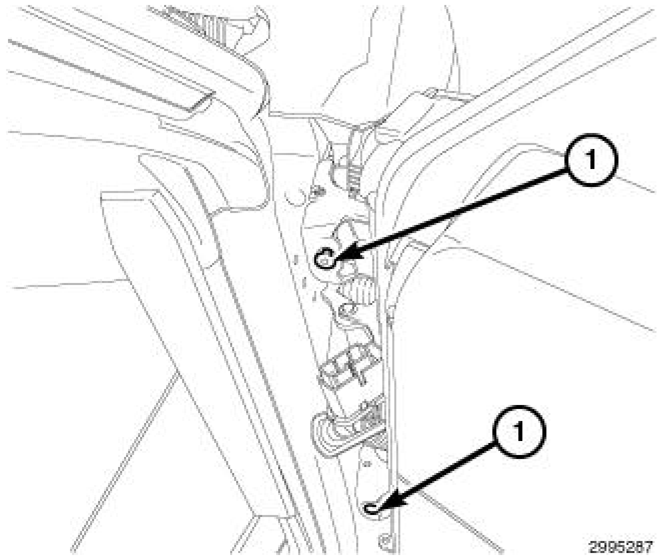


Fig. 62: Hinge Swing Stop Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Install the door hinge swing stop bolts (1) and tighten to the proper specification. Refer to **SPECIFICATIONS**.

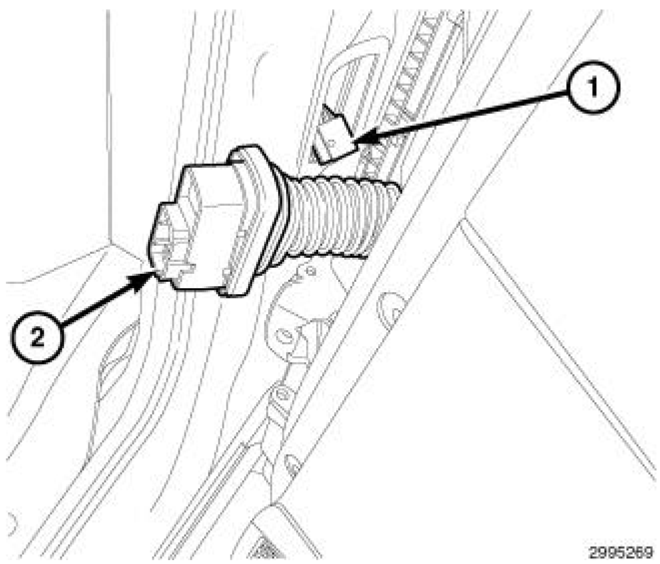

Fig. 63: Body Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

7. Connect the body wire harness connectors (1 and 2).
8. Position the door wire harness boot and connector into the opening in the A-pillar. Install the door wire harness boot over the connector. Make sure the boot is fully installed over the harness and connector.

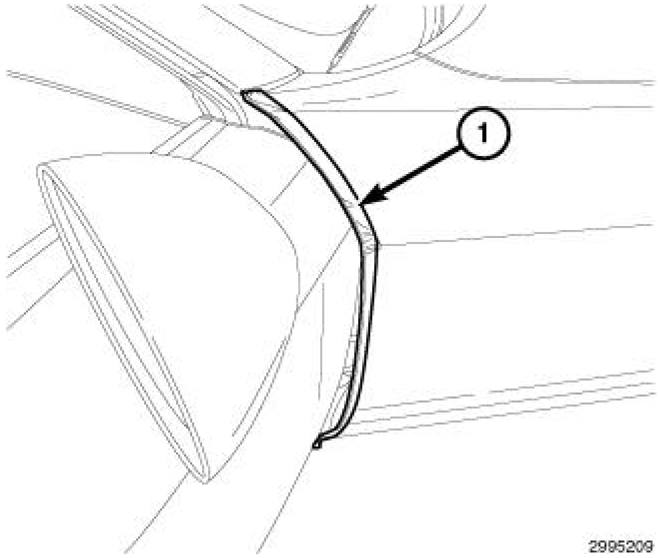

Fig. 64: Strip Of Tape On Rear Fender Edge
Courtesy of CHRYSLER GROUP, LLC

9. Remove the tape strip (1) from the fender edge.
10. Connect the negative battery cable.

NOTE: **For vehicles equipped with the optional Automatic Express Up power window feature, calibration of this feature is required whenever power to the door module is disrupted.**

11. If necessary, adjust the door. Refer to **DOOR, ADJUSTMENTS**.

GLASS, DOOR

ADJUSTMENTS

ADJUSTMENTS

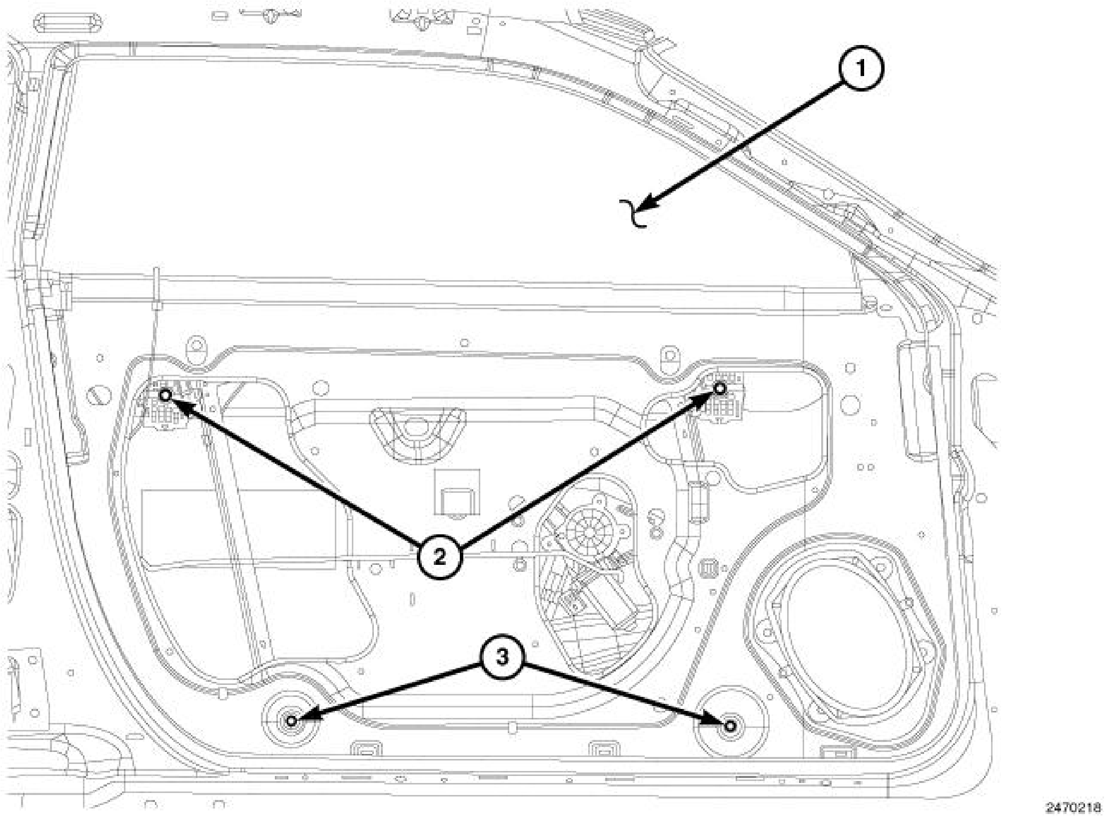

Fig. 65: Front Door Glass Adjustments
Courtesy of CHRYSLER GROUP, LLC

1 - DOOR GLASS	
2 - DOOR GLASS BOLTS	
3 - JACK SCREWS	

1. Check and adjust the door if necessary. Refer to **DOOR, ADJUSTMENTS**.
2. Remove the door trim panel and the watershield to gain access to the window regulator. Refer to **WATERSHIELD, REMOVAL**.

NOTE: **Partially loosening the door glass bolts (2) allows the door glass to stay in place while the door glass is being adjusted. If the bolts are too loose, the door glass will lose all position adjustments completely.**

3. With the door glass (1) in the full up position, partially loosen the door glass bolts (2).

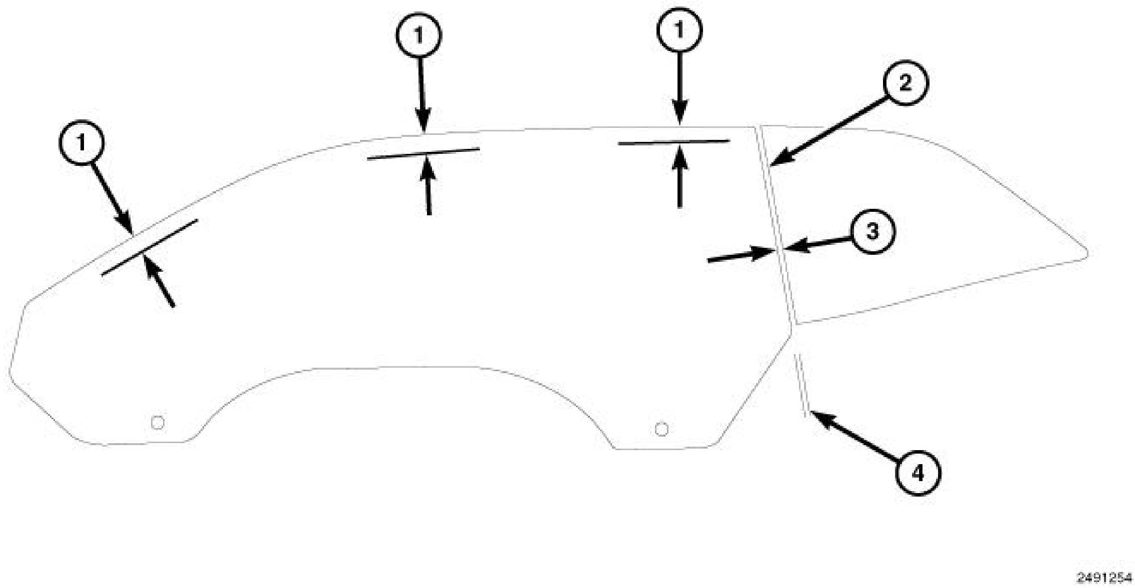

Fig. 66: Door Glass Alignment (1 Of 2)
Courtesy of CHRYSLER GROUP, LLC

1 - SEAL ENGAGEMENT 7.5 mm +/- 2.0 mm

3 - DOOR GLASS TO QUARTER GLASS GAP 6.0 mm +/- 2.0 mm	
4 - DOOR GLASS TO QUARTER GLASS PARALLEL WITHIN 2.0 mm	

4. Place a piece of tape onto the door glass and mark a line 7.5 mm (0.30 in.) minimum down from the upper edge in the three places shown in illustration (1).
5. From the outside of the vehicle, with the door closed, use a suction cup or equivalent and simultaneously slide the door glass to achieve the three minimum glass engagement tape marks (1) and the door glass to quarter glass gap (3) and parallel measurements (4).

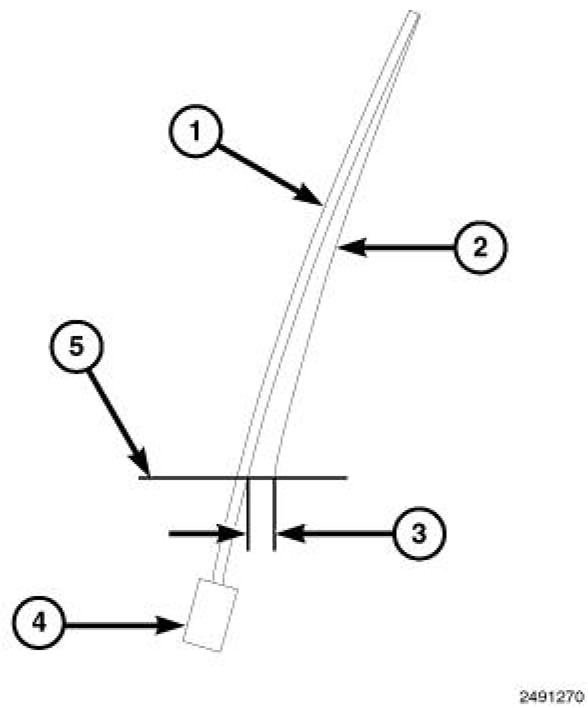

Fig. 67: Door Glass Alignment (2 Of 2)
Courtesy of CHRYSLER GROUP, LLC

1 - DOOR GLASS
2 - SASH SEAL
3 - OBSERVED BELT LINE PRE-LOAD 6.0 mm
4 - LIFT PLATE PIVOT
5 - BELT LINE

NOTE: **It is sometimes helpful to tighten or loosen the bolt at the rear of the door glass during this process.**

NOTE: **The jack screws work for minor cross car adjustments and should only be used if there is a minimal adjustment cross car required.**

6. Open the door and then carefully close the door until the B-pillar top of glass (1) just touches the quarter glass sash seal (2) and check the B-pillar glass to sash seal gap near the belt line (3). This gap (3) should be adjusted to 6 mm (0.24 in.) to put a cross car preload on the door glass. To adjust the gap open the door and push the top edge of the door glass inboard or outboard as needed. Close the door and check the gap as needed. Check that the door glass to quarter glass is flush to +3 mm (0.11 in.) over flush.

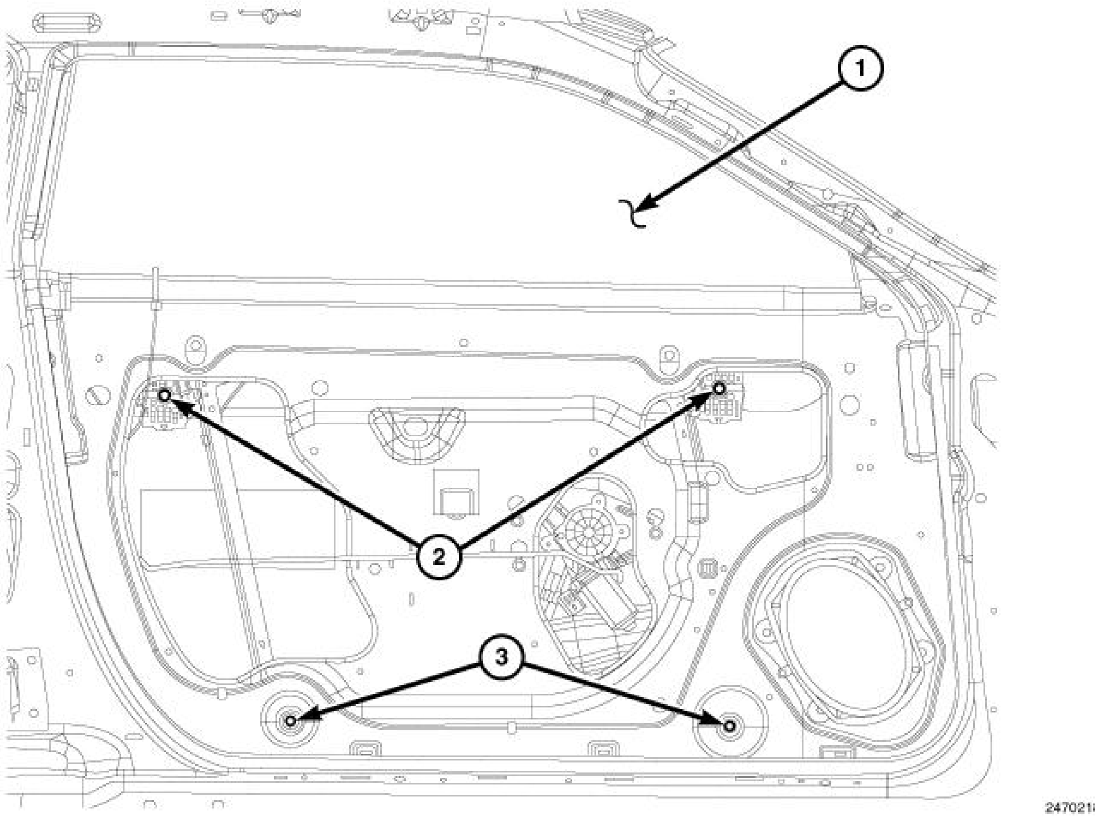

Fig. 68: Front Door Glass Adjustments
Courtesy of CHRYSLER GROUP, LLC

1 - DOOR GLASS
2 - DOOR GLASS BOLTS
3 - JACK SCREWS

7. Tighten the door glass bolts (2) to 10 N.m (89 in. lbs.).
8. From inside the vehicle with the door closed, run the door glass full down and then jog it upwards to insure the door glass does not scissor and travel inboard of the quarter glass sash seal or crush the seal and dislodge it from the retainer. If the door glass travels inboard of the sash seal, you will need to reduce the door glass preload.
9. From outside the vehicle, open and close the door and make sure the A-pillar section of the door glass travels properly into the A-pillar seal. If the door glass crushes or pinches the A-pillar seal, the door glass will need more preload and/or shifted rearward.
10. Install the watershield and door trim panel. Refer to **WATERSHIELD, INSTALLATION**.

REMOVAL

REMOVAL

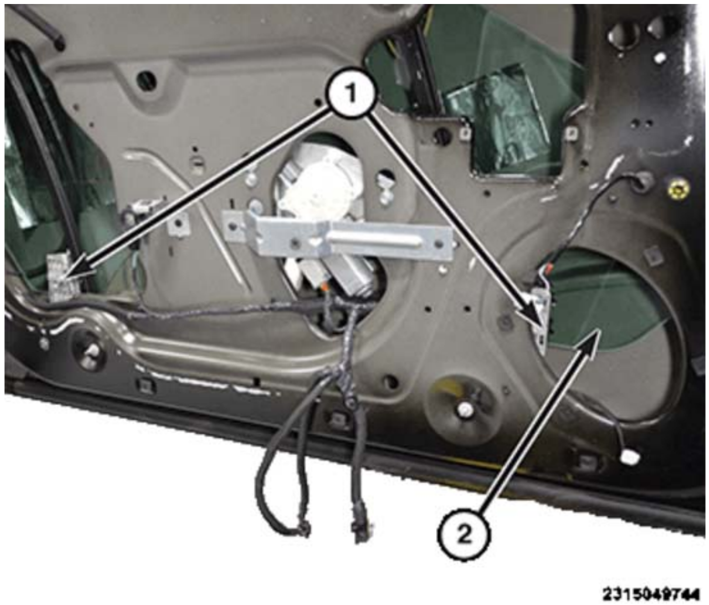

Fig. 69: Door Glass Bolts & Door Glass
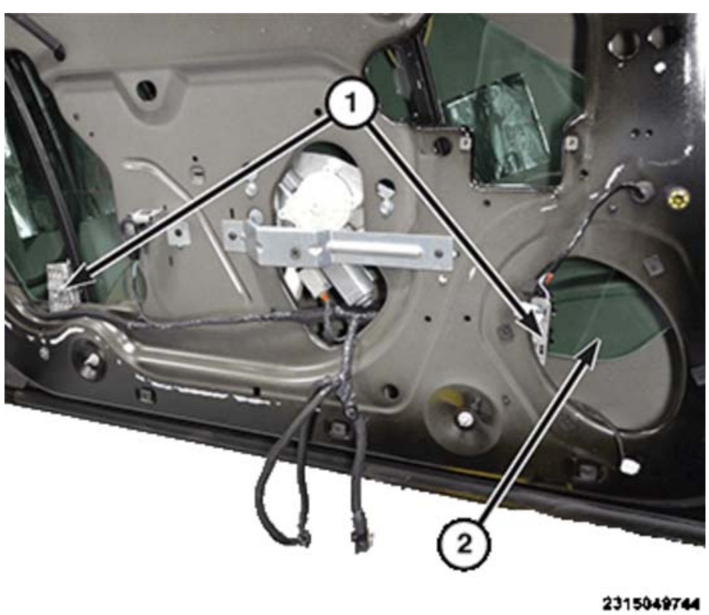
Courtesy of CHRYSLER GROUP, LLC

1. Position the door glass to the lowest position.
2. Remove the door trim panel. Refer to **PANEL, DOOR TRIM, REMOVAL**.
3. Remove the door speaker. Refer to **SPEAKER, REMOVAL** .
4. Remove the watershield at the bottom of the door to access the door glass bolts (1).
5. Using a grease pencil or equivalent, mark the position of the door glass where it is fastened to the window regulator, to aid installation.
6. Remove the door glass bolts.
7. Lift the door glass up and out of the door.

INSTALLATION

INSTALLATION



[Fig. 70: Door Glass Bolts & Door Glass](#)
Courtesy of CHRYSLER GROUP, LLC

1. Lower the door glass (2) into the top of the door.
2. Make sure the door glass is positioned correctly into the glass channel and loosely install the door glass bolts (1).
3. Align the door glass to the reference marks made previously and tighten the door glass bolts to the proper specification. Refer to **SPECIFICATIONS**.
4. Connect the window switch and check the door glass operation and adjustment. Refer to **GLASS, DOOR, ADJUSTMENTS**.
5. Press the watershield firmly to the door.
6. Install the door speaker. Refer to **SPEAKER, INSTALLATION** .
7. Install the door trim panel. Refer to **PANEL, DOOR TRIM, INSTALLATION**.

HANDLE, EXTERIOR

REMOVAL

REMOVAL

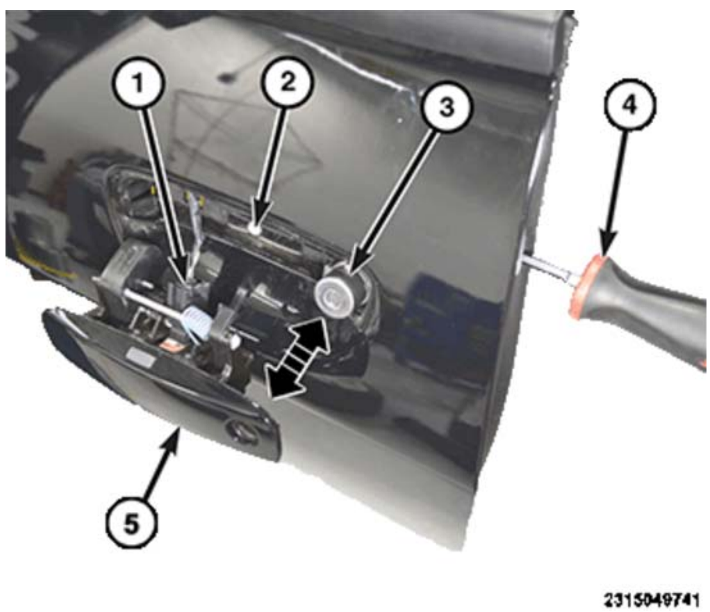


Fig. 71: Wire Harness Connector, Screw, Lock Cylinder, Suitable Tool & Exterior Door Handle
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Do not use power tools when loosening the screw (2).**

Carefully loosen the screw while lightly pulling on the exterior door handle. Only loosen enough so the exterior door handle can be removed.

The threads will be damaged if turned beyond the stop point.

1. Disconnect the negative battery cable.
2. Locate the screw access hole on door jamb.

3. Using a suitable tool (4), turn the screw counter clockwise. Carefully loosen the screw while lightly pulling on the exterior door handle (5). **Do not attempt to remove the screw.**
4. Pull the exterior door handle outward and disconnect the wire harness connector (1). Use an appropriate device to prevent the wire connector from falling inside the door.

NOTE: **Important, do not let the exterior door handle connector fall inside the door after it is disconnected .**

INSTALLATION

INSTALLATION

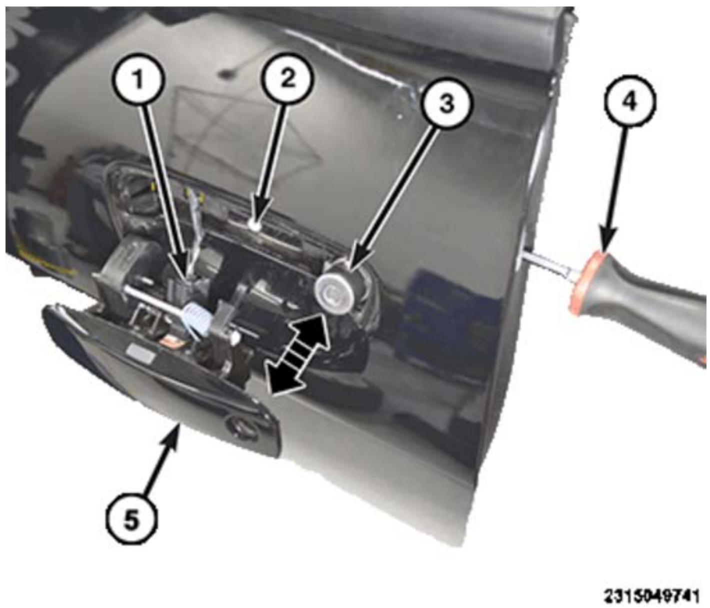

Fig. 72: Wire Harness Connector, Screw, Lock Cylinder, Suitable Tool & Exterior Door Handle
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Do not use power tools when installing the exterior door handle.**

Do not tighten the screw more than 3 N.m (27 in. lbs.). The threads can be damaged if tightened beyond specification.

1. Connect the wire harness connector (1).
2. Position the exterior door handle (5) into the bracket.
3. Insert a suitable tool (4) into the access hole and turn the screw clockwise to engage the exterior door handle. The threads may be damaged if tightened more than 3 N.m (27 in. lbs.).
4. Connect the negative battery cable.

HINGE, DOOR

REMOVAL

REMOVAL

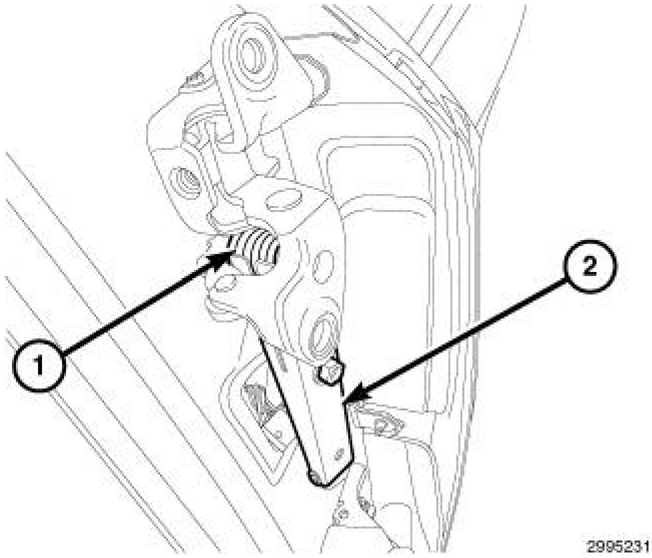

Fig. 73: Door Spring & Compression Tool
Courtesy of CHRYSLER GROUP, LLC

NOTE: Upper hinge shown in illustration, lower hinge similar.

1. Using a grease pencil or equivalent, mark the position of the door hinge on the door and on the body to aid installation.
2. Remove the door. Refer to **DOOR, REMOVAL**.
3. Using a door spring compression tool (2), remove the door spring (1) from the upper hinge.

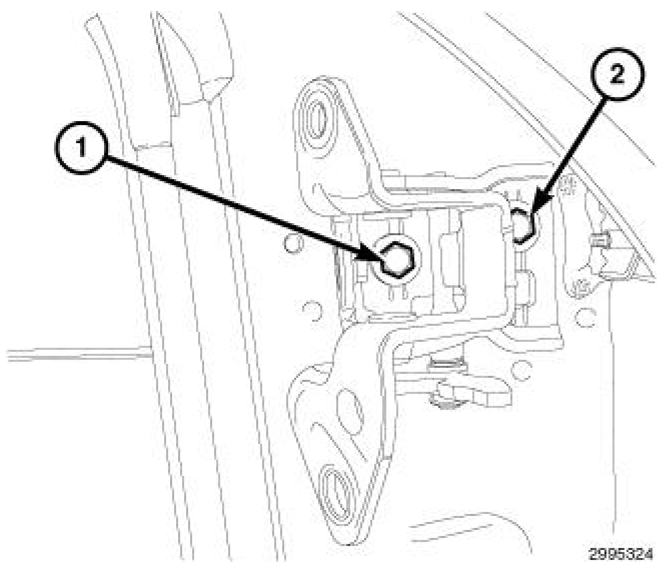

Fig. 74: Hinge Bracket Fasteners
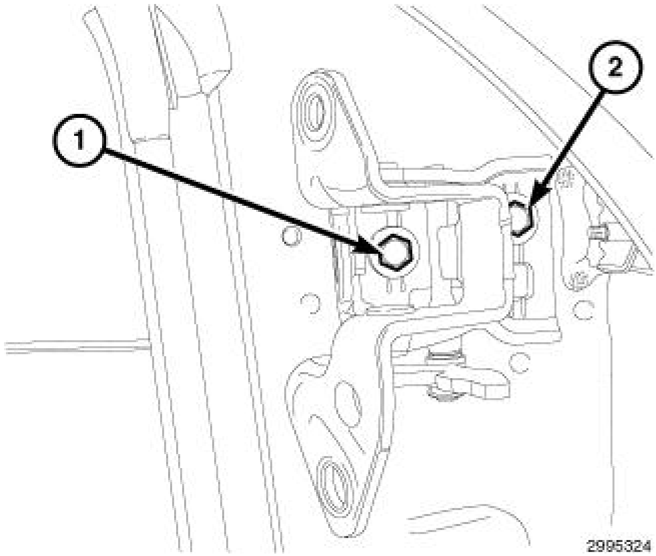
Courtesy of CHRYSLER GROUP, LLC

4. Remove the bolts (1, 2) and the door hinge.

INSTALLATION

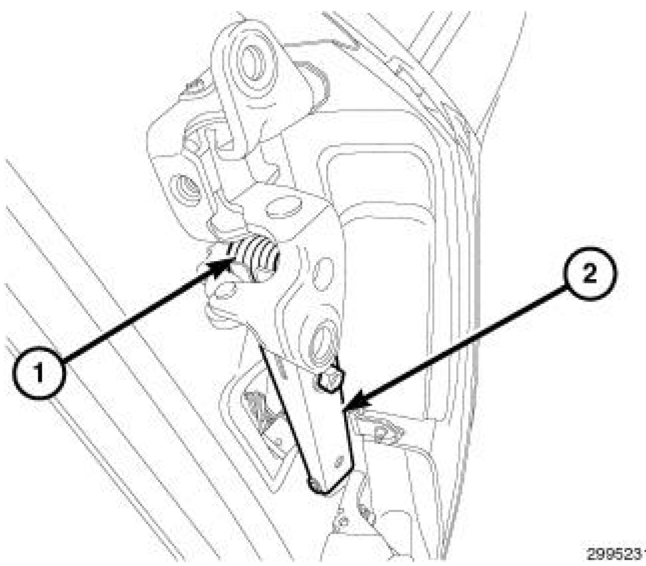
INSTALLATION



[Fig. 75: Hinge Bracket Fasteners]
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Upper hinge shown in illustration, lower hinge similar.**

1. Position the door hinge onto the body and loosely install the bolts.
2. Align the door hinge to the reference marks made previously and tighten the door hinge to body bolts to the proper specification. Refer to **SPECIFICATIONS**.



[Fig. 76: Door Spring & Compression Tool]
Courtesy of CHRYSLER GROUP, LLC

3. Using a door spring compression tool (2), install the door spring (1) to the upper hinge.
4. Install the door. Refer to **DOOR, INSTALLATION**.

LATCH, DOOR

REMOVAL

REMOVAL

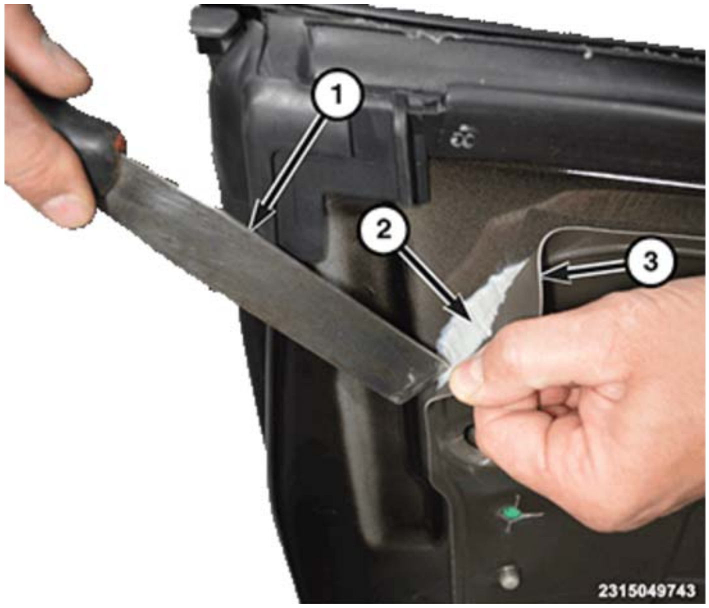


Fig. 77: Flat Bladed Tool, Adhesive Bead & Watershield
Courtesy of CHRYSLER GROUP, LLC

1. Raise the door glass to the fully closed position.
2. Remove the door trim panel. Refer to **PANEL, DOOR TRIM, REMOVAL**.
3. Pull the watershield (3) back and release the adhesive bead (2) using a flat bladed tool (1). Remove enough to access the door latch.

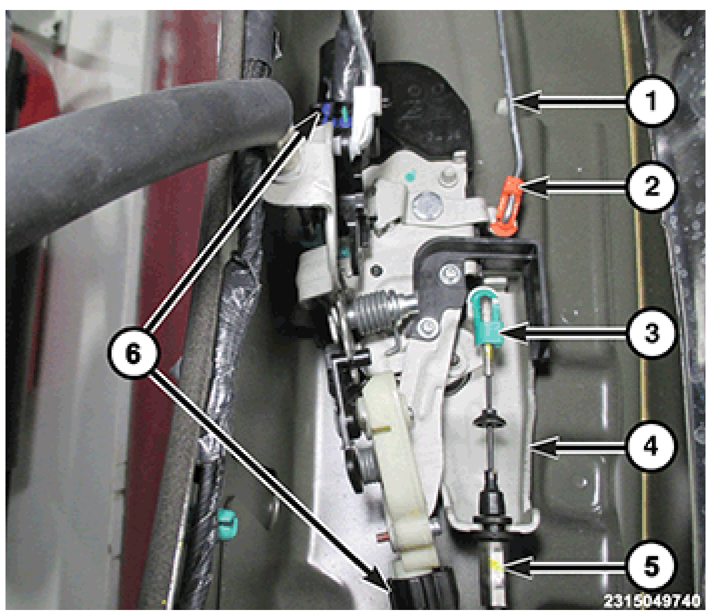

Fig. 78: Door Lock Cylinder Link, Clips), Exterior Handle Release Cable & Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

4. Reach into the door and release the clip (2) and remove the door lock cylinder link (1), if equipped.
5. Release the clip (3) and remove the exterior handle release cable (5)
6. Disconnect the wire harness connectors (6).

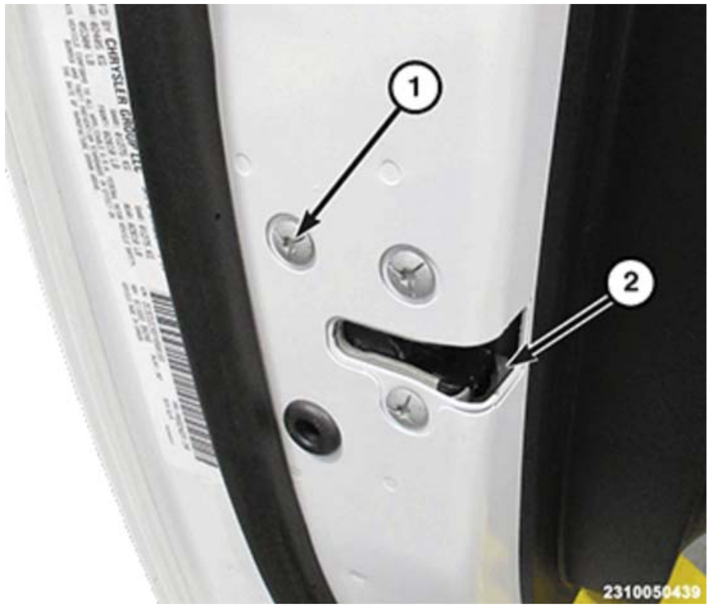

Fig. 79: Bolts & Door Latch
Courtesy of CHRYSLER GROUP, LLC

7. Remove the three bolts (1) and the door latch (2).

INSTALLATION

INSTALLATION

Fig. 80: Bolts & Door Latch
Courtesy of CHRYSLER GROUP, LLC

1. Position the door latch (2) into the door and install the three bolts (1).
2. Tighten the door latch bolts to the proper specification. Refer to **SPECIFICATIONS**.

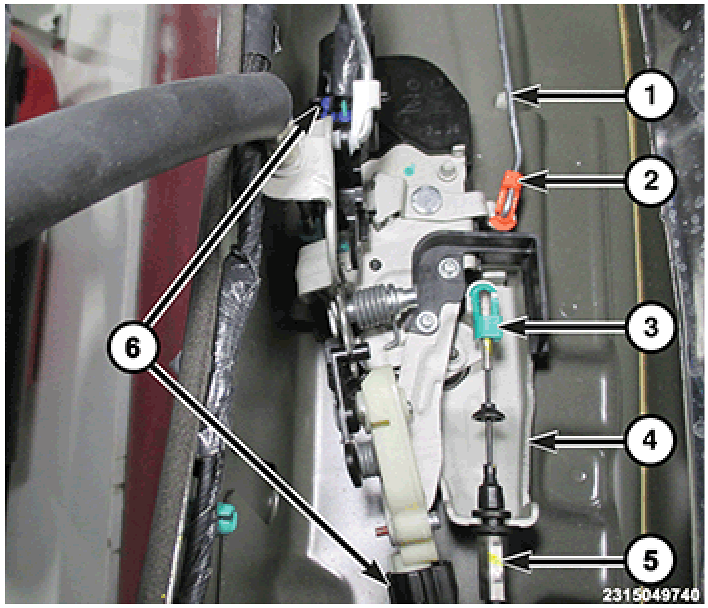

Fig. 81: Door Lock Cylinder Link, Clips), Exterior Handle Release Cable & Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

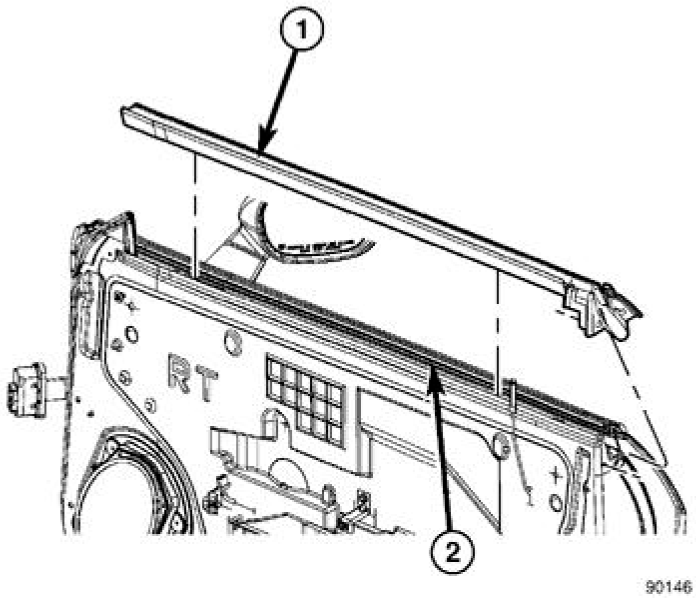
3. Connect the wire harness connectors (6).
4. Install the door lock cylinder link (1) and snap the plastic clip (2) in place, if equipped.
5. Install the exterior handle release cable (5), and snap the plastic clip (3) in place.
6. Apply firm and even pressure around the perimeter of the watershield to seal the adhesive bead to the door.
7. Using a wrench inserted through the access slot on the outer latch face of the door, loosen the hex socket adjusting screw.
8. Cycle the exterior door handle through its full travel two or three times.
9. Tighten the adjusting screw securely.
10. Install the door trim panel. Refer to **PANEL, DOOR TRIM, INSTALLATION**.

MOLDING

REMOVAL

REMOVAL

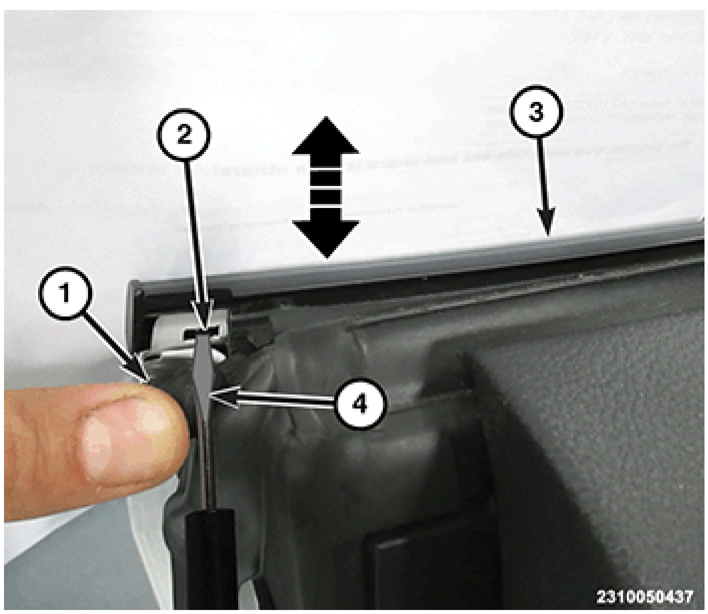
MOLDING-INNER BELT



[Fig. 82: Removing/Installing Inner Belt Molding - Door]
Courtesy of CHRYSLER GROUP, LLC

1. Remove the door trim panel. Refer to **PANEL, DOOR TRIM, REMOVAL**.
2. Starting at the front of the inner belt molding, carefully pry up on the molding and work towards the rear of the door to remove.

MOLDING-OUTER BELT



[Fig. 83: Door Seal, Tab, Outer Belt Molding & Flat Bladed Tool]
Courtesy of CHRYSLER GROUP, LLC

1. At the rear of the door, hold the door seal (1) back.
2. Using a small flat bladed tool (4), press the tab (2) and carefully pry up on the outer belt molding (3). Work towards the front of the door and remove.

INSTALLATION

INSTALLATION

MOLDING-INNER BELT

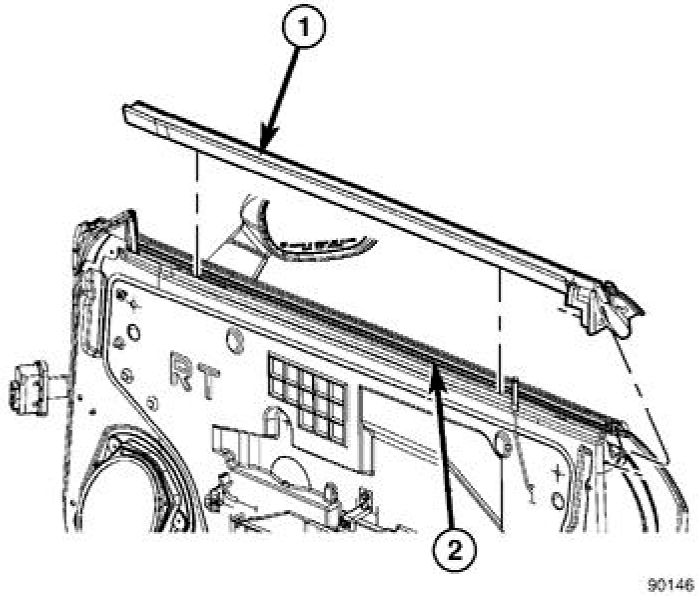


Fig. 84: Removing/Installing Inner Belt Molding - Door
Courtesy of CHRYSLER GROUP, LLC

1. Starting from the rear of the door, install the inner belt molding (1) to the door (2).
2. Continue to firmly press down working towards the front of the door.
3. Install the door trim panel. Refer to **PANEL, DOOR TRIM, INSTALLATION**.

MOLDING-OUTER BELT

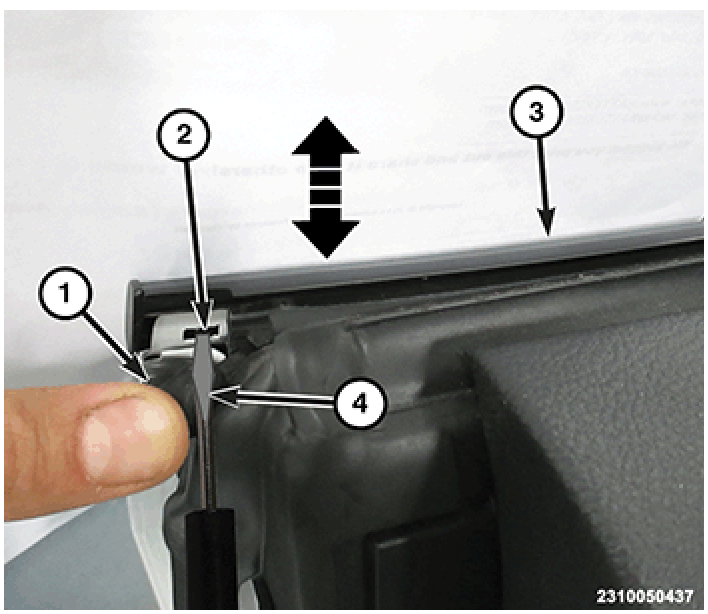

Fig. 85: Door Seal, Tab, Outer Belt Molding & Flat Bladed Tool
Courtesy of CHRYSLER GROUP, LLC

1. Starting from the front of the door, install the outer belt molding (3) to the door by firmly pressing down.

2. Make sure the tab (2) at the rear of the outer belt molding is fully engaged.

PANEL, DOOR TRIM

REMOVAL

REMOVAL

Fig. 86: Mat, Screw & Window Switch
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Using a trim stick or equivalent, remove and disconnect the window switch (3).
3. Lift the mat (1) and remove the screw (2).

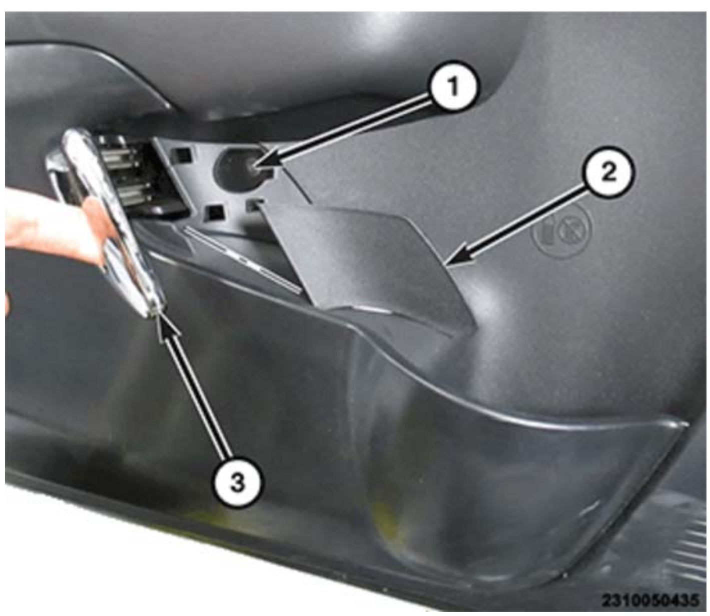

Fig. 87: Cover & Screw
Courtesy of CHRYSLER GROUP, LLC

4. Using a trim stick or equivalent, remove the cover (2) then the screw (1).

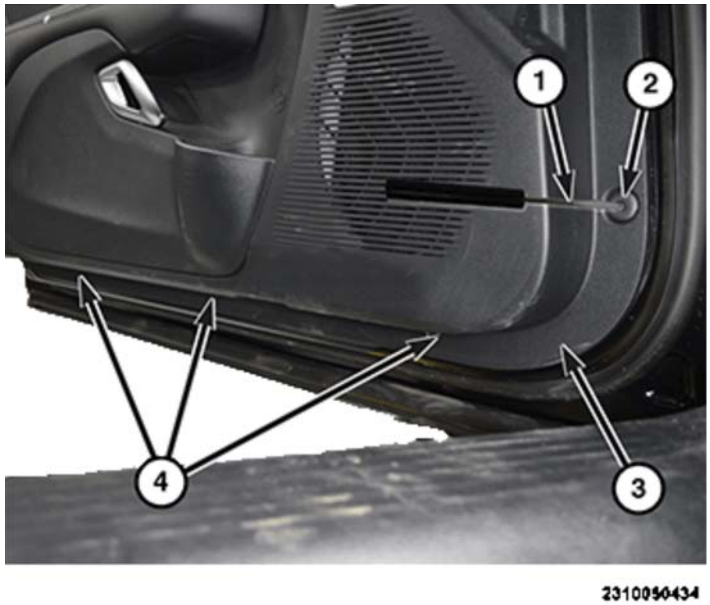

Fig. 88: Tool, Fastener, Door Trim Panel & Screws
Courtesy of CHRYSLER GROUP, LLC

5. Remove the three screws (4) at the bottom of the door trim panel (3).
6. Using a suitable tool (1), push the center of the fastener (2) then remove. Refer to **DOOR - FRONT, STANDARD PROCEDURE**.
7. Using a trim stick or equivalent, release the door trim panel starting at the lower edge and working around the perimeter to disengage the retainer clips. Position the door trim panel slightly away, do not remove.
8. Disconnect the wire harness connectors.

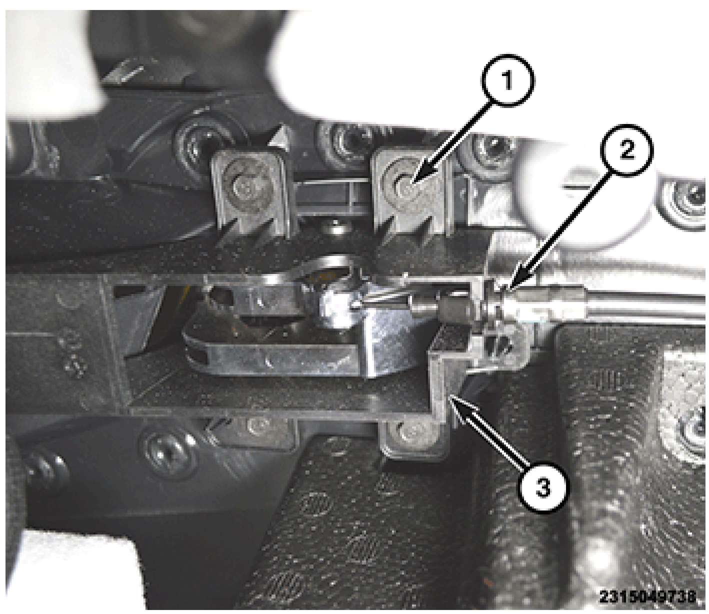

Fig. 89: Bolts, Door Latch Release Cable & Interior Door Handle
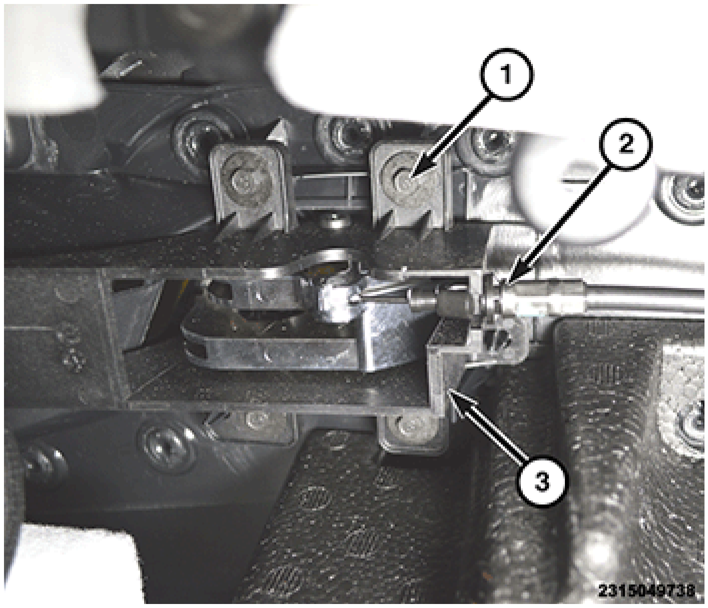
Courtesy of CHRYSLER GROUP, LLC

9. Remove the door latch release cable (2) from the interior door handle (3).

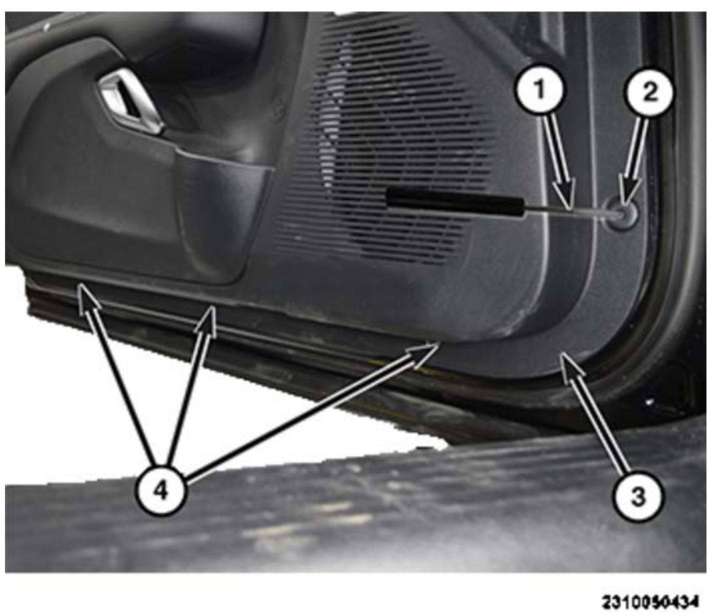
INSTALLATION

INSTALLATION



[Fig. 90: Bolts, Door Latch Release Cable & Interior Door Handle]
Courtesy of CHRYSLER GROUP, LLC

1. Position the door trim panel near the door and install the door latch release cable (2) to the interior door handle (3).
2. Connect the wire harness connectors.
3. Feed the window switch harness through the cavity in the door trim panel.



[Fig. 91: Tool, Fastener, Door Trim Panel & Screws]
Courtesy of CHRYSLER GROUP, LLC

4. Install the lock knob through the door trim panel (3). Align the door trim panel retaining clips to the door and hand tap around the perimeter to engage the retaining clips.

5. Install the push fastener (2). Refer to **DOOR - FRONT, STANDARD PROCEDURE**.
6. Install the screws (4) at the bottom of the door trim panel.

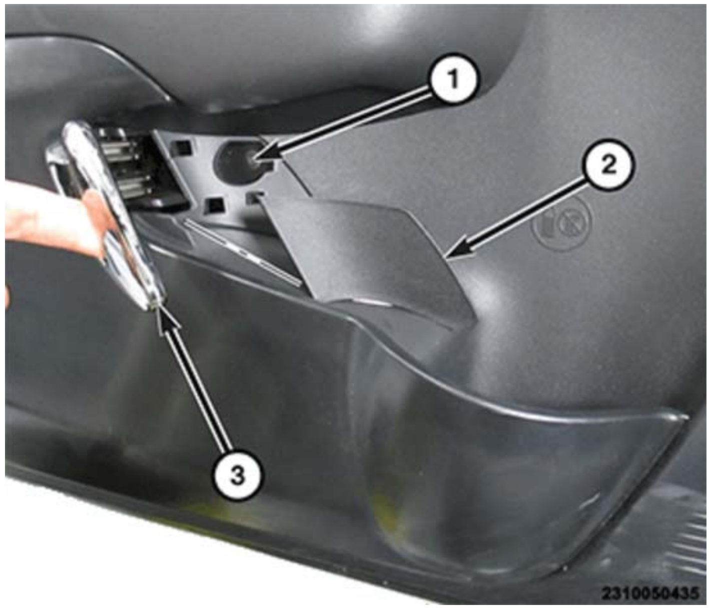


Fig. 92: Cover & Screw
Courtesy of CHRYSLER GROUP, LLC

7. Install the screw (1) and tighten securely.
8. Install the cover (2).

Fig. 93: Mat, Screw & Window Switch
Courtesy of CHRYSLER GROUP, LLC

9. Connect the window switch connector and install the window switch (3) into the door trim panel.
10. Install the screw (2) and tighten securely. Set the mat (1) in place.
11. Connect the negative battery cable.

12. Perform the door module learn procedure. Refer to **STANDARD PROCEDURE** .

REGULATOR, WINDOW

REMOVAL

REMOVAL

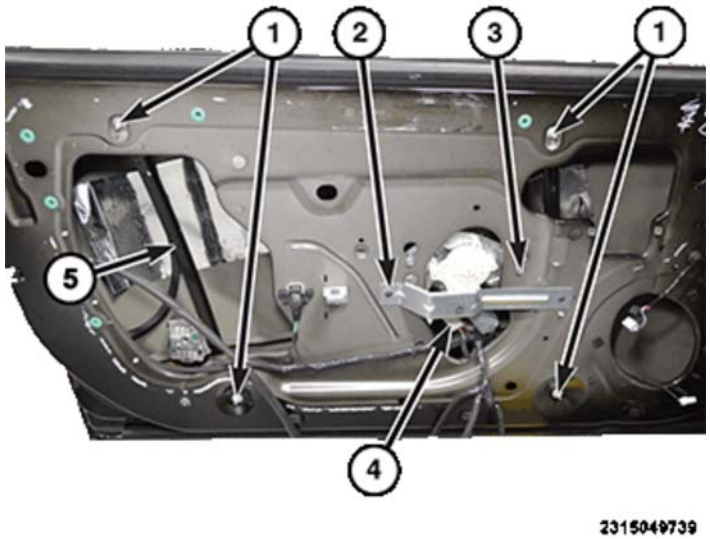

Fig. 94: Window Regulator Components
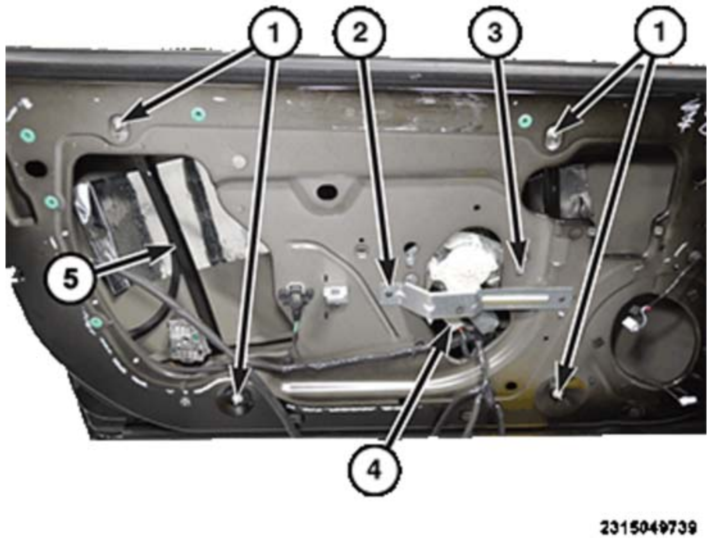
Courtesy of CHRYSLER GROUP, LLC

NOTE: **It is not necessary to completely remove the power window motor bolts (3).**

1. Remove the door glass. Refer to **GLASS, DOOR, REMOVAL**.
2. Remove the two screws (2) and the door panel bracket.
3. Disconnect the power window motor connector (4).
4. Loosen the three power window motor bolts (3).
5. Remove the window regulator nuts (1).
6. Carefully remove the window regulator (5) through the large access hole at the rear of the door.

INSTALLATION

INSTALLATION



[Fig. 95: Window Regulator Components]

Courtesy of CHRYSLER GROUP, LLC

1. Install the window regulator (5) into the door through the large access hole at the rear of the door.
2. Align the power window motor into the slots on the door and tighten the power window motor bolts (3) to the proper specification. Refer to **SPECIFICATIONS**.
3. Install the window regulator nuts (1) and tighten to the proper specification. Refer to **SPECIFICATIONS**.
4. Position the door panel bracket and install the two screws (2). Tighten the screws securely.
5. Connect the power window motor connector (4).
6. Install the door glass. Refer to **GLASS, DOOR, INSTALLATION**.

STRIKER, DOOR LATCH

REMOVAL

REMOVAL

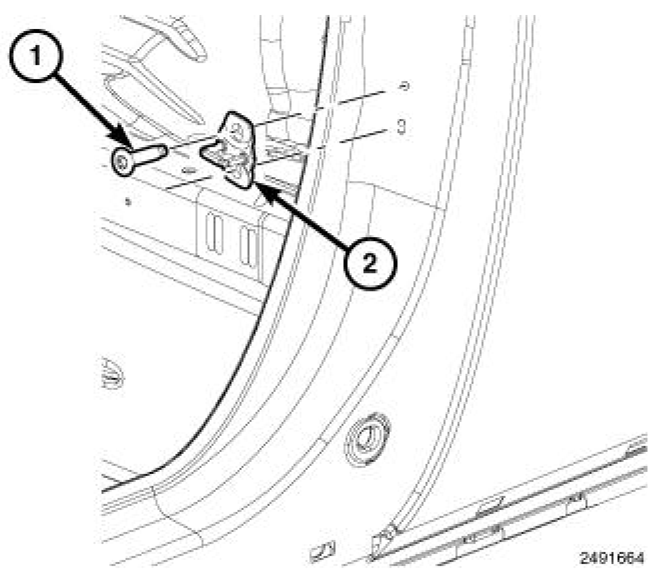


Fig. 96: Door Latch Striker
Courtesy of CHRYSLER GROUP, LLC

1. Using a grease pencil or equivalent, mark the position of the door latch striker (2) on the B-pillar to aid installation.
2. Remove the bolts (1) and the door latch striker.

INSTALLATION

INSTALLATION

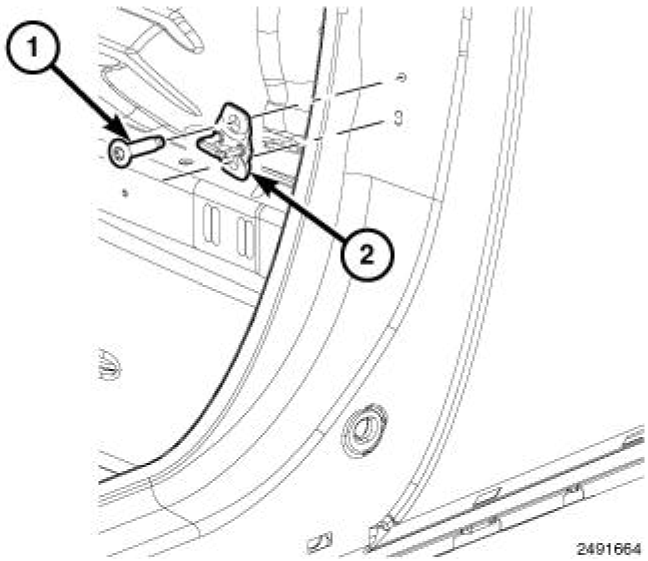

Fig. 97: Door Latch Striker
Courtesy of CHRYSLER GROUP, LLC

1. Position the door latch striker (2) and loosely install the bolts (1).
2. Align the door latch striker with the reference mark made previously and tighten the door latch striker bolts to the proper specification. Refer to SPECIFICATIONS.
3. Verify door fit and operation. Adjust the door latch striker if necessary. Refer to GAP AND FLUSH, SPECIFICATIONS.

WATERSHIELD

REMOVAL

REMOVAL

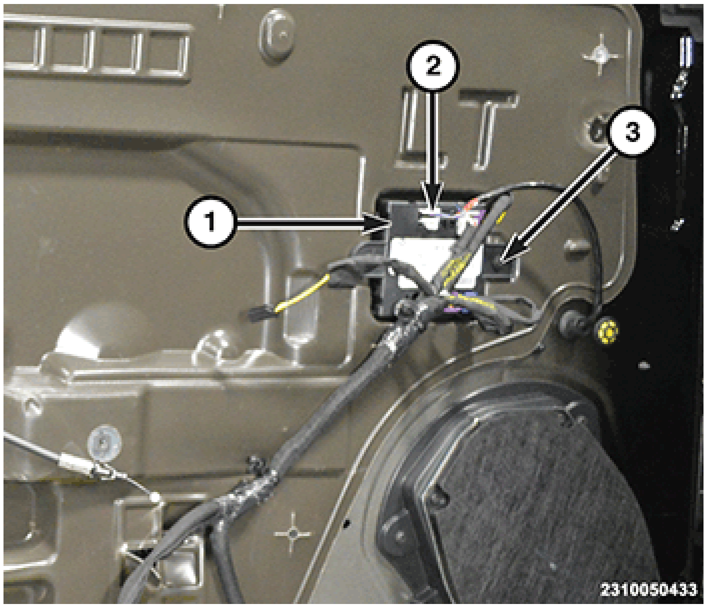

Fig. 98: Door Control Module, Wire Harness Connectors & Screw
Courtesy of CHRYSLER GROUP, LLC

CAUTION: **Do not allow the watershield or adhesive to become contaminated with dirt or other foreign substances.**

Do not damage the watershield during removal and installation.

If the watershield becomes contaminated or damaged, replace the watershield.

1. Remove the door trim panel. Refer to **PANEL, DOOR TRIM, REMOVAL**.
2. Disconnect the wire harness connectors (2). Remove the screws (3) and the door control module (1).

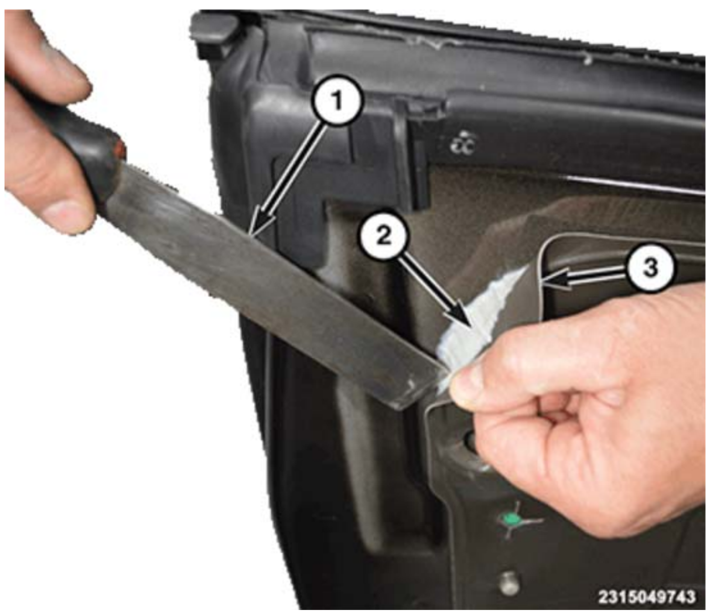

Fig. 99: Flat Bladed Tool, Adhesive Bead & Watershield
Courtesy of CHRYSLER GROUP, LLC

3. Pull the watershield (3) back and release the adhesive bead (2) using a flat bladed tool (1).

4. Carefully work around the perimeter of the watershield until fully removed.

INSTALLATION

INSTALLATION

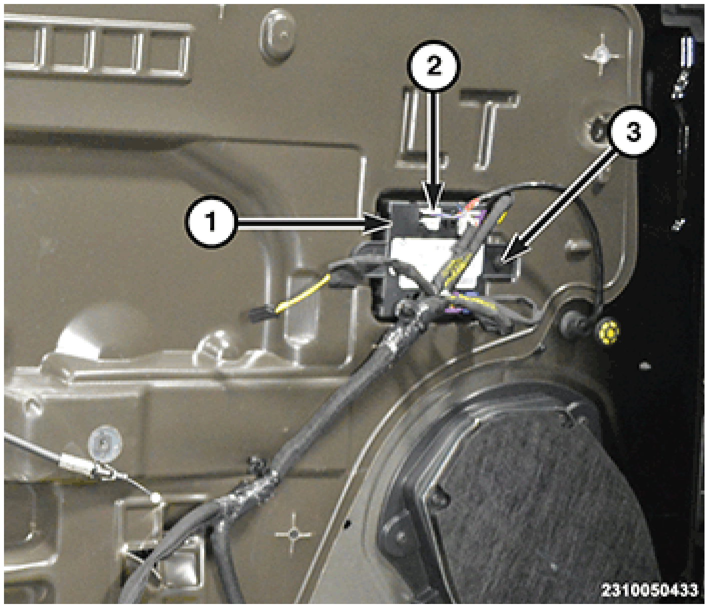

Fig. 100: Door Control Module, Wire Harness Connectors & Screw
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not allow the watershield or adhesive to become contaminated with dirt or other foreign substances.

Do not damage the watershield during removal and installation.

If the watershield becomes contaminated or damaged, replace the watershield.

1. Align the watershield to the door.
2. Apply firm and even pressure around the perimeter of the watershield to seal the adhesive bead to the door.
3. Position the door control module (1) and install the screws (3). Tighten the screws securely.
4. Connect the wire harness connectors (2).
5. Install the door trim panel. Refer to PANEL, DOOR TRIM, INSTALLATION.

EXTERIOR

CLADDING, BODY

REMOVAL

REMOVAL

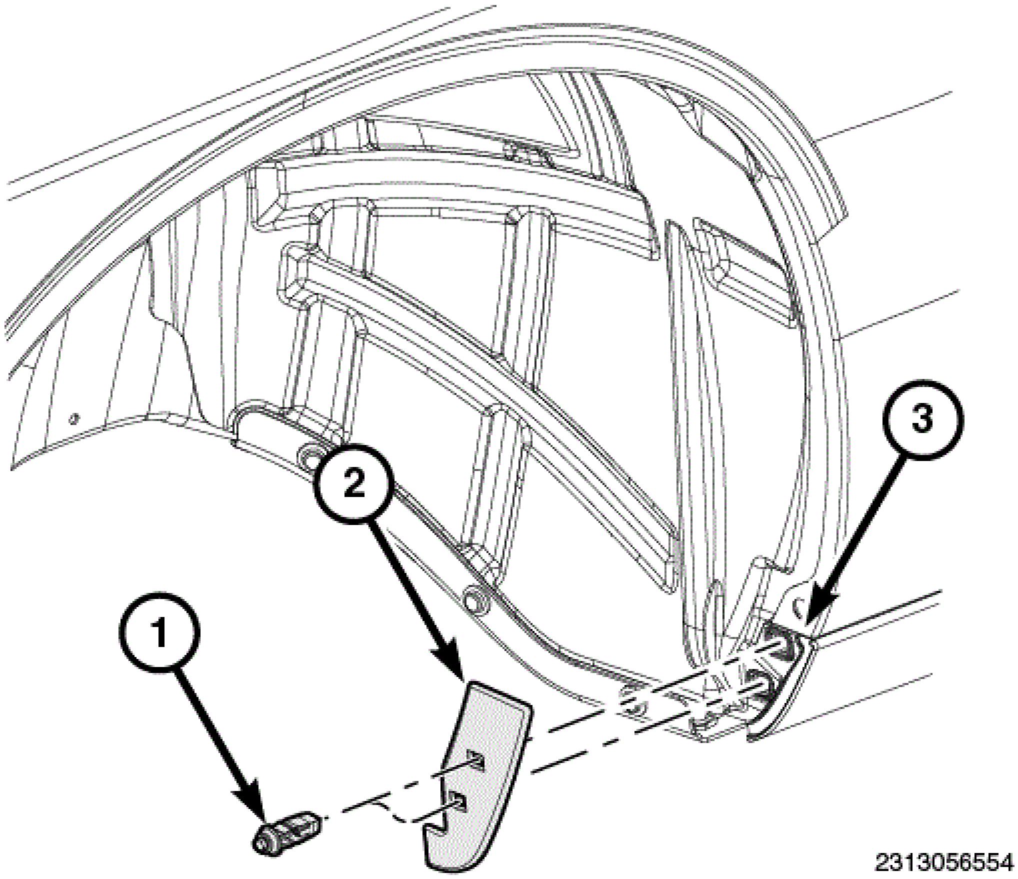

Fig. 101: Specialty Nut, Front Spat & Sill Cladding
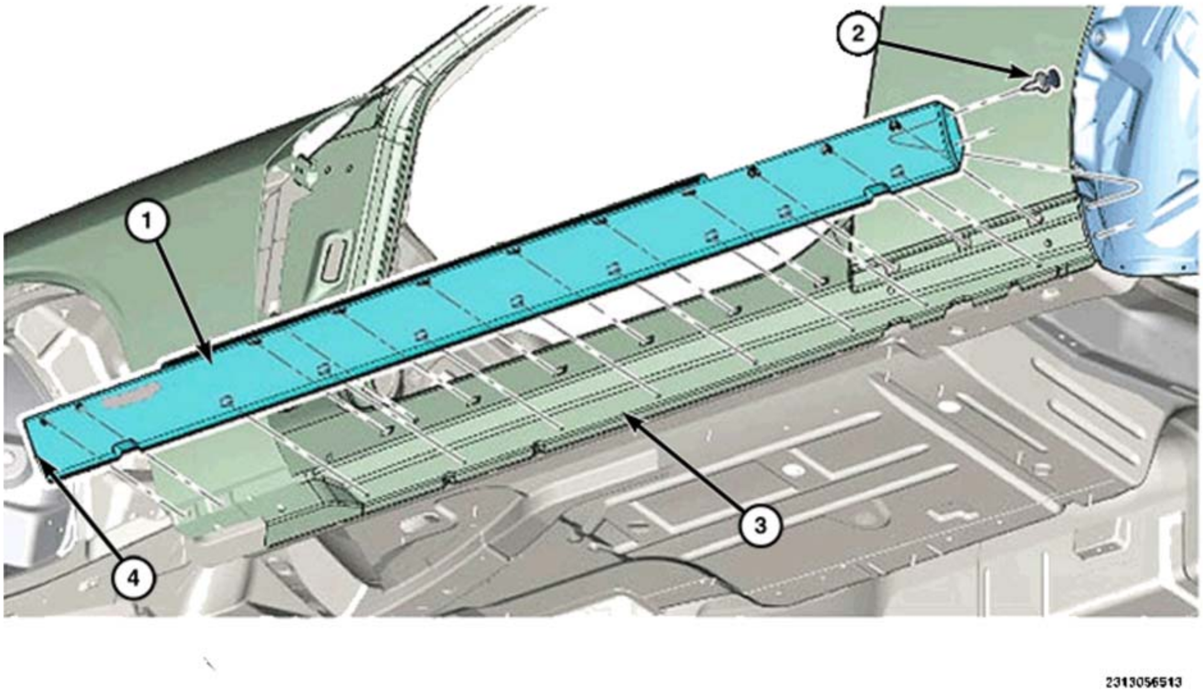
Courtesy of CHRYSLER GROUP, LLC

1. As a guide for installation, apply a length of masking tape on the body side, parallel to the top edge of the body side cladding.
2. Raise and support the vehicle Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the wheels from the side of the vehicle being serviced Refer to **REMOVAL** .
4. Remove the two specialty nuts (1) and remove the front spats (2).



[**Fig. 102: Sill Cladding, Fastener, Body & Front Foam**]
Courtesy of CHRYSLER GROUP, LLC

5. Remove the fasteners (2) from the rear wheelhouse.
6. Pull sill cladding (1) from one end and beneath until all the cross car pins are disengaged and front foam (4) is detached form the body (3).
7. Remove the sill cladding (1) and remove any clips that might be trapped in the holes to avoid falling inside the sheet metal and creating any noises.

INSTALLATION

INSTALLATION

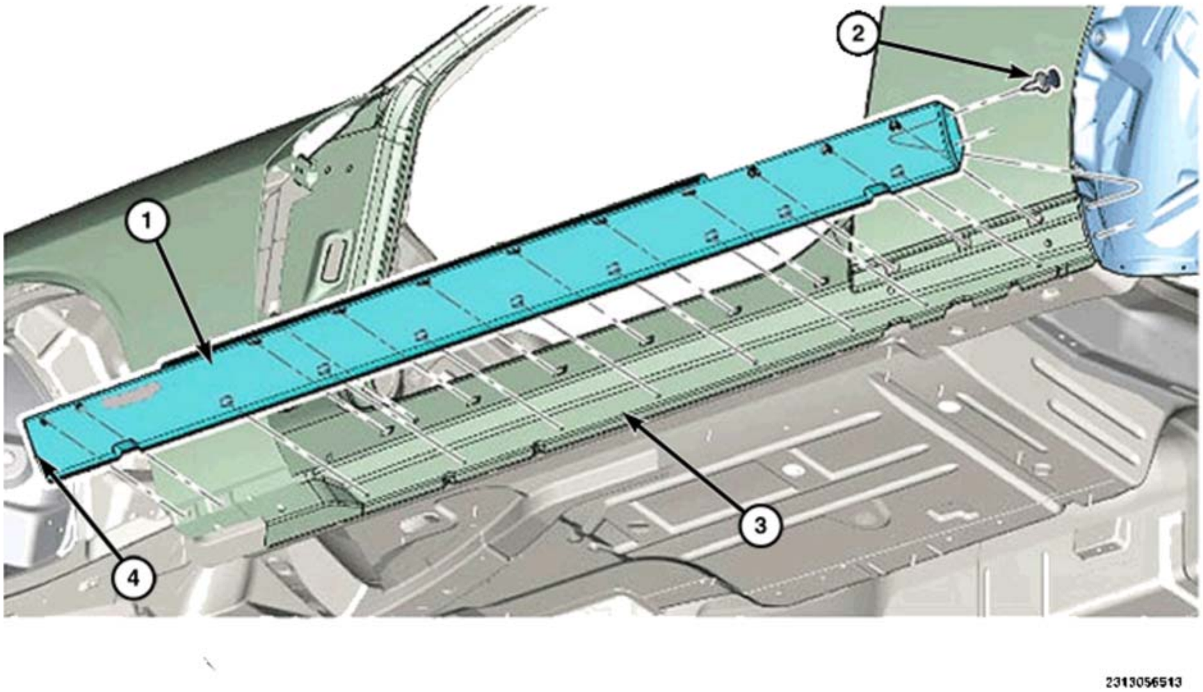


Fig. 103: Sill Cladding, Fastener, Body & Front Foam
Courtesy of CHRYSLER GROUP, LLC

1. After the sill cladding has been removed, **remove any tape residue off the sheet metal by using 3M General Purpose Adhesive Cleaner #08984 or equivalent.**
2. Wipe the attachment area (4) with a clean, lint-free cloth, moistened with a 50% solution of water and isopropylic alcohol
3. Wait 30 seconds for the alcohol to flash off.
4. Obtain sill cladding and verify that the part is not damaged and verify that it has the correct number of cross car clips and replace as necessary.

NOTE: **At the time of installation of the sill cladding, the body surface and cladding temperature shall be a minimum of 21 degrees Celsius (70 degrees Fahrenheit) and a maximum of 35 degrees Celsius (95 degrees Fahrenheit).**

5. Removing the protective tape from the foam block located at the front of the sill cladding (4).
6. Position cladding to body side aperture (3) and push cladding onto vehicle. Make sure clips are aligned with attaching holes in the body and install into holes. Starting from the center holes and working outward.
7. Apply pressure to the base of the cladding where the w-clips fasteners are located and seat fully.
8. Align cladding with rear wheelhouse and install the push pin fasteners (2).

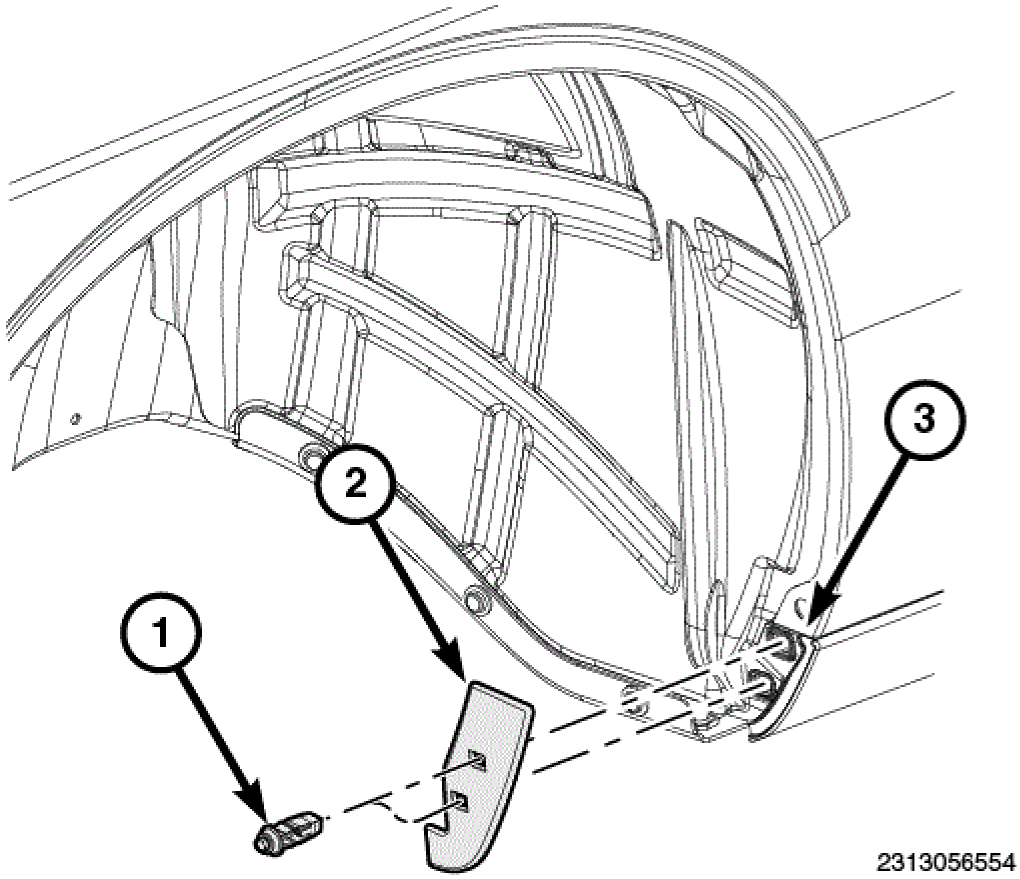

Fig. 104: Specialty Nut, Front Spat & Sill Cladding
Courtesy of CHRYSLER GROUP, LLC

9. Install the spats (2) to the front of the sill cladding (3) and install the two fasteners (1).
10. Install the wheels. Refer to **INSTALLATION** .
11. Lower the vehicle.

COVER, COWL PANEL

REMOVAL

REMOVAL

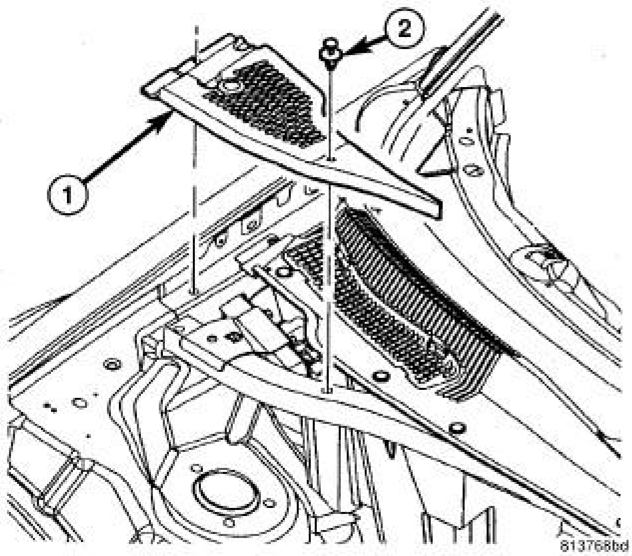

Fig. 105: Cowl Panel & Push Pins
Courtesy of CHRYSLER GROUP, LLC

1. Remove the windshield wiper arms. Refer to **ARM, WIPER, REMOVAL** .
2. Remove the push fastener and the right side seal.
3. Remove the two push fasteners (2) and the cowl top panel (1).

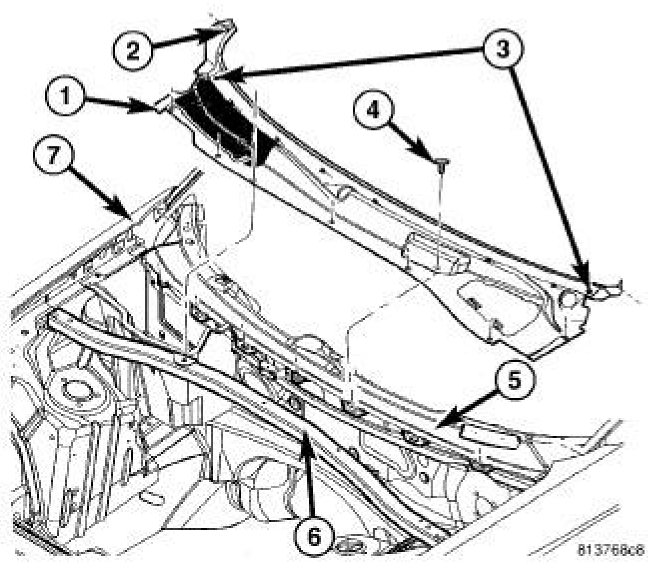

Fig. 106: Removing/Installing Cowl Panel
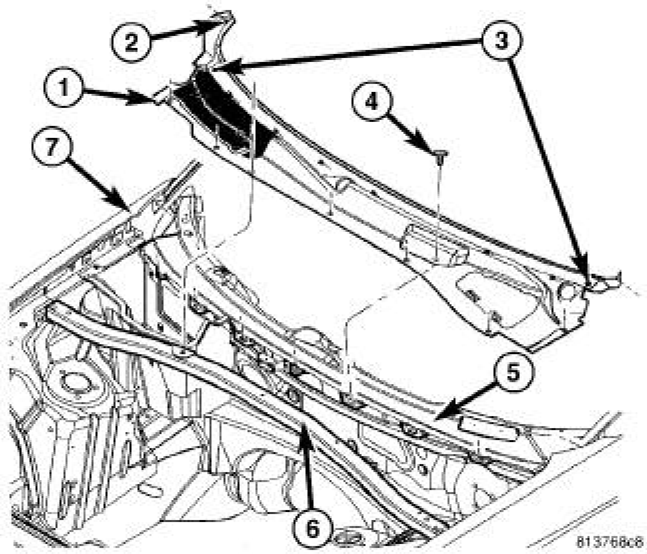
Courtesy of CHRYSLER GROUP, LLC

4. Disengage the two 1/4-turn fasteners (3) that secure the cowl top panel to the dash panel (5).
5. Remove the eight push fasteners.
6. Release the retaining clips and remove the cowl top panel.

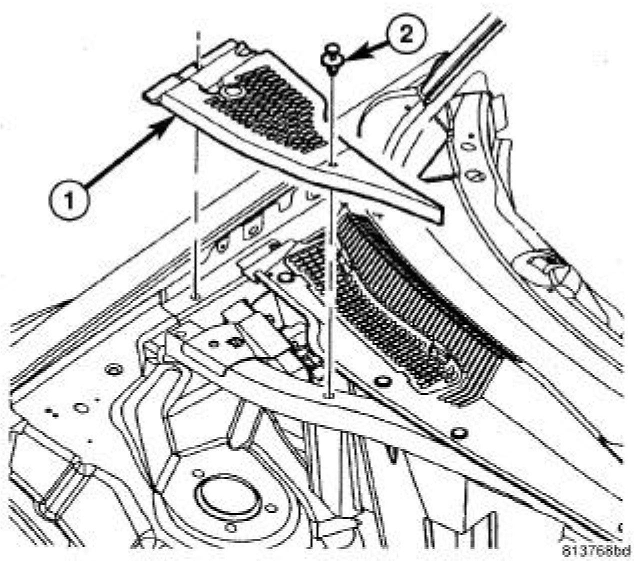
INSTALLATION

INSTALLATION



[Fig. 107: Removing/Installing Cowl Panel](#)
Courtesy of CHRYSLER GROUP, LLC

1. Position the cowl cover panel (1) and engage the retainer clips.
2. Fasten the 1/4-turn fasteners (3).
3. Install the eight push fasteners.
4. Install the windshield wiper arms. Refer to **ARM, WIPER, INSTALLATION** .



[Fig. 108: Cowl Panel & Push Pins](#)
Courtesy of CHRYSLER GROUP, LLC

5. Position the cowl top panel (1) and install the push fasteners (2).
6. Install the right side seal and the push fastener.

CROSSMEMBER, HEADLAMP MOUNTING

REMOVAL

REMOVAL

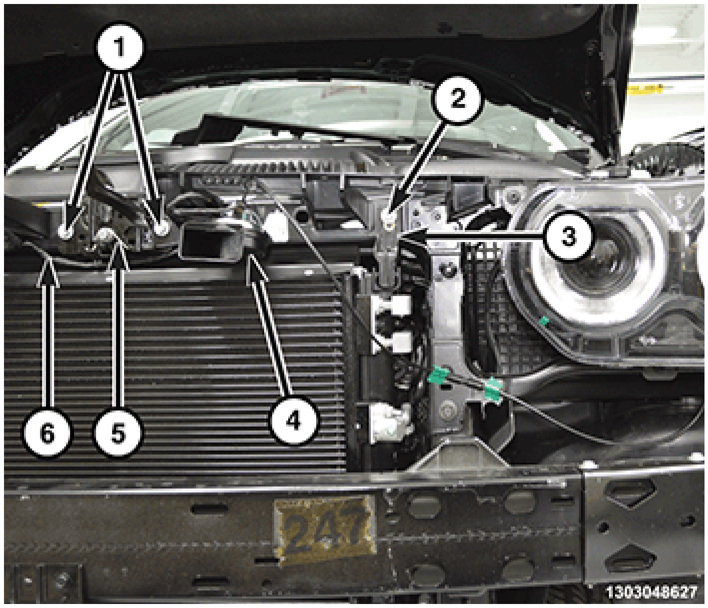


Fig. 109: Bolts, Upper Radiator Isolator, Horn, Hood Latch & Wire Harness
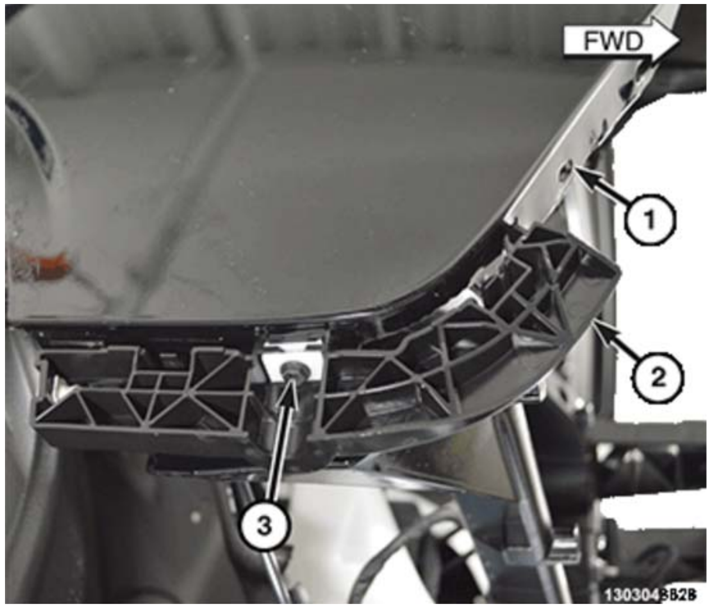
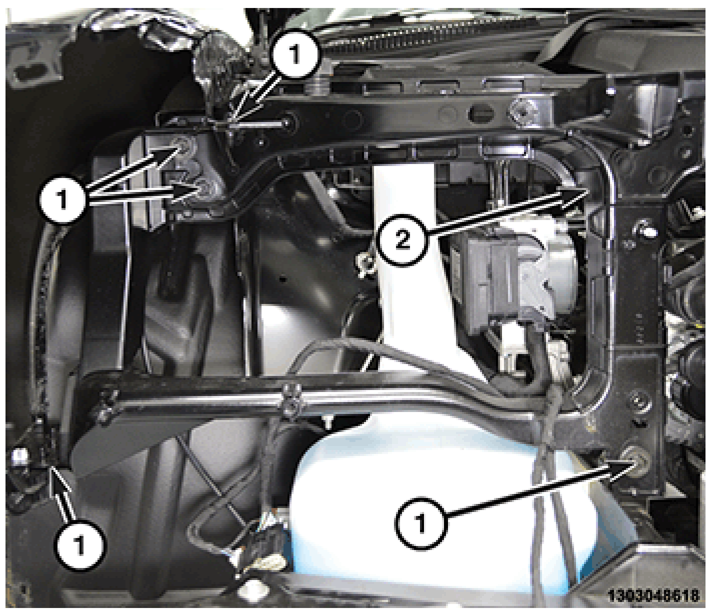
Courtesy of CHRYSLER GROUP, LLC

1. Remove the front fascia support. Refer to **SUPPORT, FRONT FASCIA, REMOVAL** .
2. Using a grease pencil or equivalent, mark the position of the hood latch (5) to aid installation.
3. Remove the bolts (1) and the hood latch. Unclip the hood release cable from the headlamp mounting crossmember and position aside.
4. Disconnect the wire harness connectors and remove the horns (4).
5. Remove the bolts (2) and upper radiator isolators (3).
6. Remove the air cleaner body. Refer to **BODY, AIR CLEANER, REMOVAL, 3.6L** , **BODY, AIR CLEANER, REMOVAL, 5.7L** , **BODY, AIR CLEANER, REMOVAL, 6.2L** or **BODY, AIR CLEANER, REMOVAL, 6.4L** .
7. Unclip the wire harness (6) from the headlamp mounting crossmember.
8. Unclip the brake lines from the backside of the headlamp mounting crossmember.
9. Remove the headlamps. Refer to **UNIT, FRONT LAMP, REMOVAL** .



[Fig. 110: Fender, Fascia Support Bracket & Screw](#)
Courtesy of CHRYSLER GROUP, LLC

10. At the bottom of each fender (1) remove the screw (3) and the fascia support bracket (2).



[Fig. 111: Bolts & Headlamp Mounting Crossmember](#)
Courtesy of CHRYSLER GROUP, LLC

11. Using a grease pencil, mark the position of the headlamp mounting crossmember (2) to the other body components prior to removal aid in installation.
12. Remove the bolts (1) on both side of the headlamp mounting crossmember and carefully remove it from the vehicle.

INSTALLATION

INSTALLATION

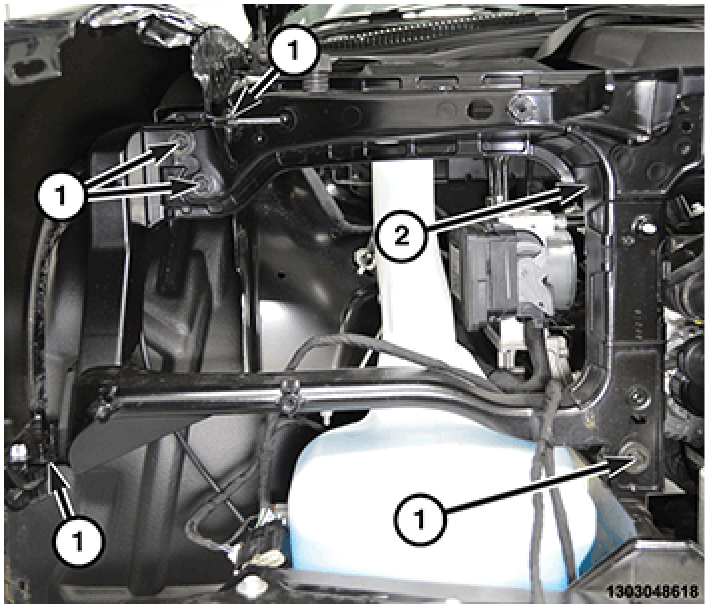


Fig. 112: Bolts & Headlamp Mounting Crossmember
Courtesy of CHRYSLER GROUP, LLC

NOTE: The Vehicle Emission Control Information (VECI) label(s) must be in place for the life of the vehicle. When replacing the component to which the VECI label is adhered, a new VECI label must also be adhered to the new component.

1. Position the headlamp mounting crossmember (2) onto the vehicle and loosely install all the bolts (1) on both sides of vehicle.
2. Align the headlamp mounting crossmember using the marks previously made and tighten the headlamp mounting crossmember bolts to the proper specification. Refer to SPECIFICATIONS.

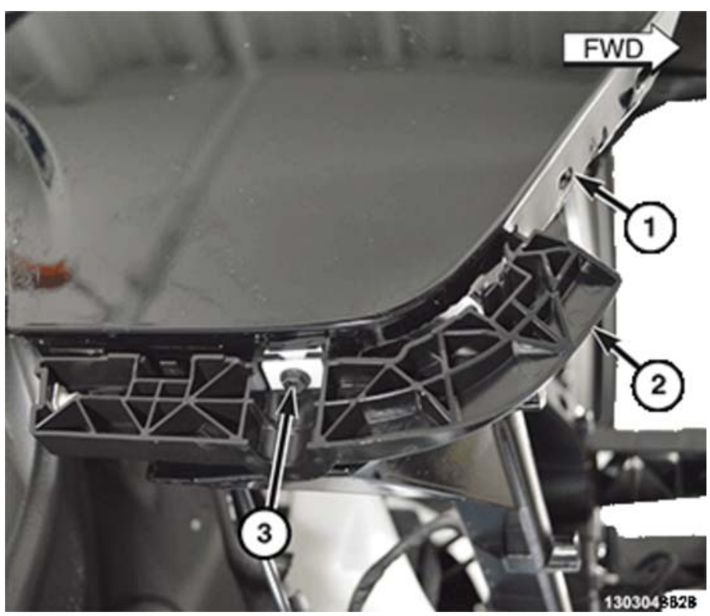

Fig. 113: Fender, Fascia Support Bracket & Screw
Courtesy of CHRYSLER GROUP, LLC

3. Install the fascia support bracket (2) at the bottom of each fender (1) and tighten the screw (3) securely.

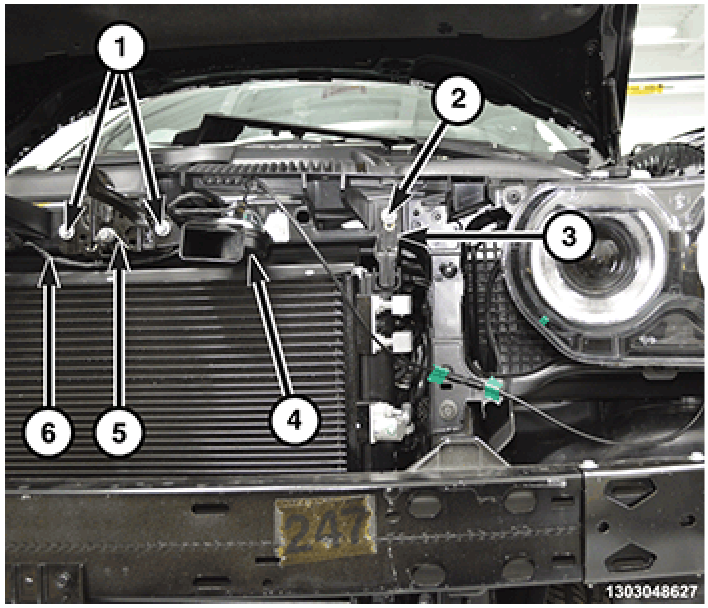

Fig. 114: Bolts, Upper Radiator Isolator, Horn, Hood Latch & Wire Harness
Courtesy of CHRYSLER GROUP, LLC

4. Route the wiring harness (6) and clip it to the headlamp mounting crossmember.
5. Clip the brake lines to the backside of the headlamp mounting crossmember.
6. Install the air cleaner body. Refer to **BODY, AIR CLEANER, INSTALLATION, 3.6L** , **BODY, AIR CLEANER, INSTALLATION, 5.7L** , **BODY, AIR CLEANER, INSTALLATION, 6.2L** or **BODY, AIR CLEANER, INSTALLATION, 6.4L** .
7. Position the upper radiator isolators (3) and install the bolts (2). Tighten the bolts securely.
8. Install the horns and tighten the horn bolts to the proper specification. Refer to **SPECIFICATIONS**.
9. Connect the horn wire harness connectors.
10. Position the hood latch (5) and install the bolts (1).
11. Align the hood latch with the reference mark made previously and tighten the hood latch bolts to the proper specification. Refer to **SPECIFICATIONS**.
12. Install the headlamps. Refer to **UNIT, FRONT LAMP, INSTALLATION** .
13. Install the front fascia support. Refer to **SUPPORT, FRONT FASCIA, INSTALLATION** .
14. Verify proper hood latch operation and fit of hood. Adjust if necessary. Refer to **GAP AND FLUSH, SPECIFICATIONS**.

GRILLE

REMOVAL

REMOVAL

LOWER GRILLE

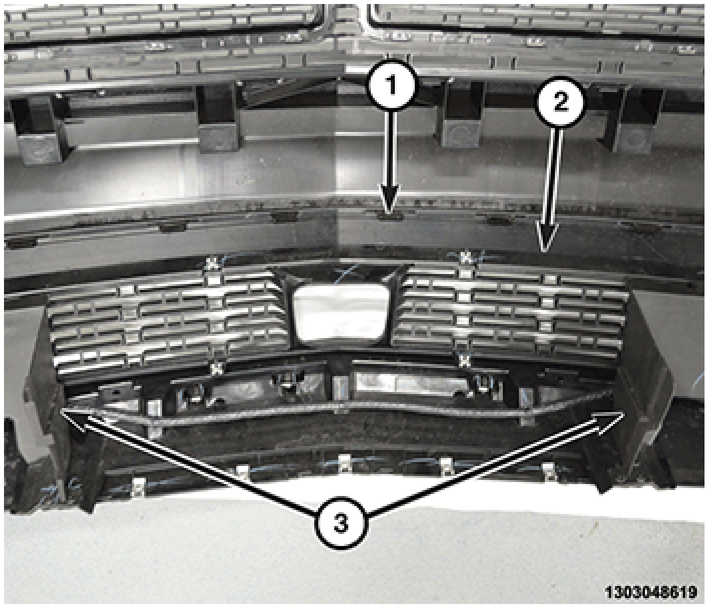

Fig. 115: Tabs, Lower Grille & Close Out Panels
Courtesy of CHRYSLER GROUP, LLC

1. Remove the front fascia. Refer to **FASCIA, FRONT, REMOVAL** .
2. Remove the plastic rivets and the close out panels (3).
3. Using a flat bladed tool or equivalent, release the tabs (1) and remove the lower grille (2) from the front fascia.

RADIATOR GRILLE

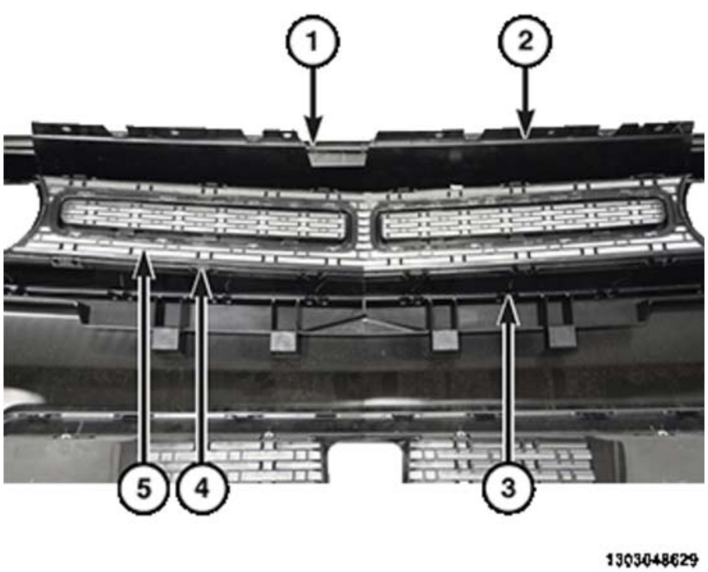

Fig. 116: Rivet, Radiator Grille & Tab
Courtesy of CHRYSLER GROUP, LLC

1. Remove the front fascia. Refer to **FASCIA, FRONT, REMOVAL** .
2. Remove the necessary rivets (1) at the top of the radiator grille (2).
3. Using a flat bladed tool or equivalent, release the tabs (3) and remove the radiator grille from the front

fascia.

INSTALLATION

INSTALLATION

LOWER GRILLE

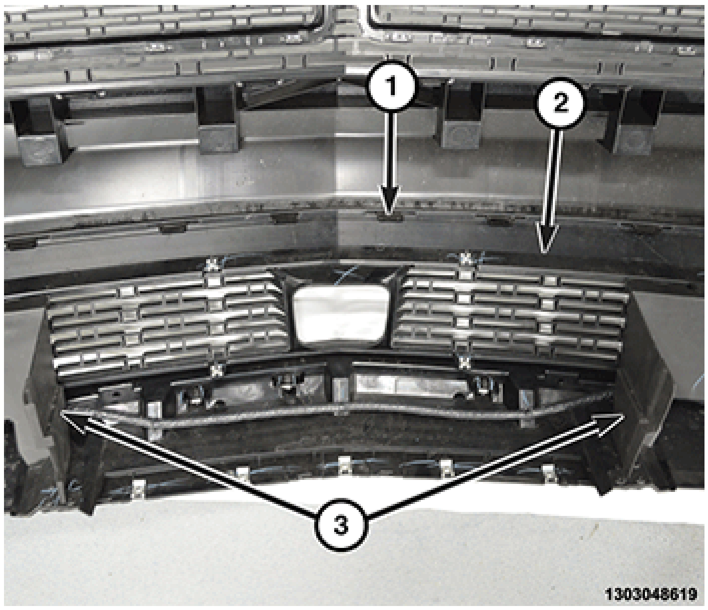

Fig. 117: Tabs, Lower Grille & Close Out Panels
Courtesy of CHRYSLER GROUP, LLC

1. Position the lower grille (2) into the front fascia and engage the tabs (1).
2. Position the close out panels (3) and install new plastic rivets.
3. Install the front fascia. Refer to **FASCIA, FRONT, INSTALLATION** .

RADIATOR GRILLE

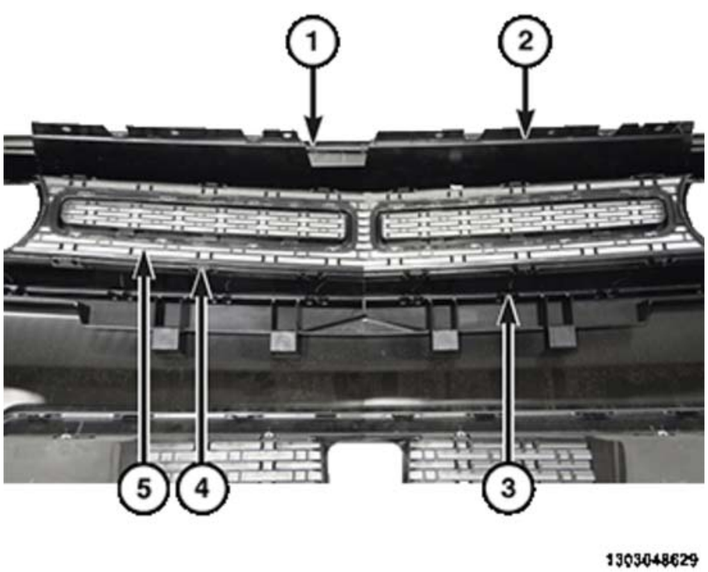

Fig. 118: Rivet, Radiator Grille & Tab

Courtesy of CHRYSLER GROUP, LLC

1. Position the radiator grille (2) onto the front fascia and engage the tabs (3).
2. Install new plastic rivets (1) at the top of the radiator grille.
3. Install the front fascia. Refer to **FASCIA, FRONT, REMOVAL** .

MIRROR, OUTSIDE REARVIEW

REMOVAL

REMOVAL

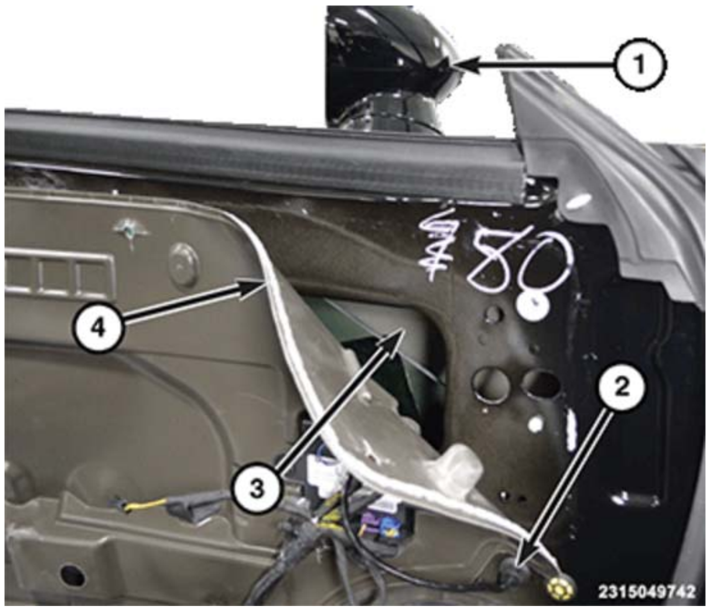

Fig. 119: Outside Rearview Mirror, Wire Harness Grommet, Opening & Watershield
Courtesy of CHRYSLER GROUP, LLC

1. Lower the door glass to the fully open position.
2. Remove the door trim panel. Refer to **PANEL, DOOR TRIM, REMOVAL**.
3. Pull the watershield (4) back and release the adhesive bead using a flat bladed tool. Release enough to access the outside rearview mirror nuts through the opening (3).
4. Disconnect the mirror wire harness connector and push the Wire Harness Grommet (2) through the door.
5. Remove the three nuts and the outside rearview mirror (1).

INSTALLATION

INSTALLATION

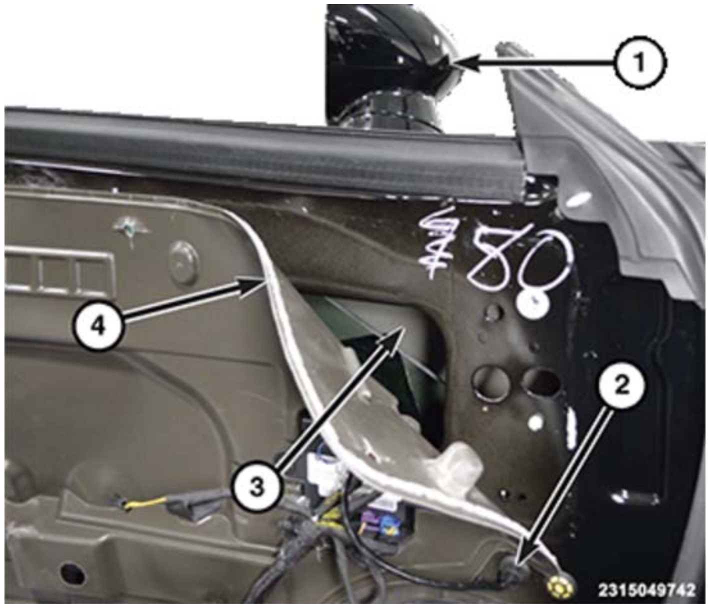

Fig. 120: Outside Rearview Mirror, Wire Harness Grommet, Opening & Watershield
Courtesy of CHRYSLER GROUP, LLC

1. Route the wire harness through the door and position the outside rearview mirror (1) onto the doors.
2. Install the three nuts and tighten securely.
3. Install the wire harness grommet (2) into the door and connect the mirror wire harness connector.
4. Apply firm and even pressure around the perimeter of the watershield (4) to seal the adhesive bead to the door.
5. Install the door trim panel. Refer to **PANEL, DOOR TRIM, INSTALLATION**.

MIRROR, OUTSIDE REARVIEW, GLASS

REMOVAL

REMOVAL

WARNING: Always wear eye and hand protection when servicing the mirror glass. Failure to observe these warnings may result in personal injury from broken glass.

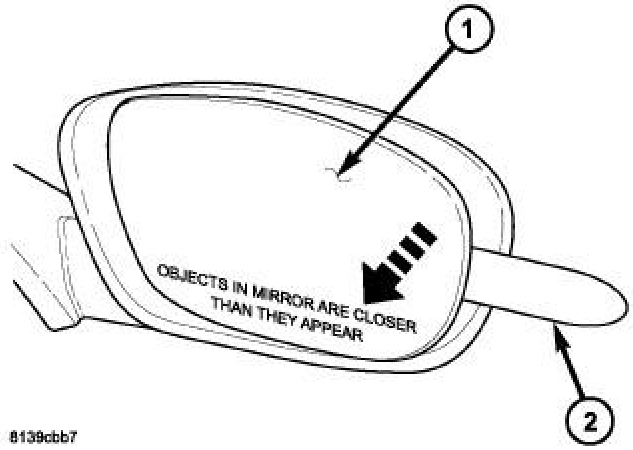

Fig. 121: Removing Glass-Outside Rearview Mirror
Courtesy of CHRYSLER GROUP, LLC

1. Position the mirror glass (1) so that it is facing in toward the vehicle as far as possible.
2. Disconnect and isolate the negative battery cable.
3. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent flat bladed tool (2), release the two outer mirror glass holder retaining clips from the mirror motor by inserting the trim stick between the mirror glass holder and the mirror motor.

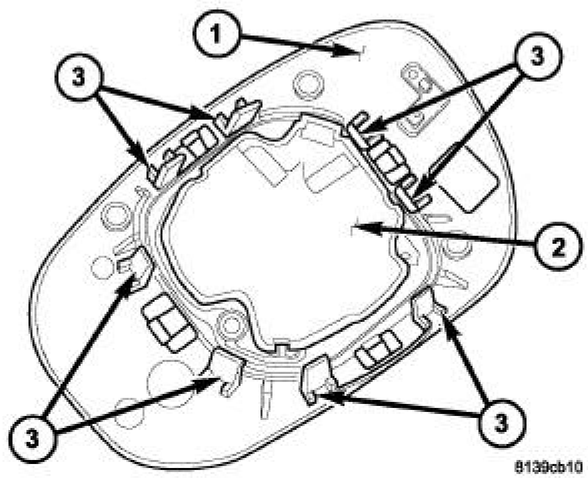

Fig. 122: Mirror Glass Holder, Retaining Clips & Motor
Courtesy of CHRYSLER GROUP, LLC

4. Carefully pull/pry the outside edges of the mirror glass holder (1) away from the mirror motor (2) to disengage the remaining six mirror glass retaining clips (3) from the mirror motor.
5. Separate the mirror glass holder from the mirror motor and disconnect the mirror wire harness from the heated glass electrical connector, if equipped.

INSTALLATION

INSTALLATION

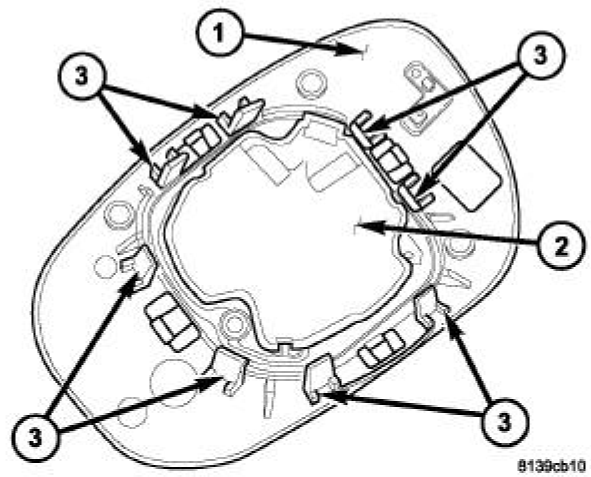

Fig. 123: Mirror Glass Holder, Retaining Clips & Motor
Courtesy of CHRYSLER GROUP, LLC

1. Connect the mirror wire harness to the heated glass electrical connector, if equipped.
2. Position the mirror glass holder (1) to the mirror assembly and align the eight mirror glass retaining clips (3) to the mirror motor (2).

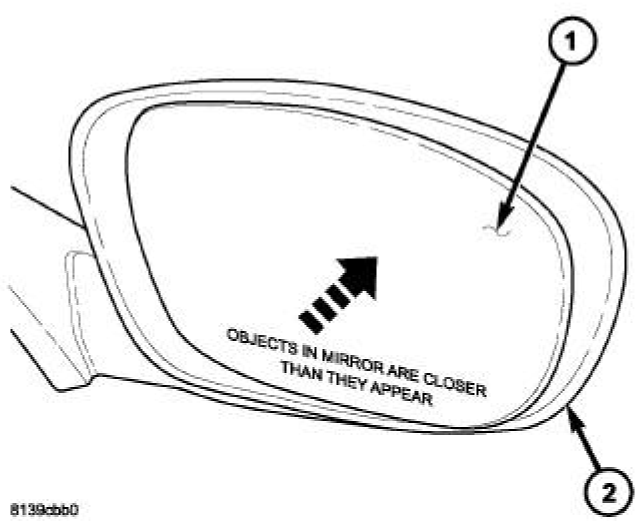

Fig. 124: Installing Outside Rearview Mirror Glass
Courtesy of CHRYSLER GROUP, LLC

NOTE:	**Pressure must be applied equally over the center portion of the mirror glass to fully engage the mirror glass retaining clips to the mirror motor.**

3. Using one hand, carefully push the mirror glass holder (1) onto the mirror motor, while at the same time supporting the mirror housing (2) from the backside with the other hand. Firmly push on the mirror glass holder until all eight mirror glass retaining clips are fully engaged.
4. Verify retention of the mirror glass holder by gently pulling outward on the glass.
5. Reconnect the negative battery cable.

NOTE: **For vehicles equipped with the optional Automatic Express Up power window feature, recalibration of this feature is required whenever power to the door module is disrupted.**

SHIELD, SPLASH, FRONT WHEELHOUSE

REMOVAL

REMOVAL

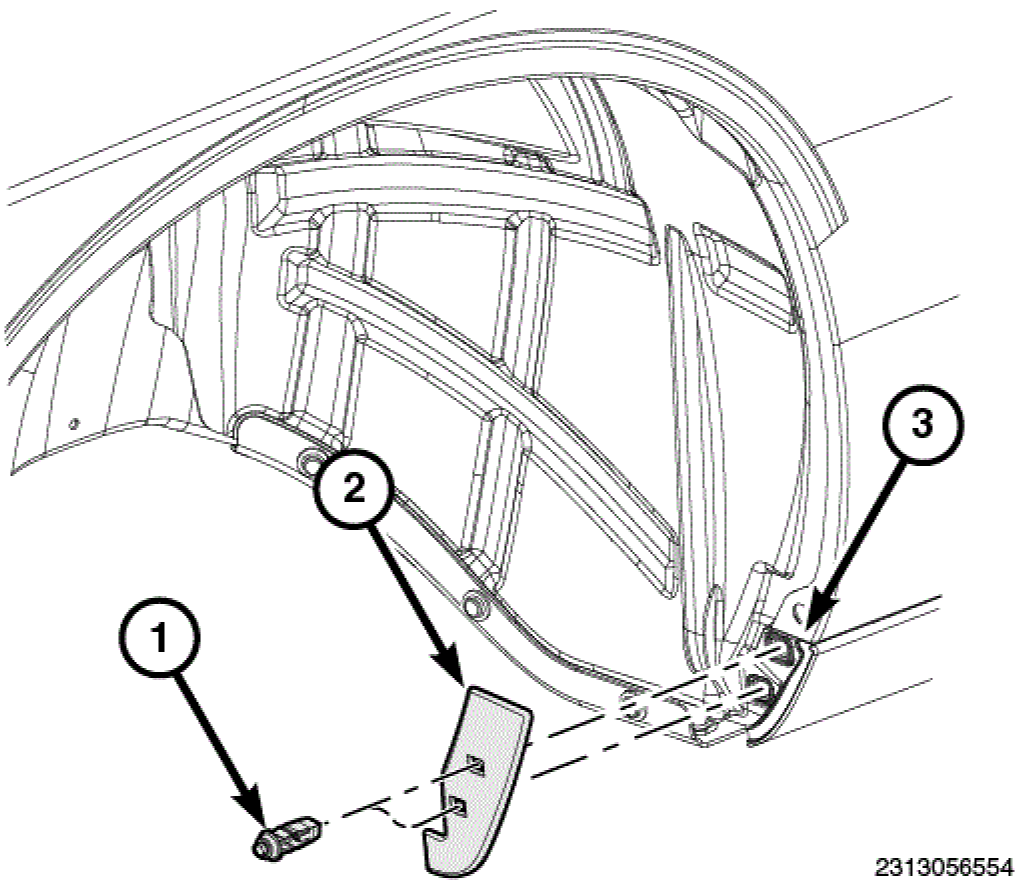

Fig. 125: Specialty Nut, Front Spat & Sill Cladding
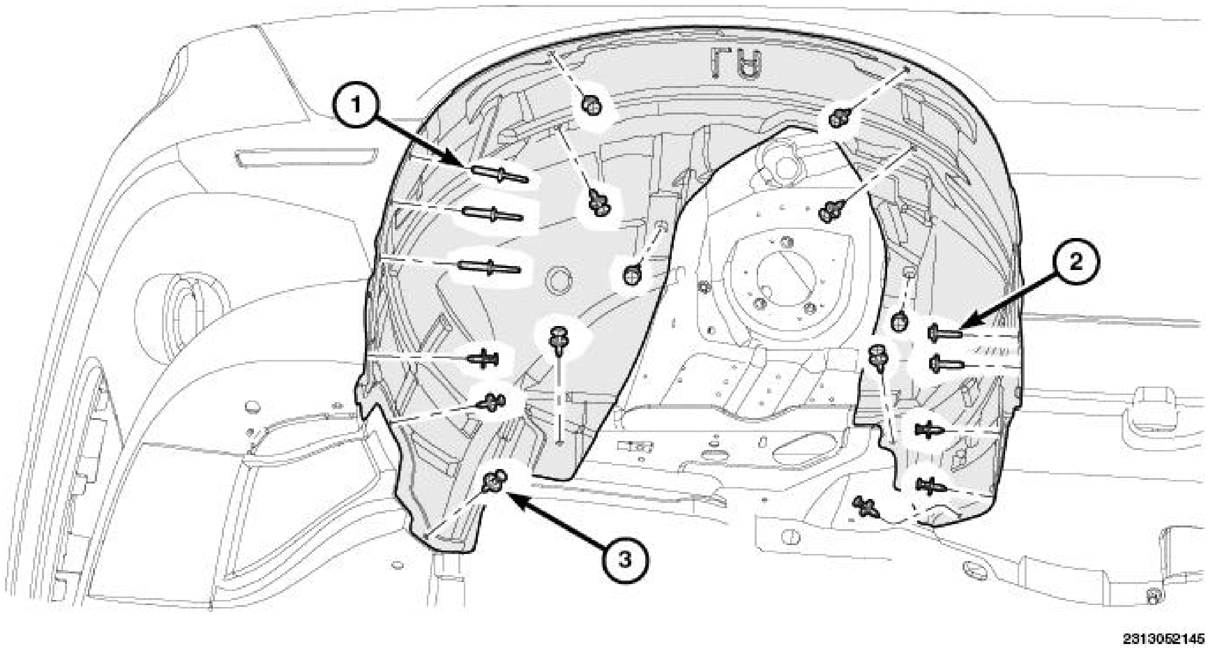
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the wheel from the side of the vehicle being serviced. Refer to **REMOVAL** .
3. Remove the two specialty nuts (1) and remove the front spats (2).

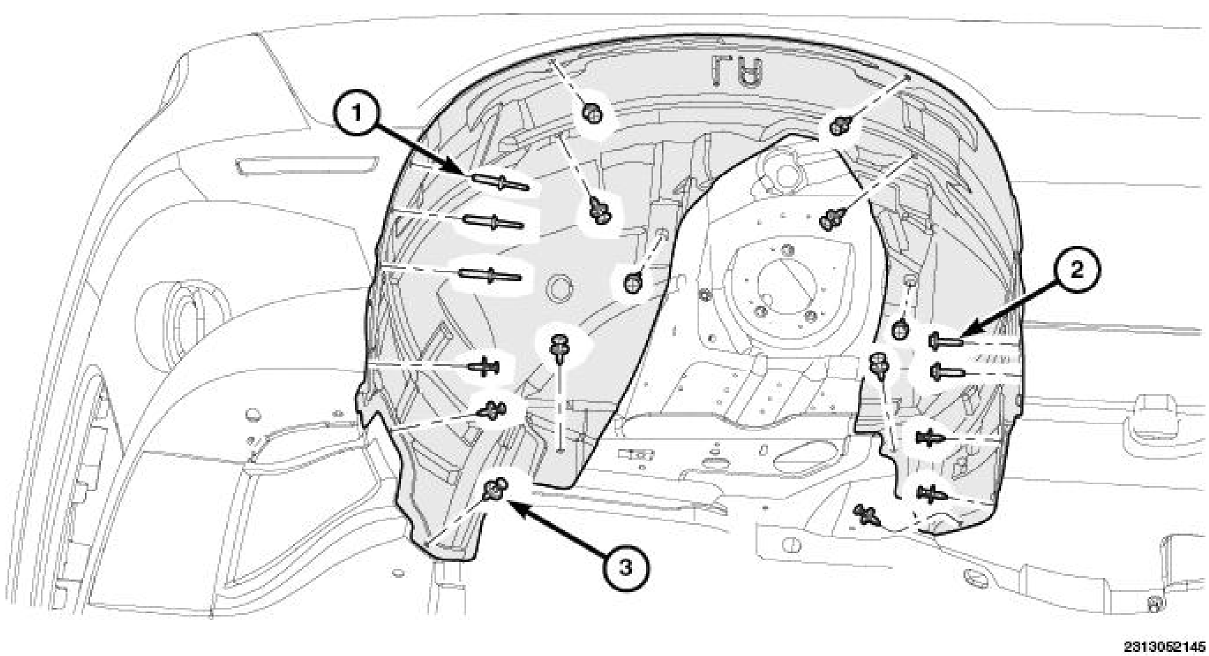


[Fig. 126: Front Wheelhouse Shield Fasteners]
Courtesy of CHRYSLER GROUP, LLC

4. Remove the plastic rivets (1) from the splash shield and discard.
5. Remove the 14 push-pins (3) that secure the front wheelhouse shield to the vehicle.
6. Remove the front wheelhouse shield from the vehicle.

INSTALLATION

INSTALLATION



[Fig. 127: Front Wheelhouse Shield Fasteners]
Courtesy of CHRYSLER GROUP, LLC

1. Position the front wheelhouse shield into the front fender well.

2. Install the 14 push-pins (3) that secure the front wheelhouse shield to the vehicle.
3. Install the new plastic rivets (1) to the splash shield.

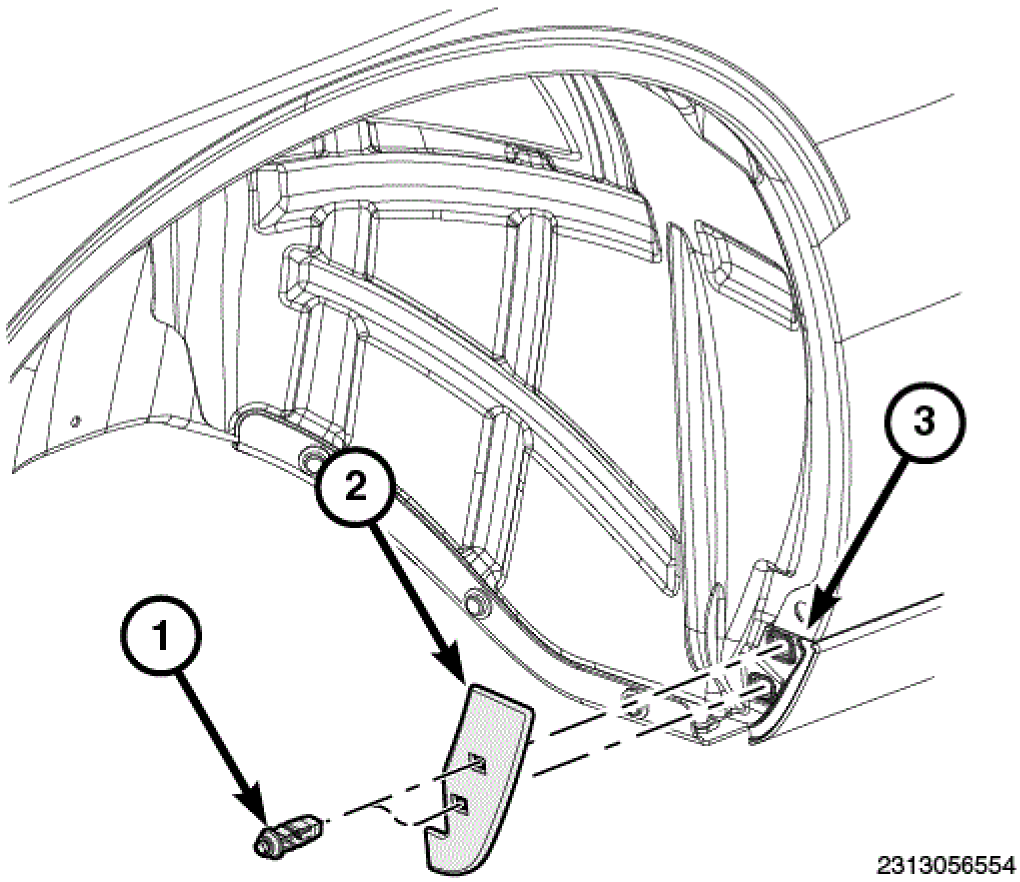


Fig. 128: Specialty Nut, Front Spat & Sill Cladding
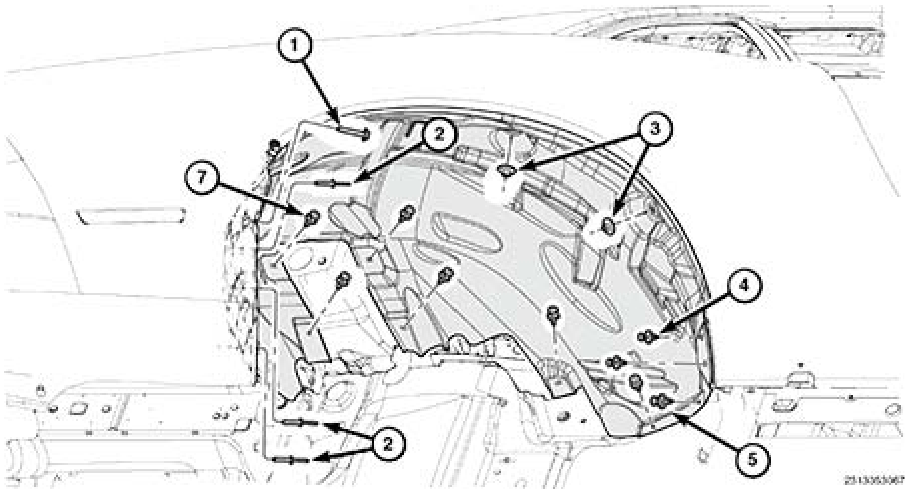
Courtesy of CHRYSLER GROUP, LLC

4. Install the spats (2) to the front of the sill cladding (3) and install the two fasteners (1).
5. Install the front wheel. Refer to **INSTALLATION** .
6. Remove the support and lower the vehicle.

SHIELD, SPLASH, REAR WHEELHOUSE

REMOVAL

REMOVAL

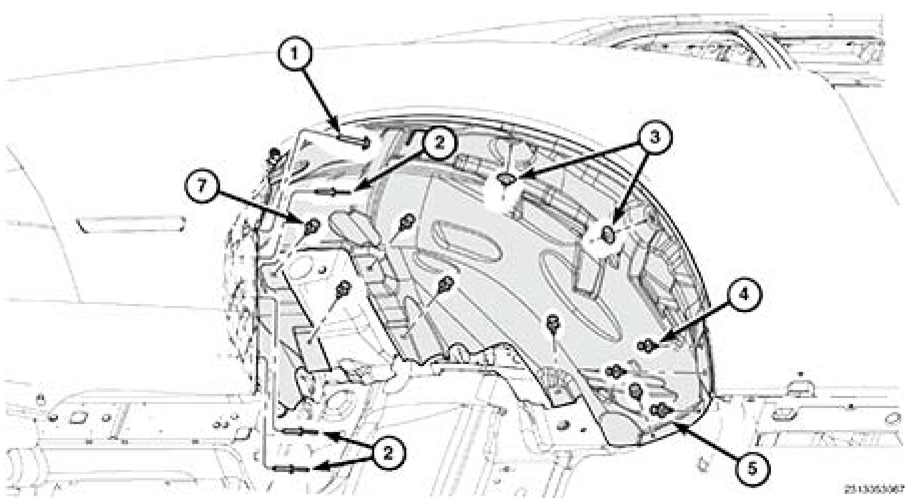


[Fig. 129: Rear Wheelhouse Shield Fasteners](#)
Courtesy of CHRYSLER GROUP, LLC

1. Remove the tire and wheel assembly. Refer to **REMOVAL** .
2. Remove the screw (1).
3. Remove the plastic rivets (2) at the lower rear, and discard.
4. Remove the seven push pin fasteners (5, 7).
5. Remove the two specialty fasteners (4) securing the sill cladding.
6. Remove the nuts (3) and remove the splash shield.

INSTALLATION

INSTALLATION



[Fig. 130: Rear Wheelhouse Shield Fasteners](#)
Courtesy of CHRYSLER GROUP, LLC

1. Install the splash shield.
2. Install the nuts (3).
3. Install the five push pin fasteners (7)
4. Install three new rivets (2).

5. Install the two push pin fasteners (5).
6. Install the screw (1).
7. Install the two specialty fasteners (4) into the sill cladding.
8. Install the tire and wheel assembly. Refer to **INSTALLATION** .

HOOD

BEZEL, HOOD

REMOVAL

REMOVAL

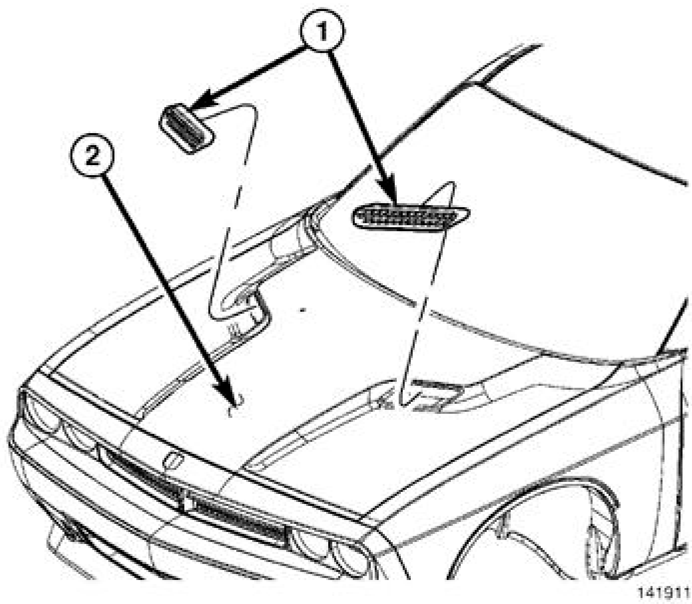


Fig. 131: Removing/Installing Hood Bezel
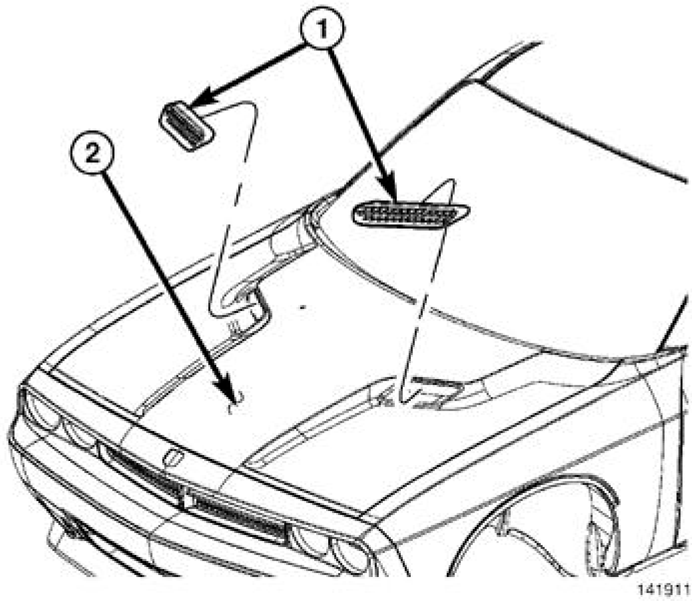
Courtesy of CHRYSLER GROUP, LLC

1. Using a trim stick or equivalent, release the clips at the bottom of the hood bezel (1), then lift and remove from the hood (2).

INSTALLATION

INSTALLATION



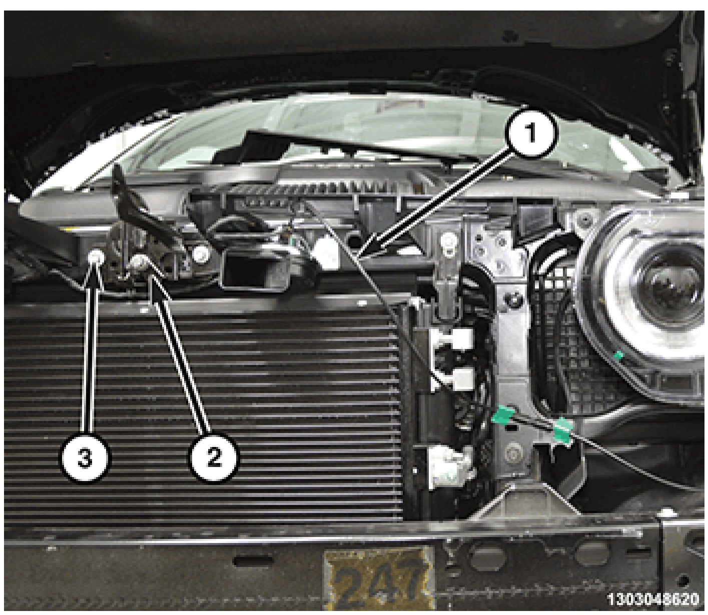
[Fig. 132: Removing/Installing Hood Bezel](#)
Courtesy of CHRYSLER GROUP, LLC

1. Insert the top of the hood bezel (1) into the hood (2).
2. Push at the bottom of hood bezel to engage the retaining clips.

CABLE, HOOD RELEASE

REMOVAL

REMOVAL



[Fig. 133: Latch Release, Cable Hood Latch & Bolt](#)
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Take note of the cable routing for correct installation.**

1. Remove the front fascia. Refer to **FASCIA, FRONT, REMOVAL** .
2. Remove hood latch (2). Refer to **LATCH, HOOD, REMOVAL**.
3. Unclip the hood latch release cable (1) from the body.

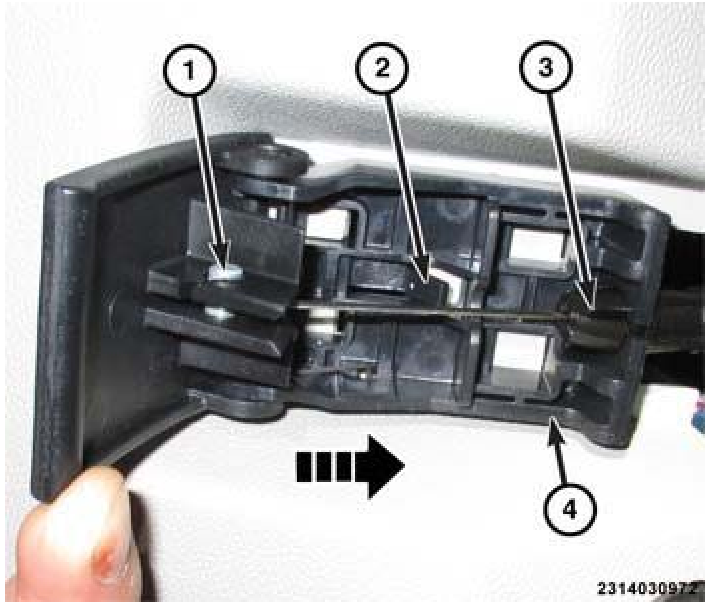


Fig. 134: Retaining Tab, Hood Release Cable, Cable End & Handle
Courtesy of CHRYSLER GROUP, LLC

4. From the passenger compartment, remove the hood release handle (4) from the steering column opening cover by lifting the retaining tab (2) and slide the hood release handle forward.
5. Press the tabs (3) and remove the hood latch release cable from the handle, then remove the cable end (1).
6. Remove the hood latch release cable grommet from the dash panel and remove the hood latch release cable.

INSTALLATION

INSTALLATION

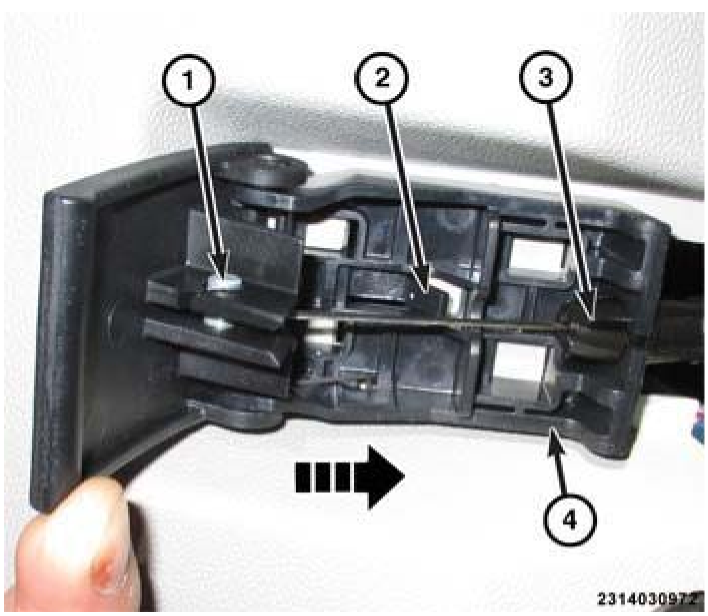

Fig. 135: Retaining Tab, Hood Release Cable, Cable End & Handle
Courtesy of CHRYSLER GROUP, LLC

1. Install the hood latch release cable through the hole in the dash panel and seat the hood latch release cable grommet.
2. Install the cable end (1) then engage the cable (3) into the hood release handle (4).
3. Position the hood release handle on the steering column opening cover and slide it rearward until the retaining tab (2) snaps into place.

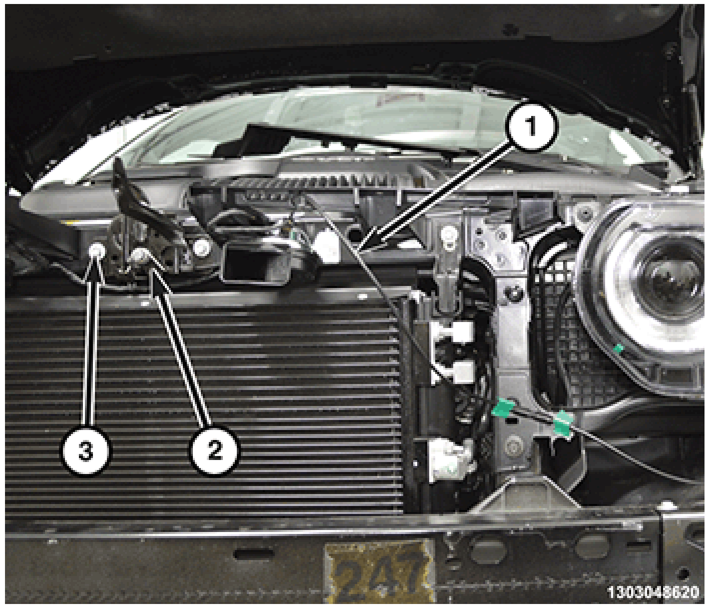

Fig. 136: Latch Release, Cable Hood Latch & Bolt
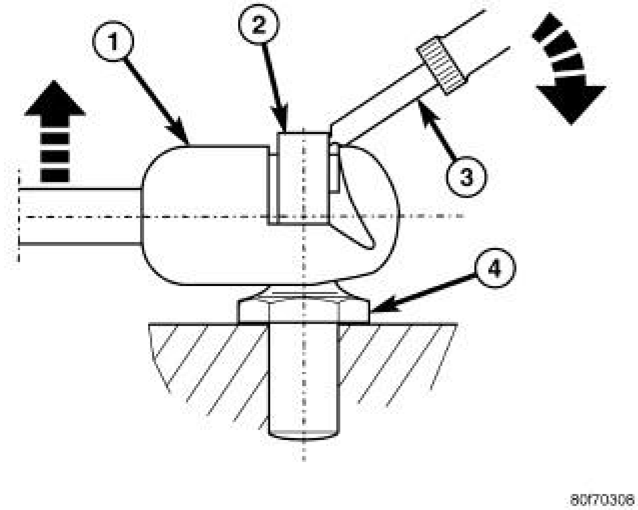
Courtesy of CHRYSLER GROUP, LLC

4. Route the hood latch release cable (1) and clip into place.
5. Install the hood latch. Refer to **LATCH, HOOD, INSTALLATION**.
6. Install the front fascia. Refer to **FASCIA, FRONT, INSTALLATION** .

HINGE, HOOD

REMOVAL

REMOVAL



[Fig. 137: Prying Retaining Clip Outward]
Courtesy of CHRYSLER GROUP, LLC

1. Open and support the hood with a suitable prop or block.

NOTE: **During service lift the ball socket end retaining clip only far enough to release the socket from the ball stud. Excessive prying or removal of the clip may result in improper clip spring tension. Improper clip tension may result in the support cylinder separating from the ball stud causing sudden, unexpected loss of hood support. Failure to do so may result in serious or fatal injury.**

2. Insert a small flat-bladed tool (3) into the notch on the outer face of one ball socket end (1) of the gas prop and carefully pry the retaining clip (2) outward while pulling the ball socket away from the ball stud (4) on the decklid hinge.
3. Release the retaining clip to its installed position.

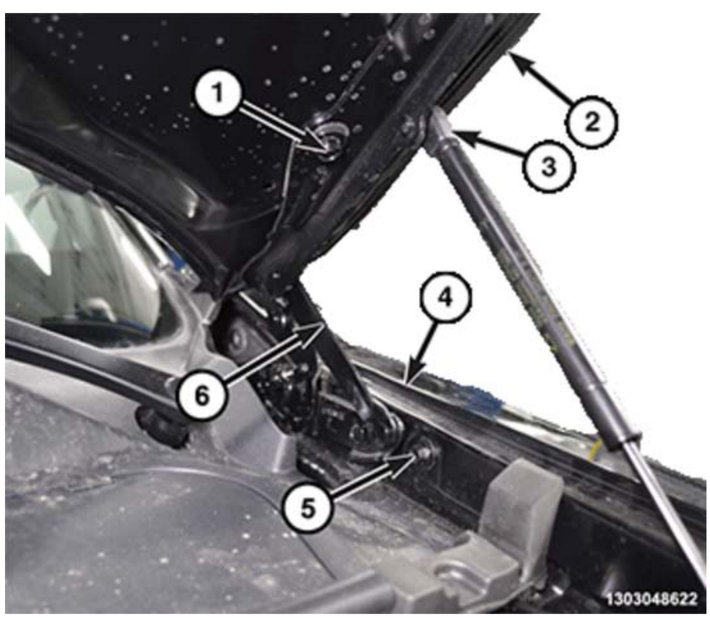


Fig. 138: Bolts, Hood, Gas Prop, Body & Hood Hinge
Courtesy of CHRYSLER GROUP, LLC

4. Using a grease pencil or equivalent, mark the position of the hood hinge (6) to aid in installation.
5. Remove the bolts (1) to hood (2).
6. Remove the bolts (5) to body (4) and the hood hinge.

INSTALLATION

INSTALLATION

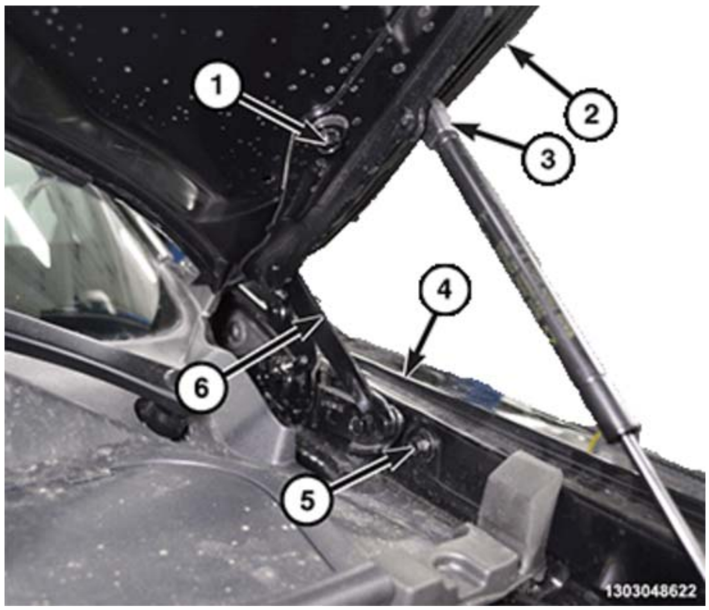

Fig. 139: Bolts, Hood, Gas Prop, Body & Hood Hinge
Courtesy of CHRYSLER GROUP, LLC

1. With the help of an assistant, position the hood hinge (6) onto the vehicle and loosely install the bolts (5).
2. Align the hood hinge with the reference mark made previously and tighten the hood hinge to body bolts to the proper specification. Refer to **SPECIFICATIONS**.
3. Position the hood to the hood hinge and loosely install the bolts (1).
4. Align the hood hinge with the reference mark made previously and tighten the hood hinge to hood bolts to the proper specification. Refer to **SPECIFICATIONS**.
5. Position the ball socket of the gas prop (3) onto the ball stud on the hood hinge.
6. Using hand pressure, press the gas prop onto the ball stud until the retainer clip snaps into place.
7. Repeat for the opposite end of the gas prop.
8. Verify proper hood latch operation and fit of hood. Adjust if necessary. Refer to **GAP AND FLUSH, SPECIFICATIONS**.

HOOD

REMOVAL

REMOVAL

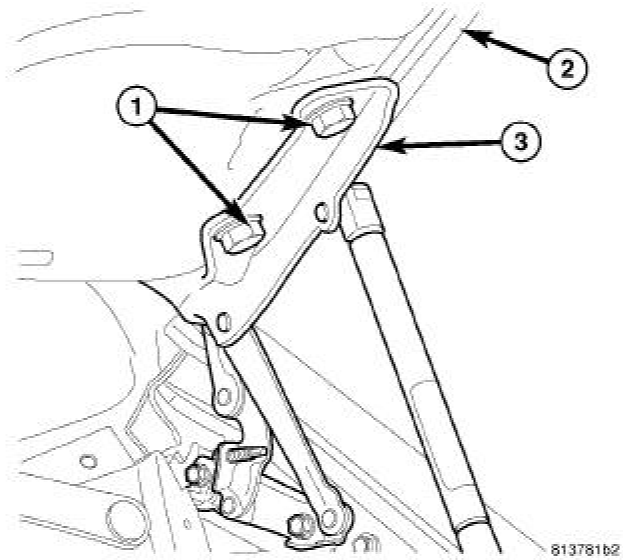

Fig. 140: Upper Hinge Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Using a grease pencil or equivalent, mark the position of the hood hinge bracket (3) to aid in installation.
2. Remove the push fasteners and lower the hood silencer enough to disconnect the windshield washer hose from the T-connector.
3. Unclip the windshield washer hose from the hood.
4. With the help of an assistant holding the hood (2), remove the bolts (1) and the hood.

INSTALLATION

INSTALLATION

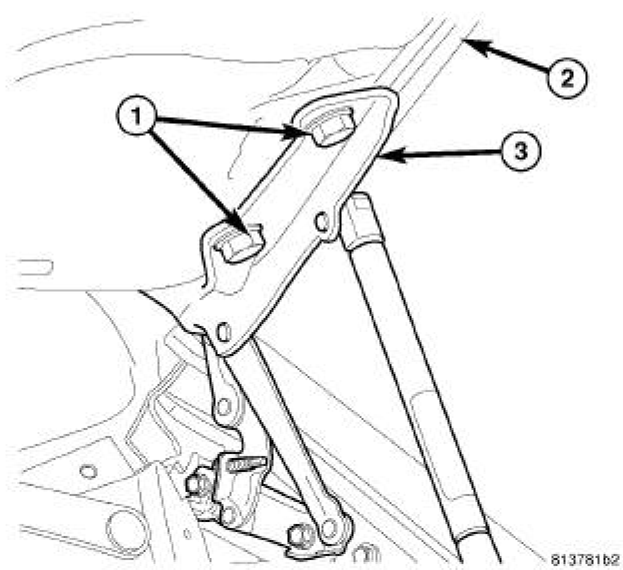

Fig. 141: Upper Hinge Bracket
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The Vehicle Emission Control Information (VECI) label(s) must be in place for**

the life of the vehicle. When replacing the component to which the VECI label is adhered, a new VECI label must also be adhered to the new component.

1. With assistance from a helper, position the hood onto the hood hinge bracket and loosely install the bolts (1).
2. Align the hood with the reference mark made previously and tighten the hood hinge to hood bolts to the proper specification. Refer to **SPECIFICATIONS**.
3. Clip the windshield washer hose to the hood.
4. Connect the windshield washer hose to the T-connector.
5. Install the hood silencer and push fasteners.
6. Verify proper hood latch operation and fit of hood. Adjust if necessary. Refer to **GAP AND FLUSH, SPECIFICATIONS**.

LATCH, HOOD

REMOVAL

REMOVAL

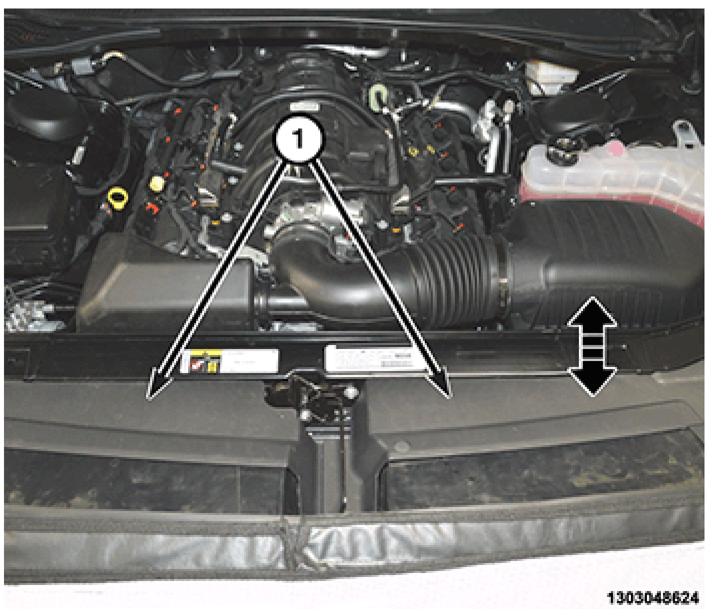

Fig. 142: Under Hood Appearance Panels

Courtesy of CHRYSLER GROUP, LLC

1. Position the instrument cluster bezel (2) and hand tap to engage the retaining clips.

COVER, INSTRUMENT PANEL

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the passenger airbag, or becoming entrapped between the passenger airbag cushion and the instrument panel top pad. Failure to observe this warning could result in occupant injuries upon airbag deployment.

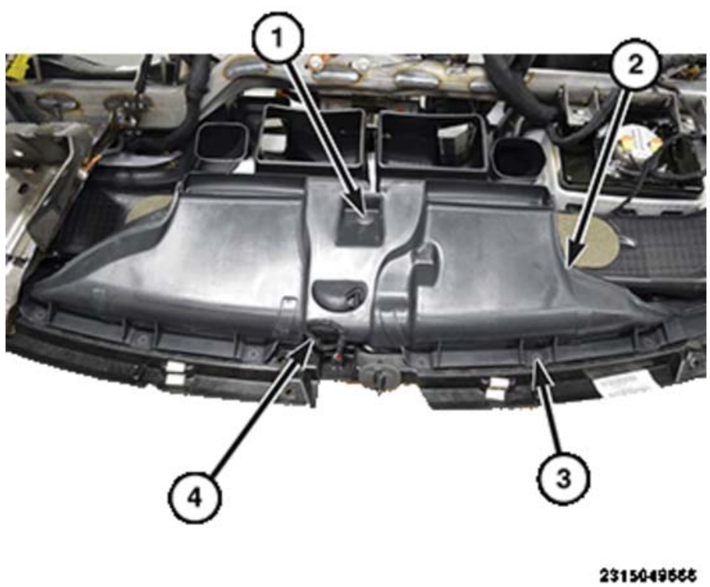

Fig. 150: Push Fastener, Defroster Duct, Screws & Wire Harness
Courtesy of CHRYSLER GROUP, LLC

1. Remove the instrument panel from the vehicle. Refer to PANEL, INSTRUMENT, REMOVAL.
2. Unclip the wire harness (4) from the defroster duct (2).
3. Remove the screws (3) and the push fastener (1), then the defroster duct.

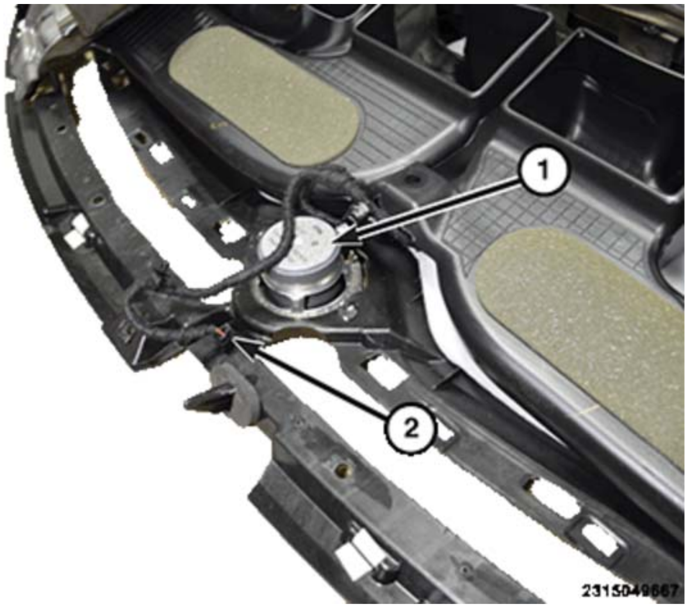

Fig. 151: Instrument Panel Speaker & Sun Sensor
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect and remove the instrument panel speakers (1).
5. Disconnect and remove the sun sensor (2).

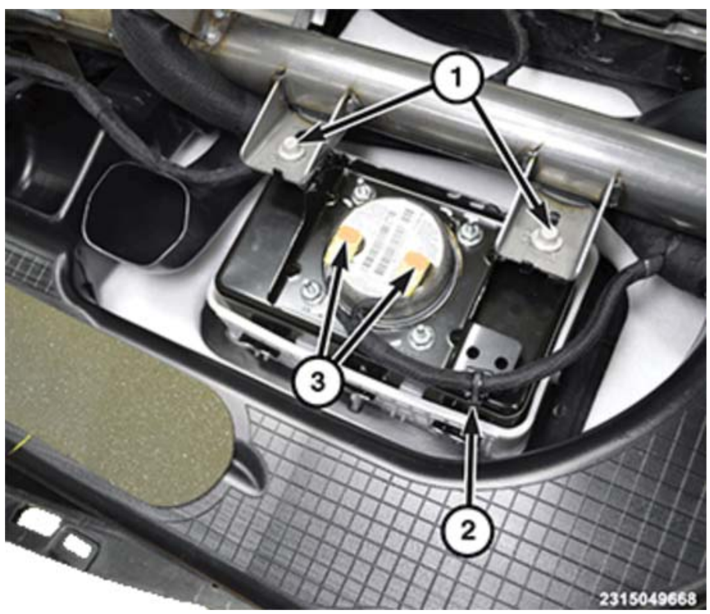

Fig. 152: Passenger Airbag Bolts, Wire Harness & Connectors
Courtesy of CHRYSLER GROUP, LLC

6. Unclip the wire harness (2) and disconnect the passenger airbag wire harness connectors (3).
7. Remove the two passenger airbag bolts (1).

Fig. 153: Defroster Duct Opening & Screw
Courtesy of CHRYSLER GROUP, LLC

8. Remove the screw (1) at the top of the instrument panel, left of the defroster duct opening (2).

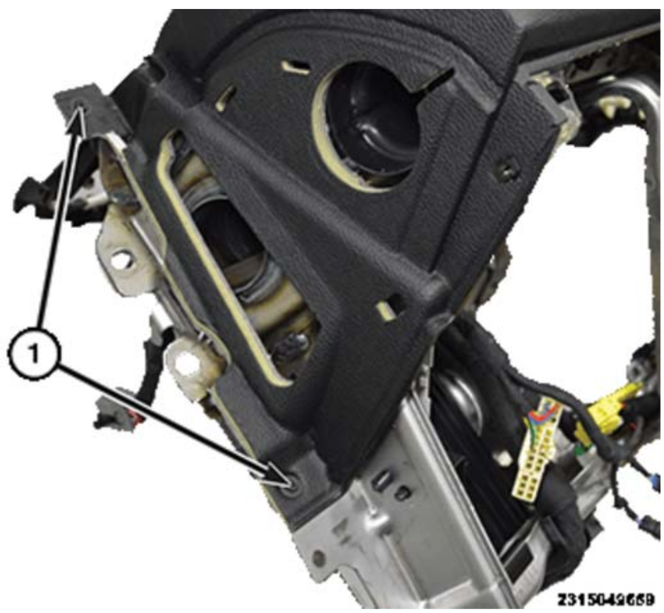

Fig. 154: Left Side Of The Instrument Panel Screws
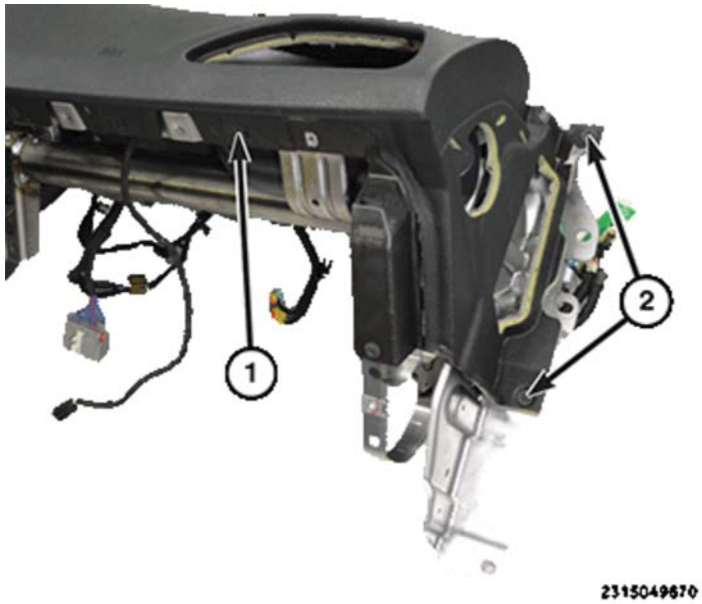
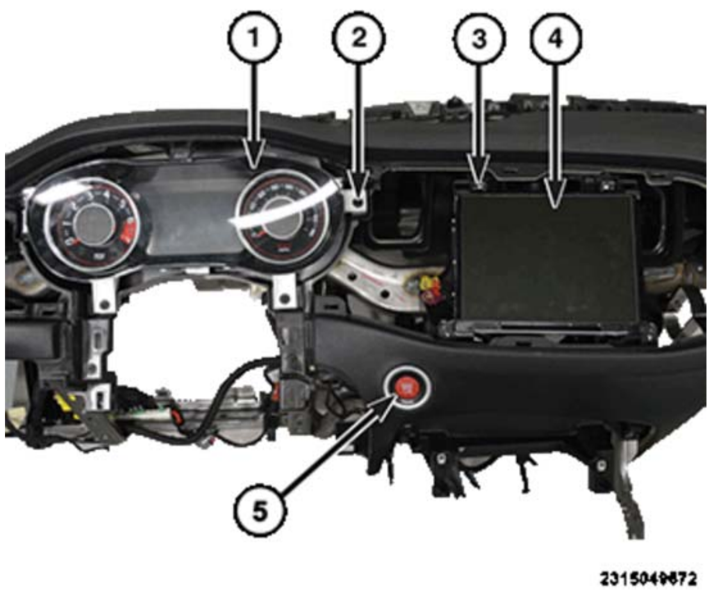
Courtesy of CHRYSLER GROUP, LLC

9. Remove the two screws (1) on the left side of the instrument panel.



[Fig. 155: Right Side Of The Instrument Panel Screws & Glove Box Opening Screws]
Courtesy of CHRYSLER GROUP, LLC

10. Remove the two screws (2) on the right side of the instrument panel.
11. Remove the seven screws (1) around the glove box opening.



[Fig. 156: Instrument Cluster, Screws, Touch Screen Display & Keyless Ignition Node]
Courtesy of CHRYSLER GROUP, LLC

12. Remove the screws (2) and the instrument cluster (1).
13. Remove the screws (3) and the radio, or touch screen display (4) if equipped.
14. Remove the right air outlet. Refer to **OUTLET, AIR, REMOVAL** .
15. Remove the keyless ignition node (5). Refer to **MODULE, KEYLESS IGNITION NODE, REMOVAL** .

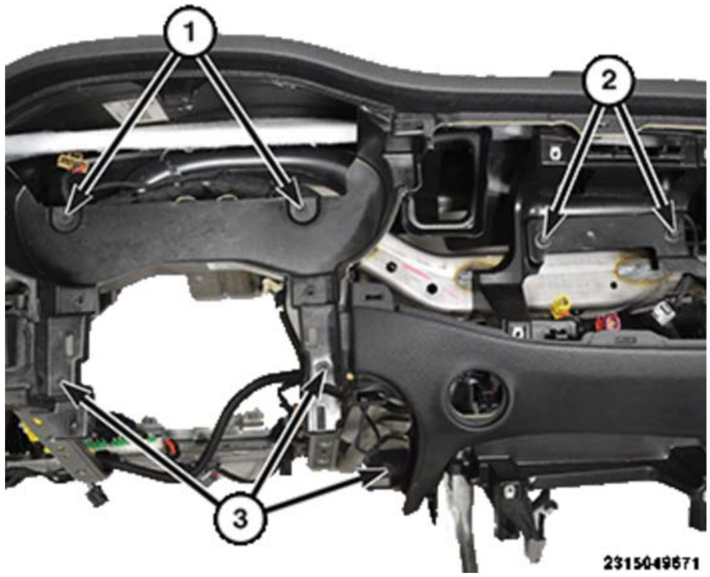


Fig. 157: Bolts & Screws
Courtesy of CHRYSLER GROUP, LLC

16. Remove the two bolts (2) located behind the radio.
17. Remove the two screws (1) located behind the instrument cluster.
18. Remove the three screws (3) located at the steering column opening.
19. Carefully remove the instrument panel cover from the support structure.
20. If necessary, remove the passenger air bag from the instrument panel cover. Refer to **AIR BAG, PASSENGER, REMOVAL** .

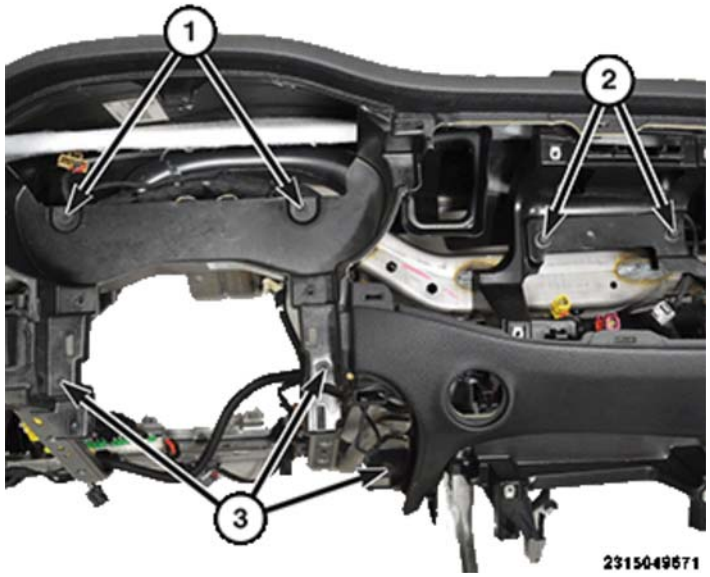
INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to follow these instructions may result in accidental airbag deployment.

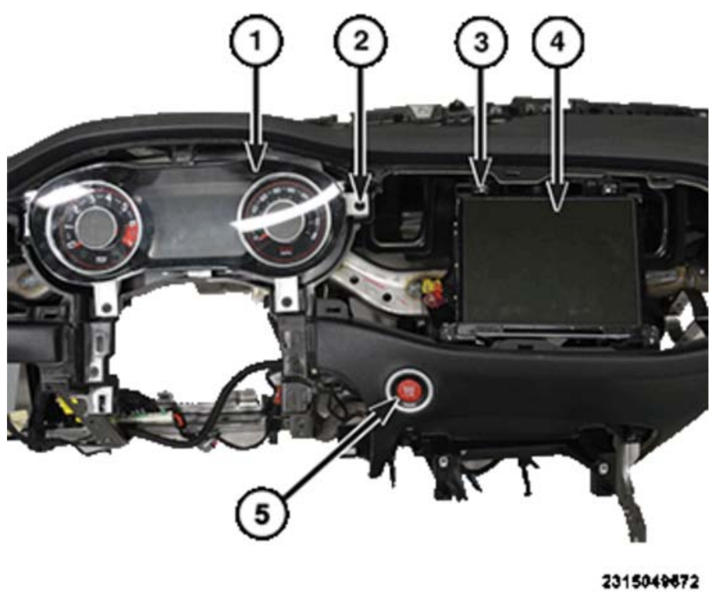
WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the passenger airbag, or becoming entrapped between the passenger airbag cushion and the instrument panel top pad. Failure to observe this warning could result in occupant injuries upon airbag deployment.



[Fig. 158: Bolts & Screws](#)
Courtesy of CHRYSLER GROUP, LLC

1. If necessary, install the passenger air bag into the instrument panel cover. Refer to **AIR BAG, PASSENGER, INSTALLATION** .
2. Carefully position the instrument panel cover onto the support structure.
3. Install the two bolts (2) located behind the radio and tighten securely.
4. Install the two screws (1) located behind the instrument cluster and tighten securely.
5. Install the three screws (3) located at the steering column opening and tighten securely.



[Fig. 159: Instrument Cluster, Screws, Touch Screen Display & Keyless Ignition Node](#)
Courtesy of CHRYSLER GROUP, LLC

6. Install the instrument cluster (1). Refer to **INSTALLATION** .
7. Install the radio, or touch screen display (4) if equipped. Refer to **RADIO, INSTALLATION** .

8. Install the right side air outlet. Refer to **OUTLET, AIR, INSTALLATION** .
9. Install the keyless ignition node (5). Refer to **MODULE, KEYLESS IGNITION NODE, INSTALLATION** .

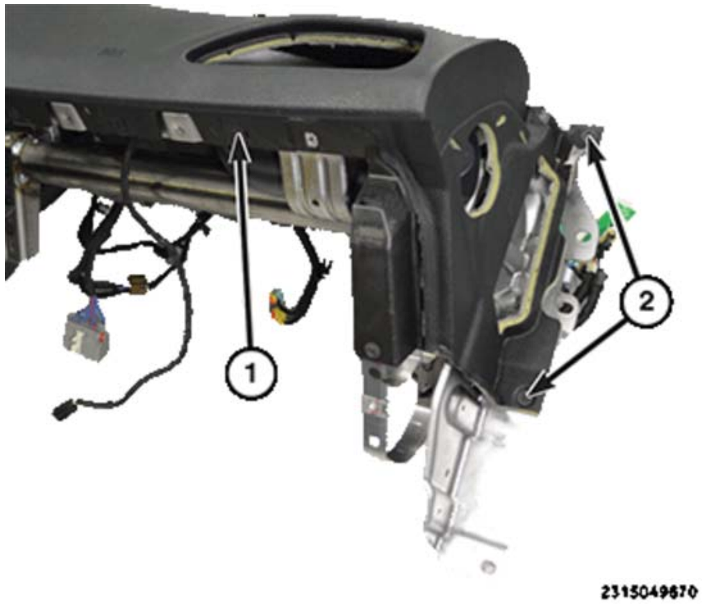


Fig. 160: Right Side Of The Instrument Panel Screws & Glove Box Opening Screws
Courtesy of CHRYSLER GROUP, LLC

10. Install the two screws (2) on the right side of the instrument panel and tighten securely.
11. Install the seven screws (1) around the glove box opening and tighten securely.

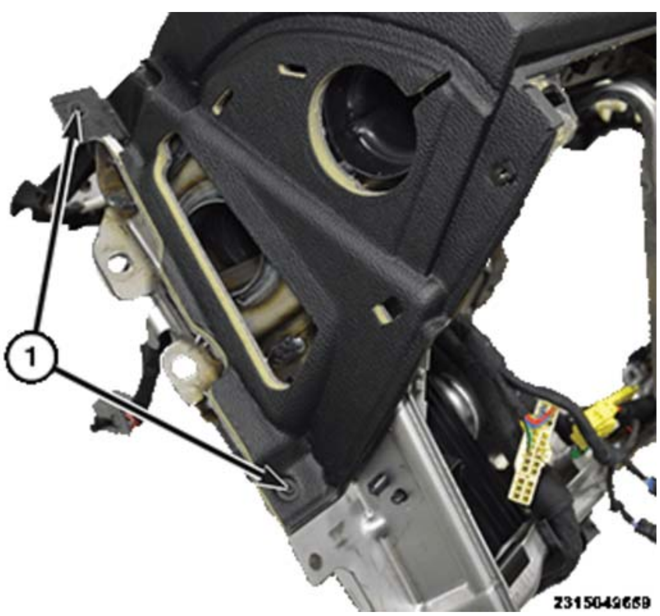

Fig. 161: Left Side Of The Instrument Panel Screws
Courtesy of CHRYSLER GROUP, LLC

12. Install the two screws (1) on the left side of the instrument panel and tighten securely.

Fig. 162: Defroster Duct Opening & Screw
Courtesy of CHRYSLER GROUP, LLC

13. Install the screw (1) at the top of the instrument panel, left of the defroster duct opening (2) and tighten securely.

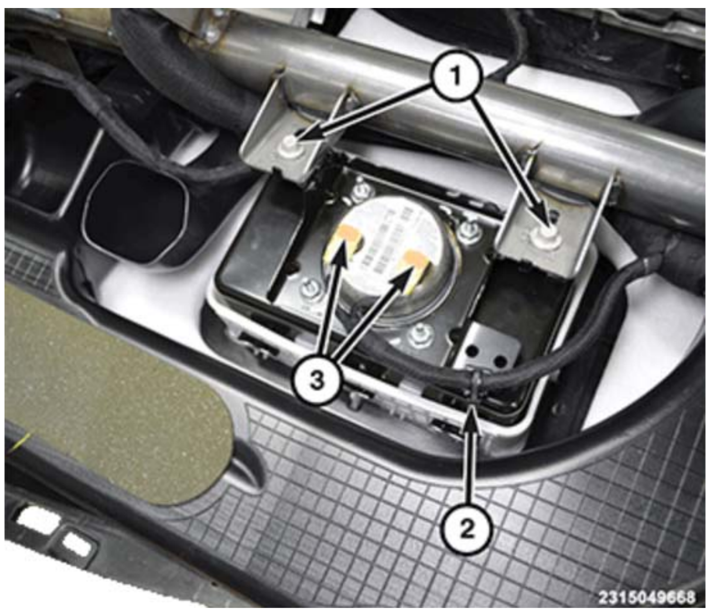

Fig. 163: Passenger Airbag Bolts, Wire Harness & Connectors
Courtesy of CHRYSLER GROUP, LLC

14. Clip the wire harness (2) into place and connect the passenger airbag wire harness connectors (3).
15. Install the two passenger airbag bolts (1) and tighten to the proper specification. Refer to **SPECIFICATIONS** .

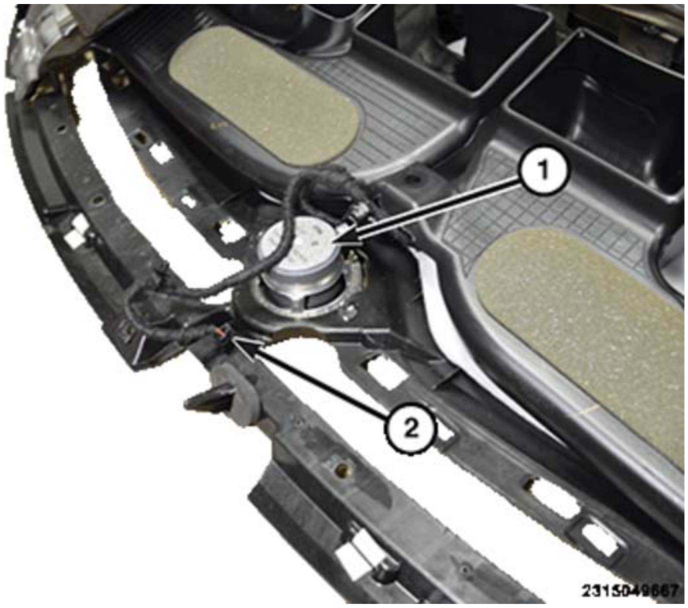

Fig. 164: Instrument Panel Speaker & Sun Sensor
Courtesy of CHRYSLER GROUP, LLC

16. Connect and install the instrument panel speakers (1). Tighten the screws securely.
17. Connect and install the sun sensor (2).

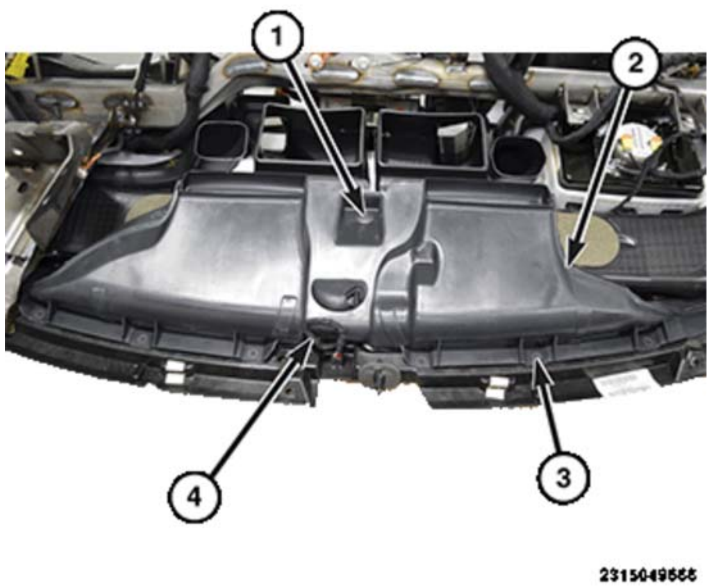

Fig. 165: Push Fastener, Defroster Duct, Screws & Wire Harness
Courtesy of CHRYSLER GROUP, LLC

18. Position the defroster duct (2) and install the screws (3). Tighten the screws securely.
19. Install the push fastener (1) and clip the wire harness (4) to the defroster duct.
20. Install the instrument panel into the vehicle. Refer to **PANEL, INSTRUMENT, INSTALLATION**.
21. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE** .

COVER, STEERING COLUMN OPENING

REMOVAL

REMOVAL

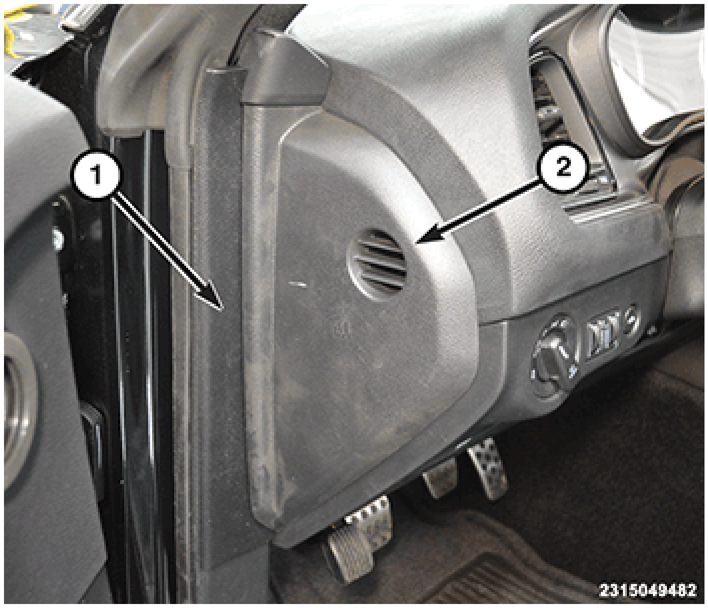

Fig. 166: A-Pillar Extension & Instrument Panel End Cap
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Using a trim stick or equivalent, remove the instrument panel end cap (2) then the A-pillar extension (1).

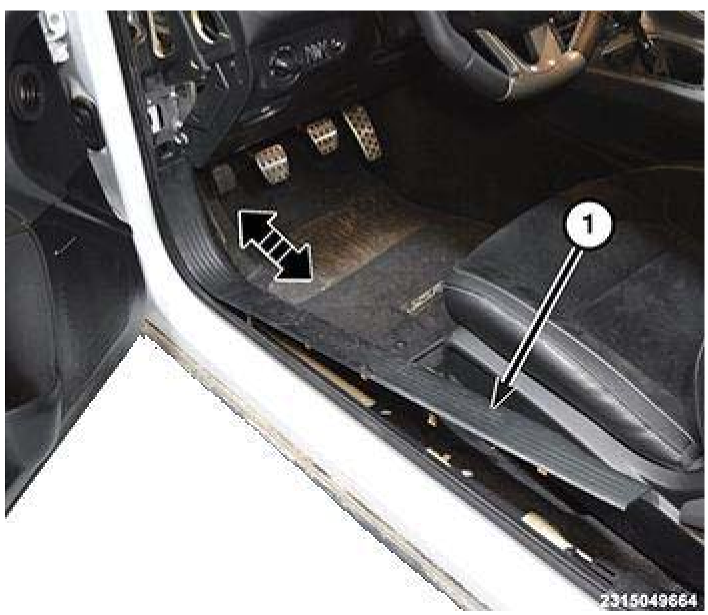

Fig. 167: Cowl Side Trim Panel
Courtesy of CHRYSLER GROUP, LLC

3. Lift the cowl side trim panel (1) at the rear, then pull rearward and remove.

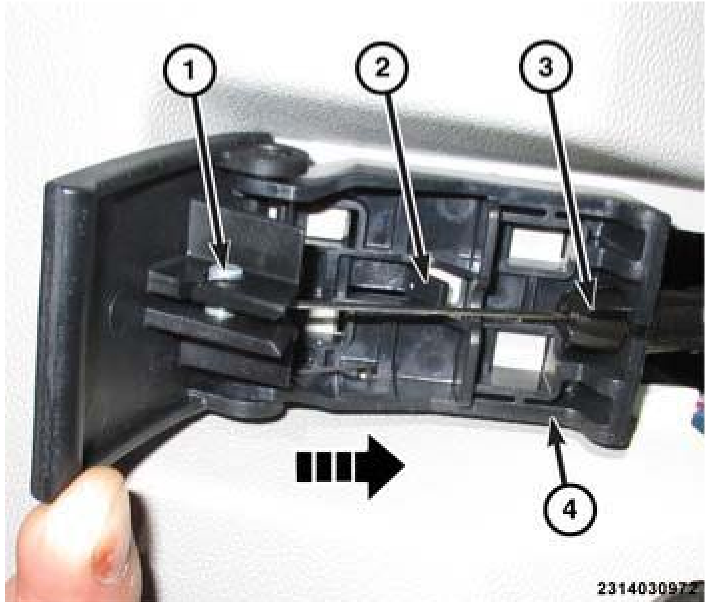

Fig. 168: Retaining Tab, Hood Release Cable, Cable End & Handle
Courtesy of CHRYSLER GROUP, LLC

4. Remove the hood release handle. Lift the retaining tab (2) and slide the handle (4) forward to remove it from the steering column opening cover.

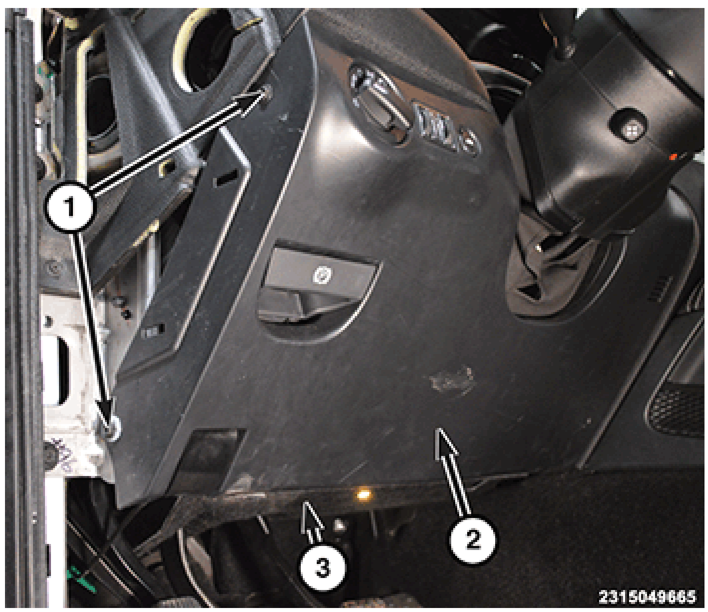

Fig. 169: Screws, Steering Column Opening Cover & Instrument Panel Closeout
Courtesy of CHRYSLER GROUP, LLC

5. Remove the push fasteners and the instrument panel closeout (3).
6. Remove the two screws (1) on the side of the steering column opening cover (2).
7. Using a trim stick or equivalent, remove the steering column opening cover and disconnect the wire harness connectors.
8. Lower the steering column opening cover and separate the parking brake release cable from the parking brake handle, if equipped.

INSTALLATION

INSTALLATION

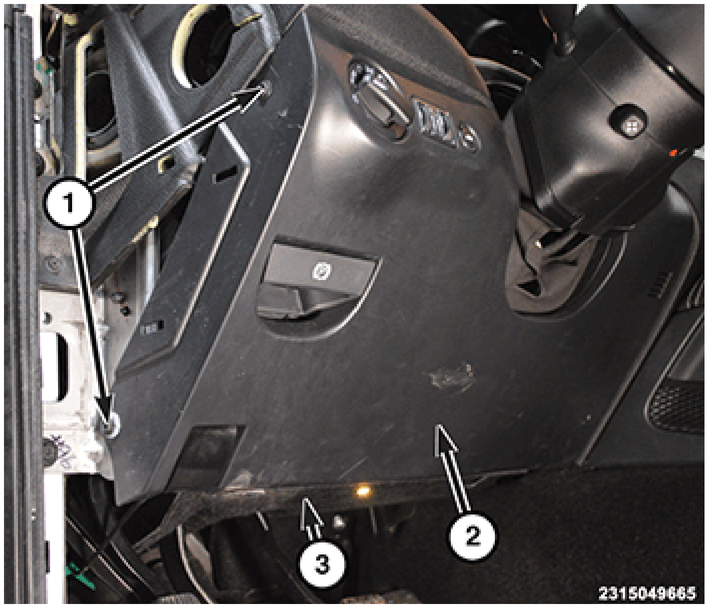

Fig. 170: Screws, Steering Column Opening Cover & Instrument Panel Closeout
Courtesy of CHRYSLER GROUP, LLC

1. Position the steering column opening cover (2) near the instrument panel and connect the wire harness connectors.
2. Install the parking brake release cable to the parking brake handle, if equipped.
3. Install the steering column opening cover onto the instrument panel and hand tap to engage the retaining clips.
4. Install the instrument panel closeout (3) and the push fasteners.
5. Install the two screws (1) and tighten securely.

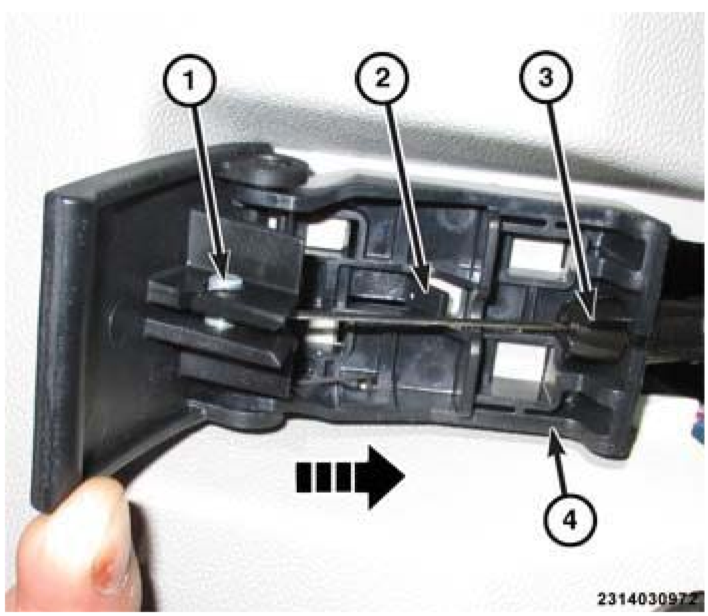

Fig. 171: Retaining Tab, Hood Release Cable, Cable End & Handle

Courtesy of CHRYSLER GROUP, LLC

6. Position the hood release handle (4) onto the steering column opening cover and slide rearward until the retaining tab (2) snaps into place.

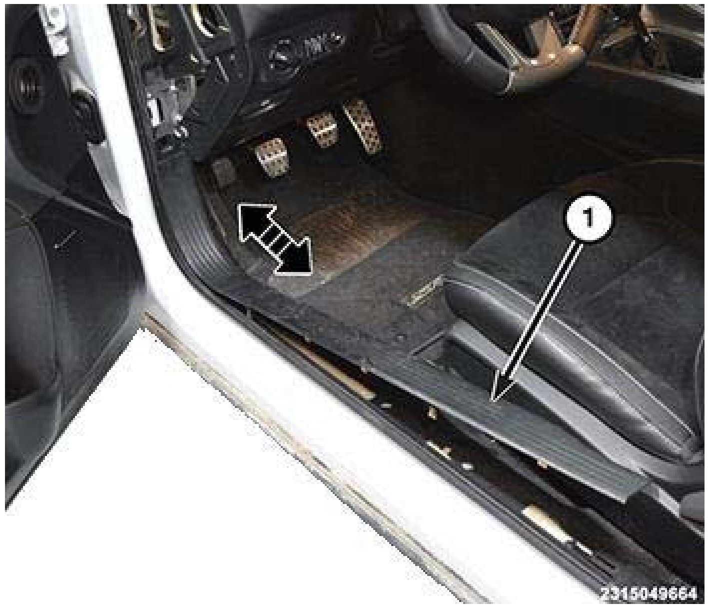

Fig. 172: Cowl Side Trim Panel
Courtesy of CHRYSLER GROUP, LLC

7. Install the cowl side trim panel (1) at the front, then hand tap the rear to install the retaining clips.

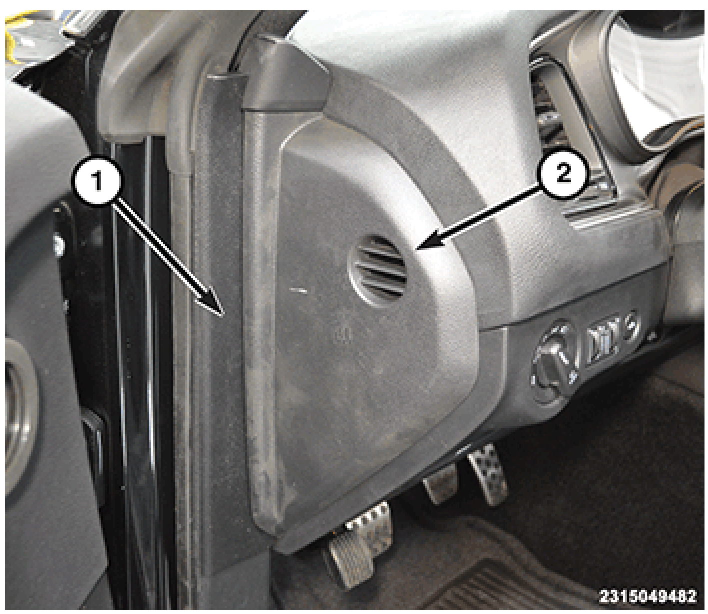

Fig. 173: A-Pillar Extension & Instrument Panel End Cap
Courtesy of CHRYSLER GROUP, LLC

8. Position the A-pillar extension (1) and hand tap to engage the retaining clips.
9. Position the instrument panel end cap (2) and hand tap to engage the retaining clips.
10. Connect the negative battery cable.

CYLINDER, GLOVE BOX LOCK

REMOVAL

REMOVAL

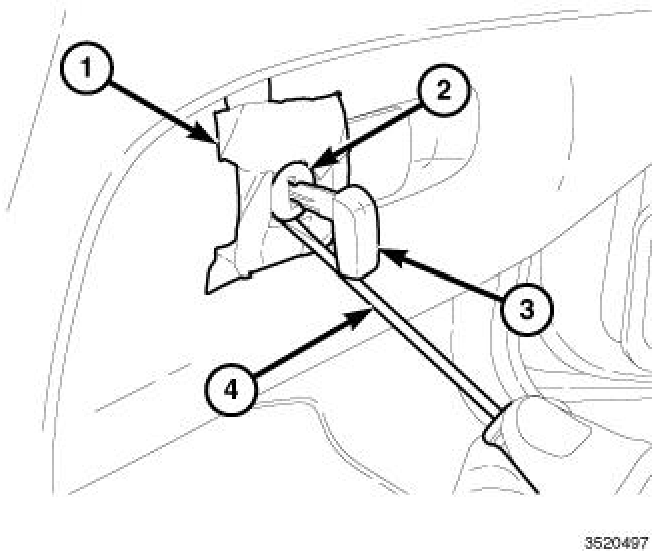

Fig. 174: Masking Tape, Lock Cylinder, Key & Screwdriver
Courtesy of CHRYSLER GROUP, LLC

1. Prior to removal, place masking tape (1) or equivalent around the perimeter of the lock cylinder (2).
2. Insert the key (3) into the lock cylinder (2) and turn the key into the locked position.
3. Insert a small flat bladed screwdriver (4) into the opening between the lock cylinder and bezel at the "6 o'clock position".
4. Apply downward pressure on the screwdriver while turning the key clockwise approximately 45Â°.

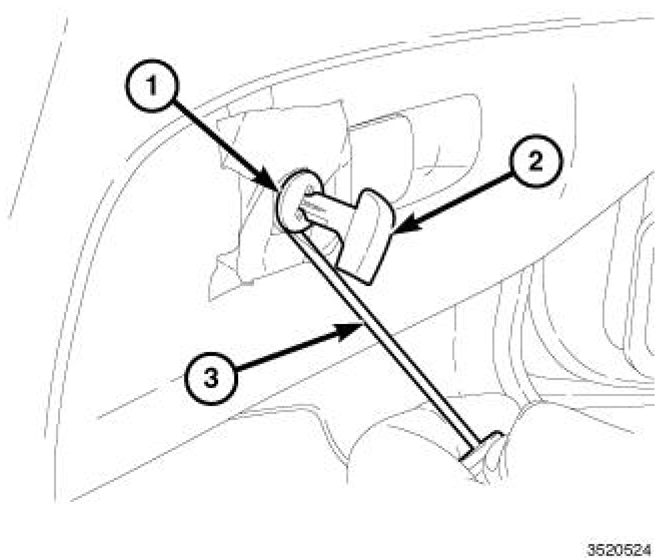

Fig. 175: Lock Cylinder, Key & Screwdriver
Courtesy of CHRYSLER GROUP, LLC

5. Remove the lock cylinder (1), key (2) and screwdriver (3) together.

INSTALLATION

INSTALLATION

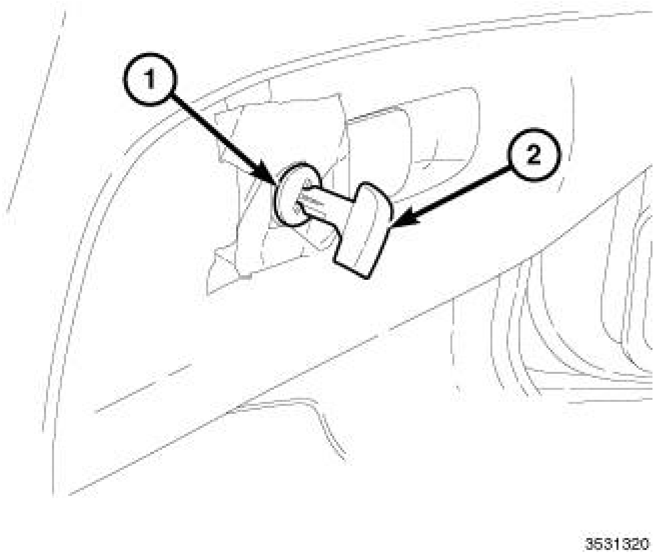

Fig. 176: Glove Box Lock Cylinder
Courtesy of CHRYSLER GROUP, LLC

1. Install the lock cylinder (1) and key (2) into the glove box door together in a position approximately 45Ā° clockwise from the locked position.

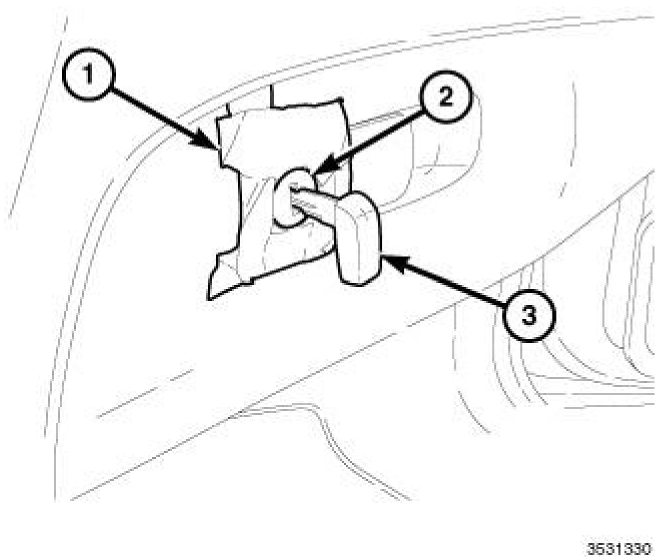

Fig. 177: Key, Lock Cylinder & Masking Tape
Courtesy of CHRYSLER GROUP, LLC

2. Turn the key (3) counter clockwise to the locked position.
3. Remove the key from the lock cylinder (2).
4. Reinsert the key and verify the lock cylinder is functioning properly.
5. Remove the masking tape (1) from the lock cylinder perimeter.

GLOVE BOX, INSTRUMENT PANEL

REMOVAL

REMOVAL

GLOVE BOX

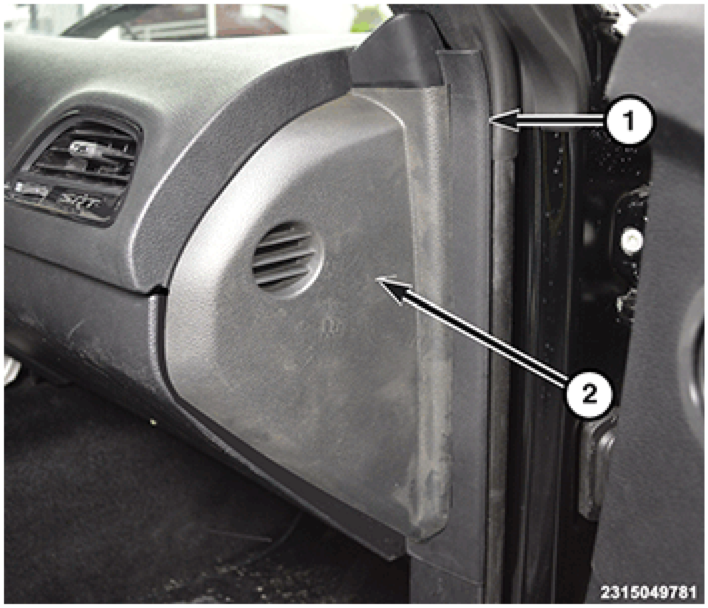

Fig. 178: A-Pillar Extension & Instrument Panel End Cap
Courtesy of CHRYSLER GROUP, LLC

1. Using a trim stick or equivalent, remove the instrument panel end cap (2) then the A-pillar extension (1).

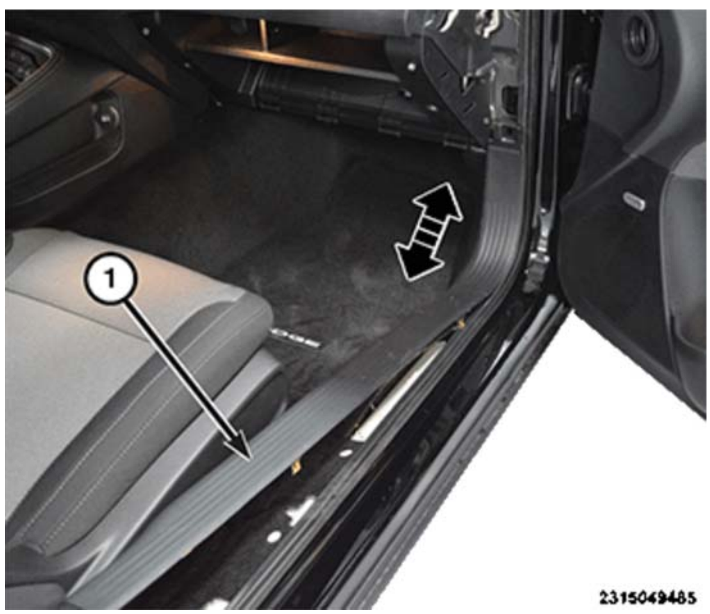

Fig. 179: Cowl Side Trim Panel
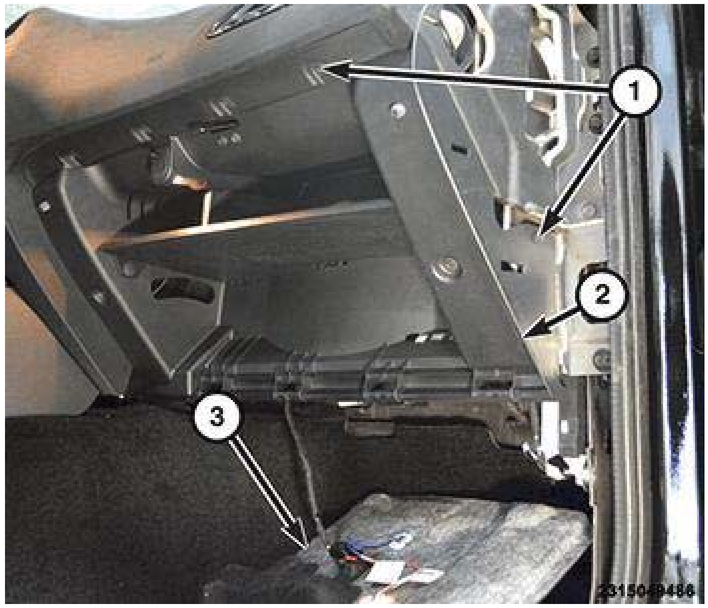
Courtesy of CHRYSLER GROUP, LLC

2. Lift the cowl side trim panel (1) at the rear, then pull rearward and remove.

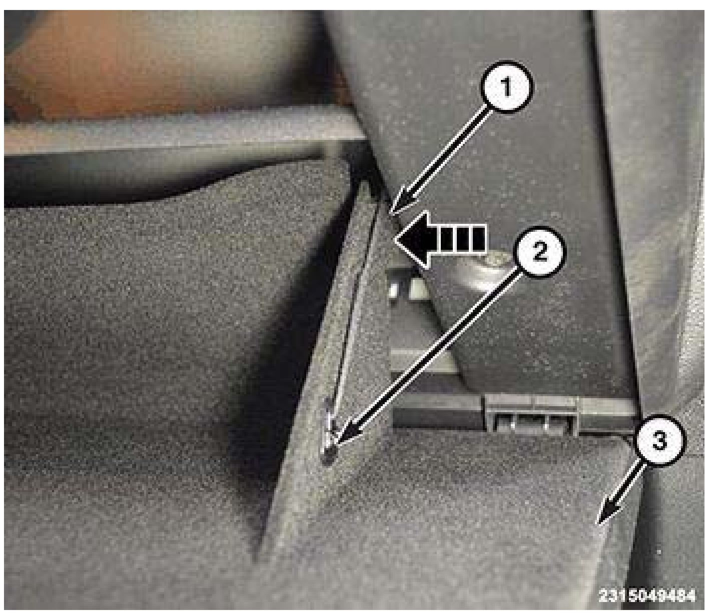


[Fig. 180: Glove Box, Instrument Panel Closeout & Screws]
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Shown in illustration with the glove box door removed, but not necessary.**

3. Remove the push fasteners, disconnect the wire harness connector and remove the instrument panel closeout (3).
4. Remove the eight screws (1).
5. Disconnect the wiring harness connectors from the glove box and remove.

GLOVE BOX DOOR



[Fig. 181: Glove Box Door, Support Strap And Retainer & Stops]
Courtesy of CHRYSLER GROUP, LLC

1. Open the glove box door (3).

2. Remove the support strap and retainer (2) from glove box door.
3. Push in on the glove box door stops (1) to disengage, then rotate the glove box door downward and remove.

INSTALLATION

INSTALLATION

GLOVE BOX

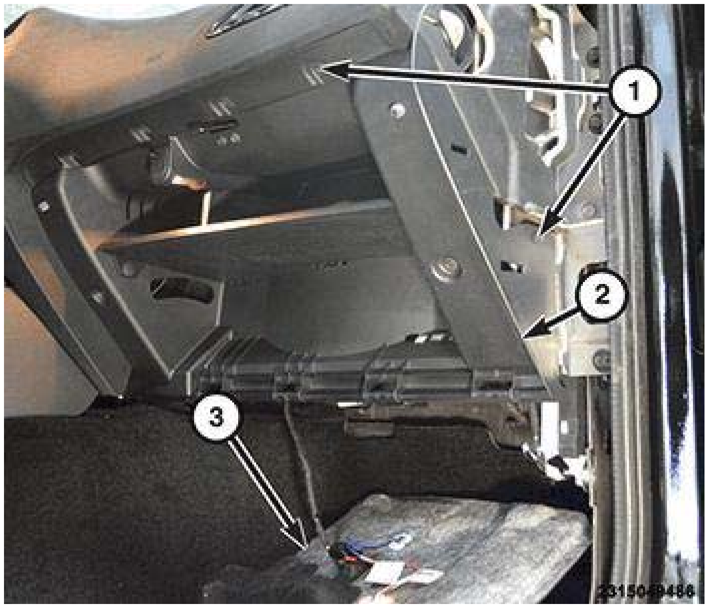


Fig. 182: Glove Box, Instrument Panel Closeout & Screws
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Shown in illustration with the glove box door removed, but not necessary.**

1. Connect the wiring harness and position the glove box (2) into the instrument panel.
2. Install the eight screws (1) and tighten securely.
3. Connect the wiring harness connector and install the instrument panel closeout (3).

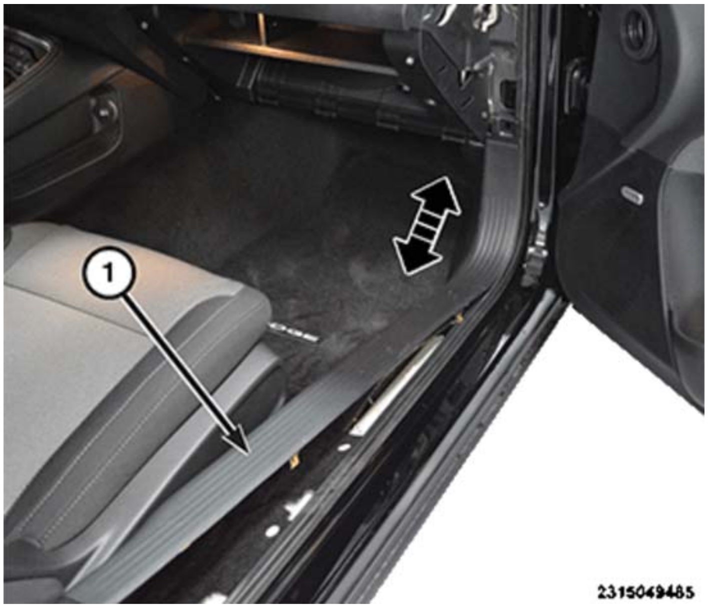

Fig. 183: Cowl Side Trim Panel
Courtesy of CHRYSLER GROUP, LLC

4. Install the cowl side trim panel (1) at the front, then hand tap the rear to install the retaining clips.

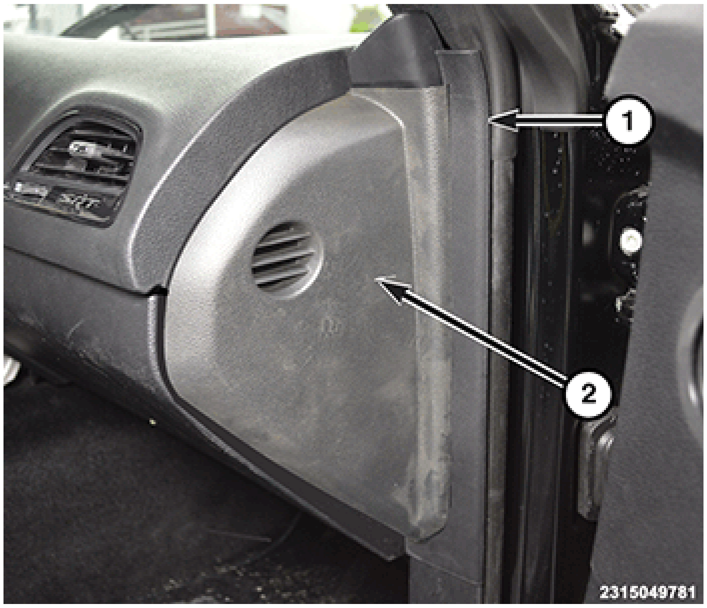

Fig. 184: A-Pillar Extension & Instrument Panel End Cap
Courtesy of CHRYSLER GROUP, LLC

5. Position the A-pillar extension (1) and hand tap to engage the retaining clips.
6. Position the instrument panel end cap (2) and hand tap to engage the retaining clips.

GLOVE BOX DOOR

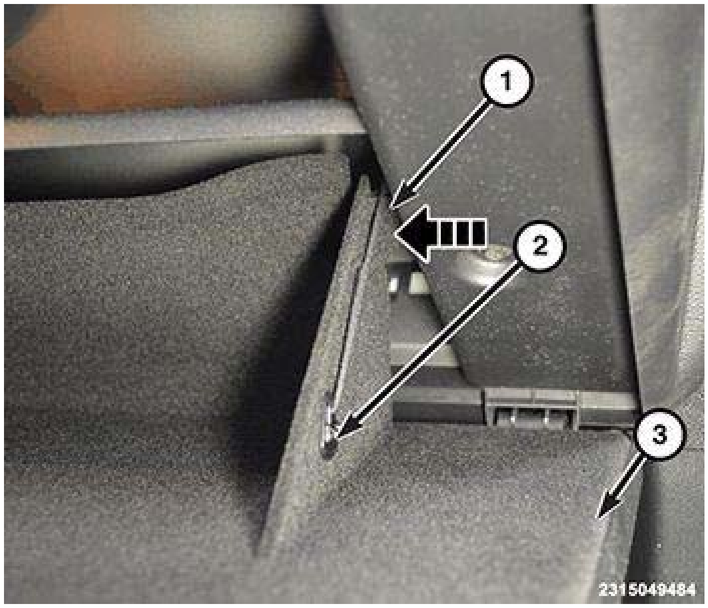

Fig. 185: Glove Box Door, Support Strap And Retainer & Stops
Courtesy of CHRYSLER GROUP, LLC

1. Align the glove box door (3) in the lower hinge slots.
2. Install the support strap and retainer (2) into the slot on the glove box door.
3. Push in on the glove box door stops (1) and rotate the glove box door upward.

GRILLE, DEFROSTER

REMOVAL

REMOVAL

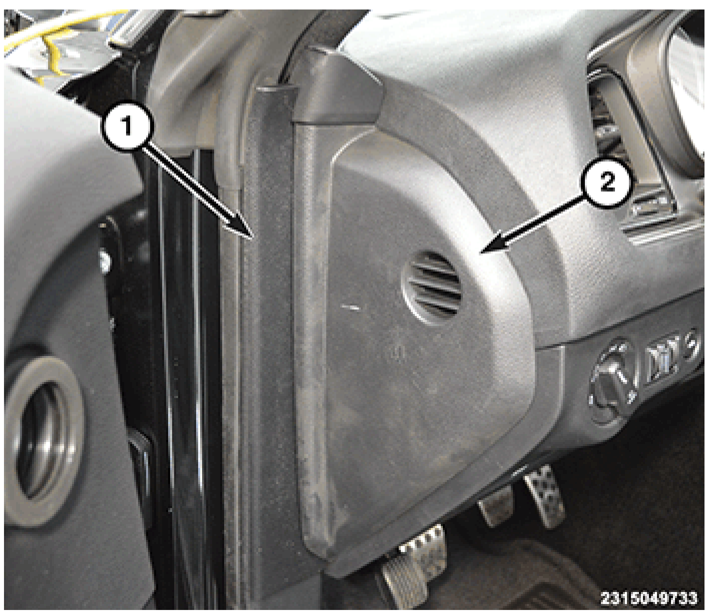

Fig. 186: A-Pillar Extension & Instrument Panel End Cap
Courtesy of CHRYSLER GROUP, LLC

1. Remove the A-pillar trim panels. Refer to PANEL, A-PILLAR TRIM, REMOVAL.

2. Using a trim stick or equivalent, remove the instrument panel end cap (2) and the A-pillar extension (1), on both sides of vehicle.

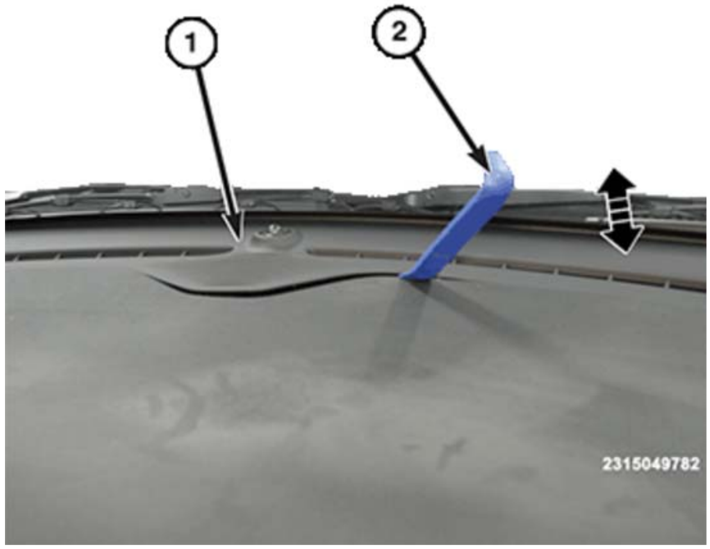

Fig. 187: Defroster Grille & Trim Stick
Courtesy of CHRYSLER GROUP, LLC

3. Using a trim stick (2) or equivalent, lift the rear of the defroster grille (1) to release the retaining clip.
4. Pull the defroster grille rearward and remove.

INSTALLATION

INSTALLATION

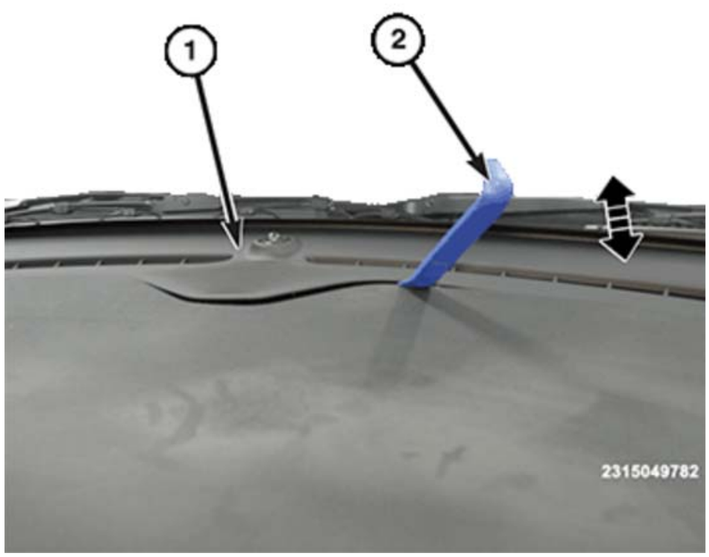

Fig. 188: Defroster Grille & Trim Stick
Courtesy of CHRYSLER GROUP, LLC

1. Position the defroster grille (1) onto the top of the instrument panel.

2. Hand tap the defroster grille to engage the retaining clips.

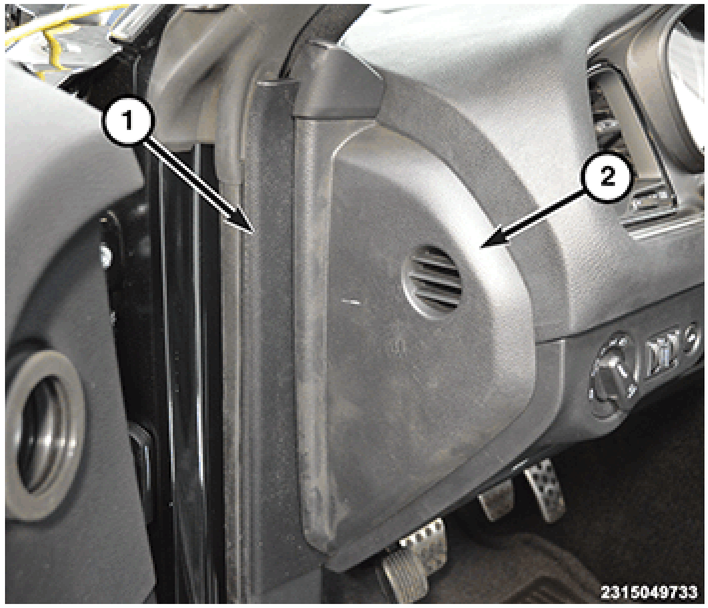

Fig. 189: A-Pillar Extension & Instrument Panel End Cap
Courtesy of CHRYSLER GROUP, LLC

3. Position the and the A-pillar extension (1) and hand tap to engage the retaining clips.
4. Position the and the instrument panel end cap (2) and hand tap to engage the retaining clips.

PANEL, INSTRUMENT

REMOVAL

REMOVAL

WARNING: Disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the Supplemental Restraint System (SRS). Failure to take the proper precautions could result in accidental airbag deployment and serious or fatal injury.

WARNING: Never strike or drop the Occupant Restraint Controller (ORC), as it can damage the impact sensor or affect its calibration. The occupant restraint controller contains the impact sensor, which enables the system to deploy the supplemental restraints. If an airbag control module is accidentally dropped during service, the module must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper supplemental restraint deployment and serious or fatal injury.

CAUTION: On vehicles equipped with the Occupant Classification System (OCS), never replace both the Occupant Restraint Controller (ORC) and the Occupant

Classification Module (OCM) at the same time. If both require replacement, replace one. Then perform the supplemental restraint verification test before replacing the other. Both the ORC and the OCM store OCS calibration data, which they transfer to one another when one of them is replaced. If both are replaced at the same time, an irreversible fault will be set in both modules.

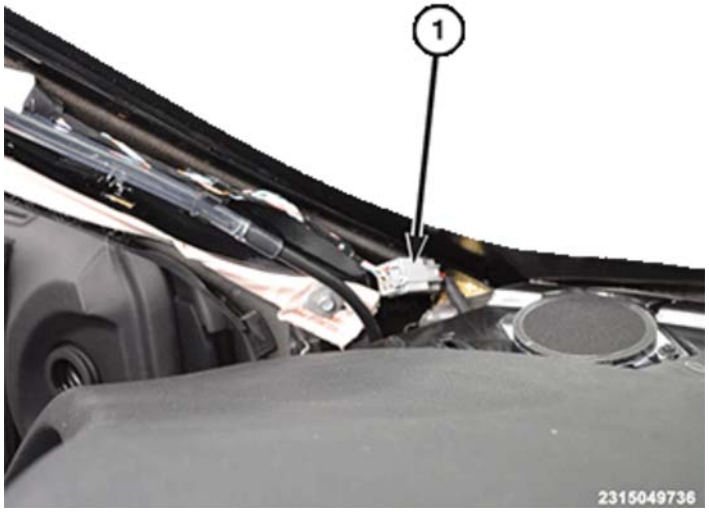

Fig. 190: Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions.
2. Remove the floor console. Refer to **CONSOLE, FLOOR, REMOVAL**.
3. Remove the steering column. Refer to **COLUMN, REMOVAL** .
4. Remove the glove box. Refer to **GLOVE BOX, INSTRUMENT PANEL, REMOVAL**.
5. Remove the defroster grille. Refer to **GRILLE, DEFROSTER, REMOVAL**.
6. Disconnect the wire harness connectors (1) at the A-pillar, on both sides of vehicle.

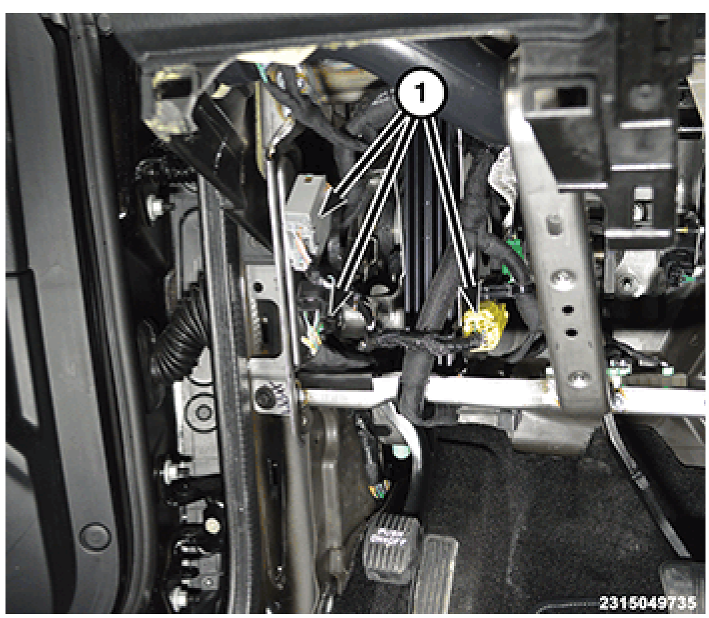

Fig. 191: Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

7. Under the left side of the instrument panel disconnect the wire harness connectors (1).

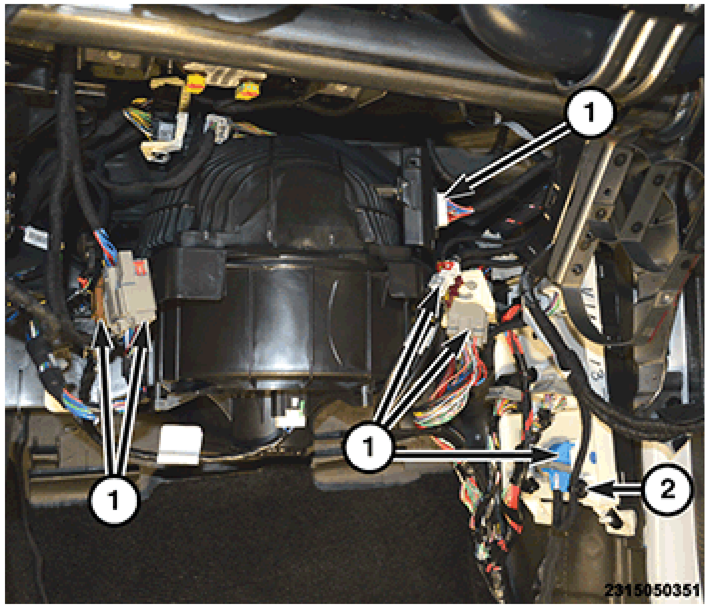

Fig. 192: Wire Harness Connectors & Harness
Courtesy of CHRYSLER GROUP, LLC

8. Under the right side of the instrument panel unclip the harness (2) and disconnect the wire harness connectors (1).

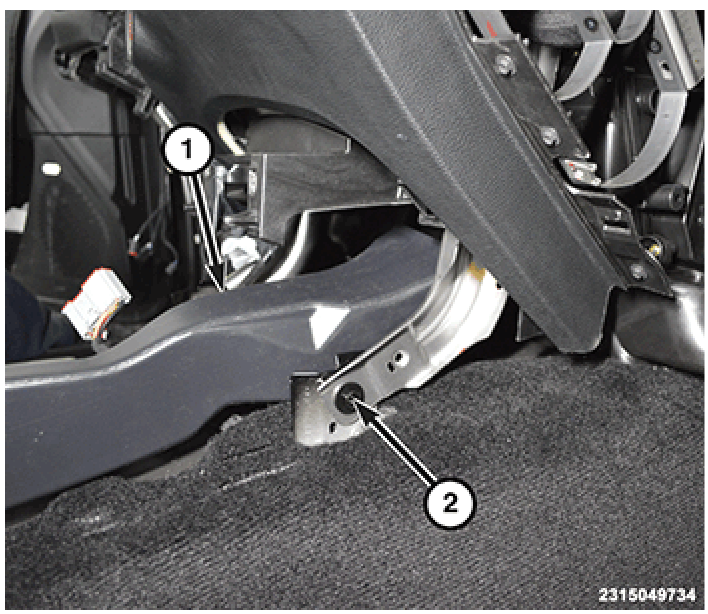

Fig. 193: Floor Duct & Instrument Panel Center Bracket Bolt

9. Remove the push fastener and the floor duct (1).
10. Remove the two instrument panel center bracket bolts (2).

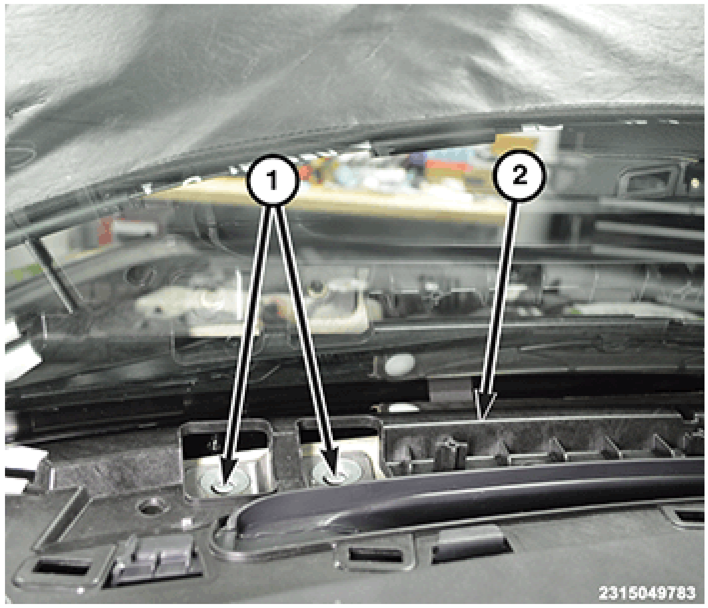

Fig. 194: Instrument Panel & Top Bolts
Courtesy of CHRYSLER GROUP, LLC

11. Remove the two bolts (1) at the front of the instrument panel (2) on left side.

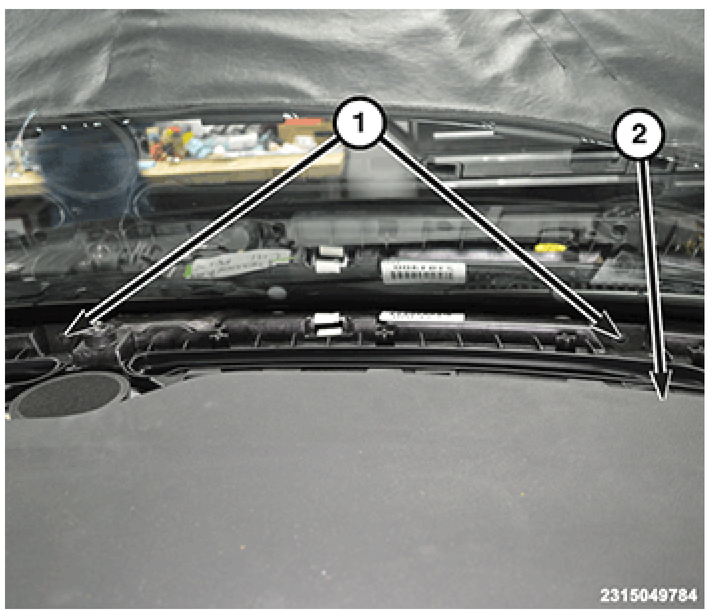

Fig. 195: Instrument Panel & Screws
Courtesy of CHRYSLER GROUP, LLC

12. Remove the two screws (1) at the front of the instrument panel (2) near the center and on right side.

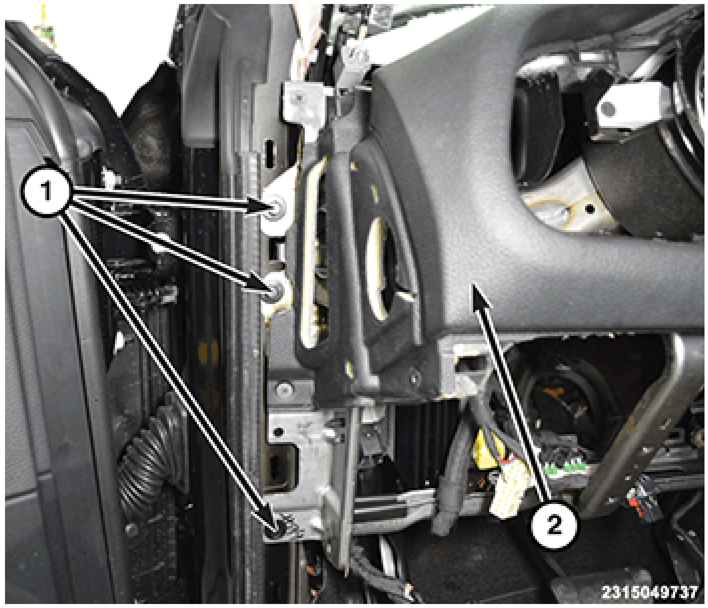

Fig. 196: Instrument Panel Assembly & Bolts
Courtesy of CHRYSLER GROUP, LLC

13. Remove the instrument panel side bolts (1) on both sides of the vehicle.
14. Lift the instrument panel assembly (2) off of the supports. Carefully roll the instrument panel rearward to make sure there is nothing attached, then remove it from the vehicle.

INSTALLATION

INSTALLATION

WARNING: **Disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the Supplemental Restraint System (SRS). Failure to take the proper precautions could result in accidental airbag deployment and serious or fatal injury.**

WARNING: **Never strike or drop the Occupant Restraint Controller (ORC), as it can damage the impact sensor or affect its calibration. The occupant restraint controller contains the impact sensor, which enables the system to deploy the supplemental restraints. If an airbag control module is accidentally dropped during service, the module must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper supplemental restraint deployment and serious or fatal injury.**

CAUTION: **On vehicles equipped with the Occupant Classification System (OCS), never replace both the Occupant Restraint Controller (ORC) and the Occupant Classification Module (OCM) at the same time. If both require replacement, replace one. Then perform the supplemental restraint verification test before replacing the other. Both the ORC and the OCM store OCS calibration data,**

which they transfer to one another when one of them is replaced. If both are replaced at the same time, an irreversible fault will be set in both modules.

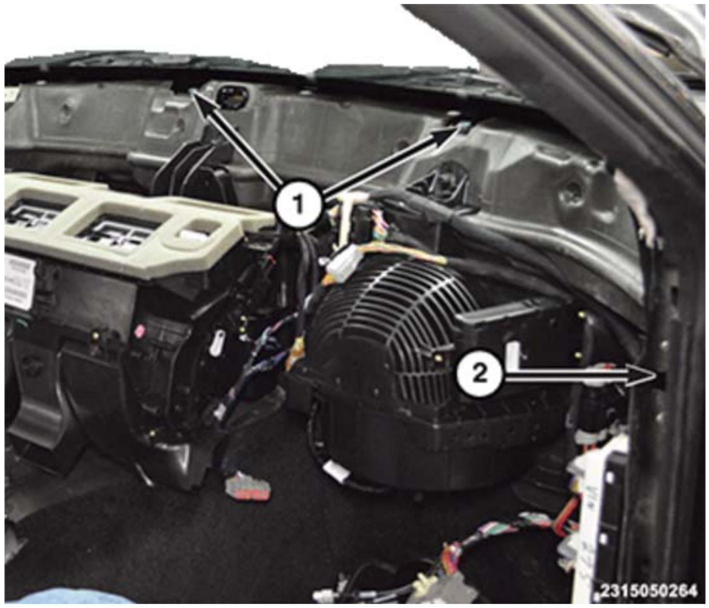

Fig. 197: Spring Nuts & Slot
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions.
2. If required, install new spring nuts (1) into the dash panel.
3. Carefully position the instrument panel in the vehicle through the drivers door. Hook the instrument panel into the slots (2) on both sides.
4. Loosely install all the instrument panel bolts and screws.

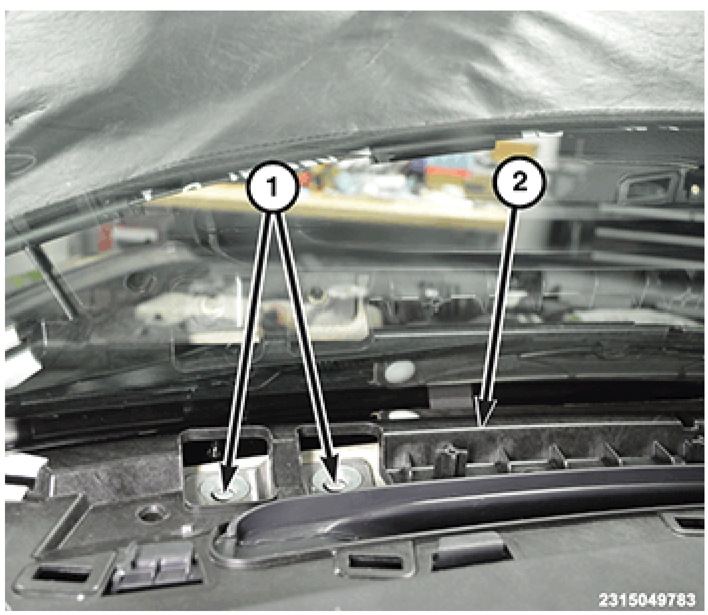

Fig. 198: Instrument Panel & Top Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Tighten the instrument panel top bolts (1) to the proper specification. Refer to **SPECIFICATIONS**.

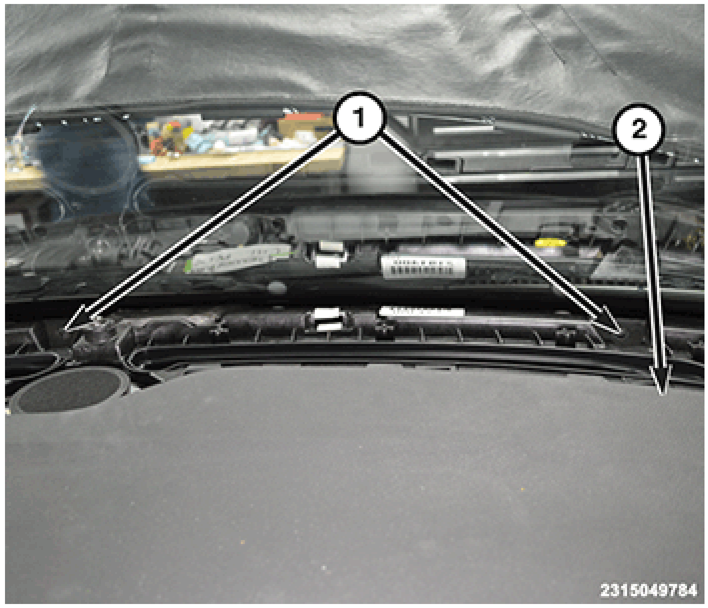

Fig. 199: Instrument Panel & Screws
Courtesy of CHRYSLER GROUP, LLC

6. Tighten the instrument panel top screws (1) to the proper specification. Refer to SPECIFICATIONS.

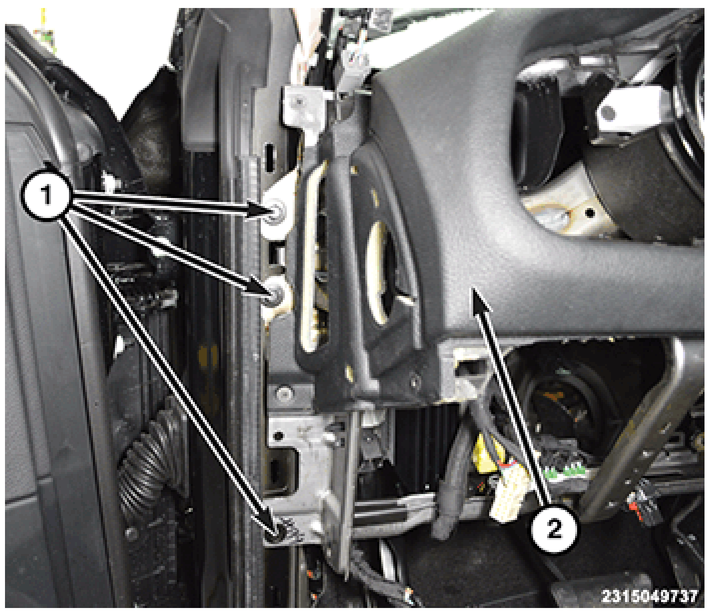

Fig. 200: Instrument Panel Assembly & Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Tighten the instrument panel side bolts (1) to the proper specification. Refer to SPECIFICATIONS.

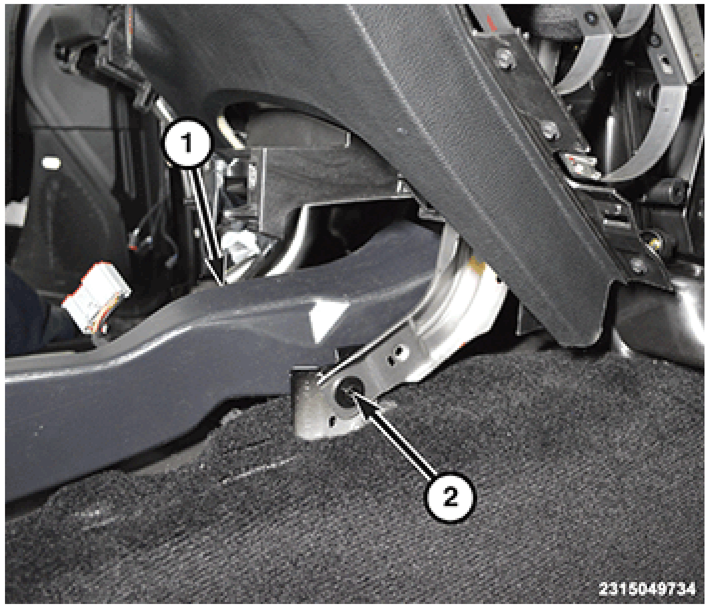

Fig. 201: Floor Duct & Instrument Panel Center Bracket Bolt
Courtesy of CHRYSLER GROUP, LLC

8. Tighten the instrument panel center bracket bolts (2) to the proper specification. Refer to **SPECIFICATIONS**.
9. Install the floor duct (1) and push fastener.

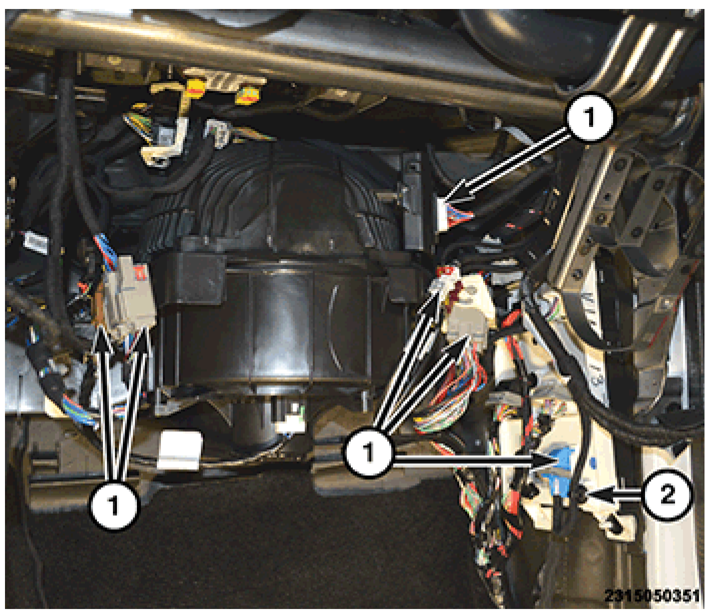

Fig. 202: Wire Harness Connectors & Harness
Courtesy of CHRYSLER GROUP, LLC

10. Under the right side of the instrument panel connect the wire harness connectors (1) and clip the harness (2) in place.

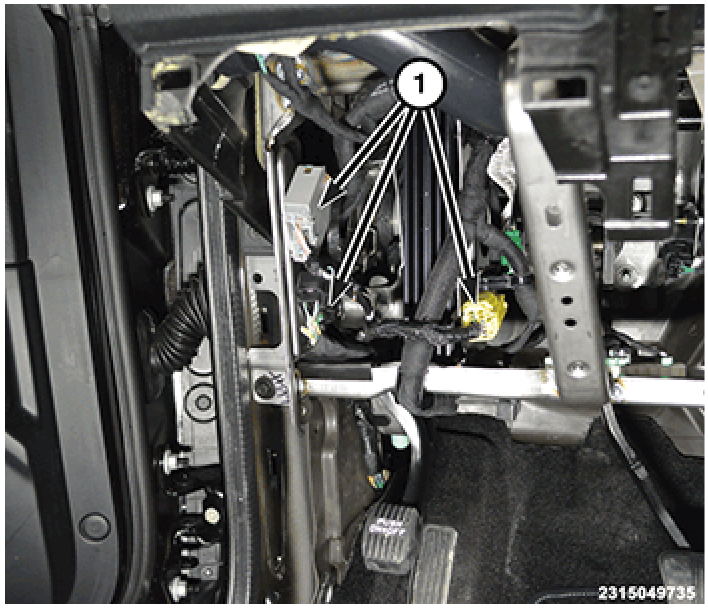

Fig. 203: Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

11. Under the left side of the instrument panel connect the wire harness connectors (1).

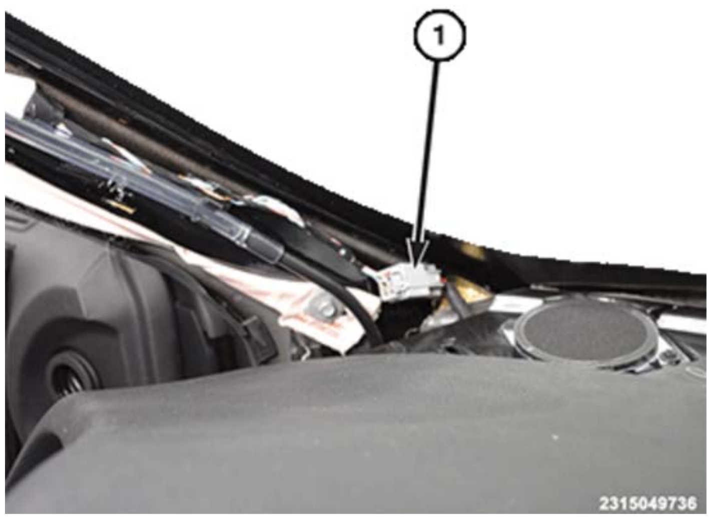

Fig. 204: Wire Harness Connectors
Courtesy of CHRYSLER GROUP, LLC

12. Connect the wire harness connectors (1) at the A-pillar, on both sides of vehicle.
13. Install the defroster grille. Refer to **GRILLE, DEFROSTER, INSTALLATION**.
14. Install the glove box. Refer to **GLOVE BOX, INSTRUMENT PANEL, INSTALLATION**.
15. Install the steering column. Refer to **COLUMN, INSTALLATION** .
16. Install the floor console. Refer to **CONSOLE, FLOOR, INSTALLATION**.

INTERIOR

CARPET

REMOVAL

REMOVAL

FRONT FLOOR CARPET

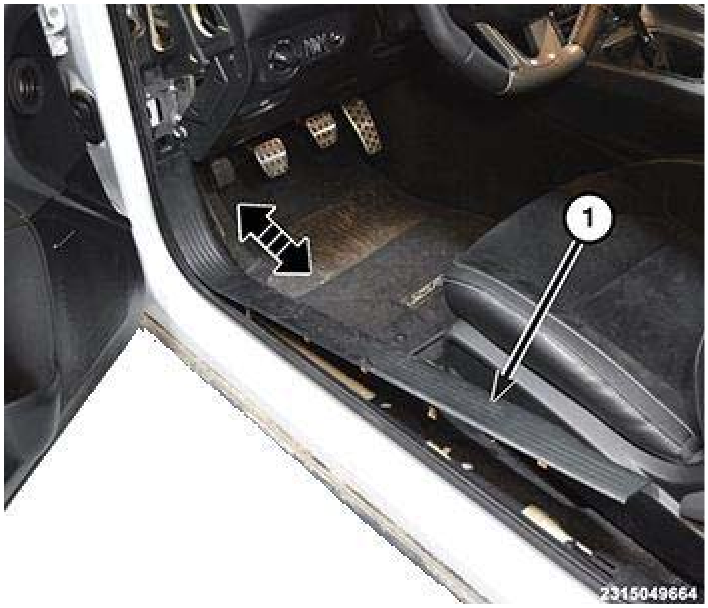

Fig. 205: Cowl Side Trim Panel
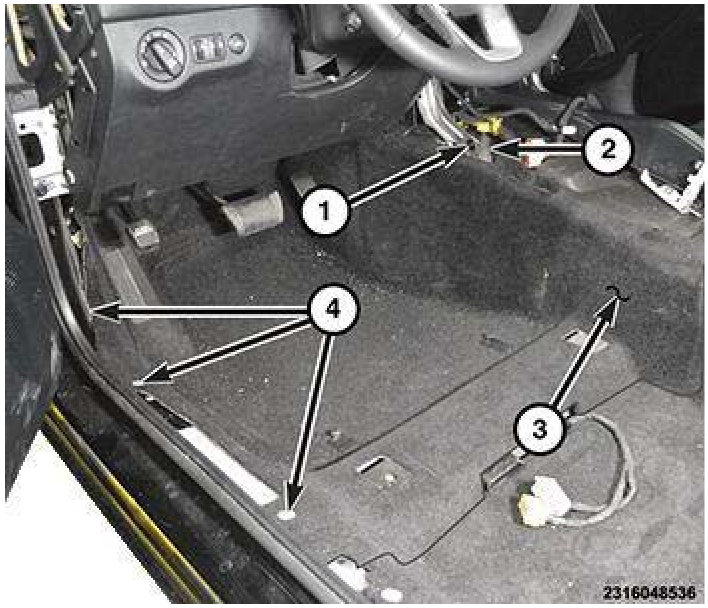
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The front floor carpet consists of two components, one for the driver side and one for the passenger side. These carpets can be removed and installed separately.**

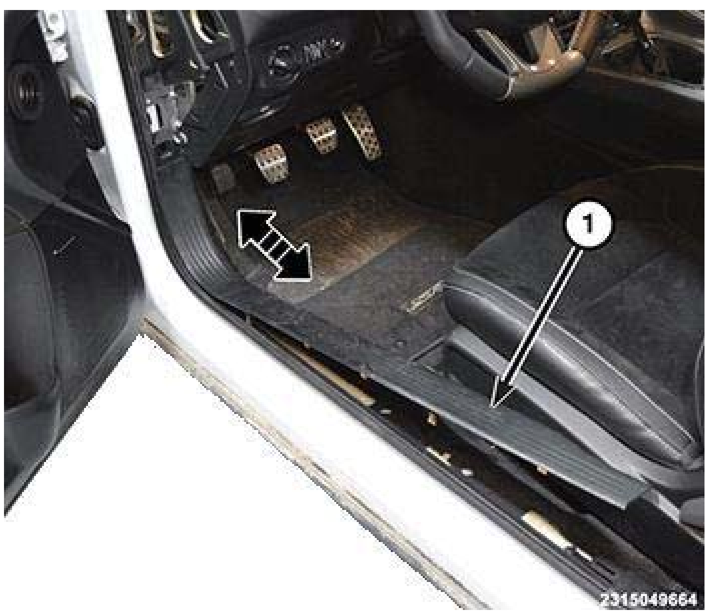
1. Lift the cowl side trim panel (1) at the rear, then pull rearward and remove.
2. Remove the driver or passenger front seat from the vehicle as necessary. Refer to **SEAT, FRONT, REMOVAL**.
3. Remove the floor console. Refer to **CONSOLE, FLOOR, REMOVAL**.



[Fig. 206: Instrument Panel Bracket, Bolt, Front Floor Carpet & Push Fasteners]
Courtesy of CHRYSLER GROUP, LLC

4. Remove the push fasteners (4).
5. Remove the bolt (1) and lift the front floor carpet over the instrument panel bracket (2).
6. Lift the front floor carpet (3) at the rear and remove.

REAR FLOOR CARPET



[Fig. 207: Cowl Side Trim Panel]
Courtesy of CHRYSLER GROUP, LLC

1. Lift the door scuff plate (1) at the rear, then pull rearward and remove. Remove the door sill scuff plate from opposite side of vehicle.
2. Remove both front seats. Refer to **SEAT, FRONT, REMOVAL**.
3. Remove the floor console. Refer to **CONSOLE, FLOOR, REMOVAL**.

4. Remove the rear seat cushion. Refer to **COVER, SEAT CUSHION, REAR, REMOVAL**.

Fig. 208: Quarter Trim Panel & Screw
Courtesy of CHRYSLER GROUP, LLC

5. Remove the screw (2), then pull the quarter trim panel (1) out to release the lower retaining clip. Perform this on both sides of vehicle.

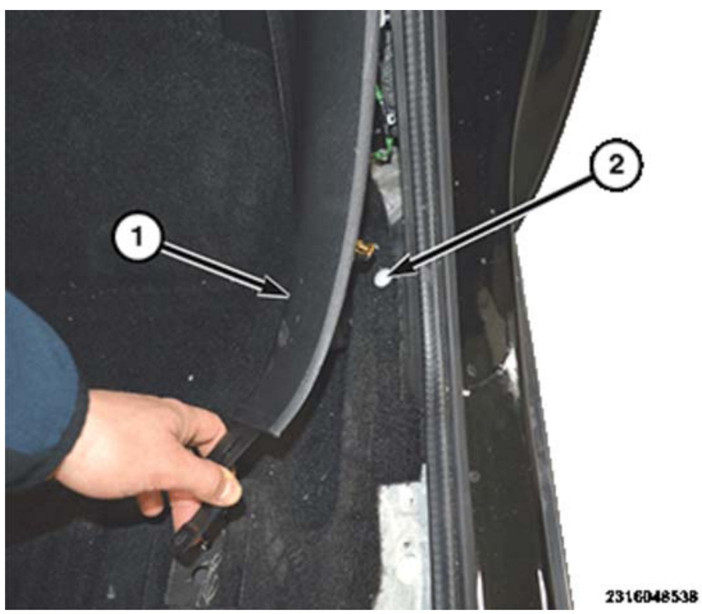


Fig. 209: Quarter Trim Panel & Push Fastener
Courtesy of CHRYSLER GROUP, LLC

6. Pull back the quarter trim panel (1) and remove the push fastener (2), on both sides of the vehicle.

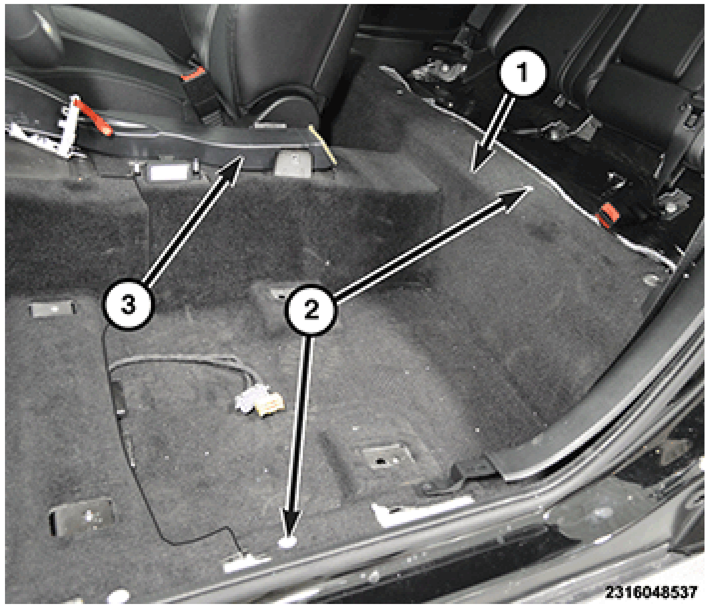

Fig. 210: Carpet, Push Fasteners & Floor Duct
Courtesy of CHRYSLER GROUP, LLC

7. Lift and remove the floor duct (3).
8. Remove the push fasteners (2).
9. Lift the rear floor carpet enough to remove the wire harness through the openings.

WHEEL WELL CARPET

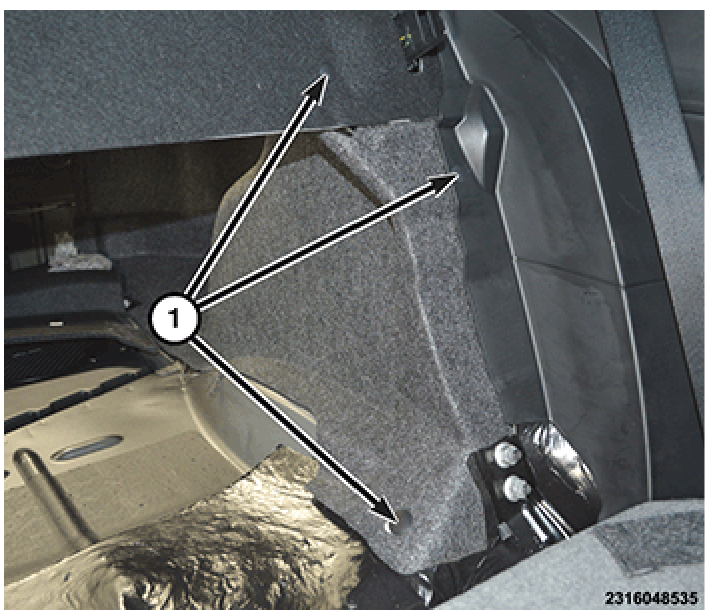

Fig. 211: Push Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Open the decklid and lift out the luggage floor carpet.
2. Fold the rear seats forward.
3. Remove the push fasteners (1).

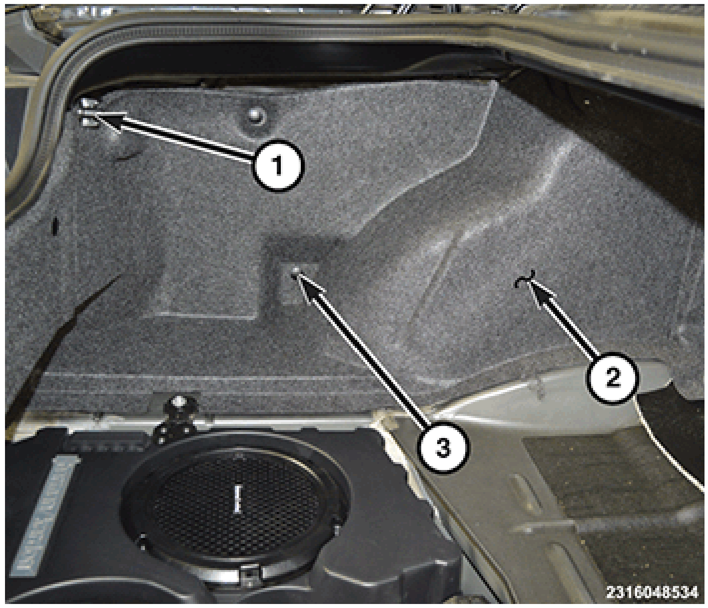

Fig. 212: Plastic Nut, Wheel Well Carpet & Push Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Remove the plastic nut (1) by hand.
5. Remove the push fasteners (3) and the wheel well carpet (2).

INSTALLATION

INSTALLATION

FRONT FLOOR CARPET

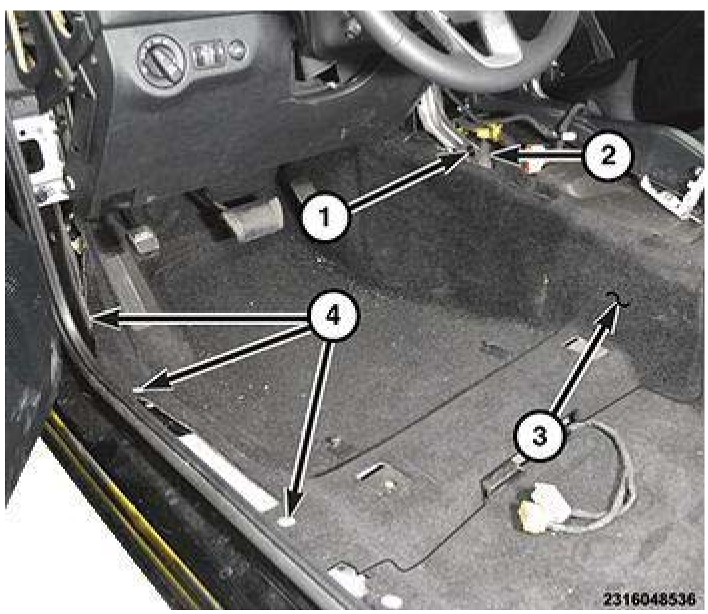

Fig. 213: Instrument Panel Bracket, Bolt, Front Floor Carpet & Push Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Position the front floor carpet (3) over the instrument panel bracket (2). Make sure the rear of the front floor carpet is fitted correctly over the floor panel crossmember and does not cover the rear floor air duct opening. Make sure the front of the front floor carpet is fitted under the instrument panel without

interference with the steering column, the accelerator, nor the heater and air conditioner unit.

2. Install the push fasteners (4).
3. Install the instrument panel bracket bolt (1) and tighten securely.

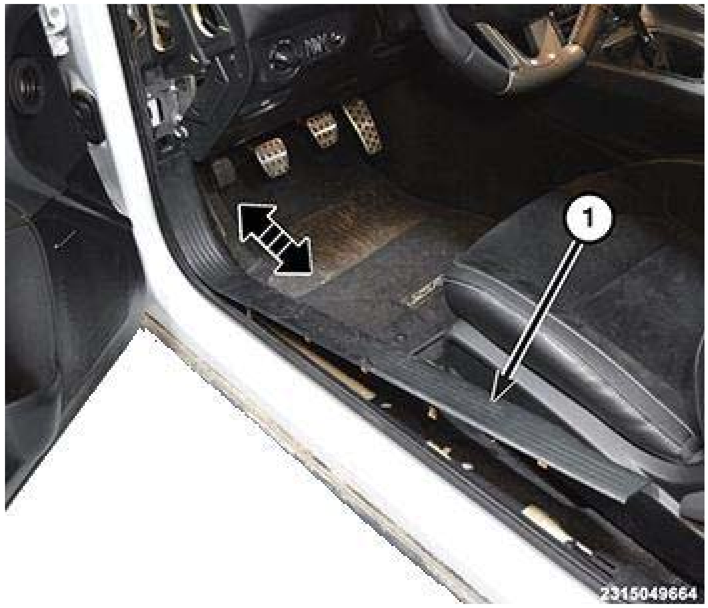

Fig. 214: Cowl Side Trim Panel
Courtesy of CHRYSLER GROUP, LLC

4. Install the cowl side trim panel (1) at the front, then hand tap the rear to install the retaining clips.
5. Install the floor console. Refer to **CONSOLE, FLOOR, INSTALLATION**.
6. Install the front seat. Refer to **SEAT, FRONT, INSTALLATION**.

REAR FLOOR CARPET

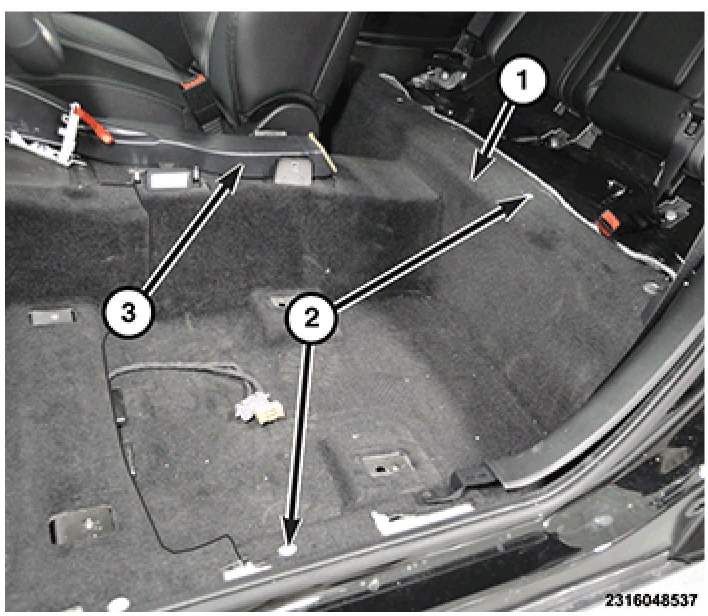

Fig. 215: Carpet, Push Fasteners & Floor Duct
Courtesy of CHRYSLER GROUP, LLC

1. Position the rear floor carpet (1) into the vehicle. Route the wire harness through the openings in the carpet as necessary.
2. Install the push fasteners (2).
3. Install the floor duct (3).

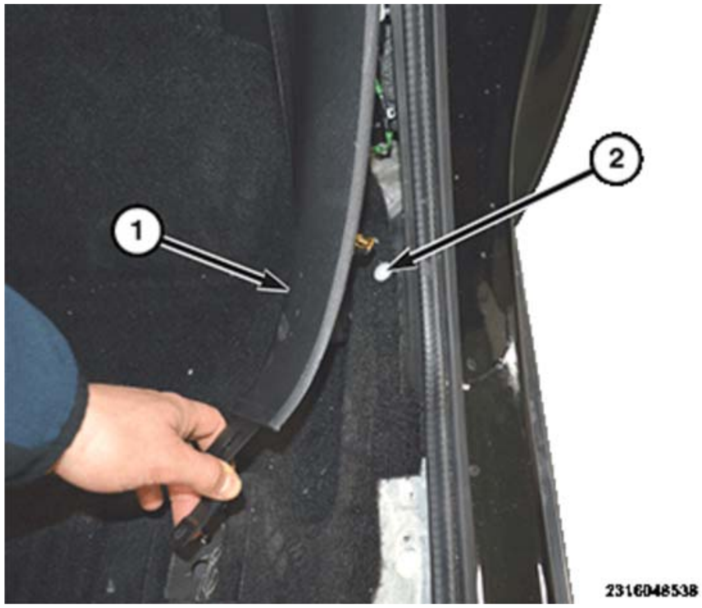

Fig. 216: Quarter Trim Panel & Push Fastener
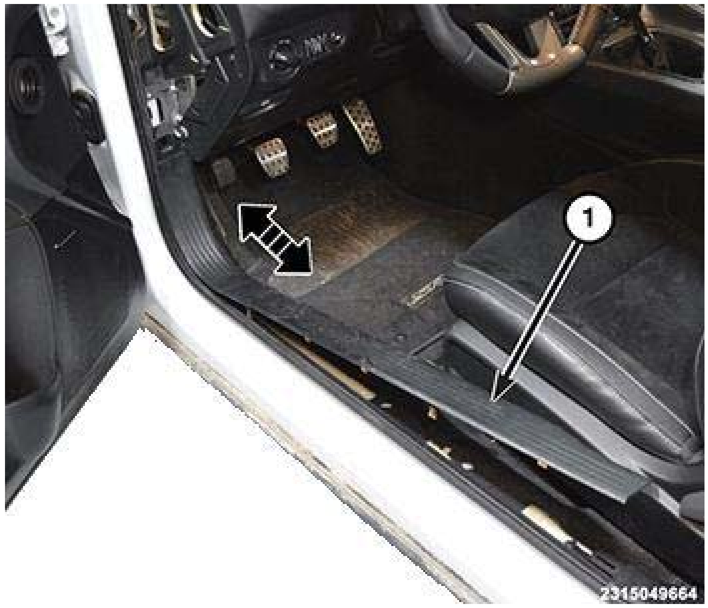
Courtesy of CHRYSLER GROUP, LLC

4. Pull back the quarter time panel (1) and install the push fastener (2), on both sides of the vehicle.

Fig. 217: Quarter Trim Panel & Screw
Courtesy of CHRYSLER GROUP, LLC

5. Push the quarter trim panel (1) to engage the retaining clip. Install the screw (2) and tighten securely.



[Fig. 218: Cowl Side Trim Panel](#)
Courtesy of CHRYSLER GROUP, LLC

6. Install the cowl side trim panel (1) at the front, then hand tap the rear to install the retaining clips. Install both cowl side trim panels.
7. Install the rear seat cushion. Refer to **SEAT CUSHION, INSTALLATION**.
8. Install the floor console. Refer to **CONSOLE, FLOOR, INSTALLATION**.
9. Install the front seats. Refer to **SEAT, FRONT, INSTALLATION**.

WHEEL WELL CARPET

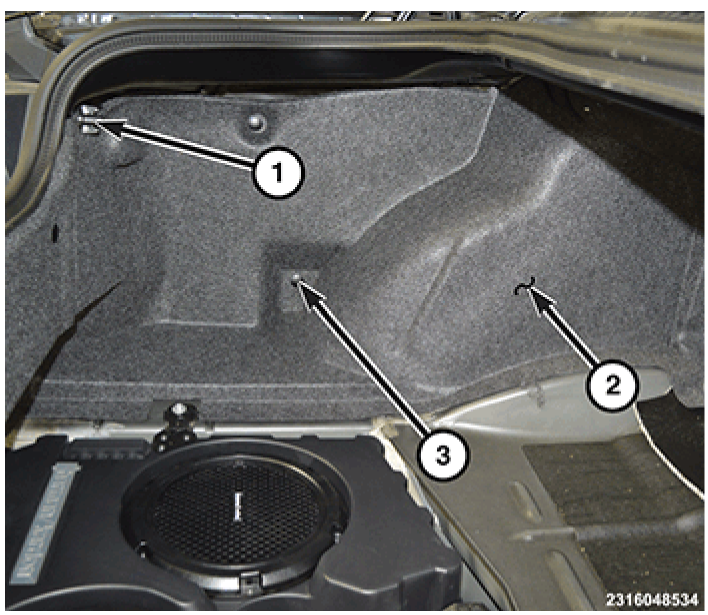


Fig. 219: Plastic Nut, Wheel Well Carpet & Push Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Position the wheel well carpet (2) into the vehicle.
2. Install the plastic nut (1) by hand.

3. Install the push fasteners (3).

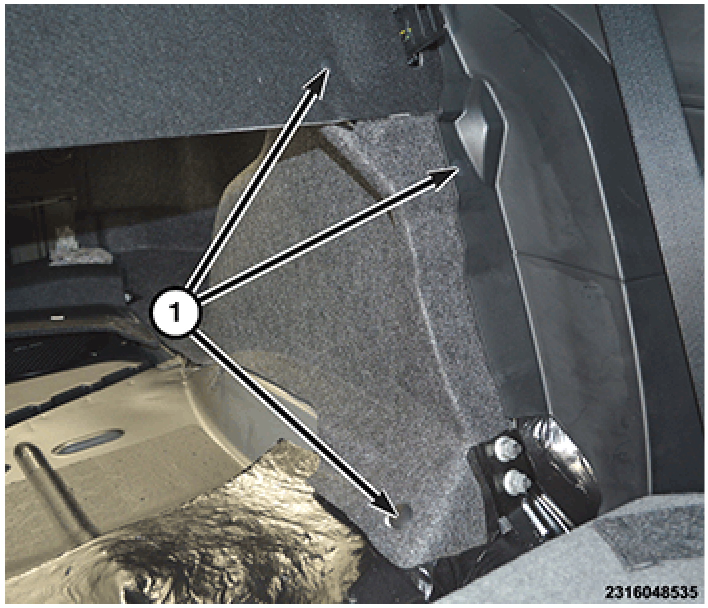

Fig. 220: Push Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Maker sure the wheel well carpet is positioned under the rear shelf panel and the quarter trim panel, then install the push fasteners (1).
5. Position the luggage floor carpet into the vehicle.

CONSOLE, FLOOR

REMOVAL

REMOVAL

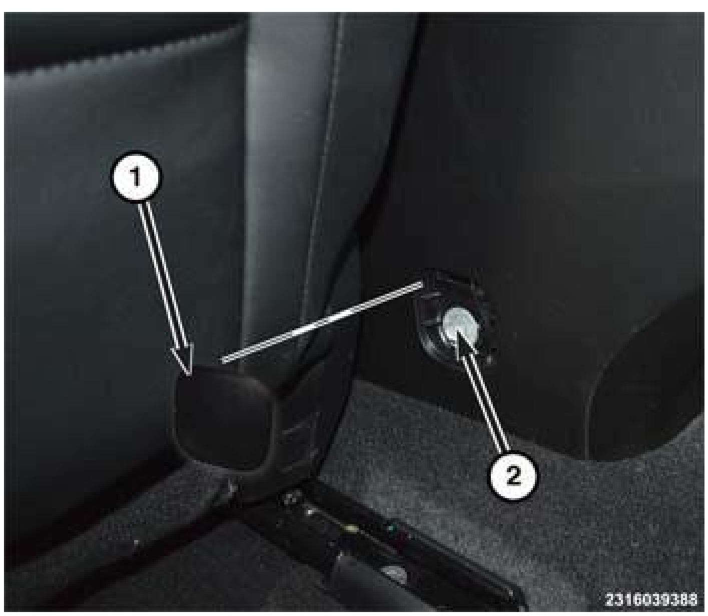

Fig. 221: Bolt Cover & Bolt
Courtesy of CHRYSLER GROUP, LLC

2. Move the front seats to the full forward position.
3. On both sides of the floor console, remove the bolt covers (1) and the bolts (2) at the rear of the floor console.
4. Move the seats to the full rear position.
5. Disconnect and isolate the negative battery cable.

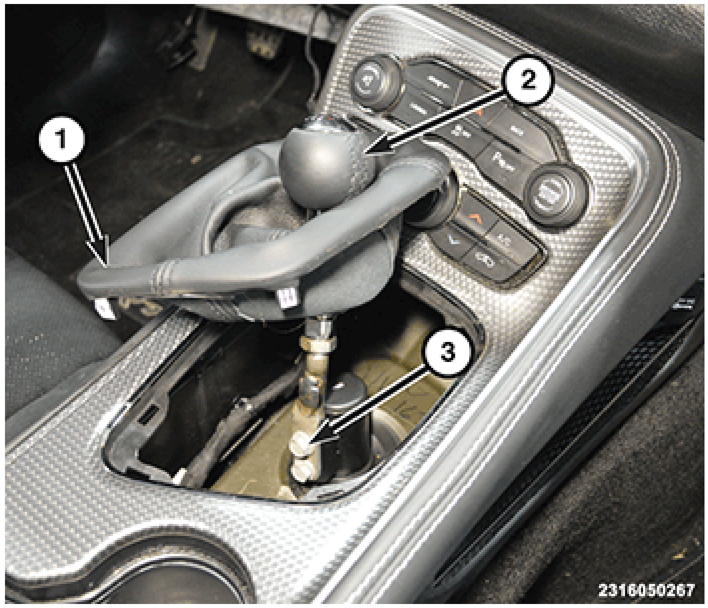

Fig. 222: Shifter Boot, Shift Lever & Bolts
Courtesy of CHRYSLER GROUP, LLC

6. For manual shifter, using a trim stick or equivalent, carefully release the retaining clips and lift the shifter boot (1).
7. Remove the bolts (3) then the shift lever (2).

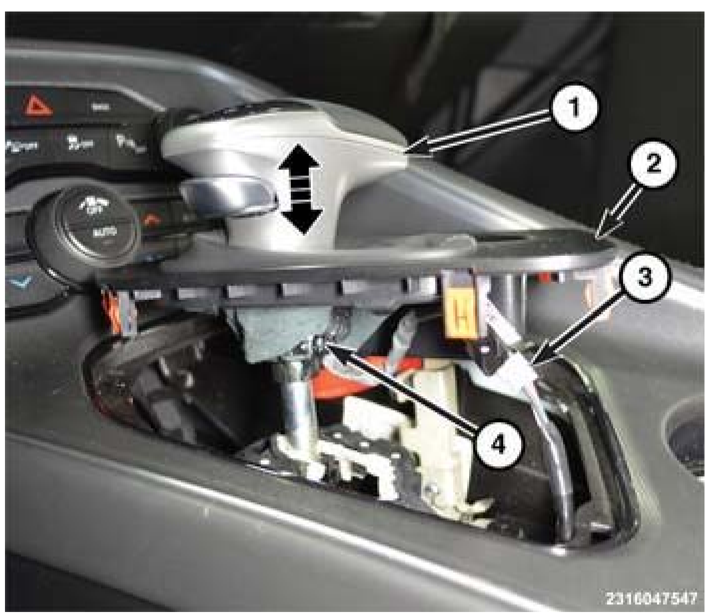

Fig. 223: Shifter Knob, Shifter Bezel, Wire Harness Connector & Screw

Courtesy of CHRYSLER GROUP, LLC

8. For automatic shifter, place the shifter in the Neutral position.
9. Using a trim stick or equivalent, carefully release the retaining clips and lift the shifter bezel (2).
10. Remove the screw (4) then lift the shifter knob (1) and remove.

Fig. 224: Floor Console Panel
Courtesy of CHRYSLER GROUP, LLC

11. Using a trim stick or equivalent, starting at the rear carefully release the retaining clip and lift the floor console panel (1). Disconnect the wire harness connectors and remove.

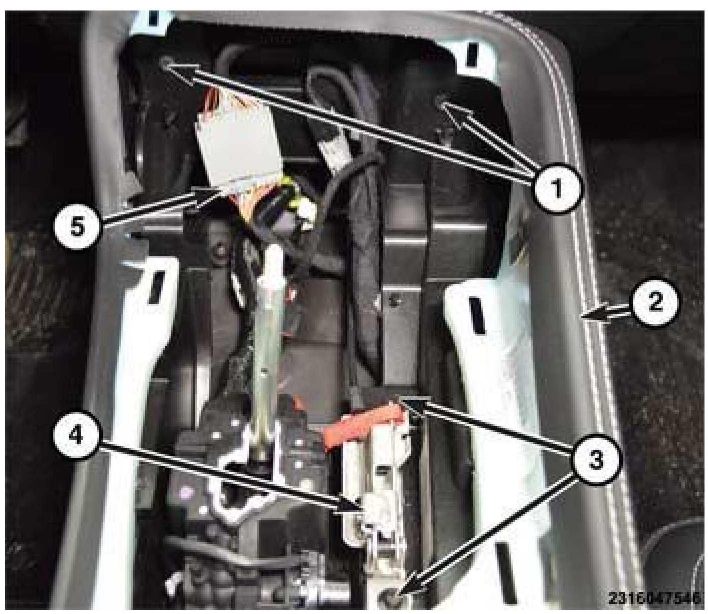

Fig. 225: Floor Console, Manual Park Release, Wire Harness Connector & Screws
Courtesy of CHRYSLER GROUP, LLC

12. Remove the two screws (1) at the front of the floor console (2).

13. Remove the two screws (3) and position the manual park release (4) aside, if equipped.
14. Disconnect the wire harness connector (5).
15. Slide the floor console rearward and remove.

INSTALLATION

INSTALLATION

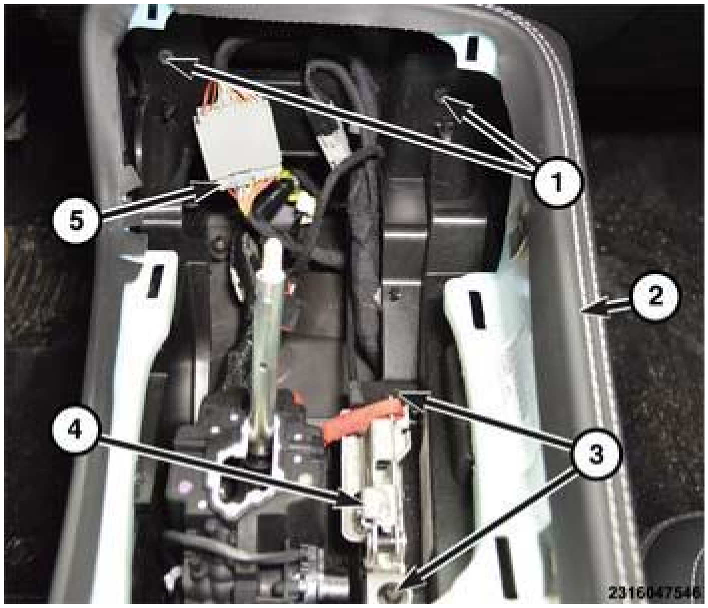

Fig. 226: Floor Console, Manual Park Release, Wire Harness Connector & Screws
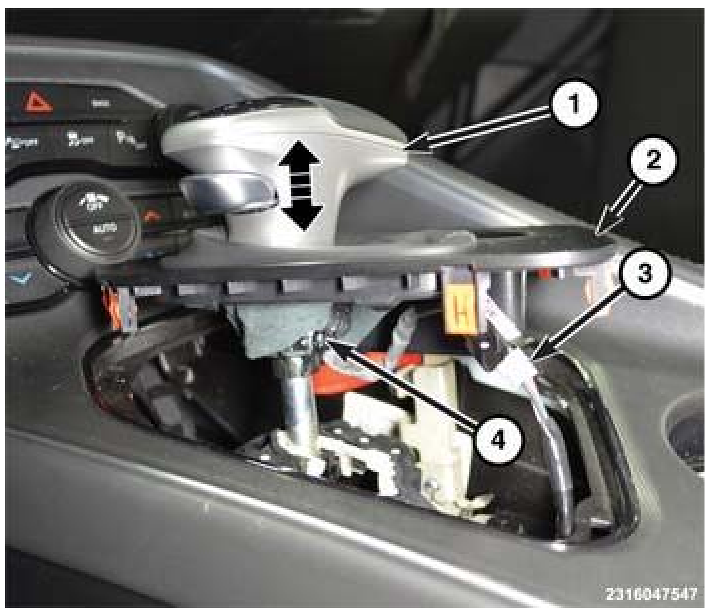
Courtesy of CHRYSLER GROUP, LLC

1. Position the floor console into the vehicle and connect the electrical connector (5).
2. Align the floor duct at the rear of the floor console. Slide the floor console forward to the instrument panel.
3. Install the two screws (1) and tighten securely.
4. Position the manual park release (4) and install the two screws (3), if equipped. Tighten the screws securely.

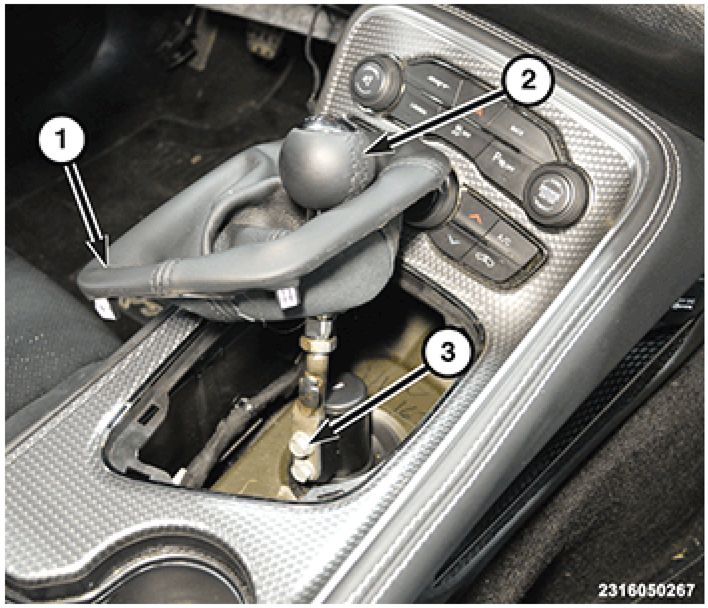
[Fig. 227: Floor Console Panel]
Courtesy of CHRYSLER GROUP, LLC

5. Connect the wire harness connectors and install the floor console panel (1).



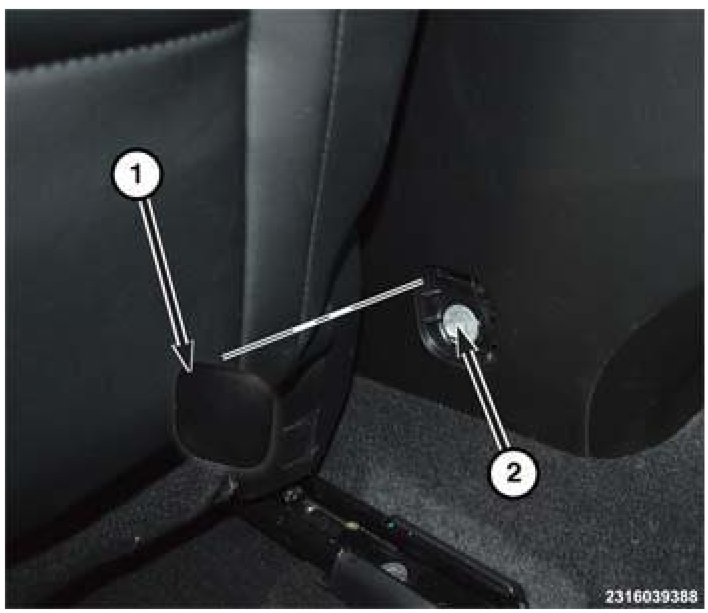
[Fig. 228: Shifter Knob, Shifter Bezel, Wire Harness Connector & Screw]
Courtesy of CHRYSLER GROUP, LLC

6. For automatic shifter, install the shifter knob and install the screw (4). Tighten the screw securely.
7. Connect the wire harness connector (3).
8. Position the shifter bezel (2) and engage the retaining clips.



[Fig. 229: Shifter Boot, Shift Lever & Bolts](#)
Courtesy of CHRYSLER GROUP, LLC

9. For manual shifter, install the shift lever (2) and the bolts (3). Tighten the shift lever bolts to 19 N.m (168 in. lbs.). .
10. Position the shifter boot (1) and engage the retaining clips.
11. Connect the battery negative cable.



[Fig. 230: Bolt Cover & Bolt](#)
Courtesy of CHRYSLER GROUP, LLC

12. Move the seats to the full forward position.
13. Install the bolts (2) and tighten securely.
14. Install the bolt covers (1).

CONSOLE, OVERHEAD, FRONT

DESCRIPTION

DESCRIPTION

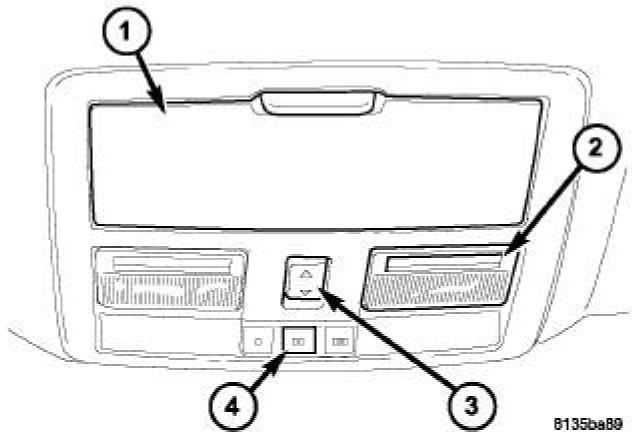


Fig. 231: Identifying Overhead Console Components
Courtesy of CHRYSLER GROUP, LLC

An overhead console is standard on this vehicle and includes the following components:

- Overhead storage compartment (1)
- Front map/reading lamps (2)
- Power sunroof switch (3) - if equipped
- Universal transmitter (4)
- Electronic Overhead Module

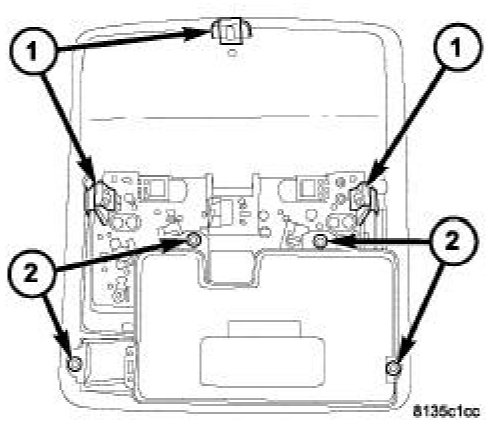

Fig. 232: Retaining Screws
Courtesy of CHRYSLER GROUP, LLC

The overhead console assembly is mounted by three snap clips (1) securing it to a molded plastic retainer bracket located above the headliner. The Electronic Overhead Module is secured to the overhead console with screws (2).

REMOVAL

REMOVAL

Fig. 233: Overhead Console & Clips

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Using a trim stick or equivalent, release the three retaining clips at the locations (1) and lower the overhead console (2).
3. Disconnect the wire harness connectors from the overhead console and remove.

INSTALLATION

INSTALLATION

Fig. 234: Overhead Console & Clips

Courtesy of CHRYSLER GROUP, LLC

1. Connect the wire harness connectors to the overhead console (2).
2. Align the three retaining clips (1) to the overhead console bracket.
3. Push firmly and evenly on the sides of the overhead console to engage the retaining clips.
4. Connect the negative battery cable.

HEADLINER

REMOVAL

REMOVAL

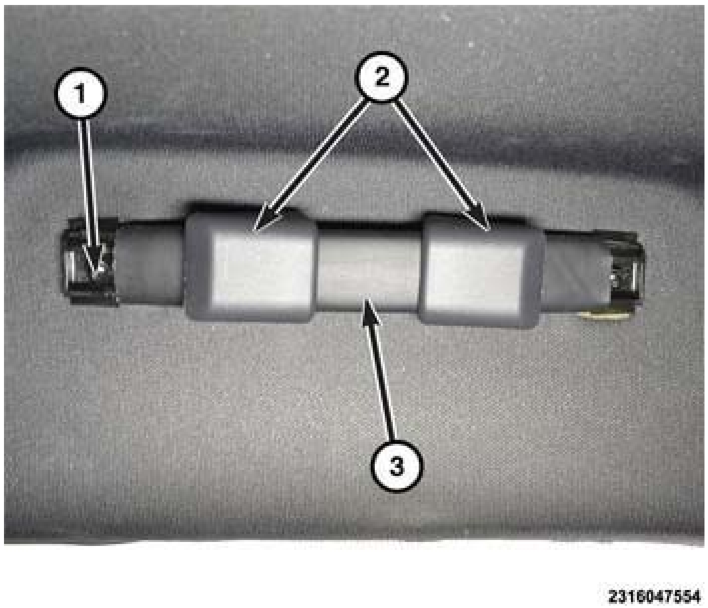

Fig. 235: Grab Handle, Screw Cover & Screw
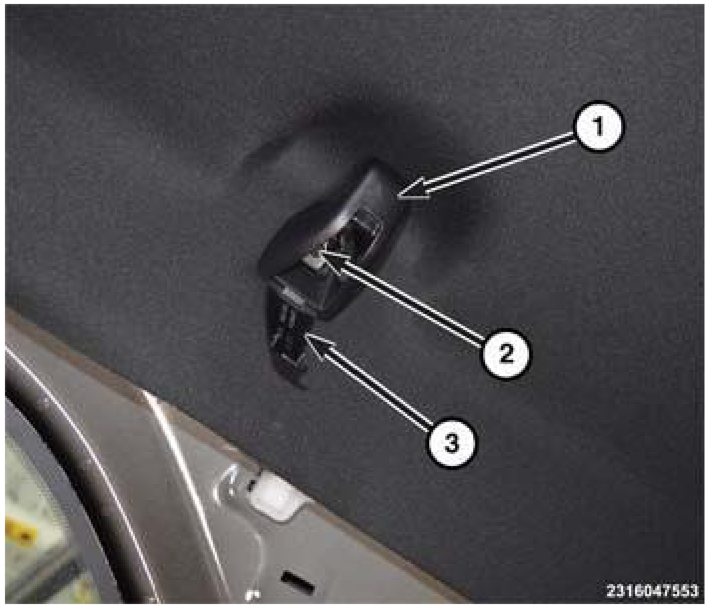
Courtesy of CHRYSLER GROUP, LLC

NOTE: **In the event the headliner is damaged or creased during removal, it will need to be replaced with a new headliner.**

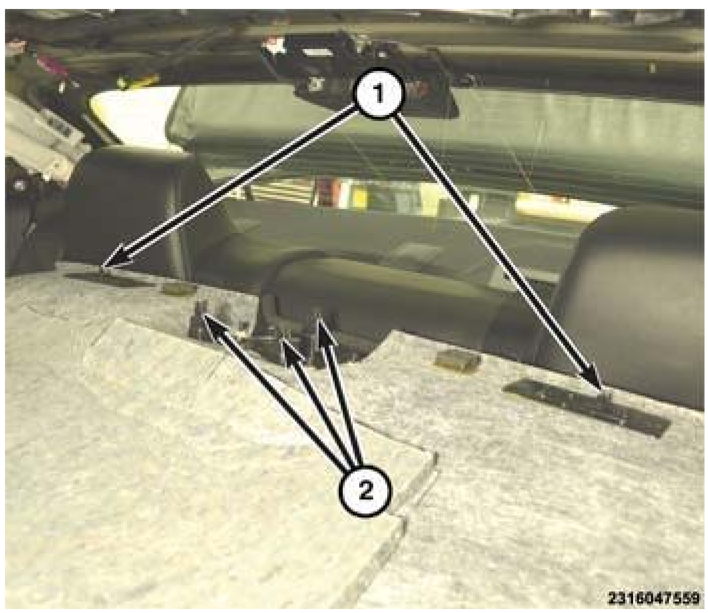
Use clean gloves or make sure your hands are clean before removing the headliner.

1. Disconnect and isolate the negative battery cable.
2. If removing the headliner from the vehicle first remove the windshield. Refer to **WINDSHIELD, REMOVAL**.
3. Using a trim stick or equivalent, position the screw covers (2) inward on the grab handle (3). Remove the two screws (1) and the grab handle. Remove all grab handles.



[Fig. 236: Coat Hook, Screw & Screw Cover]
Courtesy of CHRYSLER GROUP, LLC

4. Using a small pry tool, open the coat hook screw cover (3). Remove the screw (2) and the coat hook (1). Remove all coat hooks.
5. Remove the upper quarter trim panels. Refer to **PANEL, QUARTER TRIM, REMOVAL**.



[Fig. 237: Push Fasteners & Retainer Clips]
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The headliner is shown in illustration removed for clarification.**

6. Using a trim stick or equivalent, release the push fasteners (1) and retainer clips (2) at the rear of the headliner.
7. Carefully pull the headliner downward near the center to release the magnetic fastener.

NOTE: **The rear of the headliner can now be lowered slightly to service the center high mount stop lamp.**

8. If lowering the headliner fully or removing the headliner, continue with the procedure.
9. Remove A-pillar trim panels. Refer to **PANEL, A-PILLAR TRIM, REMOVAL**.

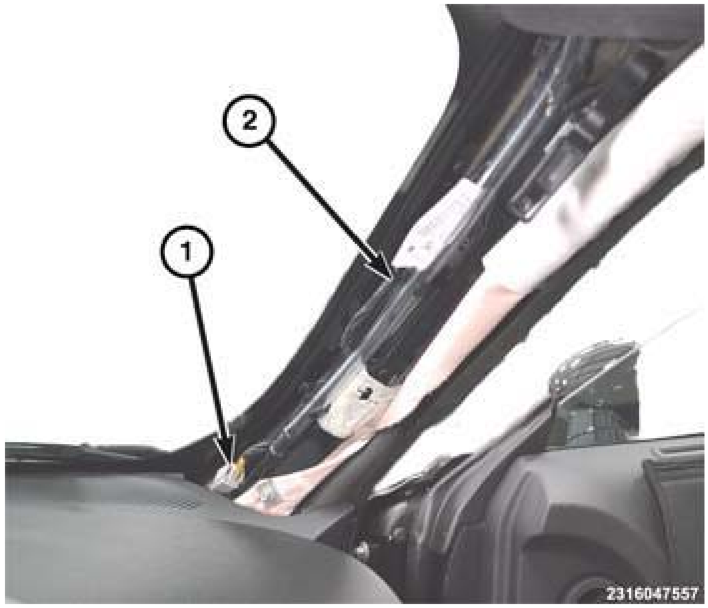


Fig. 238: Wire Harness & Connector
Courtesy of CHRYSLER GROUP, LLC

10. Unclip the headliner wire harness (2) and disconnect the headliner wire harness connector (1) at the right side A-pillar.

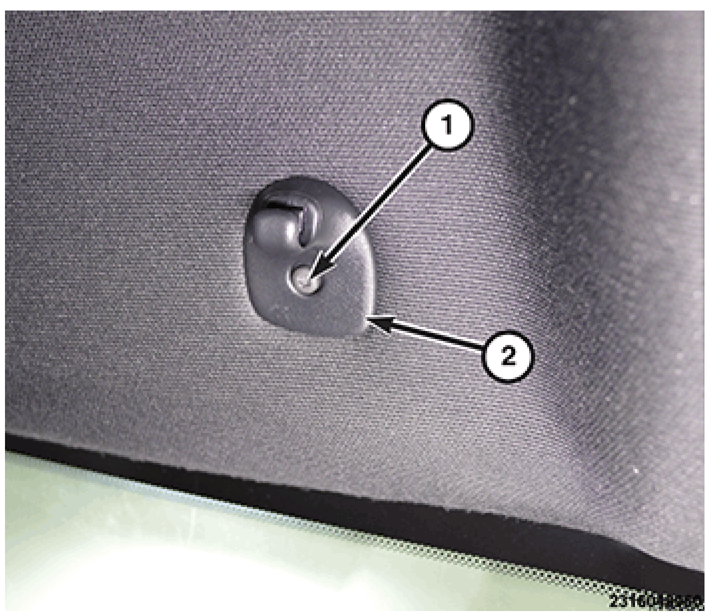

Fig. 239: Visor Support & Screw
Courtesy of CHRYSLER GROUP, LLC

11. Remove the screw (1) and the visor support (2).

12. Remove both visors. Refer to **VISOR, REMOVAL**.
13. If equipped, remove the overhead console. Refer to **CONSOLE, OVERHEAD, FRONT, REMOVAL**.
14. Recline both front seat backs.
15. Carefully pull the headliner downward near the center to release the magnetic fastener.

Fig. 240: Headliner
Courtesy of CHRYSLER GROUP, LLC

16. If the headliner is to be lowered for curtain airbag service or sunroof removal, recline both front seats to the farthest back position and move them to the farthest rearward position.
17. Lower the headliner (1) as shown in illustration.
18. If removing the headliner, carefully remove the headliner through the windshield opening.

INSTALLATION

INSTALLATION

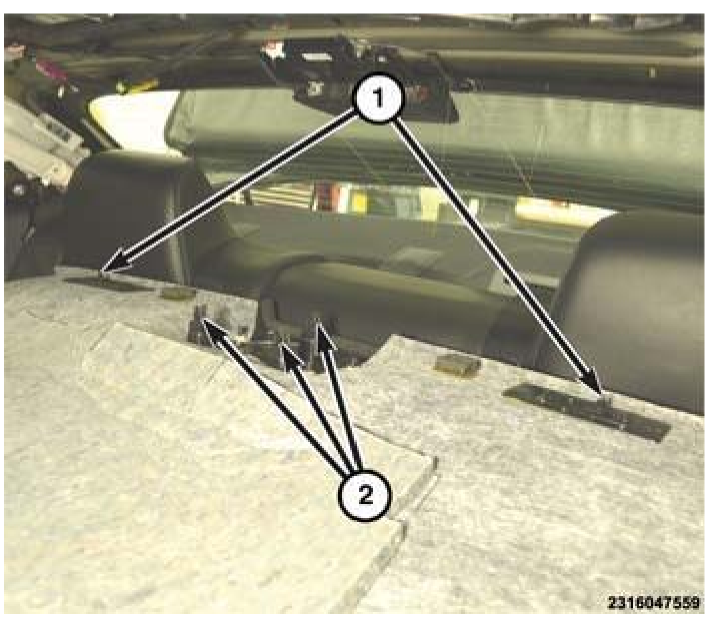

Fig. 241: Push Fasteners & Retainer Clips
Courtesy of CHRYSLER GROUP, LLC

NOTE: **In the event the headliner is damaged or creased during installation, it will need to be replaced with a new headliner.**

Use clean gloves or make sure your hands are clean before removing the headliner.

1. Carefully insert the headliner through the windshield opening.
2. With the help of an assistant, position the headliner and engage the retaining clips (2) into the roof structure. Engage the push fasteners (1).
3. Push up in the center of the headliner to engage the magnetic fastener.
4. Tuck the headliner under the trim lace around the sunroof opening.

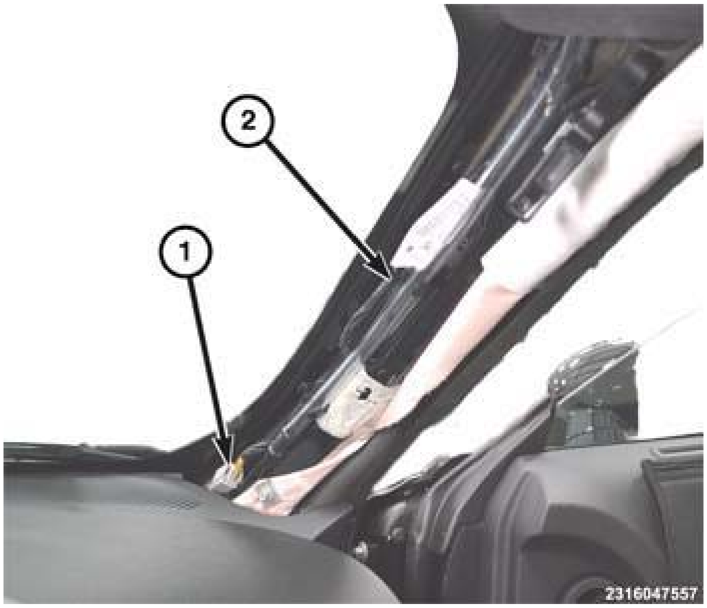

Fig. 242: Wire Harness & Connector
Courtesy of CHRYSLER GROUP, LLC

5. Route the headliner harness (2) and connect the electrical connector (1) at the A-pillar.
6. If equipped, install the overhead console. Refer to **CONSOLE, OVERHEAD, FRONT, INSTALLATION**.
7. Install both visors. Refer to **VISOR, INSTALLATION**.

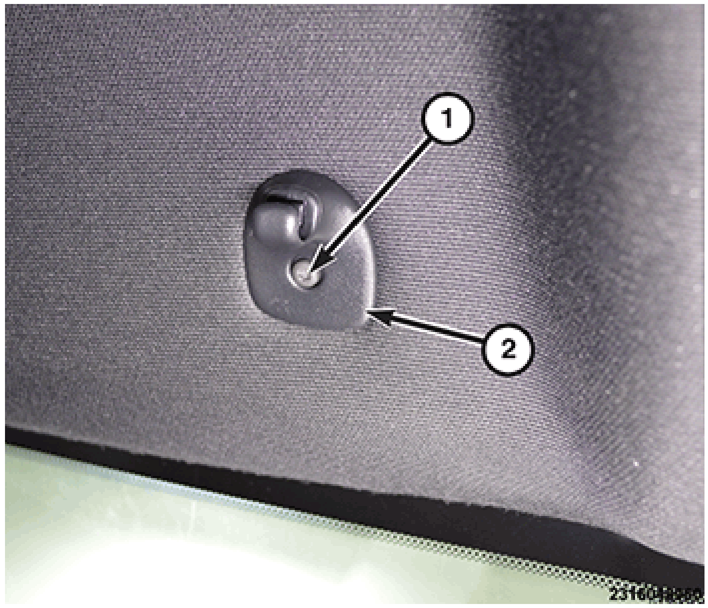

Fig. 243: Visor Support & Screw
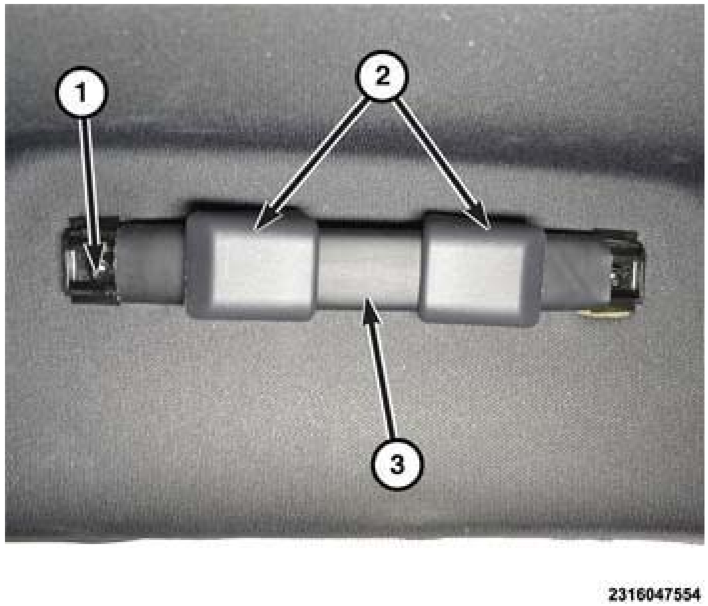
Courtesy of CHRYSLER GROUP, LLC

8. Position the visor support (2) and install the screw (1). Tighten the screw securely.

Fig. 244: Coat Hook, Screw & Screw Cover
Courtesy of CHRYSLER GROUP, LLC

9. Position the coat hook (1) and install the screw (2). Tighten the screw securely and close the screw cover (3).



[Fig. 245: Grab Handle, Screw Cover & Screw](#)
Courtesy of CHRYSLER GROUP, LLC

10. Position the grab handle (3) and install the two screws (1). Tighten the screws securely then slide the screw covers (2) outward till they snap into place.
11. Install the upper quarter trim panels. Refer to **PANEL, QUARTER TRIM, INSTALLATION**.
12. Install the A-pillar trim panels. Refer to **PANEL, A-PILLAR TRIM, INSTALLATION**.
13. If removed, install the windshield. Refer to **WINDSHIELD, INSTALLATION**.
14. Connect the negative battery cable.

MIRROR, REARVIEW

REMOVAL

REMOVAL

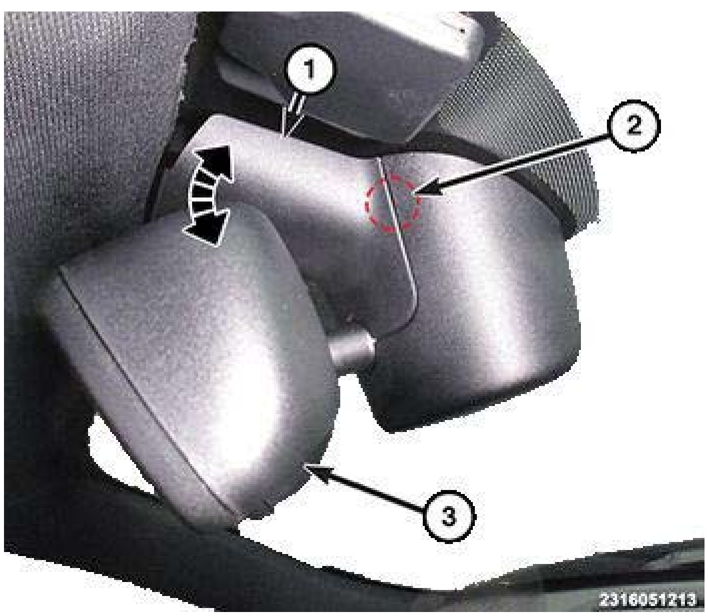


Fig. 246: Upper Mirror Trim & Clips

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Using a small flat bladed tool, release the clips (2) on each side of the upper mirror trim (1) and rotate the upper mirror trim downward to remove.

Fig. 247: Lower Mirror Trim Tabs
Courtesy of CHRYSLER GROUP, LLC

3. Using a small flat bladed tool, release the tabs (2) and lower the lower mirror trim and remove.

Fig. 248: Prying Lower Mirror Trim Tabs
Courtesy of CHRYSLER GROUP, LLC

4. The lower mirror trim (2) is shown in illustration removed, pry both tabs (1) outward to release.

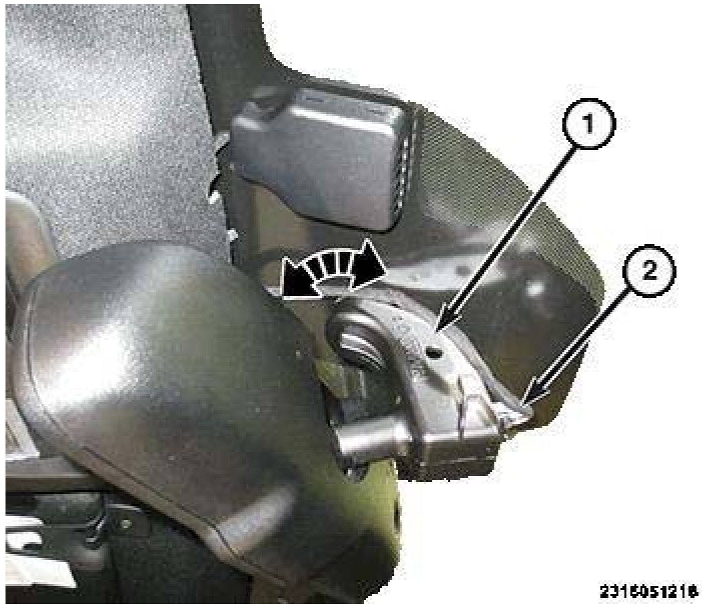

Fig. 249: Mirror & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the wire harness connector (2) from the mirror.
6. Grasp the mirror (1) by the base and rotate it clockwise approximately 90 degrees and remove.

INSTALLATION

INSTALLATION

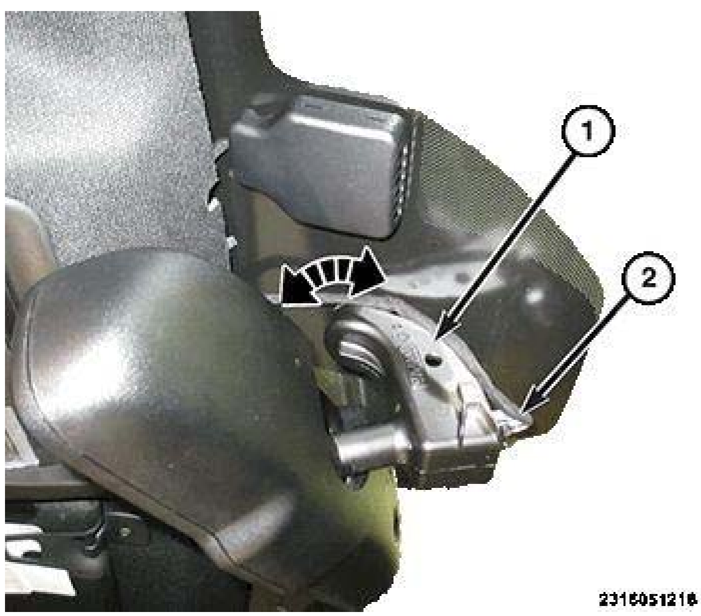

Fig. 250: Mirror & Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Place the rear view mirror (1) onto the mirror button.
2. Grasp the mirror by the base and rotate it approximately 90 degrees counter-clockwise until the mirror locks into place.

NOTE: The mirror must be fully seated onto the button before rotating.

3. Connect the wire harness connector (2).

Fig. 251: Lower Mirror Trim Tabs
Courtesy of CHRYSLER GROUP, LLC

4. Install the lower mirror trim (1) from the bottom. Make sure the tabs (2) engage fully.

Fig. 252: Upper Mirror Trim & Clips
Courtesy of CHRYSLER GROUP, LLC

5. Insert the bottom of the upper mirror trim (1) and rotate upward to engage the tabs (2).

SUPPORT BRACKET

NOTE: The rear view mirror support bracket (or button) is permanently bonded to the

inside of the windshield glass. If the bracket should become separated from the glass, it may be re-bonded using the following procedure. This procedure requires the use of a Rear View Mirror Adhesive kit that is available through MoparÂ® in single application packages that include a two-part adhesive and an accelerant with applicator.

1. Mark the proper position for the mirror bracket on the outside of the windshield glass with a wax pencil. The residual adhesive on the inside of the glass from the prior mirror bracket installation can be used as a guide.
2. Clean the bracket contact area on the inside of the glass. Use a mild powdered cleanser on a cloth saturated with isopropyl (rubbing) alcohol. Finally, clean the glass with a paper towel dampened with alcohol.
3. Sand the bonding surface (the smaller side) of the support bracket with fine grit-sandpaper. Wipe the bracket surface clean with a paper towel.
4. Apply accelerant to the bonding surface of the bracket according to the following instructions:
   - Crush the accelerant vial to saturate the felt applicator.
   - Remove the paper sleeve.
   - Apply accelerant to the bonding surface of the bracket.
   - Allow the accelerant to dry for five minutes.
   - Do not touch the bracket bonding surface after the accelerant has been applied.
5. Apply adhesive accelerant to the bracket contact area on the inside of the windshield glass. Allow the accelerant to dry for one minute. Do not touch the bracket contact area of the glass after the accelerant has been applied.
6. Install the bracket according to the following instructions:
   - Apply one drop of adhesive at the center of the bracket contact area on the inside of the windshield glass.
   - Apply an even coat of adhesive to the bonding surface of the bracket.
   - Align the bracket with the marked position on the windshield glass.
   - Press and hold the bracket in place for at least one minute.

NOTE: **Verify that the mirror support bracket is correctly aligned, because the adhesive will cure rapidly.**

7. Allow the adhesive to cure for 8-10 minutes. Remove any excess adhesive with an alcohol-dampened cloth.
8. Allow the adhesive to cure for an additional 8-10 minutes before reinstalling the mirror.

PANEL, A-PILLAR TRIM

REMOVAL

REMOVAL

Fig. 253: Removing/Installing A-Pillar Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. By hand pull at the top of the A-pillar trim panel (1) and release it from the body. Do not remove the A-pillar trim.
2. Pull the A-pillar trim panel upward to separate it from the instrument panel.

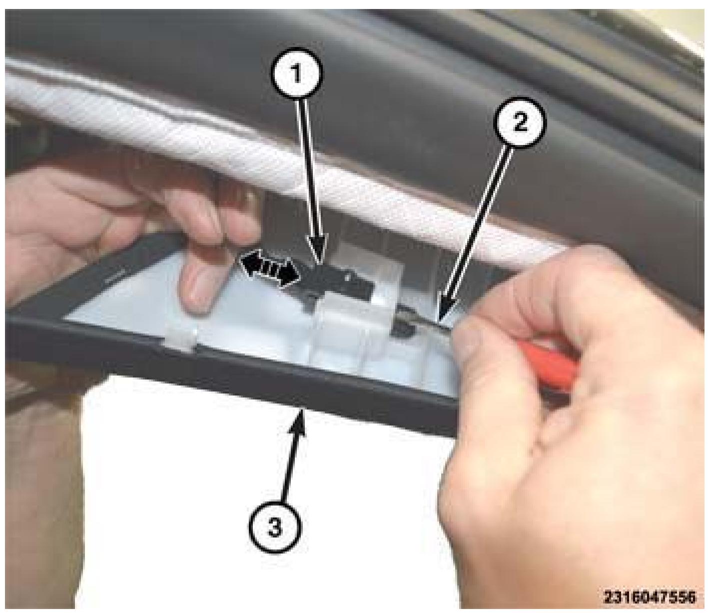

Fig. 254: Pillar Trim Panel & Tether
Courtesy of CHRYSLER GROUP, LLC

3. Using a flat bladed tool (2), press the tab to disengage the tether (1) and slide it out of A-pillar trim panel (3).

INSTALLATION

INSTALLATION

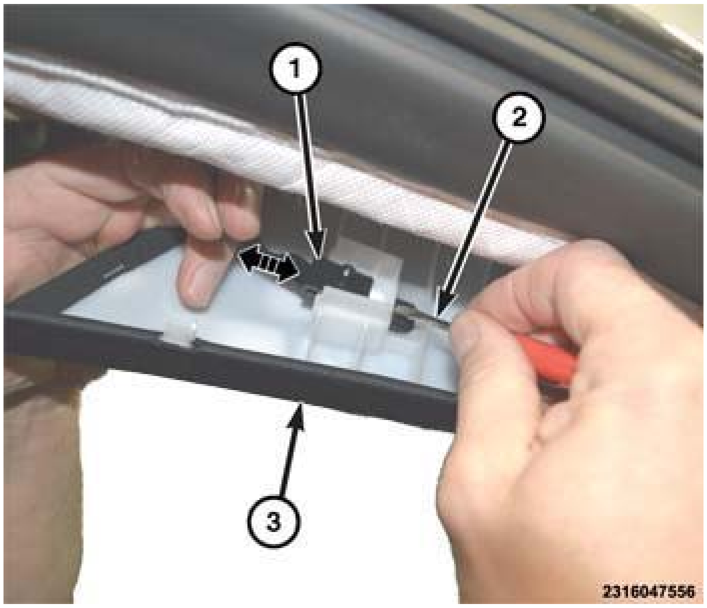

Fig. 255: Pillar Trim Panel & Tether
Courtesy of CHRYSLER GROUP, LLC

1. Insert the tether (1) into the A-pillar trim panel (3). Make sure the tab is fully engaged, and the tether is secured properly.

Fig. 256: Removing/Installing A-Pillar Trim Panel
Courtesy of CHRYSLER GROUP, LLC

2. Position the A-pillar trim panel (1) down into the top of the instrument panel.
3. Starting at the bottom of the A-pillar trim panel, align the retaining clips and hand tap to engage.

PANEL, C-PILLAR TRIM

REMOVAL

REMOVAL

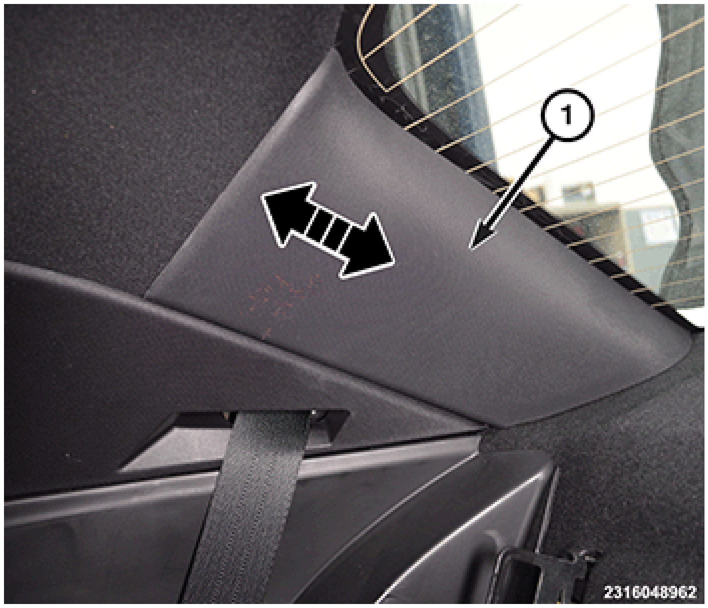

Fig. 257: C-Pillar Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. By hand pull at the top of the C-pillar trim panel (1) to release the retaining clips. Do not remove the C-pillar trim panel.

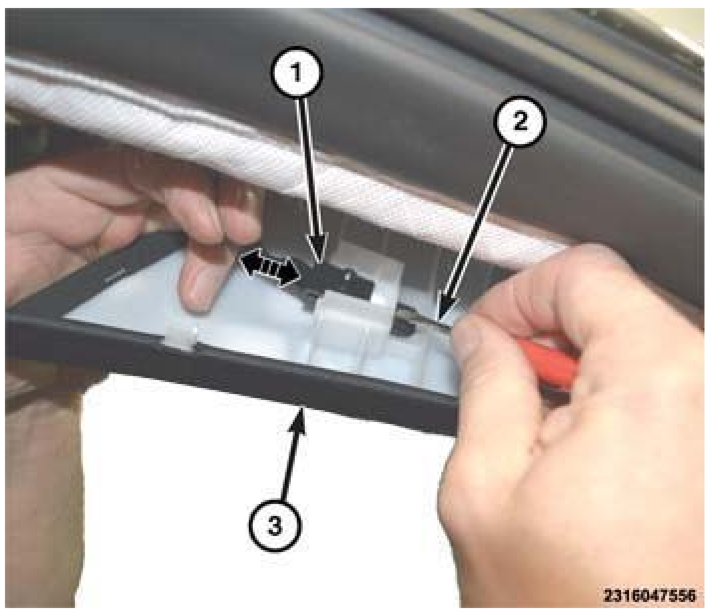

Fig. 258: Pillar Trim Panel & Tether
Courtesy of CHRYSLER GROUP, LLC

2. Using a flat bladed tool (2), press the tab to disengage the tether (1) and slide it out of the C-pillar trim panel (3).

INSTALLATION

INSTALLATION

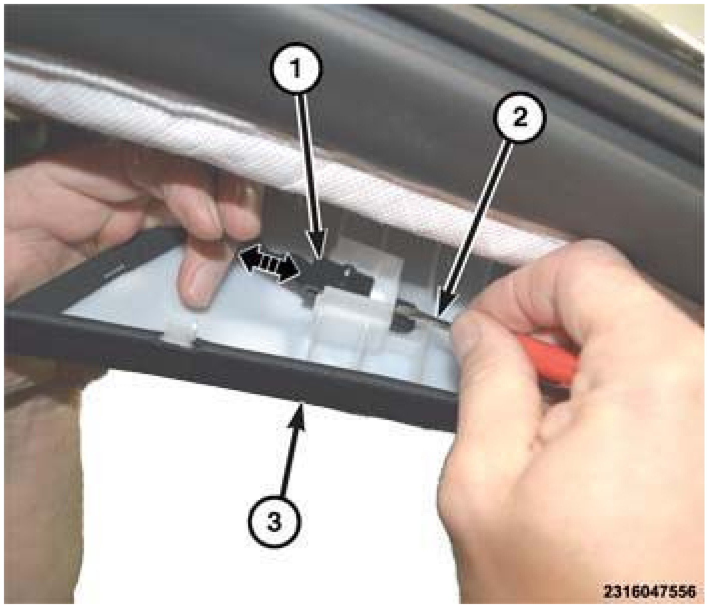

Fig. 259: Pillar Trim Panel & Tether
Courtesy of CHRYSLER GROUP, LLC

1. Insert the tether (1) into the C-pillar trim panel (3). Make sure the tab is fully engaged, and the tether is secured properly.
2. Position the C-pillar trim panel (1) and hand tap to engage the retaining clips.

PANEL, COWL TRIM

REMOVAL

REMOVAL

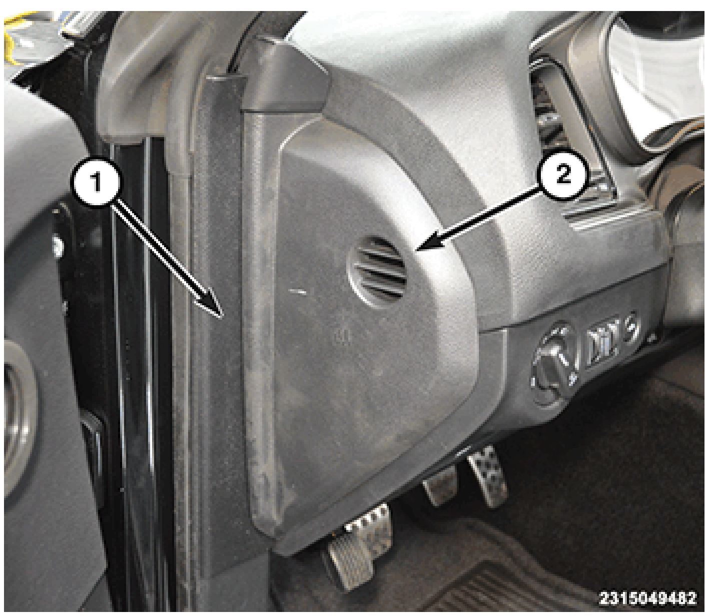

Fig. 260: A-Pillar Extension & Instrument Panel End Cap
Courtesy of CHRYSLER GROUP, LLC

1. Using a trim stick or equivalent, remove the instrument panel end cap (2) then the A-pillar extension (1).

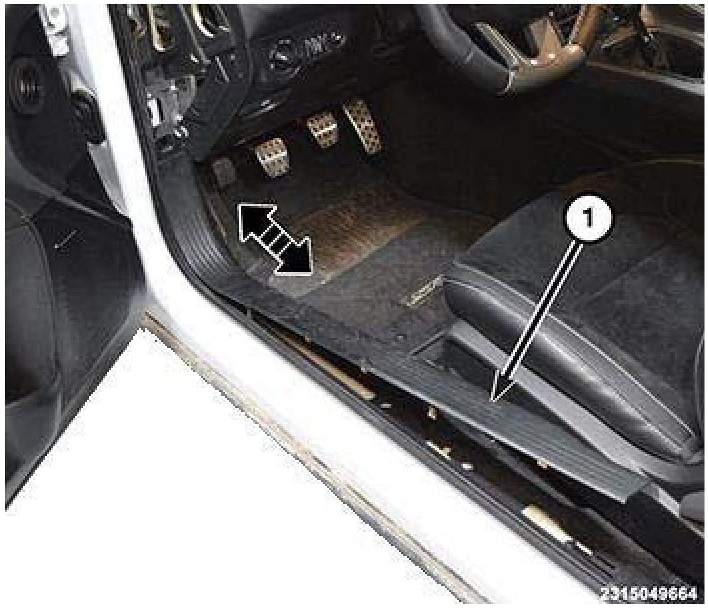

Fig. 261: Cowl Side Trim Panel
Courtesy of CHRYSLER GROUP, LLC

2. Lift the cowl side trim (1) at the rear, then pull rearward and remove.

INSTALLATION

INSTALLATION

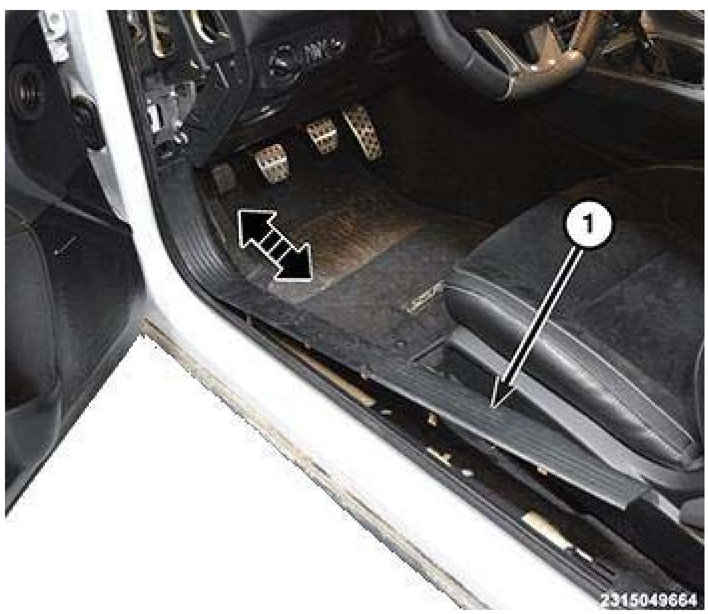

Fig. 262: Cowl Side Trim Panel
Courtesy of CHRYSLER GROUP, LLC

1. Install the cowl side trim (1) at the front, then hand tap the rear to install the retaining clips.

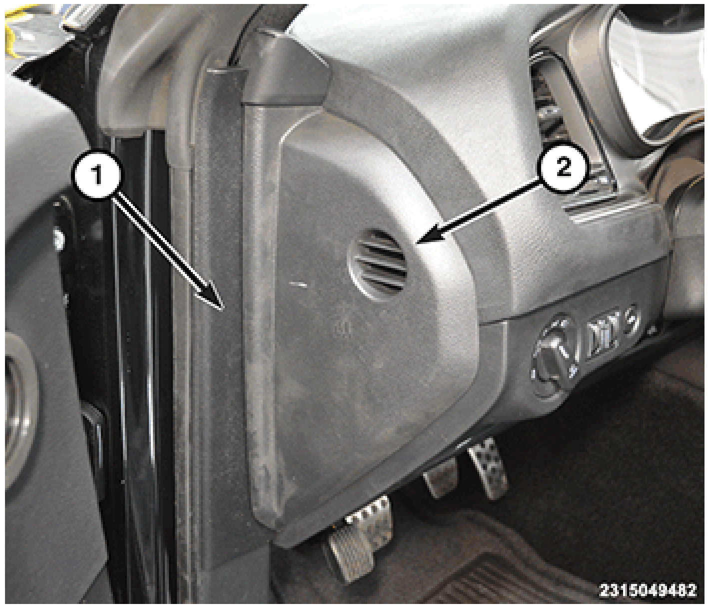

Fig. 263: A-Pillar Extension & Instrument Panel End Cap
Courtesy of CHRYSLER GROUP, LLC

2. Position the A-pillar extension (1) and hand tap to engage the retaining clips.
3. Position the instrument panel end cap (2) and hand tap to engage the retaining clips.

PANEL, QUARTER TRIM

REMOVAL

REMOVAL

QUARTER TRIM - LOWER

Fig. 264: Quarter Trim Panel & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Remove the rear seat cushion. Refer to SEAT CUSHION, REMOVAL.

2. Remove the cowl trim panel. Refer to **PANEL, COWL TRIM, REMOVAL**.
3. Remove the screw (2), then pull the lower quarter trim panel (1) out to release the lower retaining clip.

Fig. 265: Seat Belt Trim Bezel, Seat Belt Trim Panel & Seat Belt Lower Anchor Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the seat belt lower anchor bolts (2) and (3). Refer to **RETRACTOR, SEAT BELT, REMOVAL**
.
5. Remove the seat belt trim bezel (1).
6. Using a trim stick or equivalent, carefully pry the lower quarter trim panel (4) away to release the retaining clips.
7. If equipped with quarter panel speakers, disconnect the speaker wire harness connector and remove the lower quarter trim panel.

QUARTER TRIM UPPER PANEL

Fig. 266: Screws
Courtesy of CHRYSLER GROUP, LLC

1. Remove the C-pillar trim panel. Refer to **PANEL, C-PILLAR TRIM, REMOVAL**.
2. Remove the screw covers and remove the screws (1) and (2).
3. Remove the quarter trim lower panel. Refer to **PANEL, QUARTER TRIM, REMOVAL**.

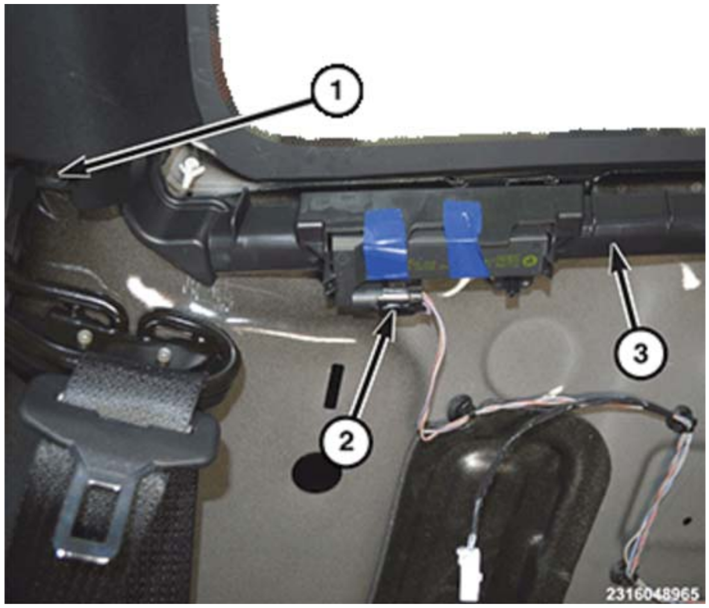

Fig. 267: Screw, Wire Harness Connector & Quarter Trim Upper Panel
Courtesy of CHRYSLER GROUP, LLC

4. Remove the screw (1).
5. Disconnect the wire harness connector (2).
6. Using a trim tool or equivalent, release the retaining clips and remove the quarter trim upper panel (3).

INSTALLATION

INSTALLATION

QUARTER TRIM - LOWER

Fig. 268: Seat Belt Trim Bezel, Seat Belt Trim Panel & Seat Belt Lower Anchor Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Route the seat belts through the openings in the lower quarter trim panel (4).
2. If equipped with quarter panel speakers, connect the speaker wire harness connector.
3. Position the lower quarter trim panel and push to engage the retaining clips.
4. Install the one push fastener at the rear of the lower quarter trim panel.
5. Install the seat belt trim bezel (1).
6. Install the seat belt lower anchor bolts (2) and (3). Refer to **RETRACTOR, SEAT BELT, INSTALLATION** .

Fig. 269: Quarter Trim Panel & Screw
Courtesy of CHRYSLER GROUP, LLC

7. Install the screw (2) and tighten securely.

8. Install the cowl trim panel. Refer to **PANEL, COWL TRIM, INSTALLATION**.
9. Install the rear seat cushion. Refer to **SEAT CUSHION, INSTALLATION**.

QUARTER TRIM UPPER PANEL

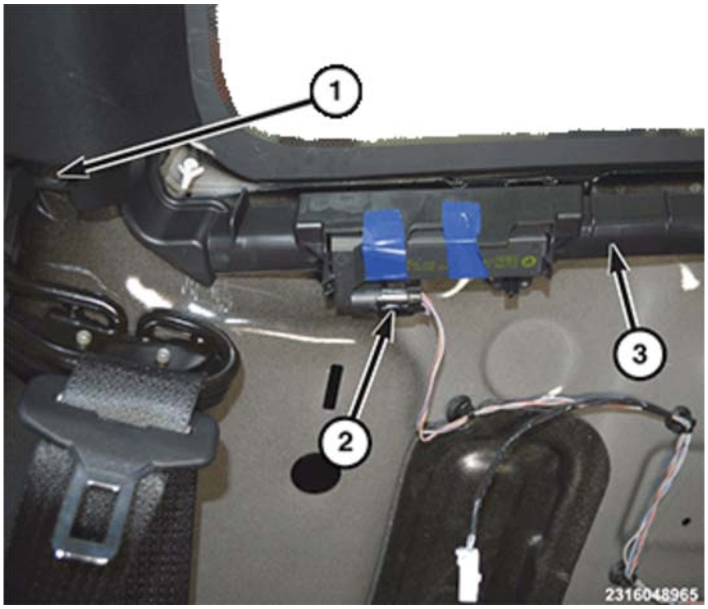

Fig. 270: Screw, Wire Harness Connector & Quarter Trim Upper Panel
Courtesy of CHRYSLER GROUP, LLC

1. Route the seat belt through the opening in the quarter trim upper panel (3).
2. Position the quarter trim upper panel and push to engage the retaining clips.
3. Connect the wire harness connector (2).
4. Install the screw (1) and tighten securely.

Fig. 271: Screws
Courtesy of CHRYSLER GROUP, LLC

5. Install the screws (1) and (2) and tighten securely, then install the screw covers.
6. Install the quarter trim lower panel. Refer to **PANEL, QUARTER TRIM, INSTALLATION**.
7. Install the C-pillar trim panel. Refer to **PANEL, C-PILLAR TRIM, INSTALLATION**.

PANEL, REAR SHELF

REMOVAL

REMOVAL

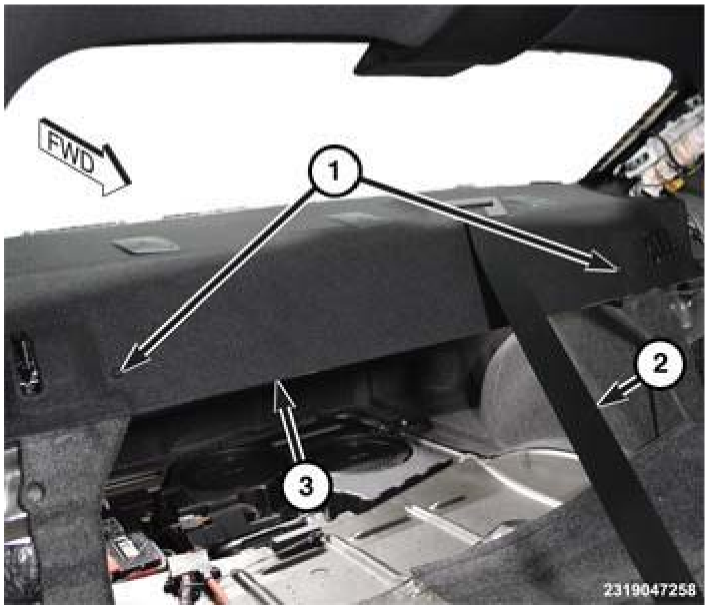

Fig. 272: Push Fasteners, Rear Seat Belt & Rear Shelf Trim
Courtesy of CHRYSLER GROUP, LLC

1. Remove the quarter trim lower panels. Refer to **PANEL, QUARTER TRIM, REMOVAL**.
2. Remove the rear seat belt (2) anchor nut. Refer to **RETRACTOR, SEAT BELT, REMOVAL** .
3. Remove the two push fasteners (1).
4. Pull the rear shelf trim (3) forward to disengage the retaining hooks from the rear shelf.
5. Feed the rear seat belt through the openings in the rear shelf panel and remove.

INSTALLATION

INSTALLATION

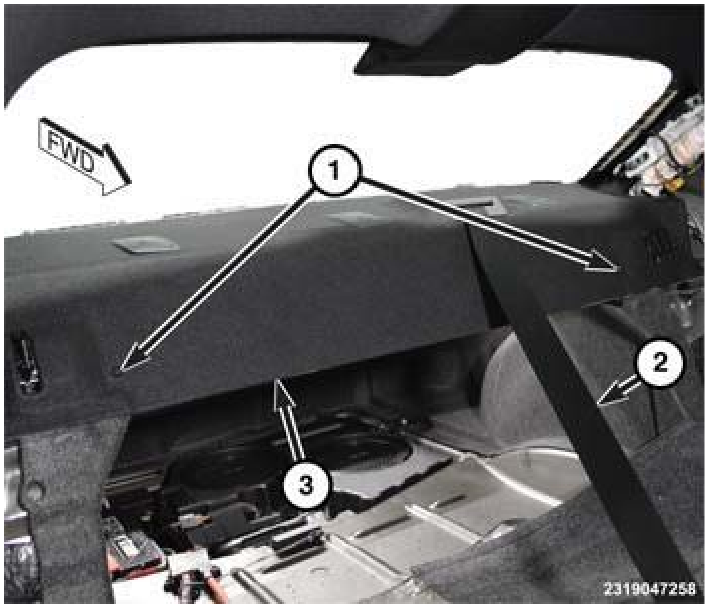

Fig. 273: Push Fasteners, Rear Seat Belt & Rear Shelf Trim
Courtesy of CHRYSLER GROUP, LLC

1. Feed the rear seat belt (2) through the opening in the rear shelf panel (3).
2. Position the rear shelf trim on the rear shelf, then push the rear shelf panel rearward to engage the retaining hooks into shelf panel.
3. Install the two push fasteners (1).
4. Install the rear seat belt anchor. Refer to **RETRACTOR, SEAT BELT, INSTALLATION** .
5. Install the quarter trim lower panels. Refer to **PANEL, QUARTER TRIM, INSTALLATION**.

VISOR

REMOVAL

REMOVAL

Fig. 274: Visor & Screw

Courtesy of CHRYSLER GROUP, LLC

CAUTION: When removing or installing the screws (1), be certain to avoid any wiring or drain tube interference.

1. Remove the three screws (1).
2. Carefully lower the visor (2) from the headliner and disconnect the wire harness connector, if equipped.

INSTALLATION

INSTALLATION

Courtesy of CHRYSLER GROUP, LLC

CAUTION: When removing or installing the screws (1), be certain to avoid any wiring or drain tube interference.

1. If equipped, connect the wire harness connector.
2. Position the visor (2) into the headliner.
3. Install the screws (1) and tighten securely.

PAINT

SPECIFICATIONS

SPECIFICATIONS

Exterior vehicle body color(s) are identified on the Vehicle Certification Label or the Body Code Plate.

The first digit of the paint code listed on the vehicle indicates the sequence of application, i.e.: P = primary coat, Q = secondary coat. The color names provided in the Paint and Trim Code Description chart are the same color names used on most repair product containers.

SEATS, FRONT

WARNING

WARNING

WARNING: **During and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler MoparÃ® parts catalog. Failure to follow these instructions may result in personal injury or death.**

WARNING: **On vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment. Failure to follow these instructions may result in personal injury or death.**

WARNING: **On vehicles equipped with airbags, before performing any welding operations disconnect and isolate the battery negative (ground) cable and disconnect all wire harness connectors from the Airbag Control Module (ACM). Failure to take the proper precautions could result in accidental airbag deployment and other possible damage to the supplemental restraint system circuits and components. Failure to follow these instructions may result in personal injury or death.**

WARNING: **Replace all restraint system components only with parts specified in the Chrysler MoparÃ® parts catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection. Failure to follow these instructions may result in personal injury or death.**

WARNING: **The fasteners, screws, and bolts originally used for the restraint system components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the restraint system. Any time a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the Chrysler MoparÃ® parts catalog. Failure to follow these instructions may result in personal injury or death.**

WARNING: **On vehicles equipped with the Occupant Classification System (OCS) do not hang any after market devices from the front passengers seat back. Do not install a front drivers seat back cover with map pocket onto the passenger seat. Failure to follow these instructions may result in personal injury or death.**

WARNING: **The Seat Weight Sensor is a sensitive, calibrated unit and must be handled carefully. Do not drop or handle roughly. If dropped or damaged, replace with another sensor. Failure to follow these instructions may result in personal injury or death.**

WARNING: **The front passenger seat must be handled carefully as well. When removing the seat, be careful when setting on floor not to drop. If dropped, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.**

WARNING: **When the seat is on the floor, no one should sit in the front passenger seat. This uneven force may damage the sensing ability of the seat weight sensors. If sat on and damaged, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.**

CABLE, SEAT BACK RELEASE

REMOVAL

REMOVAL

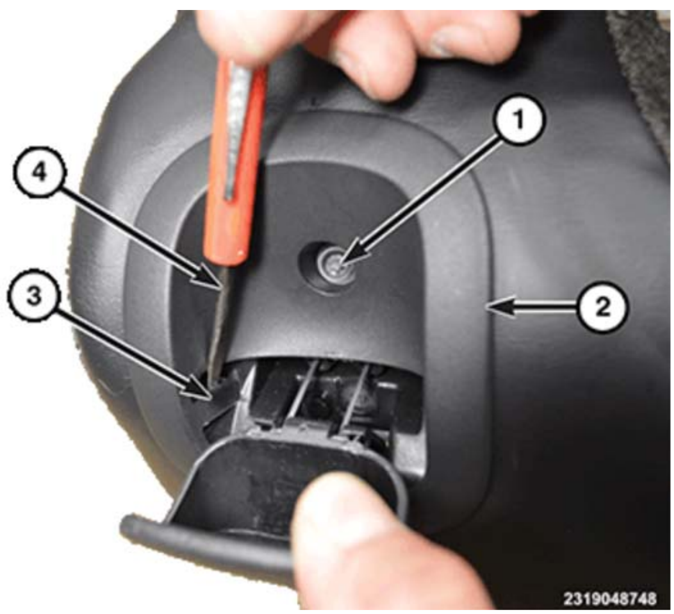

Fig. 276: Seat Back Release Cable Bezel, Tabs, Tool & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to SEATS, FRONT, WARNING.
2. Remove the front seat back. Refer to SEAT BACK, FRONT, REMOVAL .
3. Remove the front seat back panel. Refer to PANEL, SEAT BACK, FRONT, REMOVAL.

4. Remove the screw (1) from the seat back release cable bezel (2).
5. Using a small bladed tool (4), release the tabs (3) and remove the seat back release cable bezel.

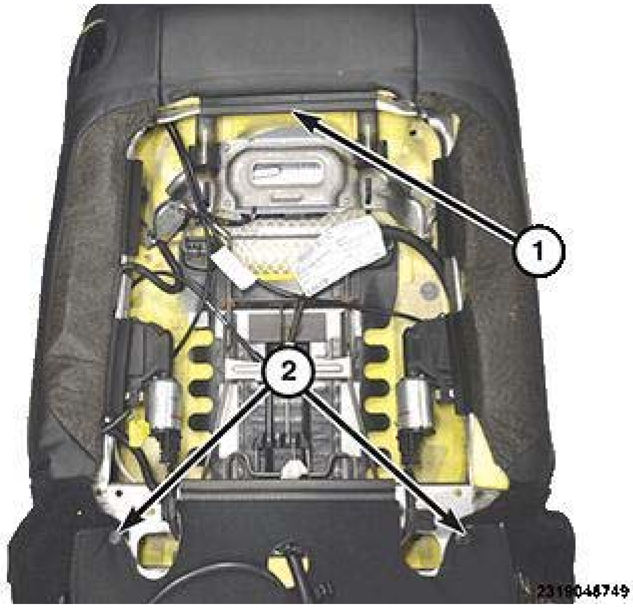

Fig. 277: J-Clip Retainers & Push Fasteners
Courtesy of CHRYSLER GROUP, LLC

6. Remove the two push fasteners (2).
7. Release all the J-clip retainers (1).

Fig. 278: Headrest Sleeve & Tab
Courtesy of CHRYSLER GROUP, LLC

8. Reach up behind the seat back cover and push the tab (1) of the headrest sleeve (2) and pull out to remove.

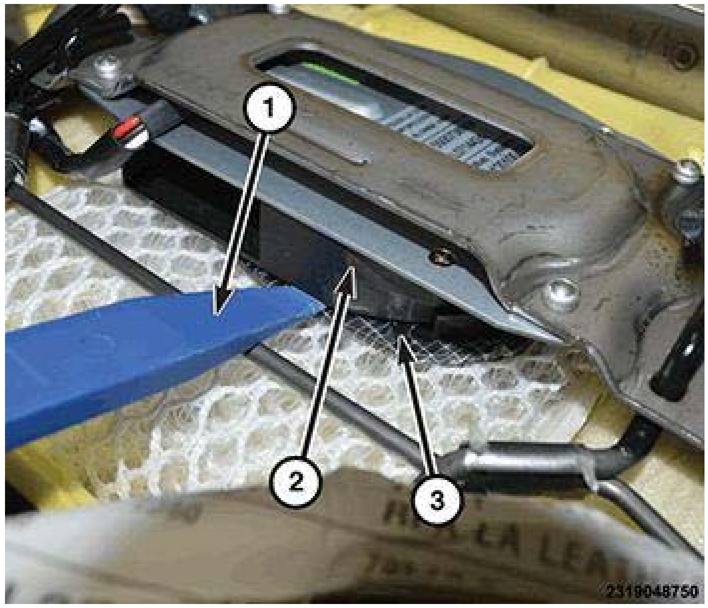

Fig. 279: Prying Seat Back Ventilation Plenum
Courtesy of CHRYSLER GROUP, LLC

9. Using a trim stick (1) or equivalent, pry the seat back ventilation plenum (3) from the seat back blower (2), if equipped.
10. Remove the seat back foam and seat back cover as an assembly, from the seat back frame.

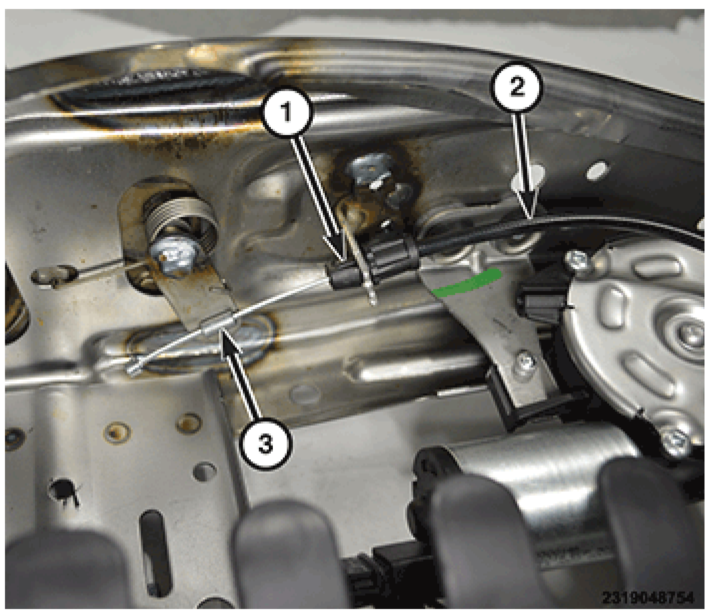

Fig. 280: Cable, Pinch Tabs & Cable End
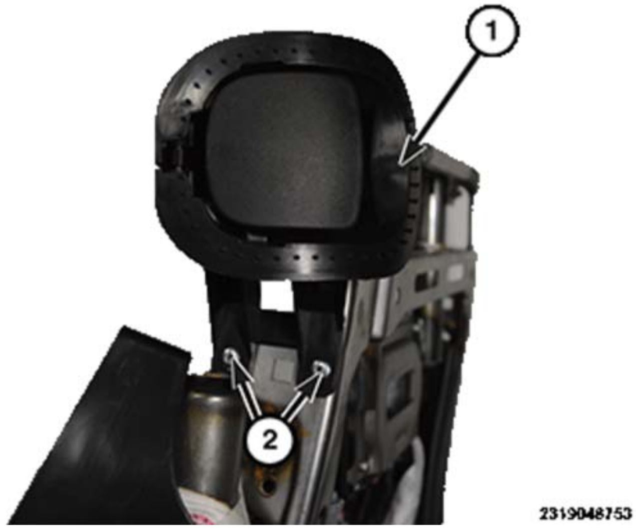
Courtesy of CHRYSLER GROUP, LLC

NOTE: Take note of the cable routing for correct installation.

11. Pinch the tabs (1) and release the cable from the seat back frame.
12. Remove the cable end (3) from the lever.

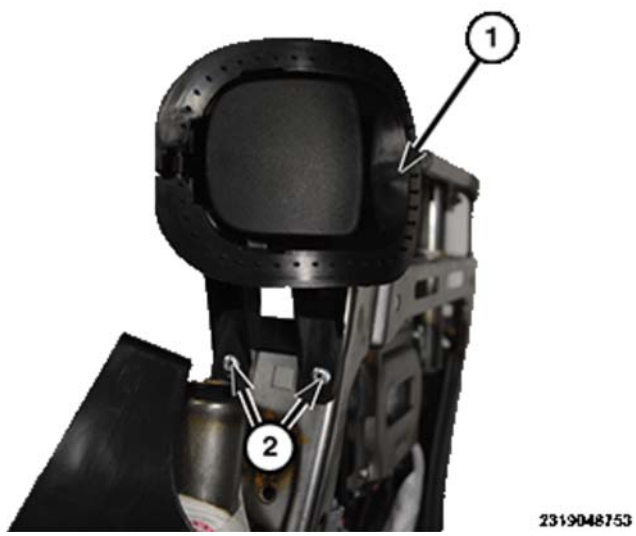


[Fig. 281: Seat Back Release Cable Assembly & Rivets]
Courtesy of CHRYSLER GROUP, LLC

13. Drill out the two rivets (2) and remove the seat back release cable assembly (1).

INSTALLATION

INSTALLATION



[Fig. 282: Seat Back Release Cable Assembly & Rivets]
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to [SEATS, FRONT, WARNING].
2. Position the seat back release cable assembly (1) and install new rivets (2).

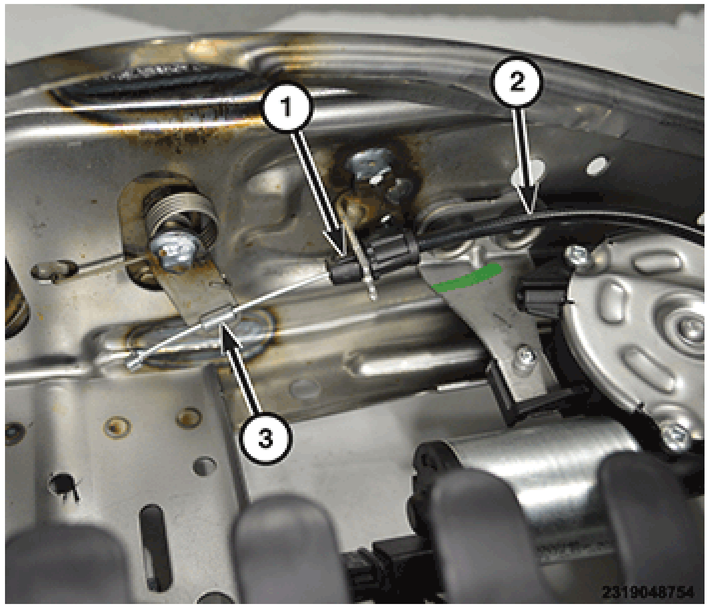


Fig. 283: Cable, Pinch Tabs & Cable End
Courtesy of CHRYSLER GROUP, LLC

3. Route the cables (2) and install the cable ends (3) into the lever.
4. Snap the cable into the seat back frame bracket (1).

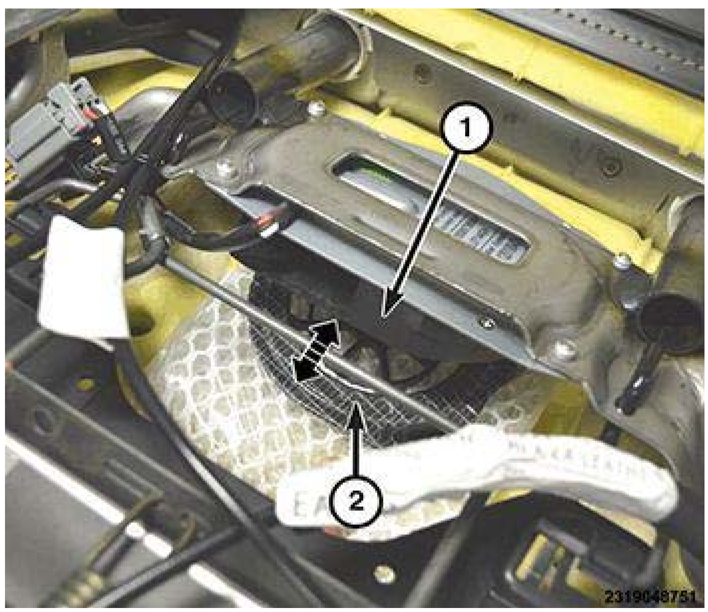

Fig. 284: Aligning Seat Back Ventilation Plenum
Courtesy of CHRYSLER GROUP, LLC

5. Position the seat back cushion assembly onto the seat back frame.
6. Align the seat cushion ventilation plenum (2) with the seat cushion blower (1) and snap into place, if equipped.

Fig. 285: Headrest Sleeve & Tab
Courtesy of CHRYSLER GROUP, LLC

7. Install the headrest sleeves (1) and hand tap to engage the tab (1).

Fig. 286: J-Clip Retainers & Push Fasteners
Courtesy of CHRYSLER GROUP, LLC

8. Install all the J-clip retainers (1).
9. Install the two push fasteners (2).

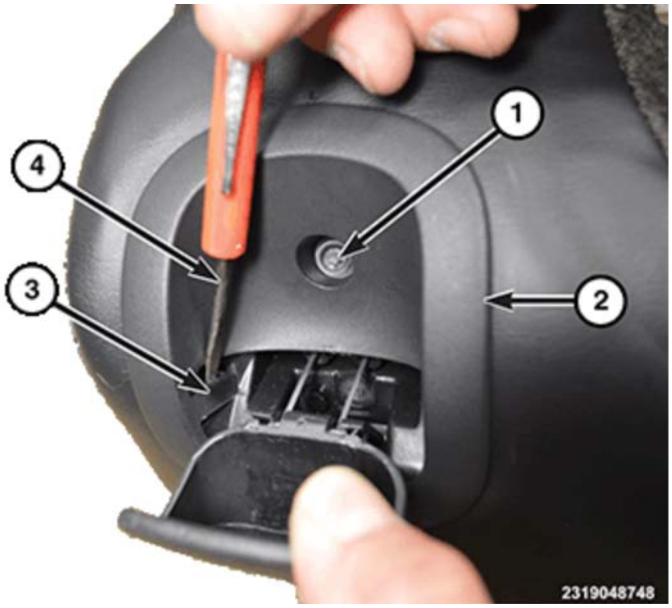

Fig. 287: Seat Back Release Cable Bezel, Tabs, Tool & Screw
Courtesy of CHRYSLER GROUP, LLC

10. Position the seat back release cable bezel (2) and push by hand to engage the tabs (3). Install the screw (1) and tighten securely.
11. Install the front seat back. Refer to **SEAT BACK, FRONT, INSTALLATION** .
12. Install the front seat. Refer to **SEAT, FRONT, INSTALLATION**.

COVER, SEAT BACK, FRONT

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any front seat diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

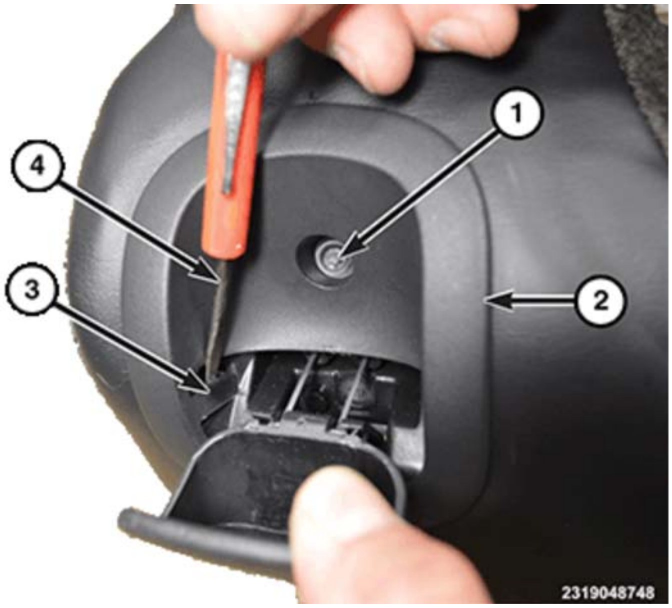

Fig. 288: Seat Back Release Cable Bezel, Tabs, Tool & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to SEATS, FRONT, WARNING.
2. Remove the front seat back. Refer to SEAT BACK, FRONT, REMOVAL .
3. Remove the front seat back panel. Refer to PANEL, SEAT BACK, FRONT, REMOVAL.
4. Remove the screw (1) from the seat back release cable bezel (2).
5. Using a small bladed tool (4), release the tabs (3) and remove the seat back release cable bezel.

Fig. 289: J-Clip Retainers & Push Fasteners

8. Release the J-hook retainers (1) and (2) at the bottom of the seat.

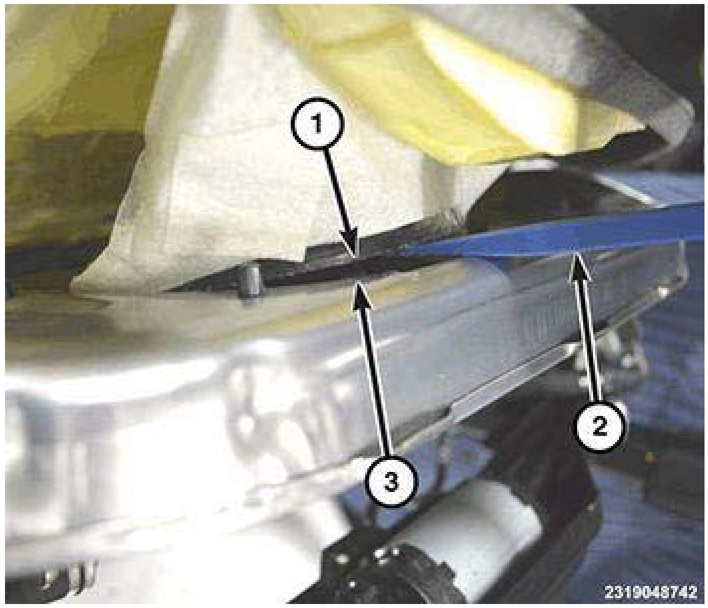

Fig. 301: Prying Seat Cushion Ventilation Plenum From Seat Cushion Blower
Courtesy of CHRYSLER GROUP, LLC

9. Carefully unwrap the cover and foam at the front of the seat cushion. Using a trim stick (2) or equivalent, pry the seat cushion ventilation plenum (1) from the seat cushion blower (3), if equipped.
10. Remove the seat cover and the seat foam as an assembly, from the seat adjuster.

NOTE: **Note the wire harness routing for correct installation.**

11. Disconnect the wire harness connector.

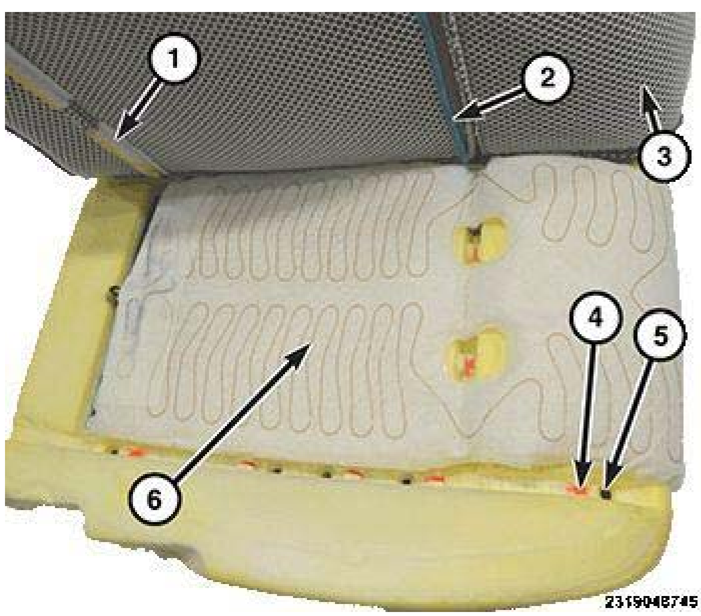

Fig. 302: Seat Cushion Cover, Clips & Fastener

Courtesy of CHRYSLER GROUP, LLC

12. Pull at the rear of the seat cushion cover (3) to release the hook and loop fastener (1).
13. Pull the seat cushion cover away from the foam and carefully release the clip strips (2) from the molded clips (4).

INSTALLATION

INSTALLATION

WARNING: Disable the airbag system before attempting any front seat diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: On all models, the front passenger seat contains an Occupant Detection Sensor (ODS) to provide information to the Occupant Restraint Controller (ORC).

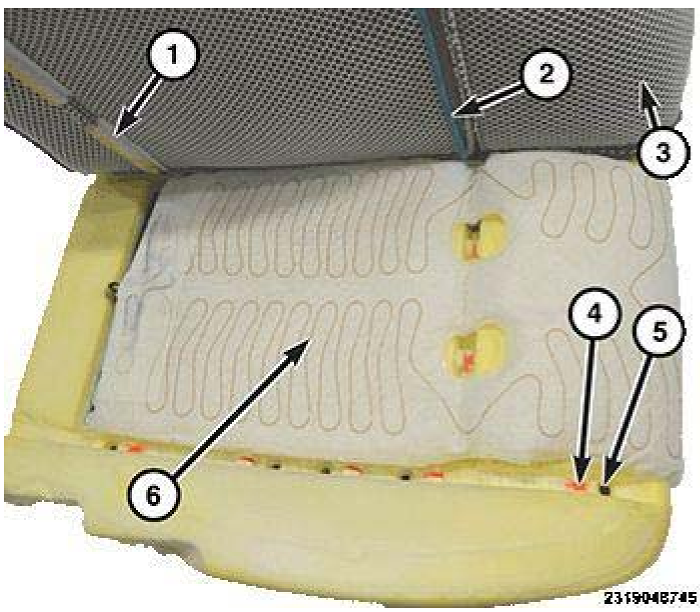

Fig. 303: Seat Cushion Cover, Clips & Fastener
Courtesy of CHRYSLER GROUP, LLC

1. Position the seat cover (3) onto the seat foam and align the clip strips (2) to the molded clips (4).

NOTE: Note that there is a hole (5) in the foam, next to each molded clip, to aid in clip strip alignment/installation.

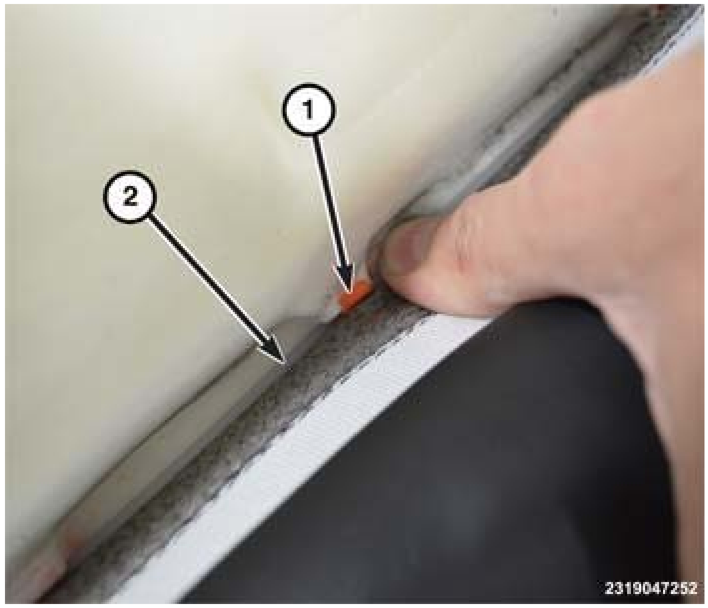

Fig. 304: Clip Strip & Molded Clip
Courtesy of CHRYSLER GROUP, LLC

2. Press the clip strip (2) into each molded clip (1).
3. Pull the seat cover tight and fasten the hook and loop fastener at the rear of the seat cushion.

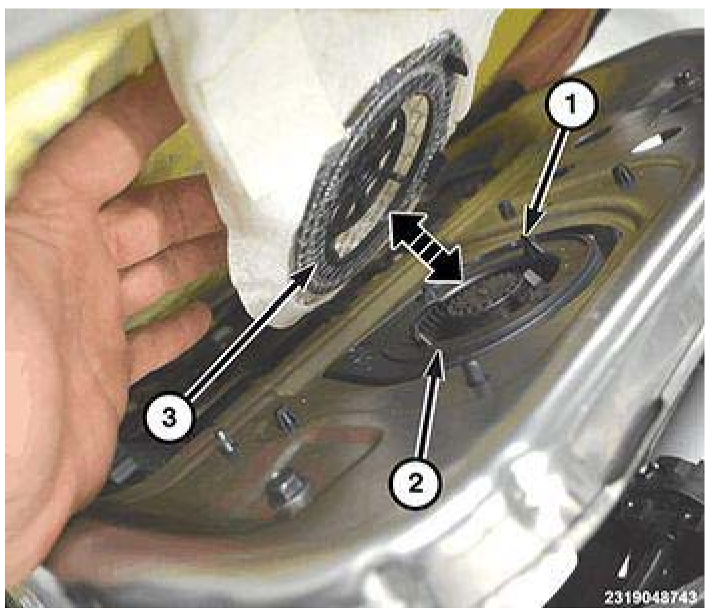

Fig. 305: Installing Seat Cushion Blower
Courtesy of CHRYSLER GROUP, LLC

4. Position the cushion assembly onto the seat adjuster.
5. Align the seat cushion ventilation plenum (3) with the tabs (1) on the seat cushion blower (2) and snap into place, if equipped.

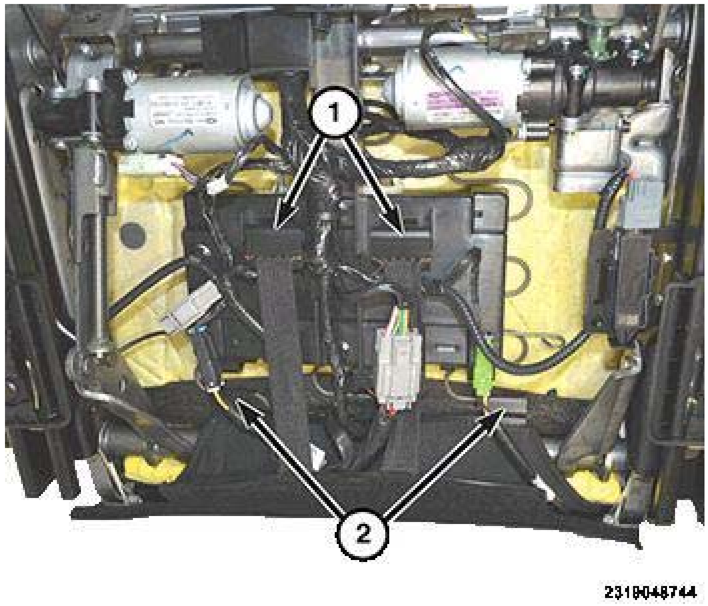

Fig. 306: J-Hook Retainers
Courtesy of CHRYSLER GROUP, LLC

6. Route the wire harness, if equipped, and install the J-hook retainers (1) at the bottom of the seat.
7. When servicing the front passenger seat, if required, install the Occupant Detection Sensor (ODS) to the seat bottom cushion. Refer to **SENSOR, OCCUPANT DETECTION, INSTALLATION** .

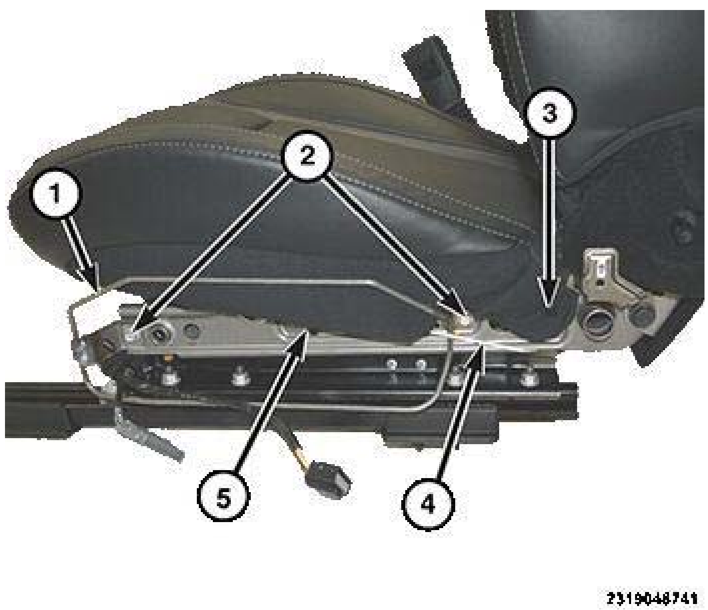

Fig. 307: Side Bracket, String, Fastener, Retainer & Bolts
Courtesy of CHRYSLER GROUP, LLC

8. Secure the J-hook retainer (5) to the side of the seat adjuster.
9. Install the seat side bracket (1) and tighten the bolts (2) securely.
10. Hook the tether string (4) to the seat. Make sure the tether string is routed as noted during removal.
11. Install the push fastener (3).
12. Install the seat side shields. Refer to **SIDE SHIELDS, SEAT CUSHION, FRONT, INSTALLATION**.

13. Install the seat. Refer to **SEAT, FRONT, INSTALLATION**.

PANEL, SEAT BACK, FRONT

REMOVAL

REMOVAL

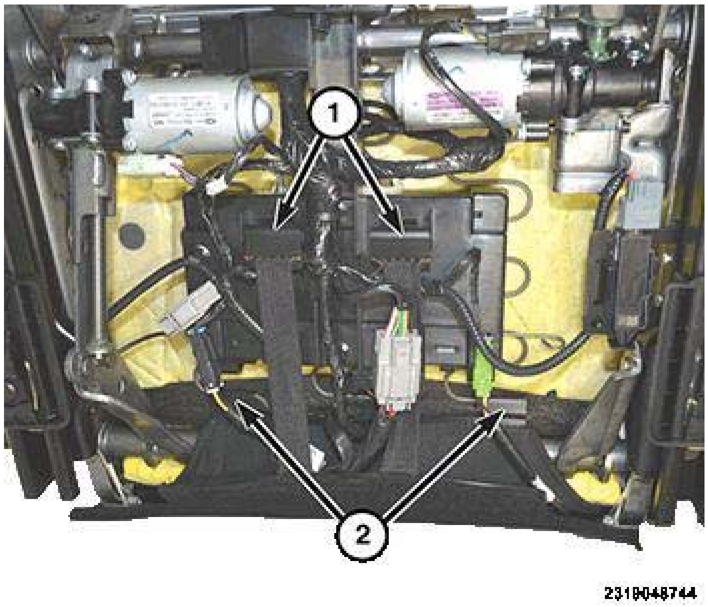

Fig. 308: J-Hook Retainers
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Review all warnings and cautions prior to servicing the seats. Failure to follow these instructions may result in serious or fatal injury.**

Refer to **SEATS, FRONT, WARNING**.

1. Position the seat fully forward.
2. Disconnect the negative battery cable.
3. Release the two J-hooks (1) at the bottom of the seat.

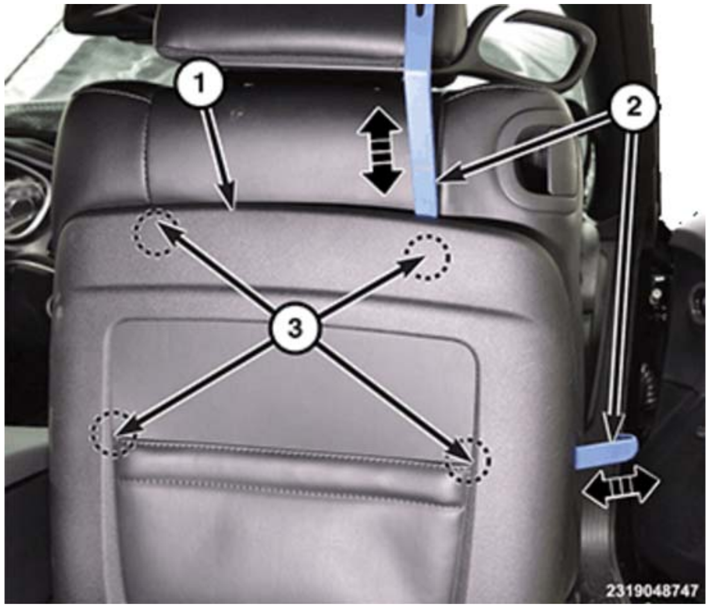

Fig. 309: Seat Back Panel, Retaining Tab Locations & Trim Sticks
Courtesy of CHRYSLER GROUP, LLC

4. Starting at one side of the seat back panel (1), use a trim stick (2) or equivalent to push at the locations shown in illustration (3) to release the retaining tabs, and pull rearward on the seat back panel.
5. Release the retaining tabs on both sides of the seat back panel, then lift the seat back panel to remove.

INSTALLATION

INSTALLATION

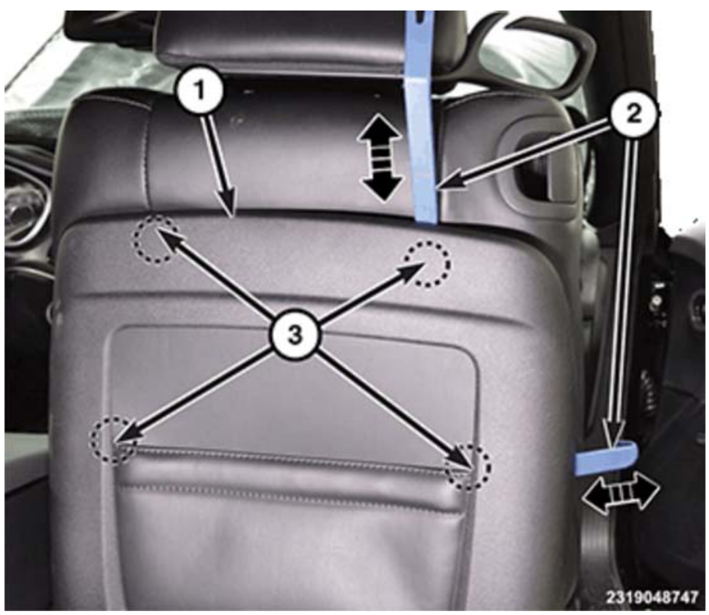

Fig. 310: Seat Back Panel, Retaining Tab Locations & Trim Sticks
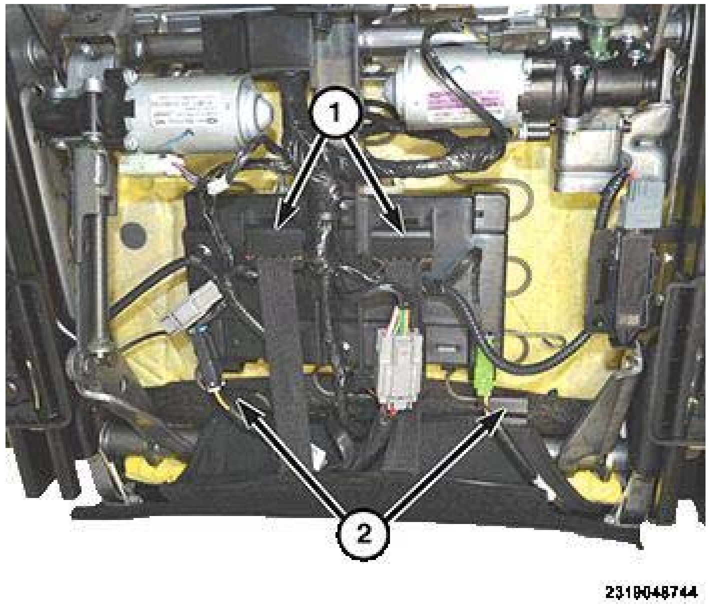
Courtesy of CHRYSLER GROUP, LLC

1. Position the seat back panel (1) bottom hooks and slide down into the seat back frame.
2. Hand tap at the locations shown in illustration (3) to engage the retaining tabs.



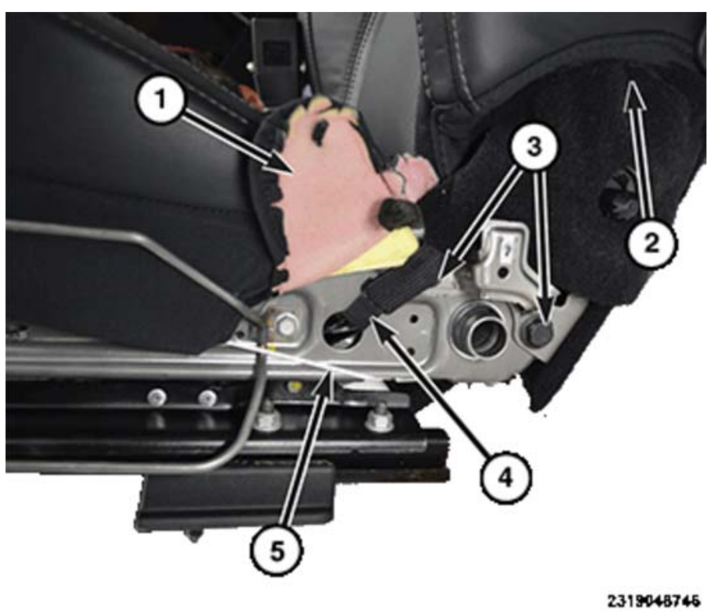
[Fig. 311: J-Hook Retainers](#)
Courtesy of CHRYSLER GROUP, LLC

3. Secure the J-hooks (1) under the seat.
4. Connect the negative battery cable.

SEAT BACK, FRONT

REMOVAL

REMOVAL



[Fig. 312: Removing/Installing Front Seat Back](#)
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to [SEATS, FRONT, WARNING](#).

2. Remove the front seat. Refer to **SEAT, FRONT, REMOVAL**.
3. Remove the front seat back panel. Refer to **PANEL, SEAT BACK, FRONT, REMOVAL**.
4. Remove the side shields. Refer to **SIDE SHIELDS, SEAT CUSHION, FRONT, REMOVAL**.
5. Disconnect the front seat back wire harness connector.

NOTE: **Take note of the wire harness routing for correct installation.**

6. Using a trim stick or equivalent, remove the push fastener and position the seat cushion cover (1) aside.
7. Release the tether string (5).
8. Release the J-hook fastener (4).
9. Remove the bolts (3) from both sides of the front seat back and remove.

INSTALLATION

INSTALLATION

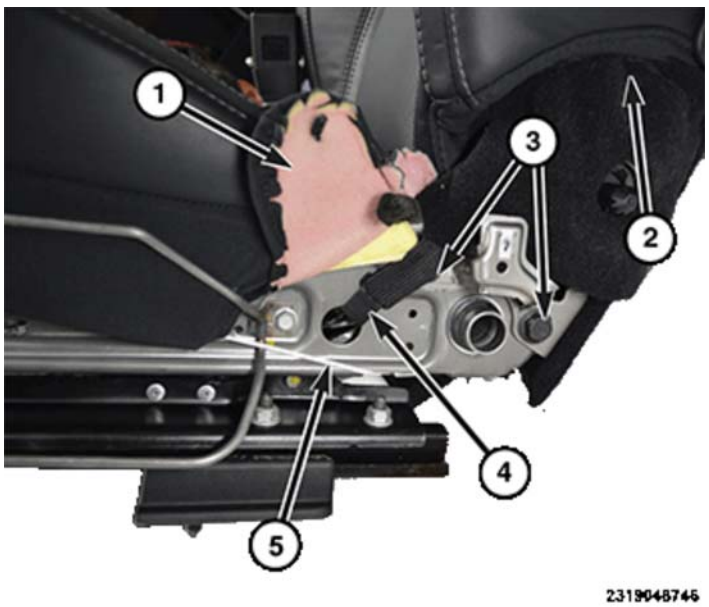


Fig. 313: Removing/Installing Front Seat Back
Courtesy of CHRYSLER GROUP, LLC

1. Position the front seat back onto the seat adjuster. Install the front eat back bolts (3) and tighten to the proper specification. Refer to **SPECIFICATIONS**.

NOTE: **Before tightening the front seat back bolts, make sure the wire harness routing is correct.**

2. Connect the seat back wire harness connector.
3. Install the side shields. Refer to **SIDE SHIELDS, SEAT CUSHION, FRONT, INSTALLATION**.
4. Install the front seat back panel. Refer to **PANEL, SEAT BACK, FRONT, INSTALLATION**.
5. Install the front seat. Refer to **SEAT, FRONT, INSTALLATION**.

SEAT, FRONT

REMOVAL

REMOVAL

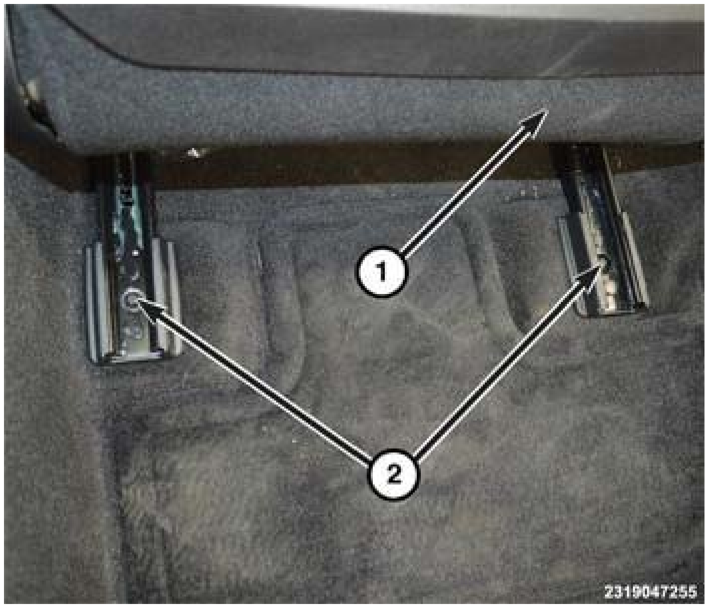

Fig. 314: Rear Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Removal process is the same for both sides of the vehicle.

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to SEATS, FRONT, WARNING.
2. Move the front seat (1) to the full forward position.
3. Remove the seat rear bolts (2).

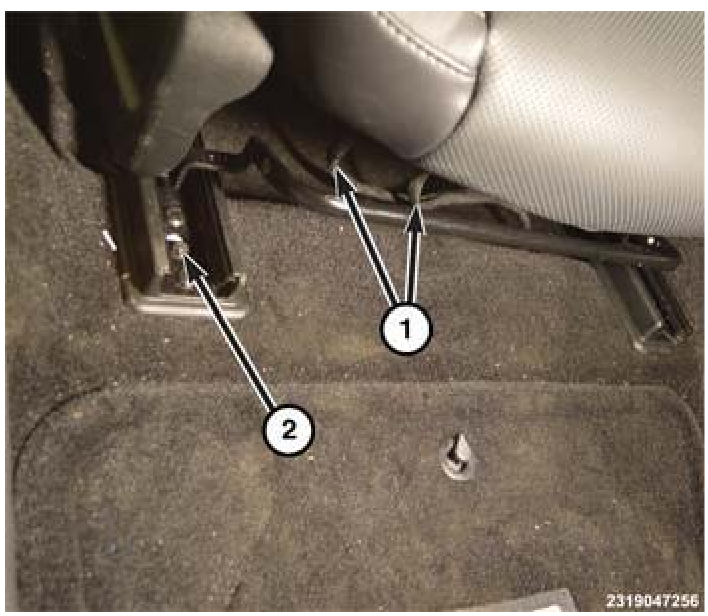

Fig. 315: Front Bolts & Connectors
Courtesy of CHRYSLER GROUP, LLC

4. Move the front seat to the full rearward position.
5. Remove the seat front bolts (2).
6. Disconnect and isolate the negative battery cable.
7. Disconnect all electrical connectors (1).

CAUTION: Do not use the adjuster release bar as a handle when removing or installing the front seat.

8. Remove the front seat from the vehicle.

INSTALLATION

INSTALLATION

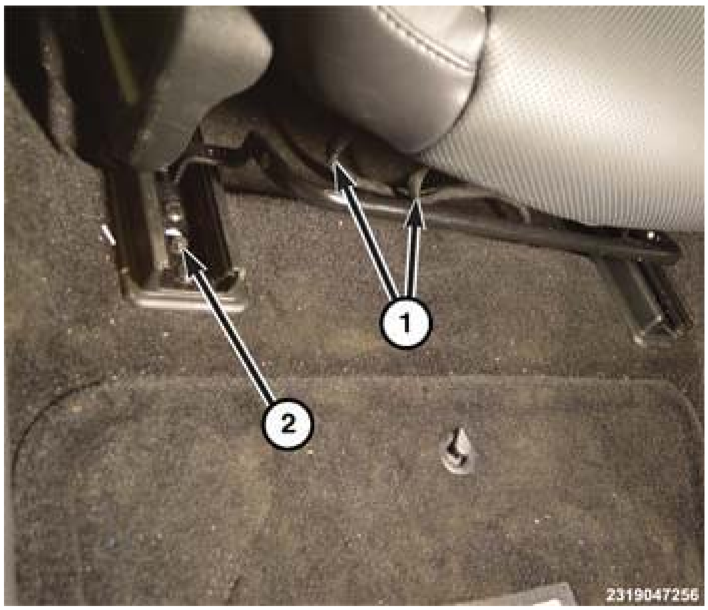

Fig. 316: Front Bolts & Connectors
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **SEATS, FRONT, WARNING**.
2. Position the front seat into the vehicle.

CAUTION: Do not use the adjuster release bar as a handle when removing or installing the front seat.

3. Connect all electrical connectors.
4. Install the seat front bolts (2) and tighten to the proper specification. Refer to **SPECIFICATIONS**.
5. Connect the negative battery cable.

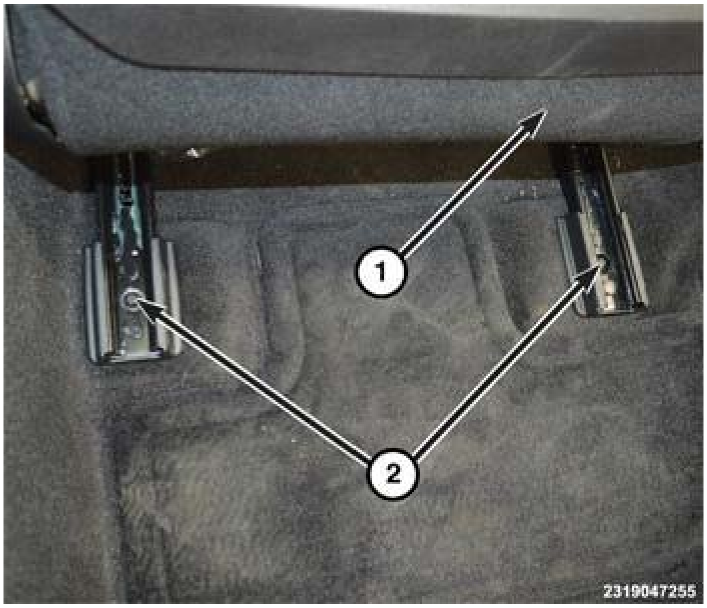

Fig. 317: Rear Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Move the front seat (1) to the full forward position.
7. Install the seat rear bolts (2) and tighten to the proper specification. Refer to **SPECIFICATIONS**.
8. The supplemental restraint system verification test procedure should be performed following service of any supplemental restraint system component. Refer to **STANDARD PROCEDURE** .
9. All of the components that make up the OCS are a factory-calibrated and assembled unit. The OCS components cannot be adjusted or repaired and, if damaged or ineffective, they must be replaced as a calibrated unit. Any time the OCS is removed or replaced for any reason, the new OCS data must be configured within the Occupant Restraint Controller (ORC) using a diagnostic scan tool. Refer to the appropriate diagnostic information.

SIDE SHIELDS, SEAT CUSHION, FRONT

REMOVAL

REMOVAL

Fig. 318: Recliner Handle
Courtesy of CHRYSLER GROUP, LLC

1. Remove the front seat. Refer to **SEAT, FRONT, REMOVAL**.
2. Using a hook tool or equivalent, remove the clip then the recliner handle (1).

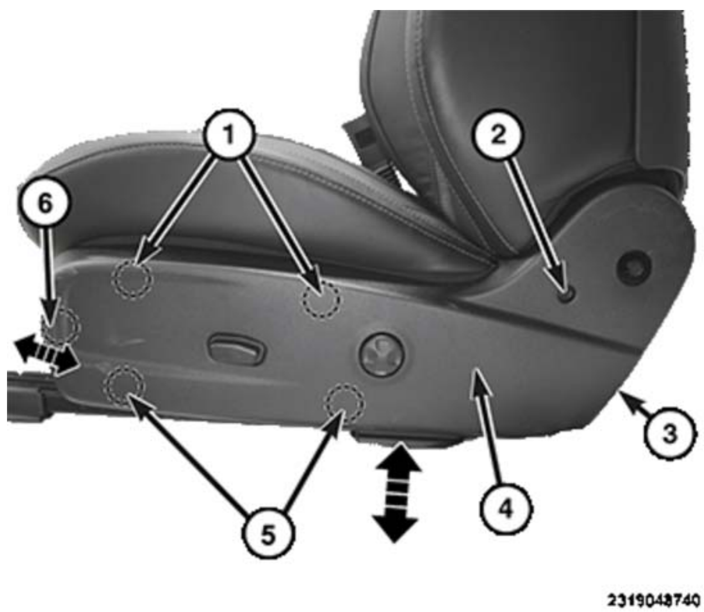

Fig. 319: Retaining Clips Location, Screws & Retaining Clips
Courtesy of CHRYSLER GROUP, LLC

3. Remove the screws (2) and (3).
4. Pull out at the bottom to release the retaining clips (5).
5. Push forward to release the front retaining clip (6) and lift up to release the top retaining clips (1) and remove. Disconnect the wire harness connectors, if equipped.

[Fig. 320: Side Shield & Screws](#)
Courtesy of CHRYSLER GROUP, LLC

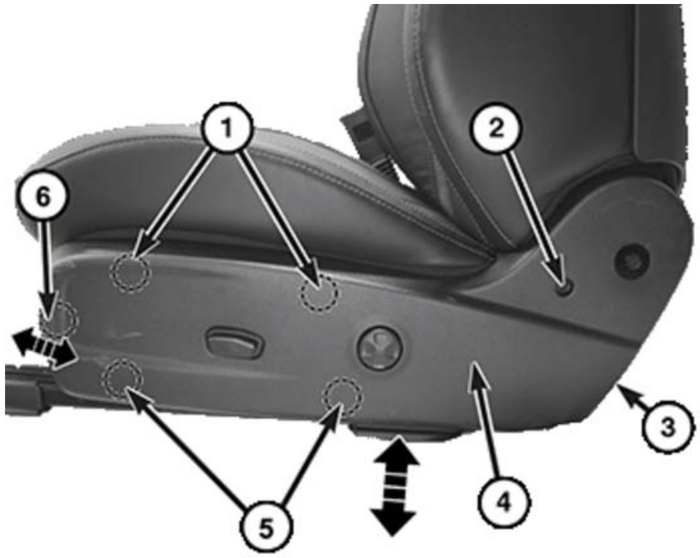
6. Remove the screws (2) and (3).
7. Lift the side shield (1) and remove.

INSTALLATION

INSTALLATION

[Fig. 321: Side Shield & Screws](#)
Courtesy of CHRYSLER GROUP, LLC

1. Position the side shield (1) and install screws (2) and (3). Tighten the screw securely.



2319048740

Fig. 322: Retaining Clips Location, Screws & Retaining Clips
Courtesy of CHRYSLER GROUP, LLC

2. Connect the wire harness connectors, if equipped.
3. Position the side shield (4) slightly forward and push down to engage the top retaining clips (1), then push rearward to engage the front retaining clip (6).
4. Push at the bottom to engage the retaining clips (5).
5. Install the screws (3) and (4). Tighten the screws securely.

2319048739

Courtesy of CHRYSLER GROUP, LLC

3. Position the seat back assembly (2) onto the seat back frame (1) and install the push fastener (3).

Fig. 333: Cover Zippers, Seat Back Cover & Retaining Strip
Courtesy of CHRYSLER GROUP, LLC

4. Fasten the retainer strip (3) at the bottom of the seat back cover (2).
5. Close the zippers (1) on both sides of the seat back and tuck the zipper up into the seat back cover.

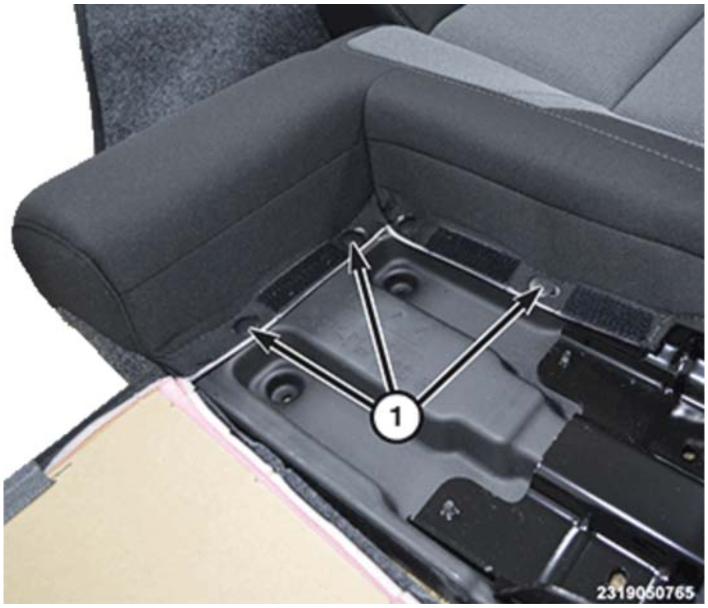

Fig. 334: Push Fasteners
Courtesy of CHRYSLER GROUP, LLC

6. Install the three push fasteners (1) in the armrest pocket.

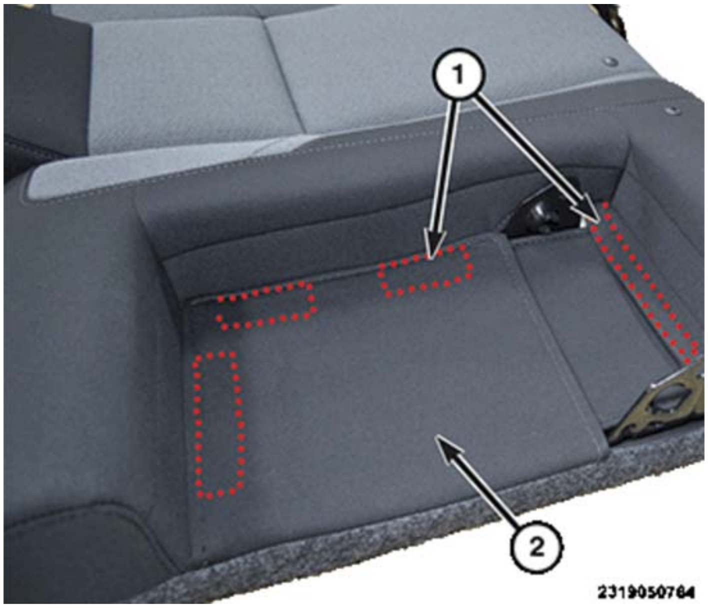

Fig. 335: Hook And Loop Fasteners & Cover
Courtesy of CHRYSLER GROUP, LLC

7. Fasten the hook and loop fasteners (1) in the armrest pocket (2).

Fig. 336: Armrest, Pivot Bolt & Retainer
Courtesy of CHRYSLER GROUP, LLC

8. Align the armrest pivot pin and rotate the armrest into position.
9. Install the armrest retainer (3) and pivot bolt (2). Tighten the armrest pivot bolt to the proper specification. Refer to **SPECIFICATIONS**.
10. Install the rear seat back into the vehicle. Refer to **SEAT BACK, REAR, INSTALLATION**.

COVER, SEAT CUSHION, REAR

REMOVAL

REMOVAL

Fig. 337: J-Hook Retainers & Seat Cushion Frame
Courtesy of CHRYSLER GROUP, LLC

1. Remove the rear seat cushion. Refer to **SEAT CUSHION, REMOVAL**.
2. Release the J-hook retainers (1) to release the seat cushion cover from the seat cushion frame (2).

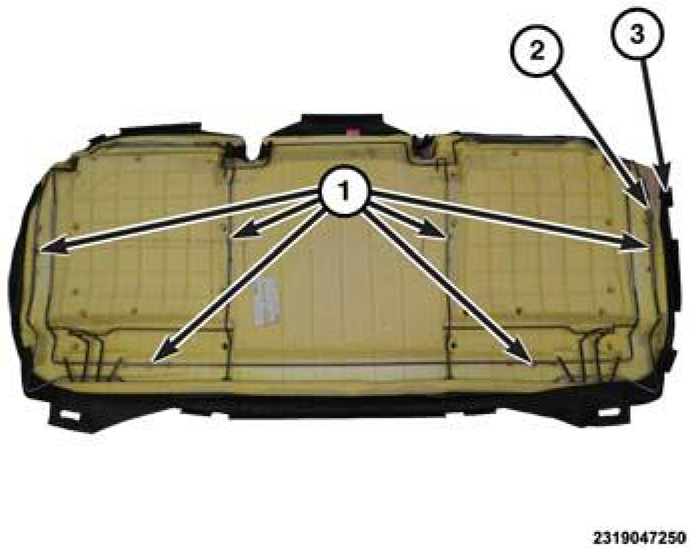

Fig. 338: Hog Rings, Seat Cushion Frame & Seat Cushion Cover
Courtesy of CHRYSLER GROUP, LLC

3. If necessary to remove the seat cushion frame (2), pull the seat cushion cover (3) back and remove the six hog rings (1).

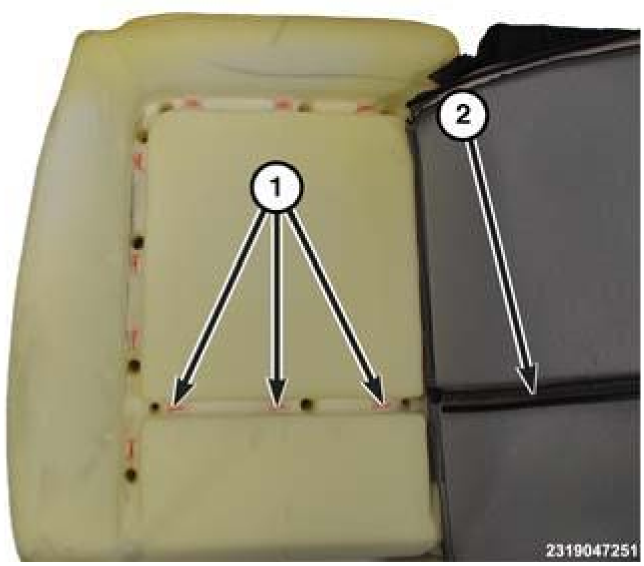

Fig. 339: Clips & Clip Strip
Courtesy of CHRYSLER GROUP, LLC

4. Pull the seat cushion cover away from the foam and carefully release the clip strips (2) from the molded clips (1).

INSTALLATION

INSTALLATION

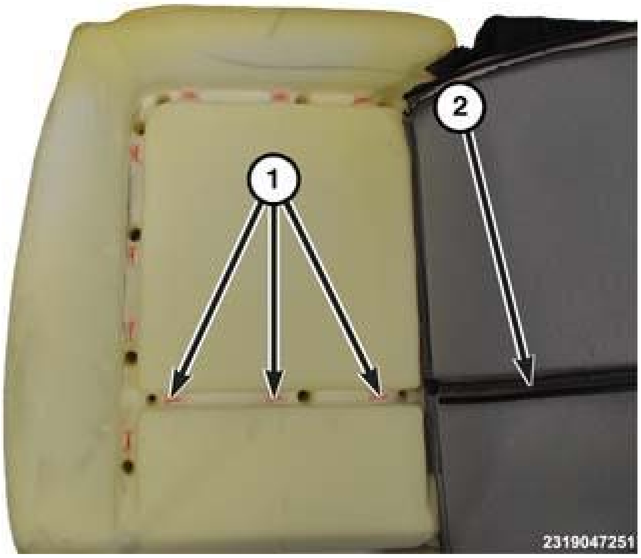

Fig. 340: Clips & Clip Strip
Courtesy of CHRYSLER GROUP, LLC

1. Position the seat cushion cover onto the seat cushion foam and align the clip strips (2) to the molded clips (1).

NOTE: **Note that there is a hole in the foam, next to each molded clip, to aid in clip strip alignment/installation.**

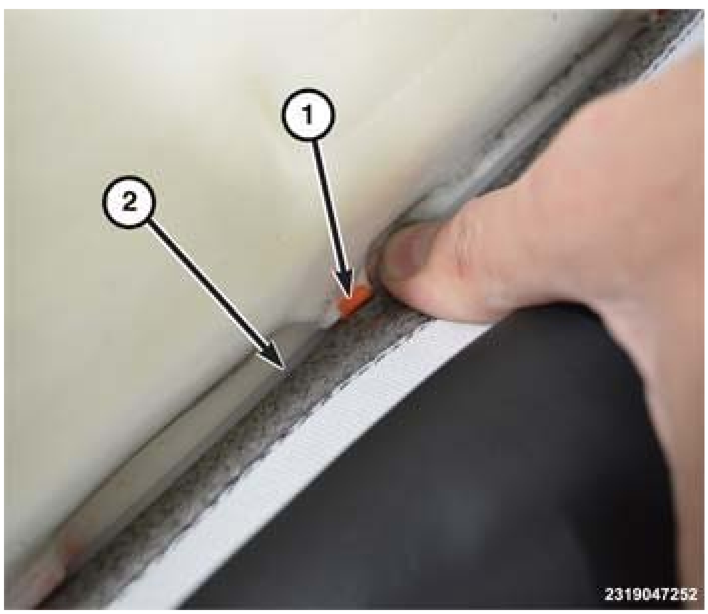

Fig. 341: Clip Strip & Molded Clip
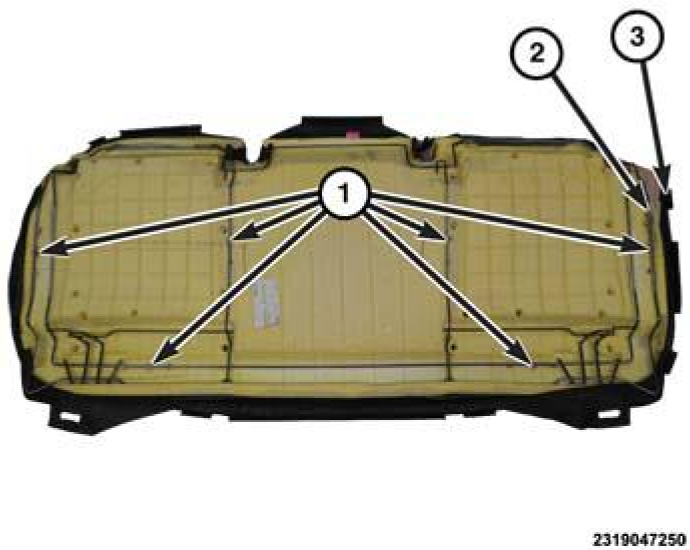
Courtesy of CHRYSLER GROUP, LLC

2. Press the clip strip (2) into each molded clip (1).



[Fig. 342: Hog Rings, Seat Cushion Frame & Seat Cushion Cover]()
Courtesy of CHRYSLER GROUP, LLC

3. Position the seat cushion frame (2) and install new hog rings (1).

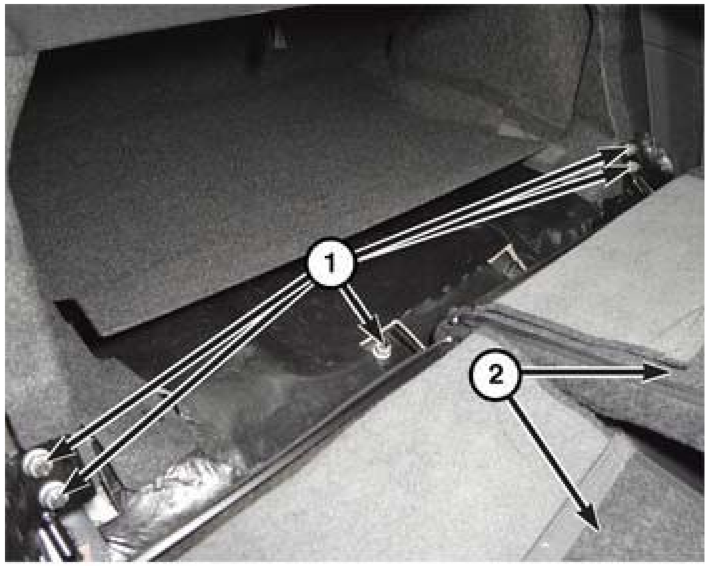
[Fig. 343: J-Hook Retainers & Seat Cushion Frame]()
Courtesy of CHRYSLER GROUP, LLC

4. Secure all the J-hook retainers (1) to the seat cushion frame (2).
5. Install the rear seat cushion. Refer to **SEAT CUSHION, INSTALLATION**.

SEAT BACK, REAR

REMOVAL

REMOVAL



[Fig. 344: Seat Backs & Outboard Nuts](#)
Courtesy of CHRYSLER GROUP, LLC

1. Fold both seat backs (2) to full down position.
2. Remove the outboard nuts (1) on the 40% split seat back.
3. Rotate the 40% split seat back forward and slide off from guide post and remove.
4. Remove the center and outboard nuts on the 60% split seat back and remove.

INSTALLATION

INSTALLATION

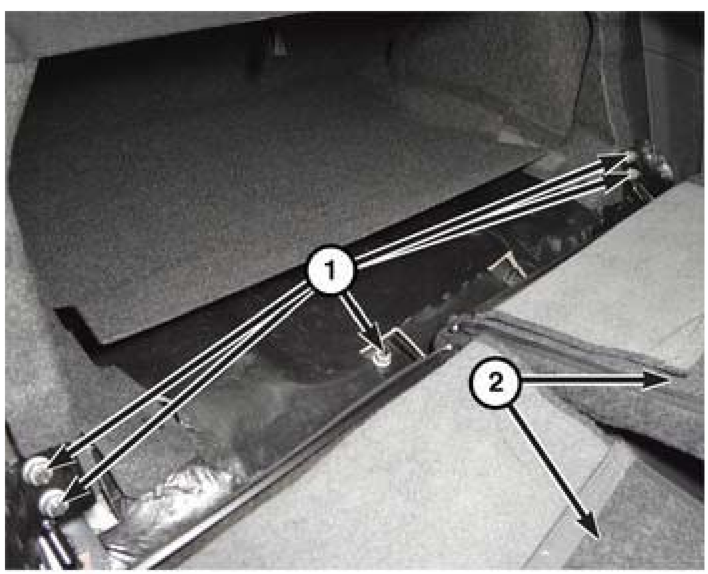


Fig. 345: Seat Backs & Outboard Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Place the 60% split seat back into the vehicle and install the center and outboard nuts (1).

2. Tighten the rear seat nuts to the proper specification. Refer to **SPECIFICATIONS**.
3. Install the 40% seat back onto the guide post of the 60% split seat back bracket and rotate into position.
4. Install the outboard nuts. Tighten the rear seat nuts to the proper specification. Refer to **SPECIFICATIONS**.

SEAT CUSHION

REMOVAL

REMOVAL

1. Push rearward then pull upward, at the front edge of the rear seat cushion, to release the it from the two seat cushion retainers.
2. Lift up and forward to remove.

INSTALLATION

INSTALLATION

1. Position the rear seat cushion under the rear seat back. Route the seat belt buckles through the rear seat cushion.
2. Push downward at the forward edge of the rear seat cushion and engage the retainers.

STRIKER, SEAT BACK, SECOND ROW

REMOVAL

REMOVAL

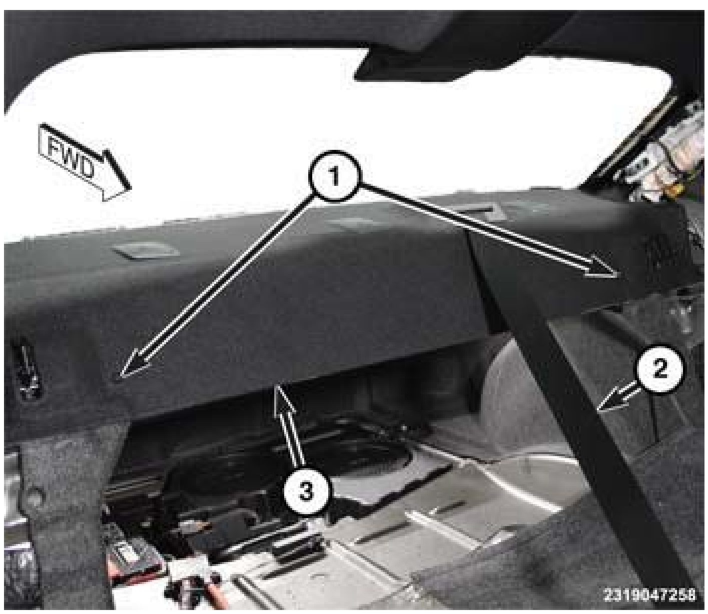

Fig. 346: Push Fasteners, Rear Seat Belt & Rear Shelf Trim
Courtesy of CHRYSLER GROUP, LLC

1. Fold the rear seat back down.
2. Remove the two push fasteners (1) from the rear shelf panel.
3. Position the rear shelf panel to gain access to the rear seat striker.

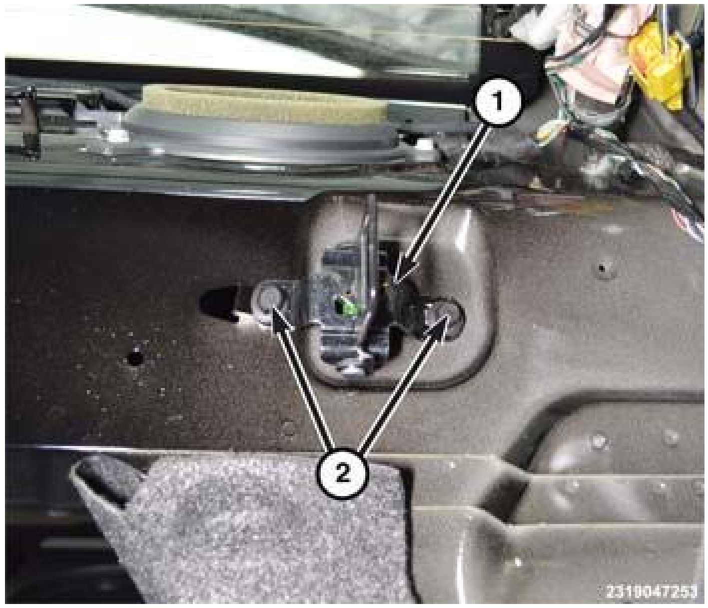

Fig. 347: Rear Seat Striker & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the bolts (2) and the rear seat striker (1).

INSTALLATION

INSTALLATION

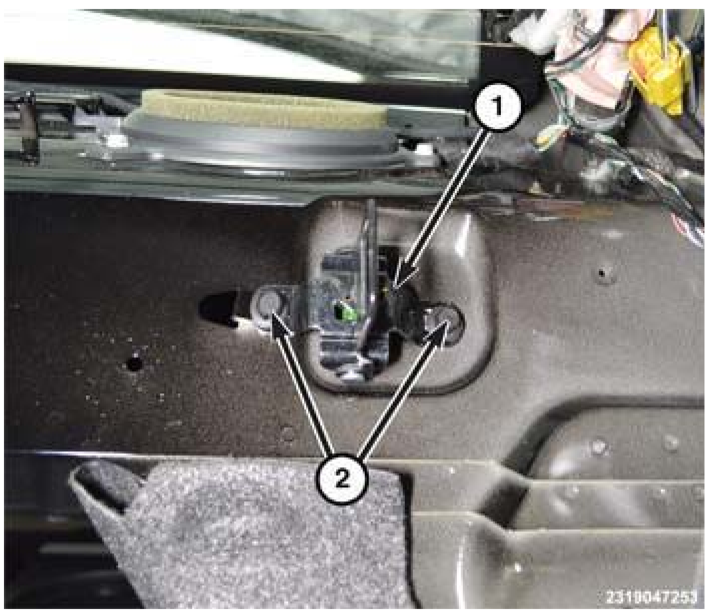

Fig. 348: Rear Seat Striker & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the rear seat striker (1) and install the bolts (2). Tighten the rear seat striker bolts to the proper specification. Refer to SPECIFICATIONS.

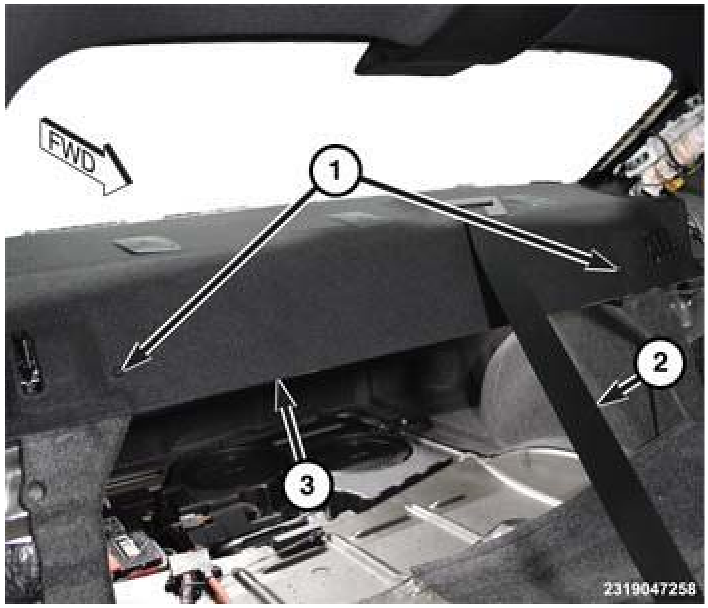

Fig. 349: Push Fasteners, Rear Seat Belt & Rear Shelf Trim
Courtesy of CHRYSLER GROUP, LLC

2. Position the rear shelf panel and install the two push fasteners (1).
3. Raise the rear seat back and verify rear seat striker fit and operation.

STATIONARY GLASS

WARNING

WARNING

WARNING: **Do not operate the vehicle within 24 hours of windshield installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the windshield may not perform properly in an accident.**

- **Urethane adhesives are applied as a system. Use glass cleaner, glass prep solvent, glass primer, PVC (vinyl) primer and pinch weld (fence) primer provided by the adhesive manufacturer. If not, structural integrity could be compromised.**
- **Chrysler does not recommend glass adhesive by brand. Technicians should review product labels and technical data sheets, and use only adhesives that their manufactures warrant will restore a vehicle to the requirements of FMVSS 212. Technicians should also insure that primers and cleaners are compatible with the particular adhesive used.**
- **Be sure to refer to the urethane manufacturer's directions for curing time specifications, and do not use adhesive after its expiration date.**
- **Vapors that are emitted from the urethane adhesive or primer could cause personal injury. Use them in a well-ventilated area.**
- **Skin contact with urethane adhesive should be avoided. Personal injury may result.**
- **Always wear eye and hand protection when working with glass.**

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

Be careful not to damage painted surfaces when removing moldings or cutting urethane around windshield.

BACKLITE

REMOVAL

REMOVAL

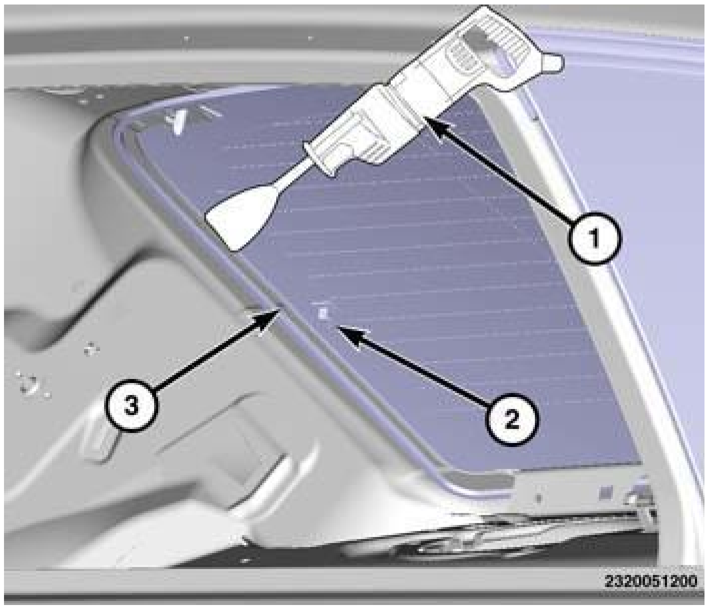

Fig. 350: Adhesive Separation
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to STATIONARY GLASS, WARNING.
2. Open the decklid.
3. Remove the C-pillar trim panel. Refer to PANEL, C-PILLAR TRIM, REMOVAL.
4. Remove the rear shelf panel. Refer to PANEL, REAR SHELF, REMOVAL.
5. Disconnect the wire connectors from rear window defogger terminals (2) and, rear window mounted radio antenna, if equipped.

CAUTION: Be careful not to damage painted surfaces when cutting urethane around the backlite.

6. Using an assistant and a glass extraction tool (1) or equivalent, cut and separate the urethane adhesive securing the backlite (2) to the backlite fence.

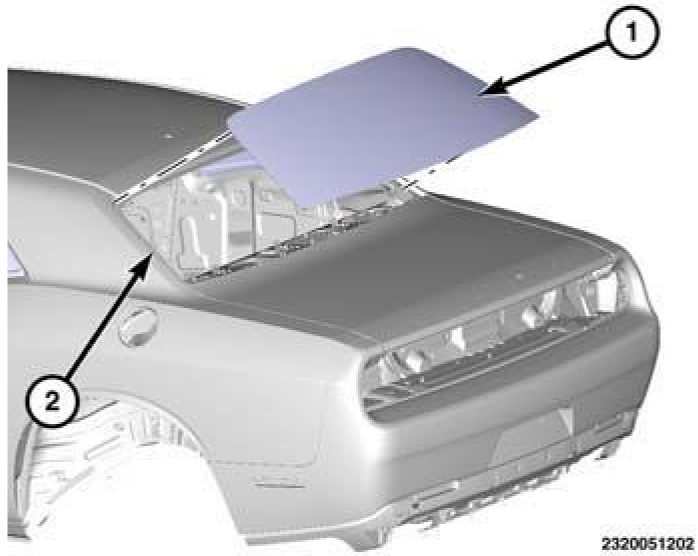

Fig. 351: Removing/Installing Backlite
Courtesy of CHRYSLER GROUP, LLC

7. Carefully remove the backlite (1) from the vehicle (2).

INSTALLATION

INSTALLATION

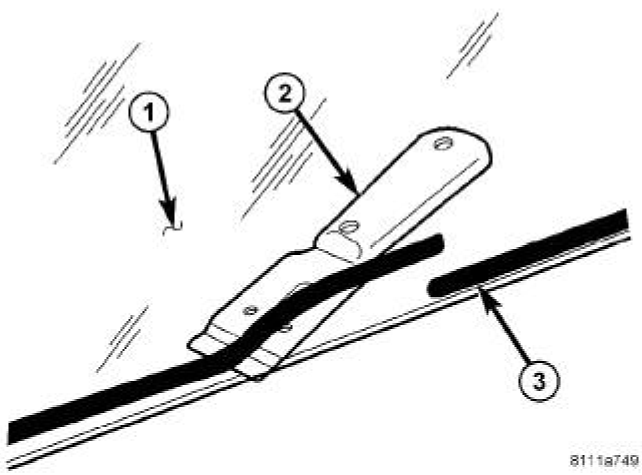

Fig. 352: Glass Adhesive Preparation
Courtesy of CHRYSLER GROUP, LLC

WARNING: **Do not operate the vehicle within 24 hours of windshield installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the windshield may not perform properly if the vehicle is in an accident.**

CAUTION: **To help prevent water leaks, partially roll down the left and right door glass before installing the backlite. This avoids pressurizing the passenger compartment if a door is slammed before the urethane is cured.**

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

1. If the backlite (1) is being reused, remove as much original urethane (3) as possible from the glass surface using a razor knife (2).

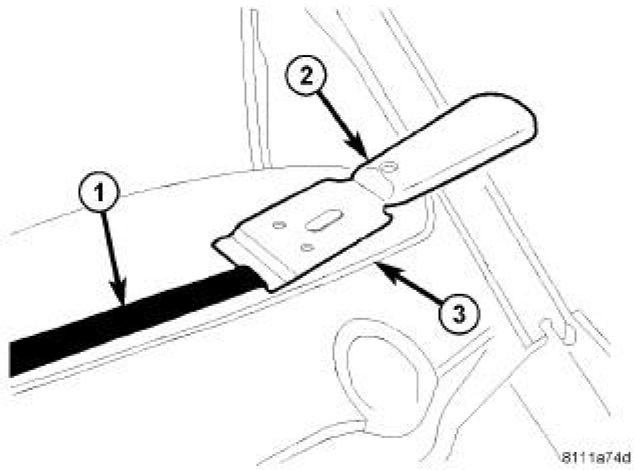

Fig. 353: Smoothing Windshield Adhesive
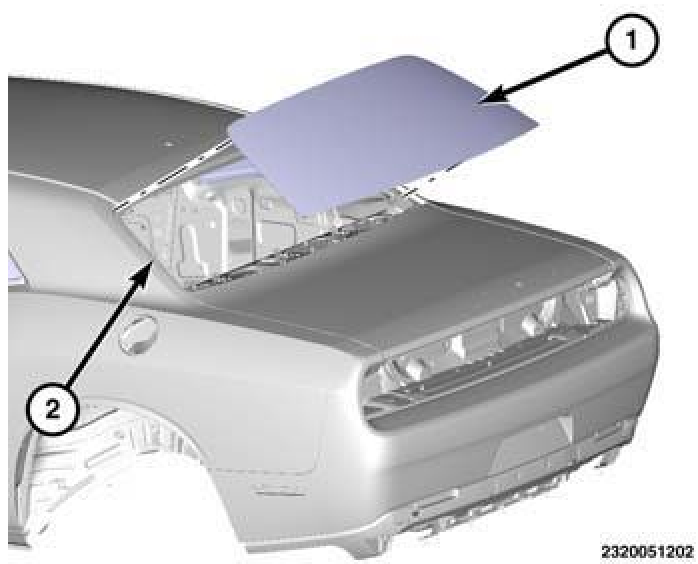
Courtesy of CHRYSLER GROUP, LLC

NOTE: To prevent corrosion, do not damage paint on the backlite fence when removing original urethane.

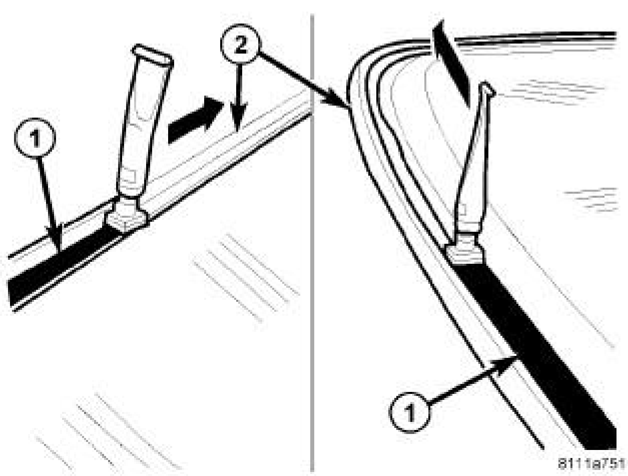
NOTE: The backlite fence should be cleaned of most of its old urethane adhesive. A small amount of old urethane, approximately 1 mm in height should remain on the fence. Do not completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected. Replace any missing or damaged spacers around the perimeter of the backlite fence.

2. Using a razor knife (2), level the original bead of urethane (1) on the backlite fence (3) to a thickness of approximately 1 mm (0.04 in.) and remove the loose adhesive.
3. Install a new rubber seal (1) around the top and bottom edges of the backlite (3).



[Fig. 354: Removing/Installing Backlite]
Courtesy of CHRYSLER GROUP, LLC

4. Install new spacers along the backlite fence as required.
5. Using an assistant, position the backlite (1) into the backlite opening and against the backlite fence.
6. Verify the backlite (2) lays evenly against the fence at the top, bottom and sides of the opening. If not, the fence must be formed to the shape of the backlite.
7. Mark the backlite (2) and fence with a grease pencil or pieces of masking tape to use as a reference for installation.
8. Using an assistant, remove the backlite from the backlite opening and place it on a suitable padded work surface.



[Fig. 355: Windshield Primer]
Courtesy of CHRYSLER GROUP, LLC

WARNING: Do not use solvent based glass cleaners to clean the backlite before applying glass prep and primer or poor glass adhesion may result.

9. Clean the inside of the backlite with an ammonia based glass cleaner and a lint-free cloth.
10. Apply glass prep adhesion promoter 25 mm (1 in.) wide (1) around the perimeter of the backlight (2) and 5 mm (0.2 in.) from the edge of the glass and wipe dry with a clean lint-free cloth until no streaks are visible.
11. Apply glass primer 25 mm (1 in.) wide around the perimeter of the backlight and 5 mm (0.2 in.) from the edge of the glass. Allow at least three minutes drying time.
12. Using a flashlight, verify that the primer is completely and evenly installed along the perimeter of the backlite.
13. Re-prime any area that is not fully and evenly primed.

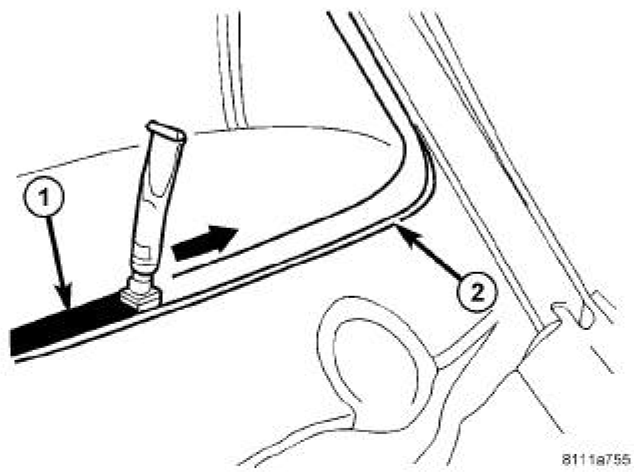


Fig. 356: Applying Windshield Primer
Courtesy of CHRYSLER GROUP, LLC

14. Clean the backlite fence with an ammonia based glass cleaner and a lint-free cloth.
15. Apply pinch weld primer 15 mm (0.75 in.) wide (1) around the backlite fence (2). Allow at least three minutes drying time.
16. Using a flashlight, verify that the primer is completely and evenly installed along the backlite fence.
17. Re-prime any area that is not fully and evenly primed.

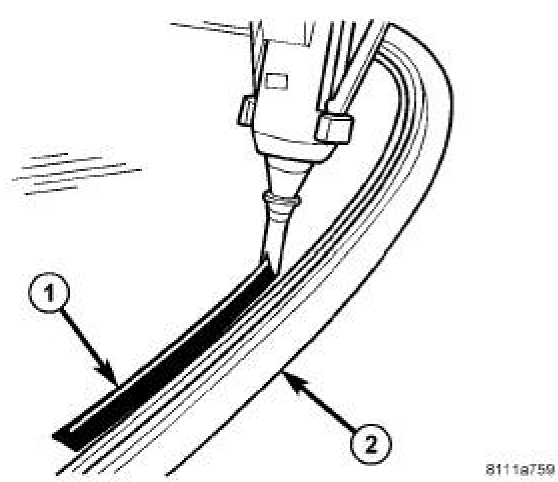

Fig. 357: Applying Windshield Adhesive

Courtesy of CHRYSLER GROUP, LLC

CAUTION: **Always apply the bead of adhesive to the backlite. Always install the backlite within 5 minutes after applying the adhesive.**

NOTE: **If the original urethane adhesive has been exposed for more than 12 hours, the entire adhesive area will need to be re-primed prior to installing new adhesive.**

18. Apply approximately a 10 mm (0.4 in.) wide bead of adhesive (1) with a triangular nozzle approximately 6 mm (0.230 in.) from the edge of the glass (2) starting at the bottom center of the backlite.
19. Run the end of the adhesive bead (2) on the backlite (3) parallel to the start of the bead and smooth the ends flush.

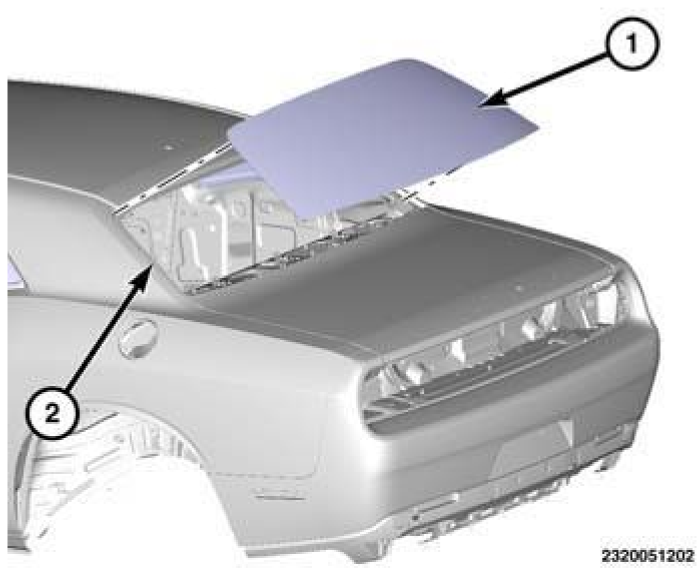

Fig. 358: Removing/Installing Backlite
Courtesy of CHRYSLER GROUP, LLC

20. Using an assistant, position the backlite (1) over the backlite opening.
21. Using the grease pencil marks or tape as reference points, align the backlite (1) to the opening (2).
22. Carefully lower the backlite (1) onto the backlite fence. Guide the backlite and the rubber seal around the backlite into its proper location.

CAUTION: **It is not possible to move the backlite after installation. The backlite should never be pressed into place by more than one person, because the backlite can break if pressed simultaneously on both sides.**

23. Push the backlite (1) inward until the backlite comes into contact with the spacers located on the backlite fence.
24. Connect the wire connectors to the rear window defogger terminals and, rear window mounted radio antenna, if equipped.
25. Install the rear shelf panel. Refer to PANEL, REAR SHELF, INSTALLATION.

26. Install the C-pillar trim. Refer to **PANEL, C-PILLAR TRIM, INSTALLATION**.

GLASS, QUARTER

REMOVAL

REMOVAL

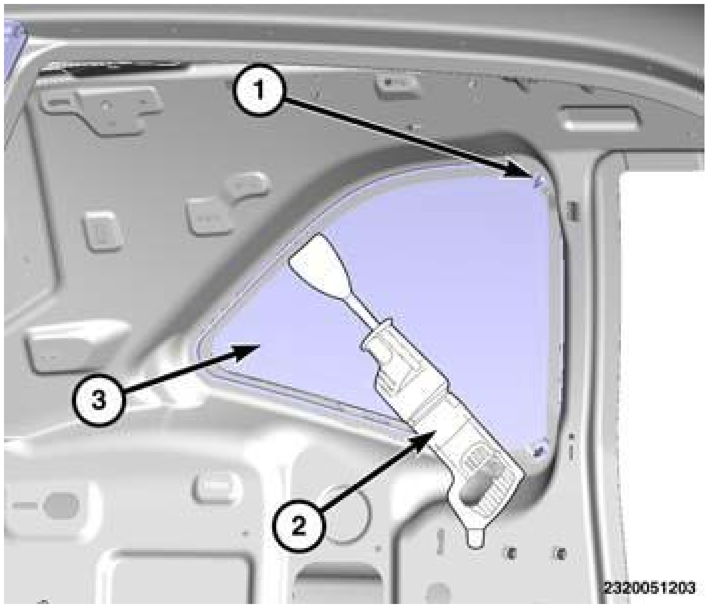

Fig. 359: Adhesive Separation
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **STATIONARY GLASS, WARNING**.
2. Remove the C-pillar trim panel. Refer to **PANEL, C-PILLAR TRIM, REMOVAL**.
3. Using a glass extraction tool (2) or equivalent, cut and separate the urethane adhesive and the alignment pins (1) that secure the quarter glass (3) to window fence.

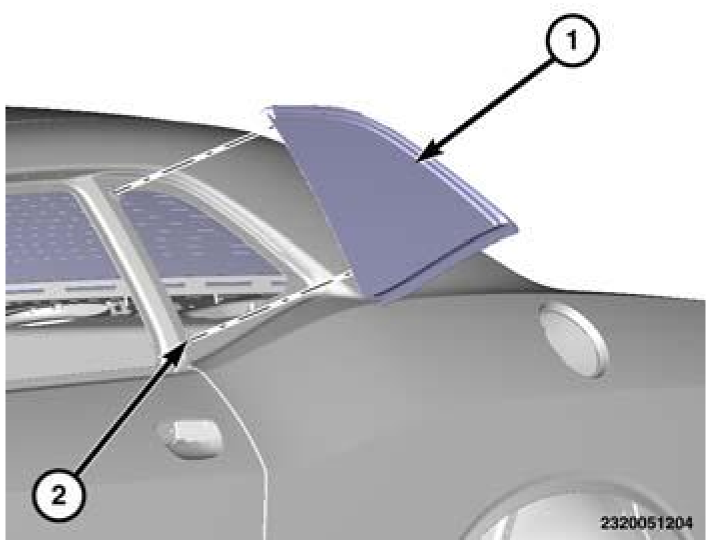

Fig. 360: Removing/Installing Quarter Glass
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Be careful not to damage painted surfaces when removing moldings or cutting urethane around the fixed glass/windshield.

4. Carefully push the quarter window glass (1) from the opening.

INSTALLATION

INSTALLATION

WARNING: Do not operate the vehicle within 24 hours of quarter glass installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the quarter glass may not perform properly if the vehicle is in an accident.

CAUTION: To help prevent water leaks, partially roll down the left and right door glass before installing the quarter glass. This avoids pressurizing the passenger compartment if a door is slammed before the urethane is cured.

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

NOTE: To prevent corrosion, do not damage paint on the quarter glass fence when removing original urethane.

NOTE: The quarter glass fence should be cleaned of most of its old urethane adhesive. A small amount of old urethane, approximately 1 mm (.04 in) in height should remain on the fence. Do not completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected.

1. Using a razor knife, level the original bead of urethane on the fence to a thickness of approximately 1 mm (0.04 in).
2. If the quarter glass (2) is being reused, remove as much of the original urethane as possible from the glass surface using a razor knife.

WARNING: Do not use solvent based glass cleaners to clean the quarter glass before applying glass prep and primer or poor glass adhesion may result.

3. Clean the inside of the quarter glass (2) with an ammonia based glass cleaner and a lint-free cloth.
4. Apply glass prep adhesion promoter 25 mm (1 in) wide around the perimeter of the glass and 5 mm (0.2 in) from the edge of the glass and wipe dry with a clean lint-free cloth until no streaks are visible.
5. Apply glass primer 25 mm (1 in) wide around the perimeter of the glass and 5 mm (0.2 in) from the edge of the glass. Allow at least three minutes drying time.
6. Using a flashlight, verify that the primer is completely and evenly installed along the perimeter of the quarter glass.
7. Re-prime any area that is not fully and evenly primed.

8. Clean the quarter glass fence with an ammonia based glass cleaner and a lint-free cloth.
9. Apply pinch weld primer 15 mm (0.75 in) wide around the quarter glass fence. Allow at least three minutes drying time.
10. Using a flashlight, verify that the primer is completely and evenly installed along the quarter glass fence.
11. Re-prime any area that is not fully and evenly primed.

CAUTION: Always apply the bead of adhesive to the quarter glass. Always install the quarter glass within 5 minutes after applying the adhesive.

NOTE: If the original urethane adhesive has been exposed for more than 12 hours, the entire adhesive area will need to be re-primed prior to installing new adhesive.

12. Apply approximately a 10 mm (0.4 in) wide bead of adhesive with a triangular nozzle approximately 6 mm (0.230 in) from the edge of the glass starting at the bottom center of the quarter glass.
13. Run the end of the adhesive bead on the quarter glass parallel to the start of the bead and smooth the ends flush.

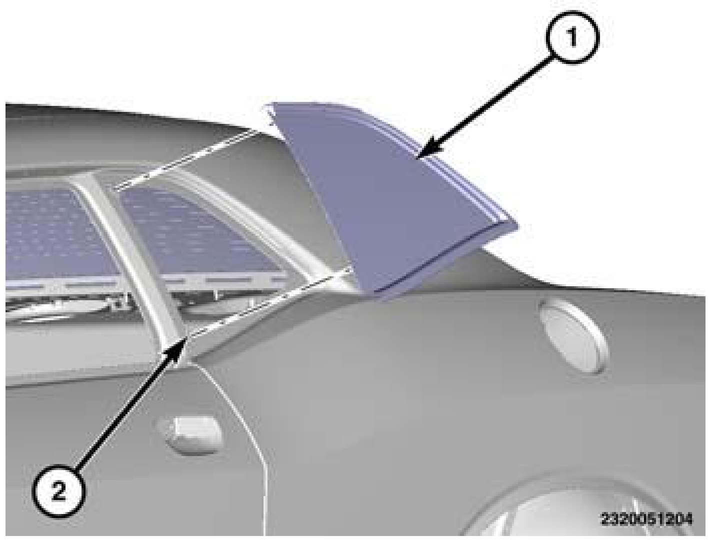

Fig. 361: Removing/Installing Quarter Glass
Courtesy of CHRYSLER GROUP, LLC

14. Place the quarter glass (1) into the window opening (2) and insert mounting studs through the holes in the window fence.
15. Install the C-pillar trim panel. Refer to **PANEL, C-PILLAR TRIM, INSTALLATION**.

WINDSHIELD

DESCRIPTION

DESCRIPTION

The windshield is attached to the window frame (fence) with urethane adhesive. The urethane adhesive is applied cold and seals the surface area between the window opening and the glass. The primer adheres the

urethane adhesive to the windshield.

It is difficult to salvage a windshield during the removal operation. The windshield is part of the structural support for the roof. The urethane bonding used to secure the windshield to the fence is difficult to cut or clean from any surface. If the rubber seals are set in urethane, it would also be unlikely they could be salvaged. Before removing the windshield, check the availability of the windshield and seals from the parts supplier.

REMOVAL

REMOVAL

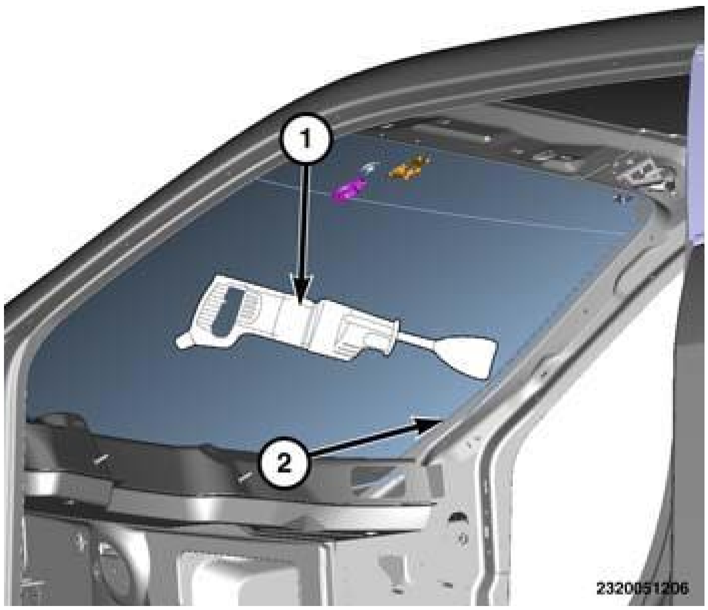

Fig. 362: Adhesive Separation
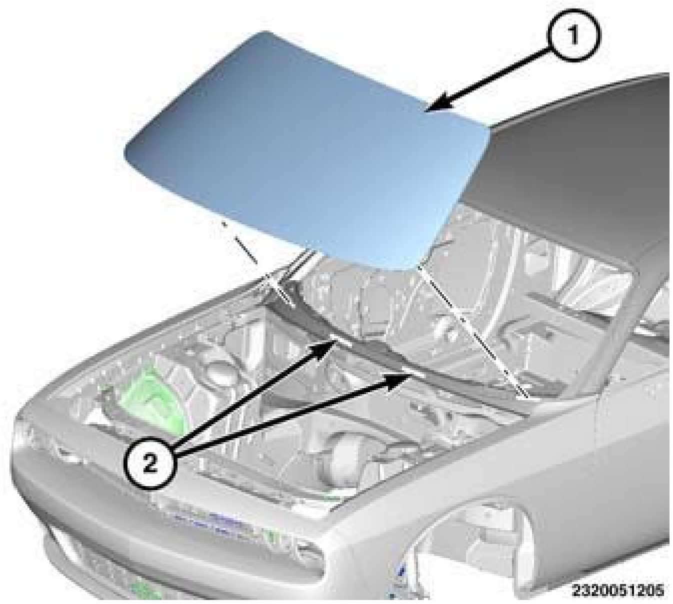
Courtesy of CHRYSLER GROUP, LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. Refer to **STATIONARY GLASS, WARNING**.
2. Disconnect and isolate the negative battery cable.
3. Remove the rear view mirror. Refer to **MIRROR, REARVIEW, REMOVAL**.
4. Remove the rain sensor module from the windshield. Refer to **MODULE, LIGHT RAIN SENSOR, REMOVAL** .
5. Remove the forward facing camera, if equipped.
6. Remove the humidity sensor. Refer to **SENSOR, HUMIDITY, REMOVAL** .
7. Remove the A-pillar trim panels. Refer to **PANEL, A-PILLAR TRIM, REMOVAL**.
8. Remove the cowl cover panel. Refer to **COVER, COWL PANEL, REMOVAL**.
9. Lower the front of the headliner if necessary. Refer to **HEADLINER, REMOVAL**.
10. Using an assistant and a glass extraction tool (1) or equivalent, cut and separate the urethane adhesive securing the windshield (2) to the windshield fence.



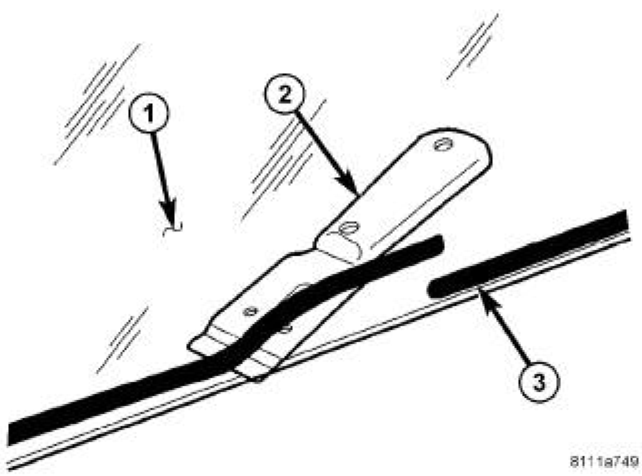
[Fig. 363: Removing/Installing Windshield](#)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Be careful not to damage painted surfaces when removing moldings or cutting urethane around the windshield.

11. Using appropriate tools, carefully remove the windshield (1) from the vehicle.

INSTALLATION

INSTALLATION



[Fig. 364: Removing Old Windshield Adhesive](#)
Courtesy of CHRYSLER GROUP, LLC

WARNING: Do not operate the vehicle within 24 hours of windshield installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the windshield may not perform properly if the vehicle is in an accident.

CAUTION: To help prevent water leaks, partially roll down the left and right door glass

before installing the windshield. This avoids pressurizing the passenger compartment if a door is slammed before the urethane is cured.

CAUTION: **Protect all painted and trimmed surfaces from coming in contact with urethane or primers.**

1. If the windshield (1) is being reused, remove as much of the original urethane (3) as possible from the glass surface using a razor knife (2).

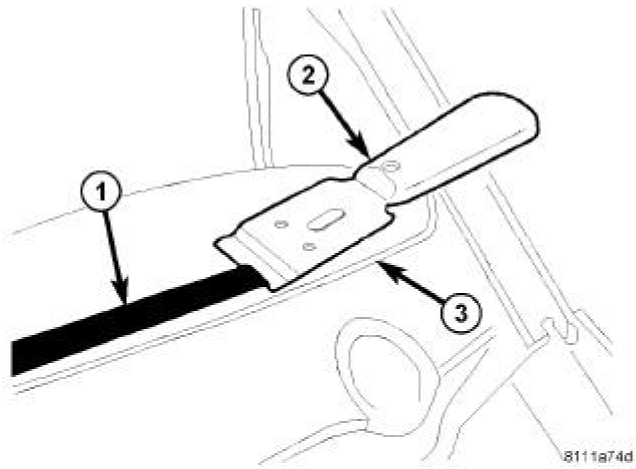


Fig. 365: Leveling Windshield Adhesive
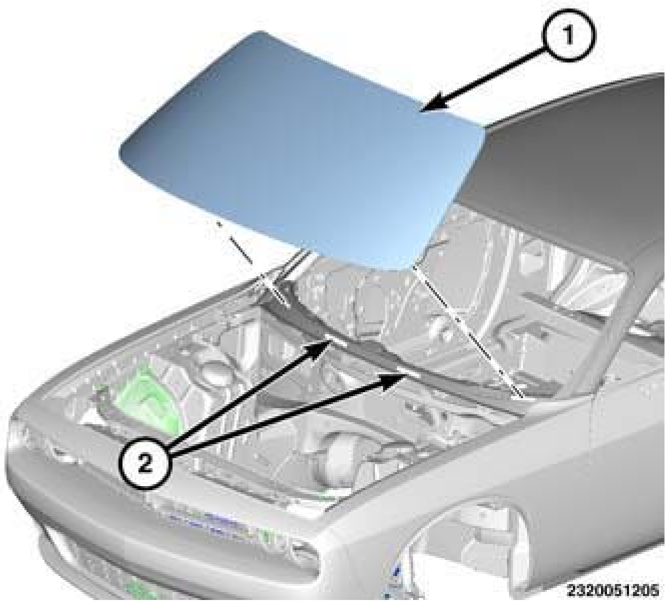
Courtesy of CHRYSLER GROUP, LLC

NOTE: **To prevent corrosion, do not damage paint on windshield fence when removing original urethane.**

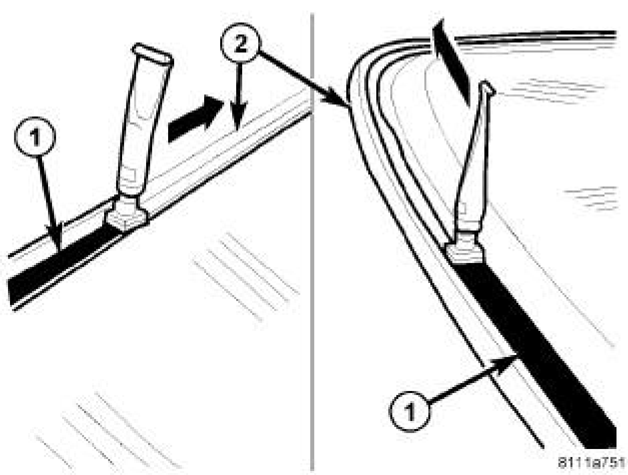
NOTE: **The windshield fence should be cleaned of most of its old urethane adhesive. A small amount of old urethane, approximately 1 mm (.04 in) in height should remain on the fence. Do not completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected. Support spacers located near the cowl at the bottom of the windshield fence should be replaced with new spacers. Replace any missing or damaged spacers around the perimeter of the windshield fence.**

2. Using a razor knife (2), level the original bead of urethane (1) on the windshield fence (3) to a thickness of approximately 1 mm (0.04 in) and remove any damaged adhesive backed spacers.



[Fig. 366: Removing/Installing Windshield](#)
Courtesy of CHRYSLER GROUP, LLC

3. Install new spacers (2) along the windshield fence as required.
4. Install a new rubber seal along the top of the windshield (1).
5. Using an assistant, position the windshield into the windshield opening and against the windshield fence and spacers (2).
6. Verify the windshield lays evenly against the fence at the top, bottom and sides of the opening. If not, the fence must be formed to the shape of the windshield.
7. Mark the windshield and the windshield fence with a grease pencil or pieces of masking tape to use as a reference for installation.
8. Using an assistant, remove the windshield from the windshield opening and place it on a suitable padded work surface.



[Fig. 367: Applying Primer To Gluing Surface Of Windshield Seal](#)
Courtesy of CHRYSLER GROUP, LLC

WARNING: Do not use solvent based glass cleaners to clean the windshield before applying glass prep and primer or poor glass adhesion may result.

9. Clean the inside of the windshield with an ammonia based glass cleaner and a lint-free cloth.
10. Apply glass prep adhesion promoter 25 mm (1 in) wide (1) around the perimeter of the windshield (2) and 5 mm (0.2 in) from the edge of the glass and wipe dry with a clean lint-free cloth until no streaks are visible.
11. Apply glass primer 25 mm (1 in) wide (1) around the perimeter of the windshield (2) and 5 mm (0.2 in) from the edge of the glass. Allow at least three minutes drying time.
12. Using a flashlight, verify that the primer is completely and evenly installed along the perimeter of the windshield.
13. Re-prime any area that is not fully and evenly primed.

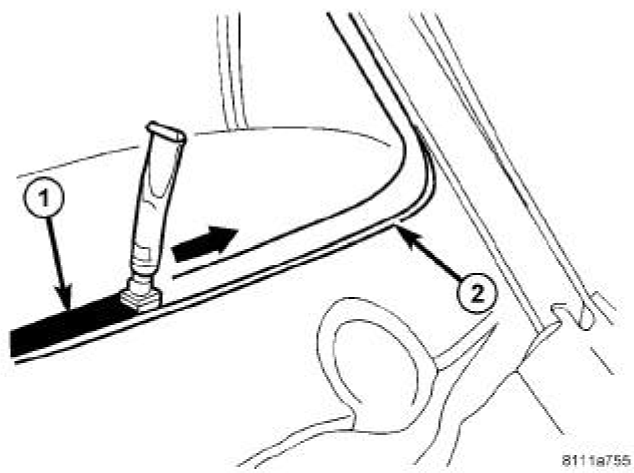


Fig. 368: Applying Windshield Primer
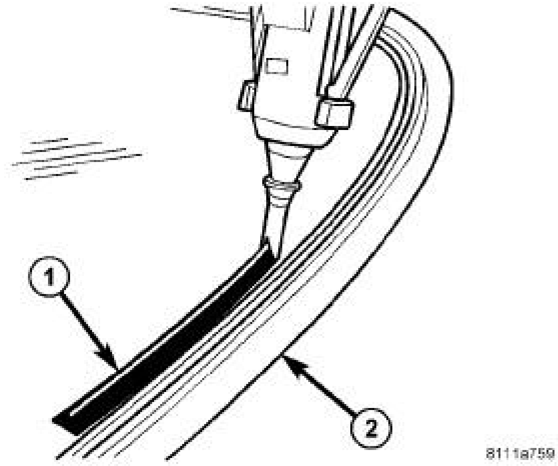
Courtesy of CHRYSLER GROUP, LLC

14. Clean the windshield fence with an ammonia based glass cleaner and a lint-free cloth.
15. Apply pinch weld primer 15 mm (0.75 in) wide (1) around the windshield fence (2). Allow at least three minutes drying time.
16. Using a flashlight, verify that the primer is completely and evenly installed along the windshield fence.
17. Re-prime any area that is not fully and evenly primed.

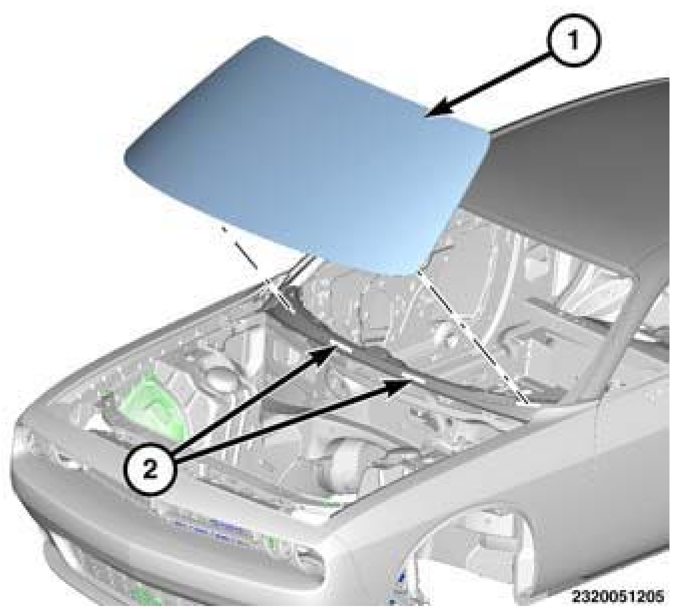


[Fig. 369: Applying Windshield Adhesive](#)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: **Always apply the bead of adhesive to the windshield. Always install the windshield within 5 minutes after applying the adhesive.**

NOTE: **If the original urethane adhesive has been exposed for more than 12 hours, the entire adhesive area will need to be re-primed prior to installing new adhesive.**

18. Apply approximately a 10 mm (0.4 in) wide bead of adhesive (1) with a triangular nozzle approximately 6 mm (0.230 in) from the edge of the glass starting at the bottom center of the windshield.
19. Run the end of the adhesive bead on the windshield parallel to the start of the bead and smooth the ends flush.



[Fig. 370: Removing/Installing Windshield](#)
Courtesy of CHRYSLER GROUP, LLC

20. Using an assistant, position the windshield (1) over the windshield opening.

21. Using the grease pencil marks or tape as reference points, align the windshield to the windshield opening.
22. Carefully lower the windshield into the windshield opening. Guide the windshield and the rubber seal at the top of the windshield into its proper location.

CAUTION: It is not possible to move the windshield after installation. The windshield should never be pressed into place by more than one person, because the windshield can break if pressed simultaneously on both sides.

23. Push the windshield inward until the windshield comes into contact with the retainers (3) located on the windshield fence.
24. Install the cowl cover panel. Refer to **COVER, COWL PANEL, INSTALLATION**.
25. Install the rear view mirror onto the windshield. Refer to **MIRROR, REARVIEW, INSTALLATION**.
26. Install the A-pillar trim panels. Refer to **PANEL, A-PILLAR TRIM, INSTALLATION**.
27. Install the rain sensor module onto the windshield. Refer to **MODULE, LIGHT RAIN SENSOR, INSTALLATION** .
28. Install the humidity sensor. Refer to **SENSOR, HUMIDITY, INSTALLATION** .
29. Install the forward facing camera, if equipped.
30. Connect the negative battery cable.

SUNROOF

DESCRIPTION

DESCRIPTION

15 - RIGHT SUNROOF GLASS GUIDE
16 - WIND DEFLECTOR STRAP SCREWS (2)

The power sunroof system allows the sunroof to be opened, closed or placed in the vent position electrically by actuating a switch in the overhead console. The sunroof system receives battery feed through a fuse in the Power Distribution Center (PDC). The sunroof will operate normally with the key in any position while the Accessory Delay system is active.

The sunroof glass panel tilts upward at the rear for ventilation and slides rearward under the roof when open. The panel seals flush with the roof in the closed position to eliminate wind noise. The sunroof includes a manual-sliding sunshade to cover the deep-tinted glass panel.

In addition to the standard power sunroof operation, this vehicle offers several additional features. There is an express (one-touch) opening and closing feature as well as Excessive Force Limitation (EFL). The EFL function detects obstacles trapped between the glass and the vehicle roof during a closing motion. Upon sensing an obstacle the EFL function will reverse direction of the glass to allow removal of the obstacle.

The main components of the power sunroof system are:

- The motor/module assembly
- The power sunroof glass and frame assembly
- The power sunroof switch
- The manual-sliding sunshade

OPERATION

OPERATION

This vehicle has a vent, tilt and slide power sunroof system with express (one-touch) open and closing feature. The sunroof system receives constant battery feed through a fuse in the Power Distribution Center (PDC). The sunroof will operate normally with the ignition in any position while the Accessory Delay system is active. If the sunroof is moving when the ignition is turned to the START position (crank engine), all motion stop. A new ignition press is required to start sunroof motion. The sunroof will stop a requested motion if the Accessory Delay system goes inactive while the motion is in progress.

A combination push-button and rocker switch module mounted in the overhead console controls sunroof operation. The sunroof switch is a rocker design with a push button in the center of the two halves of the rocker. Pressing the rocker towards the front of the car commands the sunroof closed. Pressing the rocker towards the rear of the car commands the sunroof open. Pressing the center push button commands the sunroof up into the vent position (Rear of sunroof glass raises above the vehicle roof with glass still covering the sunroof opening). All switch commands operate with the glass starting in any position. For additional information. Refer to **OPERATION** .

An electronic control system, integral to the motor/module assembly, provides the express and manual modes of

operation for the open and close functions. Manual operation is activated when by pressing and holding the open, close or vent rocker switch. In manual mode operation the glass will stop operation as soon as the switch is released or when the full closed or full open position is reached. Express operation is activated by pressing and releasing the "open" or "closed" rocker switch within one half second. In express operation the glass will automatically open/close to the full open, vent open or closed position and automatically stop. During express closing, anytime an obstacle is detected in the way of the glass, the motor will stop and reverse travel to avoid pinching an occupant's finger, ice in the track, etc. This function is called Excessive Force Limitation (EFL). There are two methods of overriding the EFL function.

1. When three EFL events occur without the glass being allowed to fully close, the next close attempt will only move while the close switch is continuously actuated. This allows the sunroof to be forced closed if multiple close attempts fail.
2. EFL is not active during manual close operation (press and hold switch).

While in EFL override, the closing motion will cease if the sunroof switch is released at any time.

The sunroof is calibrated to stop the glass in the correct open, close and vent positions. If the sunroof becomes uncalibrated, it will only respond to the vent switch. If the vent switch is pressed, the glass will move toward vent; if the switch is released, all motion stops. In the event that the sunroof system becomes uncalibrated perform the sunroof position calibration procedure. Refer to **MOTOR, SUNROOF, STANDARD PROCEDURE** .

DIAGNOSIS AND TESTING

POWER TOP - SUNROOF

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

SUNROOF

Refer to the **SUNROOF DIAGNOSIS CHART** for possible symptoms. Before beginning sunroof diagnostics verify that all other power accessories are in proper operating condition. If not, a common electrical problem may exist. Refer to appropriate Wiring Diagrams for circuit, splice and component descriptions. Check the condition of the circuit protection (20 amp circuit breaker in the power distribution block). Inspect all wiring connector pins for proper engagement and continuity. Check for battery voltage at the power sunroof controller, refer to appropriate Wiring Diagrams, for circuit information. If battery voltage of more than 10 volts is detected at the controller, proceed with the following tests (the controller will not operate at less than 10 volts):

Before beginning diagnosis for wind noise or water leaks, verify that the problem was not caused by releasing the control switch before the sunroof was fully closed. The sunroof module has a water-management system. If however, the sunroof glass is in a partial closed position, high pressure water may be forced beyond the water management system boundaries and onto the headlining.

SUNROOF DIAGNOSIS CHART

SYMPTOM	POSSIBLE CAUSE

SYMPTOM	POSSIBLE CAUSE
Sunroof motor inoperative.	Faulty control switch.
	Faulty circuit ground between sunroof module, control switch, and body harness.
	Faulty power circuit between sunroof module, control switch, and body harness.
	Faulty sunroof drive motor.
	Faulty sunroof module.
Audible whine when switch is depressed, sunroof does not operate.	Faulty sunroof drive motor.
	Binding cable.
Audible clicking or ratcheting when switch is pressed, sunroof does not operate.	Broken or worn drive cable.
	Worn drive motor gear.
	Mechanisms not synchronized.
Sunroof vents and opens, but does not close.	Broken or disengaged drain channel
	Binding cable.
	Faulty circuit.
	Faulty control switch.
	Faulty sunroof module.
	Faulty drive motor.
Sunroof vents, but does not open.	Binding cable or mechanism.
	Faulty circuit.
	Faulty switch.
	Faulty sunroof module.
Sunroof does not vent	Binding cable or mechanism.
	Faulty circuit.
	Faulty control switch.
	Faulty sunroof module.
Sunroof water leak.	Drain tubes clogged or kinked or disconnected from the sunroof.
	Glass panel improperly adjusted.
	Faulty glass panel seal.
Gurgling sound from sunroof	Low spot in drain hose routing, allowing water to stand.
Wind noise from sunroof.	Glass panel compression to the roof opening not consistent.
	Wind deflector not deploying properly.
	Glass not installed or adjusted properly.
	Faulty glass panel seal.
Buzz, Squeak, Rattles from sunroof	Loose or broken attaching hardware.
	No lubrication in track.
	Worn or broken mechanism.
	Cables bunched or kinked.
Sunshade will not function or does not operate smoothly	Sunshade feet are broken.
	Sunshade feet are in the wrong track.
	Track obstructions or interference.

SYMPTOM	POSSIBLE CAUSE
	Trim lace incorrectly installed in track.
Glass movement not consistent or glass does not operate smoothly	Glass and Track timing.
	Glass and Track alignment.
	Cables and Guide alignment.
	Excessive dirt or debris in tracks.
Broken or jammed guide mechanism	Mechanism cover was not installed correctly.

WATER DRAINAGE AND WIND NOISE DIAGNOSIS

The sliding glass panel is designed to seal water entry with a snug fit between the roof and the seal. The fit can be checked by inserting a business card or equivalent, between the roof and the seal. The piece of paper should have some resistance when pulled out when the glass panel is in the closed position. The sunroof housing will drain off a minimum amount of water. Excessive wind noise could result if the gap clearances are exceeded. The sunroof glass panel may need to be adjusted. Refer to **GLASS, SUNROOF, ADJUSTMENTS**.

Adequate drainage is provided by a drain trough in the sunroof housing which encircles the sliding glass panel and leads to drain hoses. If a wet headliner or other water leak complaints are encountered, before performing any adjustments, first ensure that the drainage system is not plugged or disconnected. Use a pint container to pour water into the sunroof housing drain trough. If water flow is restricted, use compressed air to blow out any material plugging the drain system. Retest system again.

To further check for a disconnected drain hose:

NOTE: Care must be taken not to fold or kink the headliner upon removal.

1. Lower headliner as necessary to gain access to sunroof housing drain tube. Refer to **HEADLINER, REMOVAL**.
2. Repair as necessary.

REMOVAL

REMOVAL

WARNING: The Excessive Force Limitation (EFL) feature must be calibrated any time a sunroof motor/module is replaced with a new component. Failure to perform this procedure could result in vehicle damage and/or personal injury.

Refer to **MOTOR, SUNROOF, STANDARD PROCEDURE** .

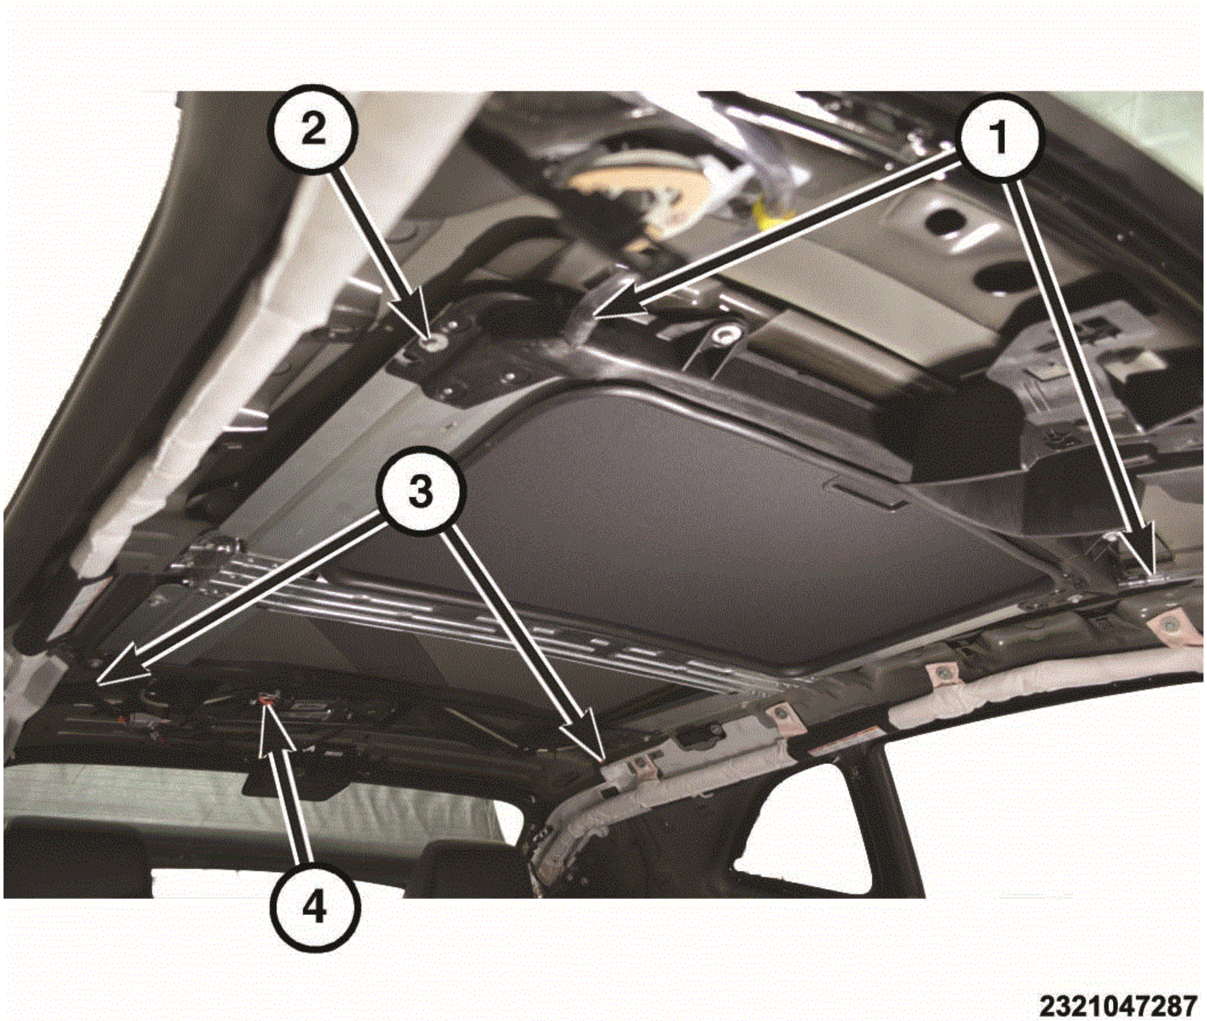

Fig. 372: Drain Tubes, Harness Connector & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Lower the headliner in the vehicle. Refer to **HEADLINER, REMOVAL**.
2. Detach the rear drain tubes (3) from the sunroof.
3. Detach the front drain tubes (1) from the sunroof.
4. Disconnect the sunroof harness connector (4).
5. With the help of an assistant holding the sunroof, remove all the sunroof bolts (2).
6. With the help of an assistant, carefully remove the sunroof through the front door opening.
7. Check the sunroof's guide tracks for any excessive dirt and debris. If necessary, clean the guide tracks and lubricate with MoparÂ® White Lithium Grease or equivalent.

INSTALLATION

INSTALLATION

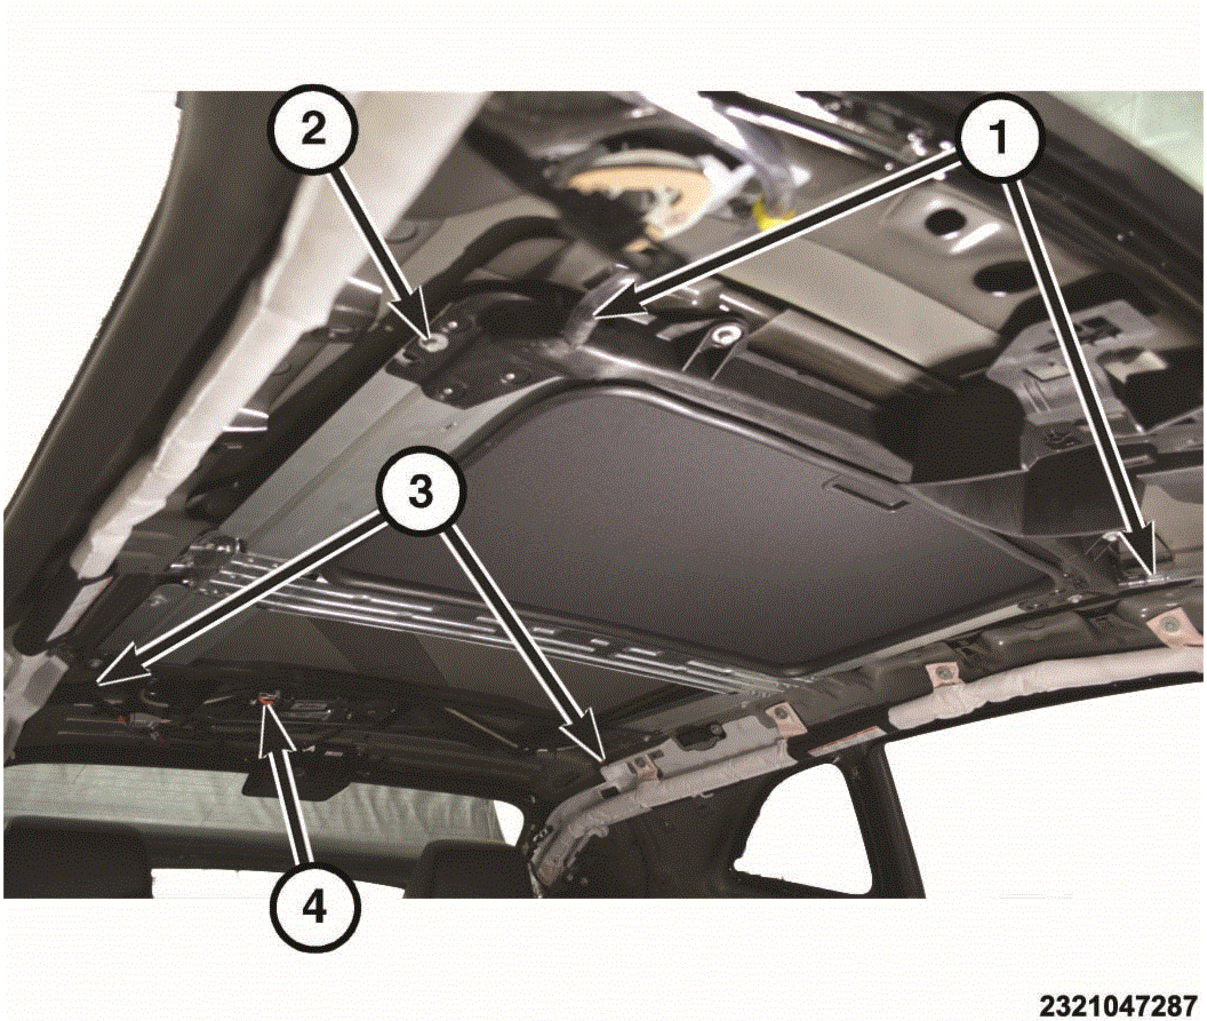

Fig. 373: Drain Tubes, Harness Connector & Bolts
Courtesy of CHRYSLER GROUP, LLC

WARNING: The Excessive Force Limitation (EFL) feature must be calibrated any time a sunroof motor/module is replaced with a new component. Failure to perform this procedure could result in vehicle damage and/or personal injury.

Refer to **MOTOR, SUNROOF, STANDARD PROCEDURE** .

1. With the help of an assistant, position the sunroof into the vehicle and loosely install the sunroof to body bolts (2). Make sure the seal around the perimeter of the sunroof glass is seated evenly around the roof opening.
2. Tighten the sunroof to body bolts to the proper specification. Refer to **SPECIFICATIONS**.
3. Attach the front drain tubes (1) to the sunroof.
4. Connect the sunroof harness connector (4).
5. Attach the rear drain tubes (3) to the sunroof.
6. Verify proper operation of the power sunroof system.
7. If necessary, adjust the sunroof glass. Refer to **GLASS, SUNROOF, ADJUSTMENTS**.
8. Raise and install the headliner. Refer to **HEADLINER, INSTALLATION**.

9. Perform the sunroof position calibration. Refer to **MOTOR, SUNROOF, STANDARD PROCEDURE** .
10. Perform the Excessive Force Limitation (EFL) calibration. Refer to **MOTOR, SUNROOF, STANDARD PROCEDURE** .

CHANNEL, SUNROOF DRAIN

REMOVAL

REMOVAL

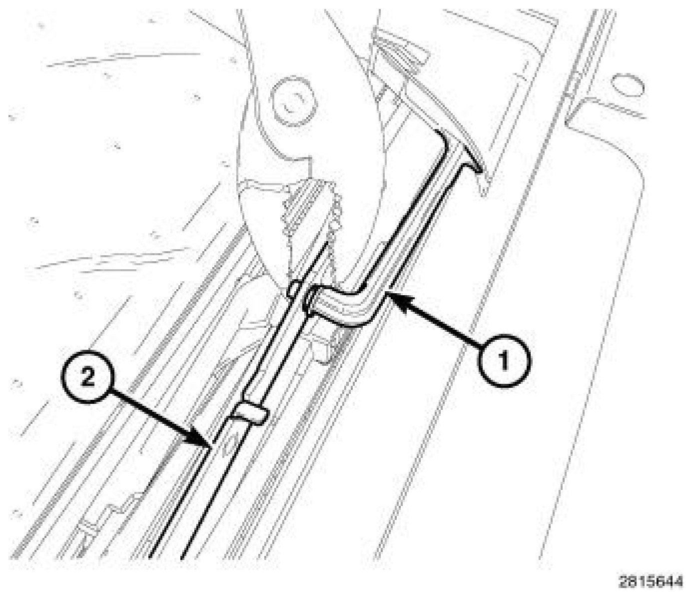

Fig. 374: Identifying Drain Channel Arm & Guide Mechanisms
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Left side shown in illustration, right side typical.**

1. Remove glass panel. Refer to **GLASS, SUNROOF, REMOVAL**.
2. Using pliers, disengage the drain channel arm (1) from the guide mechanisms (2) one at a time by pushing the drain channel arm retaining tab through the retention hole located in the guide mechanism. **Do not use excessive force to remove.**

CAUTION: **Disengage the drain channel arms one at a time. Do not disengage both sides at the same time.**

CAUTION: **Do not pull or pry the channel arms. Doing so will result in breaking the channel arms. Only disengage the channel arms as shown in illustration.**

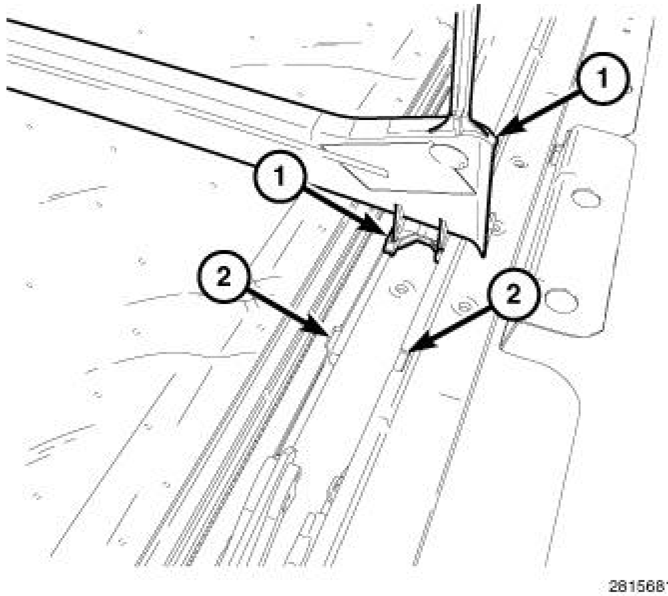

Fig. 375: Drain Channel & Notches
Courtesy of CHRYSLER GROUP, LLC

3. Carefully slide the drain channel (1) forward to the notches (2) in the track assembly. Pull up on one side to disengage, repeat on the opposite side and remove the drain channel.

INSTALLATION

INSTALLATION

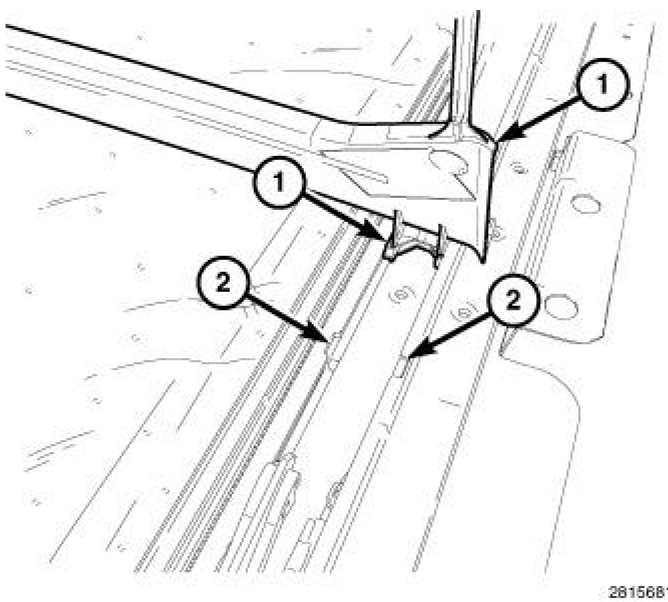

Fig. 376: Drain Channel & Notches
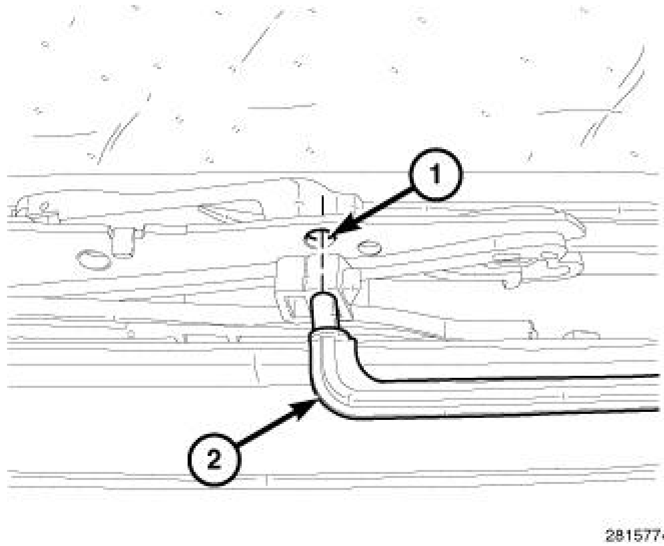
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Left side shown in illustration, right side typical.**

1. Carefully position the drain channel (1) one side at a time into the notches (2) in the track assembly. Once positioned, push down until it engages into the track assembly. Repeat steps on the opposite side and slide the drain channel rearward.



[Fig. 377: Installing Drain Channel Arms Into Mechanism Holes]
Courtesy of CHRYSLER GROUP, LLC

2. Install the drain channel arms (2) into the mechanism holes (1) one at a time.

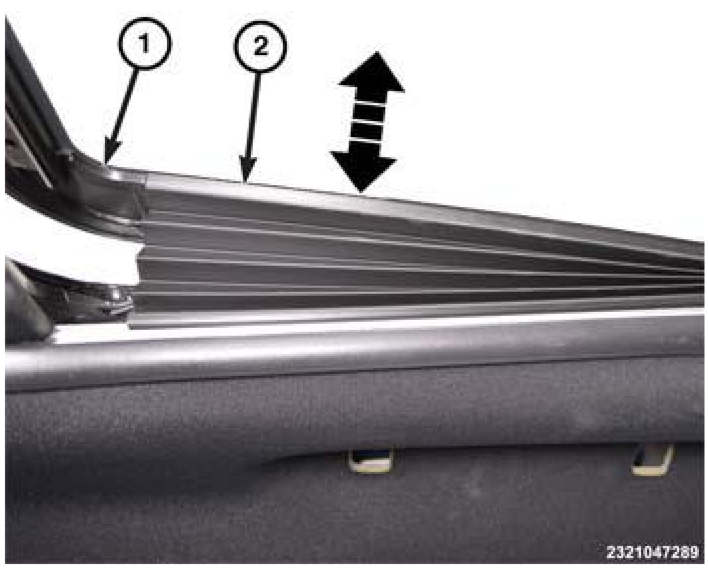
CAUTION: **Do not push the guide arms at the same time or you could break the guide mechanism. Do not use excessive force to install.**

3. Install the sunroof glass. Refer to **GLASS, SUNROOF, INSTALLATION**.

COVER, SUNROOF MECHANISM

REMOVAL

REMOVAL



[Fig. 378: Sunroof Glass & Mechanism Cover]
Courtesy of CHRYSLER GROUP, LLC

1. Slide sunshade rearward to the open position.

2. Move the sunroof glass (1) to the vent position.
3. Separate the mechanism cover (2) from the sunroof glass by pulling the top edge inboard, starting at the rear.

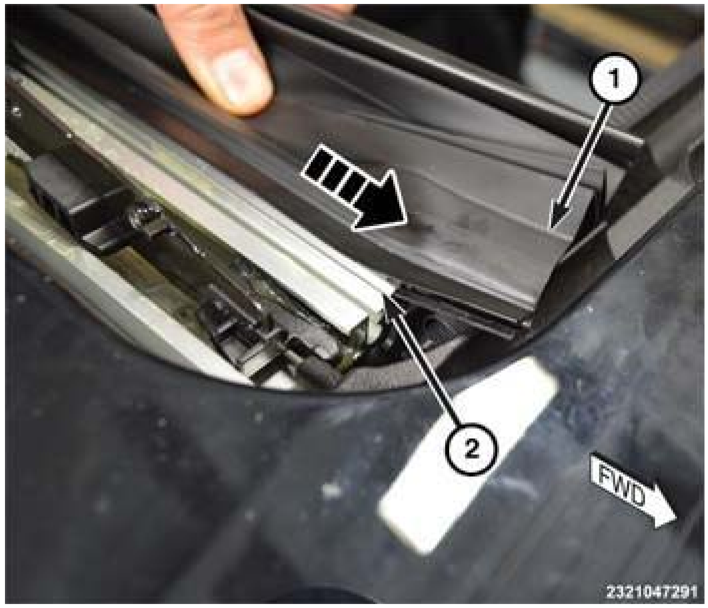


Fig. 379: Mechanism Cover & Guide
Courtesy of CHRYSLER GROUP, LLC

4. Slide the mechanism cover (1) forward and out of the guide in the frame (2).

INSTALLATION

INSTALLATION

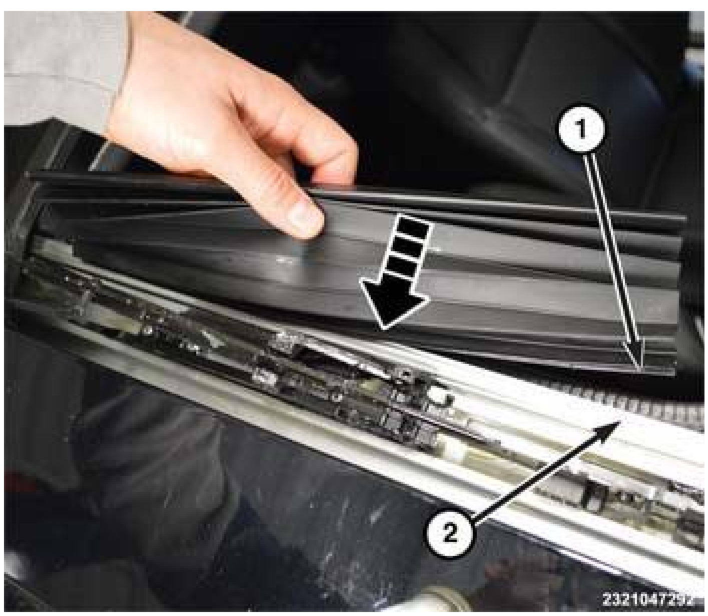

Fig. 380: Mechanism Cover & Guide
Courtesy of CHRYSLER GROUP, LLC

1. With the sunroof in the open position, snap the mechanism cover (1) into the upper guide (2).

2. Close the sunroof.

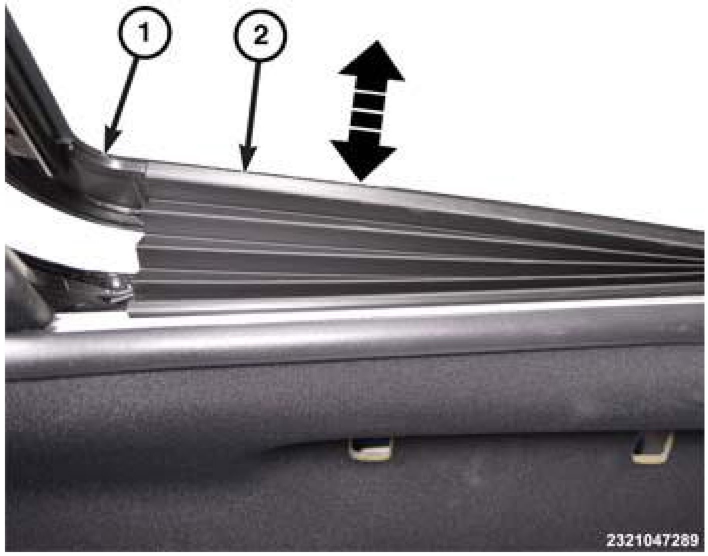

Fig. 381: Sunroof Glass & Mechanism Cover
Courtesy of CHRYSLER GROUP, LLC

3. Push the mechanism cover (2) onto the sunroof glass (1) between the locating features.

DEFLECTOR, WIND

REMOVAL

REMOVAL

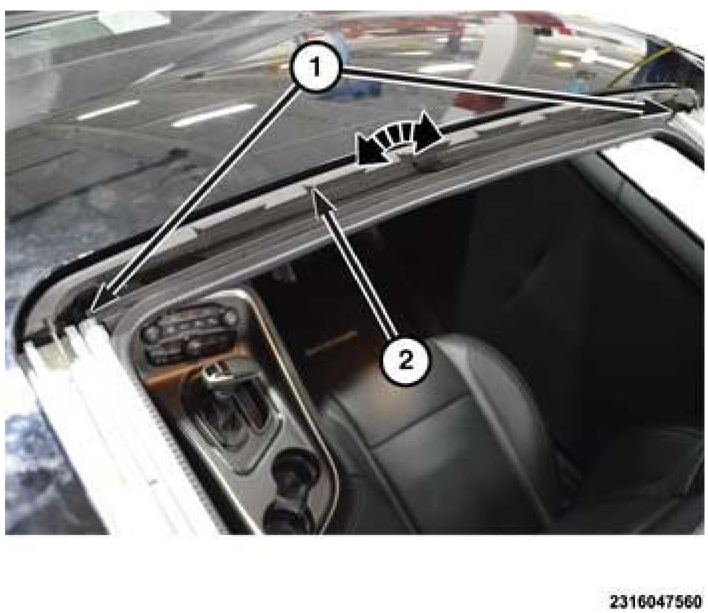

Fig. 382: Strap Screws & Wind Deflector

1. Position the wind deflector spring arms (2) into the holes of the frame (1).

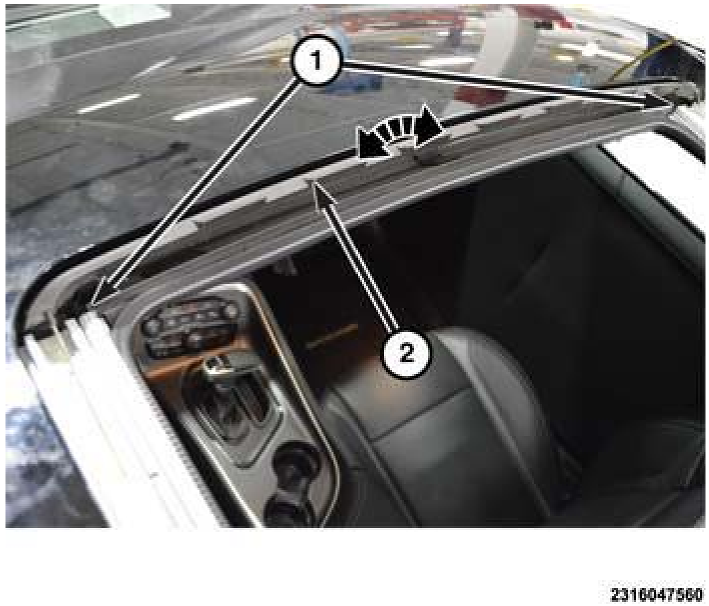

Fig. 385: Strap Screws & Wind Deflector
Courtesy of CHRYSLER GROUP, LLC

2. Rotate the wind deflector (2) down and install the two strap screws (1). Tighten the strap screws securely.
3. Verify sunroof operation.

GLASS, SUNROOF

ADJUSTMENTS

ADJUSTMENTS

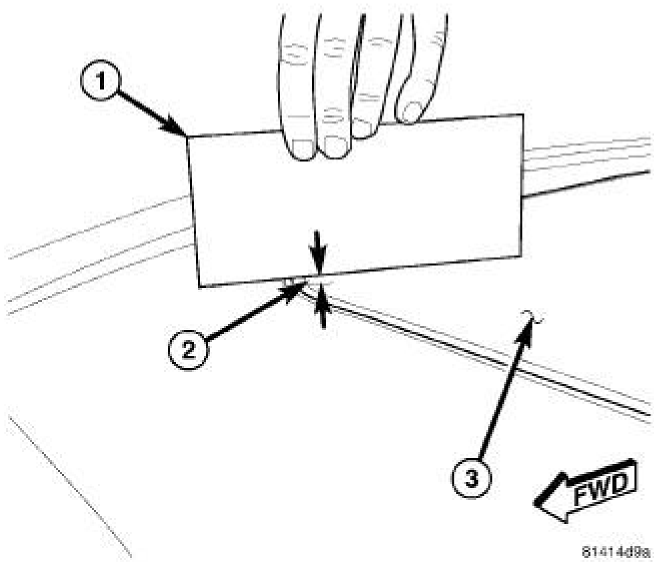

Fig. 386: Checking Sunroof Front Height
Courtesy of CHRYSLER GROUP, LLC

1. Remove the mechanism covers. Refer to COVER, SUNROOF MECHANISM, REMOVAL.
2. Move the sunroof glass to the fully closed position.

3. Loosen the four sunroof glass screws so that the sunroof glass can be adjusted in the vertical and fore-aft directions.

NOTE: **Before making adjustments, tape a line at 300 mm (11.8 inches) outboard from the center of vehicle. This is where flush measurements are taken.**

4. Standing outside the vehicle (one side at a time with one hand supporting the front corner of the sunroof glass) lift the front glass corner (3) until it is between flush and slightly under flush (0.00 to -2.0 mm / 0.00 to -0.080 inches) (2). Use your free hand to snug up the screw with sufficient force (finger tight) that the weight of the glass is supported. Repeat this process on the other side of the vehicle.

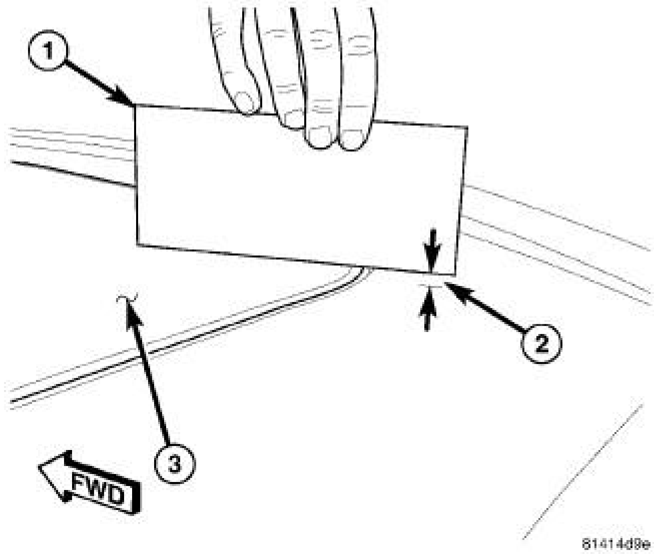

Fig. 387: Checking Sunroof Rear Height
Courtesy of CHRYSLER GROUP, LLC

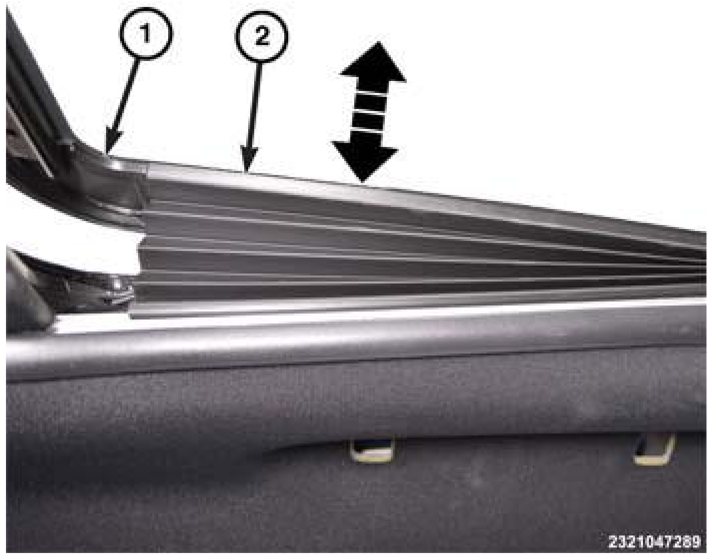
NOTE: **Before making adjustments, tape a line at 300 mm (11.8 inches) outboard from the center of vehicle. This is where flush measurements are taken.**

5. Move to the rear of the sunroof glass. Standing outside of the vehicle (one side at a time with one hand supporting the rear corner of the glass) lift the rear glass corner (3) until it is between flush and slightly over flush (0.00 to +2.0 mm / 0.00 to +0.080 inches) (2). Use your free hand to snug up the glass screw with sufficient force (finger tight) that the weight of the glass corner is supported. Repeat this process on the other side of the vehicle.
6. Check the flushness of the sunroof glass in the corners with a business card (1) (or other straight edged tool that won't scratch the glass or roof) held at a 45 degree angle to the vehicle's for/aft centerline. The preferred sunroof glass placement for blockage of water/air leaks is flush at all the corners. If this is not possible, adjust the sunroof glass' vertical placement within the tolerance ranges described above towards the flush position.
7. Check for proper fit by inserting a business card between the sunroof glass seal and the roof. Slide the business card around the entire perimeter of the sunroof glass. The effort to slide the card should be uniform around the entire perimeter. If the effort is not uniform, repeat the sunroof glass adjustment.
8. Once the proper sunroof glass position has been achieved, tighten the four screws to 5 N.m (35 in. lbs.).

9. Check for proper fit. If not OK, repeat sunroof glass adjustment.

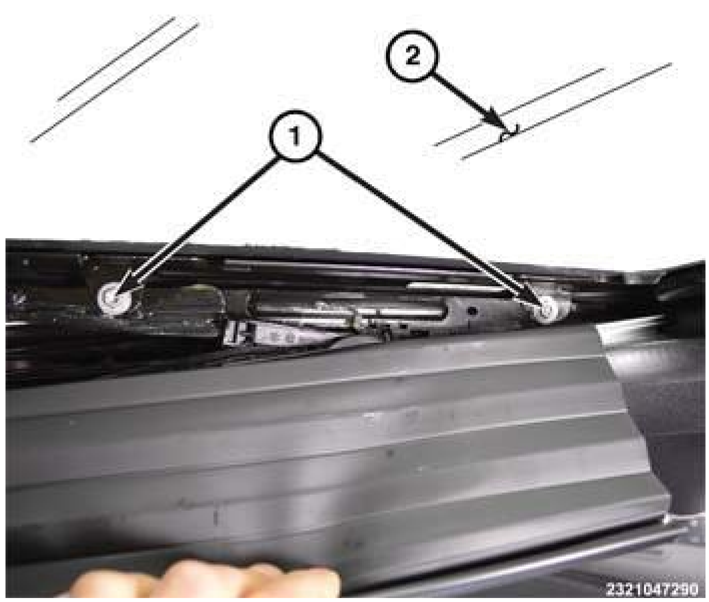
REMOVAL

REMOVAL



[**Fig. 388: Sunroof Glass & Mechanism Cover**]
Courtesy of CHRYSLER GROUP, LLC

1. Slide the sunshade rearward to the open position.
2. Move the sunroof glass (1) to the vent position.
3. Separate the mechanism covers (2) from the sunroof glass by pulling the top edge inboard, starting at the rear.

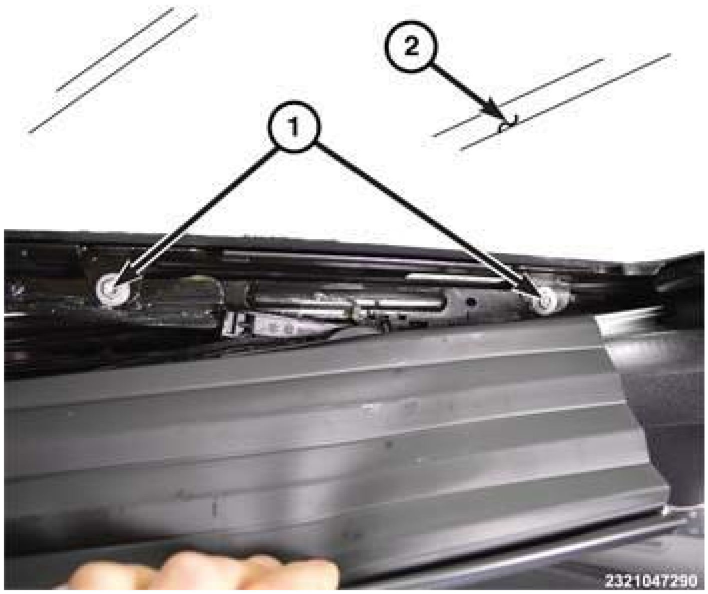


[**Fig. 389: Sunroof Glass & Screws**]
Courtesy of CHRYSLER GROUP, LLC

4. Remove the four screws (1), two on each side.
5. Lift off the sunroof glass (2) and remove.

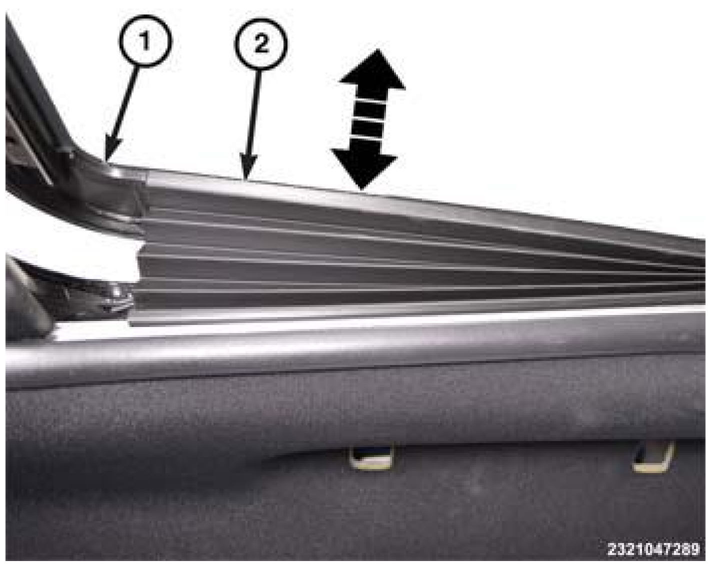
INSTALLATION

INSTALLATION



[Fig. 390: Sunroof Glass & Screws]
Courtesy of CHRYSLER GROUP, LLC

1. Position the sunroof glass (2) and loosely install the four screws (1).
2. Connect the negative battery cable and verify that the sunroof is in the fully closed position.
3. Adjust the sunroof glass. Refer to GLASS, SUNROOF, ADJUSTMENTS.



[Fig. 391: Sunroof Glass & Mechanism Cover]
Courtesy of CHRYSLER GROUP, LLC

4. Push the mechanism covers (2) onto the sunroof glass (1) between the locating features.
5. Verify the sunroof operation.

GUIDE, SUNROOF, GLASS

REMOVAL

REMOVAL

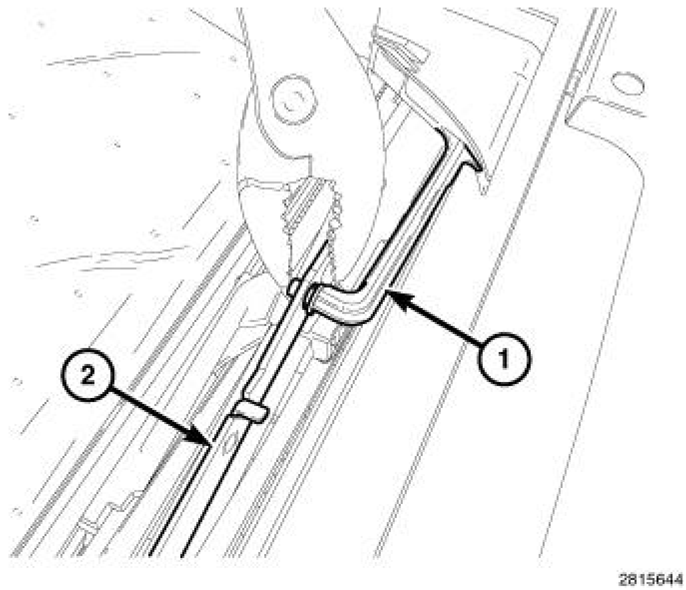


Fig. 392: Identifying Drain Channel Arm & Guide Mechanisms
Courtesy of CHRYSLER GROUP, LLC

1. Remove the sunroof glass. Refer to GLASS, SUNROOF, REMOVAL.
2. Separate the drain channel arms (1) from the guide mechanisms (2) one at a time.

CAUTION: Disengage the drain channel arms one at a time. Do not disengage both sides at the same time.

CAUTION: Do not pry the guide arms apart at the same time, damage to the guide mechanism may occur.

3. Slide the drain channel rearward out of the way.

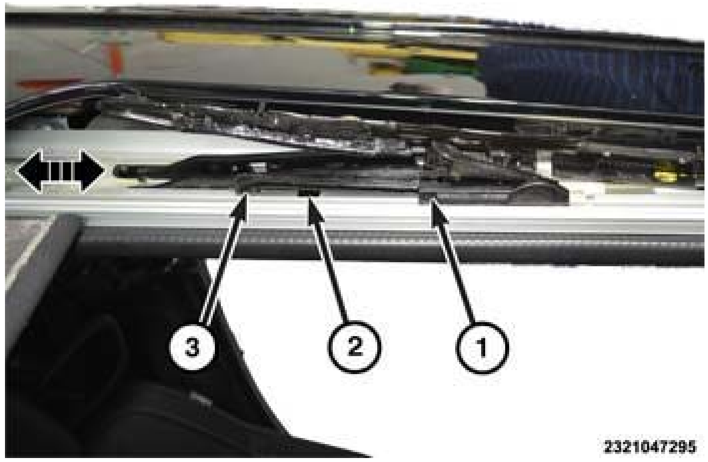

Fig. 393: Glass Guide/Guide Carriage Assembly, Notch & Locking Tab
Courtesy of CHRYSLER GROUP, LLC

4. Using a small flat bladed tool, pry or lift the locking tab (3) out of the notch (2) and slide the glass guide/guide carriage assembly (1) rearward approximately 25-30 mm (0.98-1.18 inches) in the track.

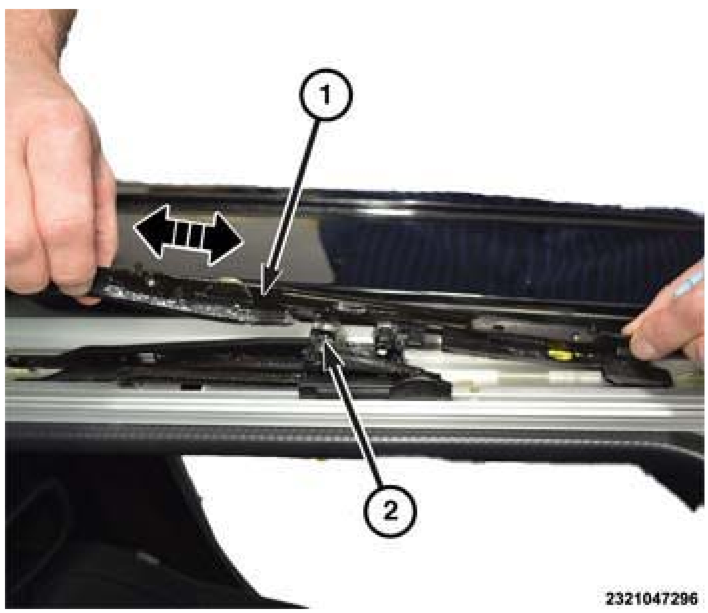

Fig. 394: Glass Guide & Locking Lever
Courtesy of CHRYSLER GROUP, LLC

5. Lift the glass guide (1) from the locking lever (2) and slide rearward to remove.

INSTALLATION

INSTALLATION

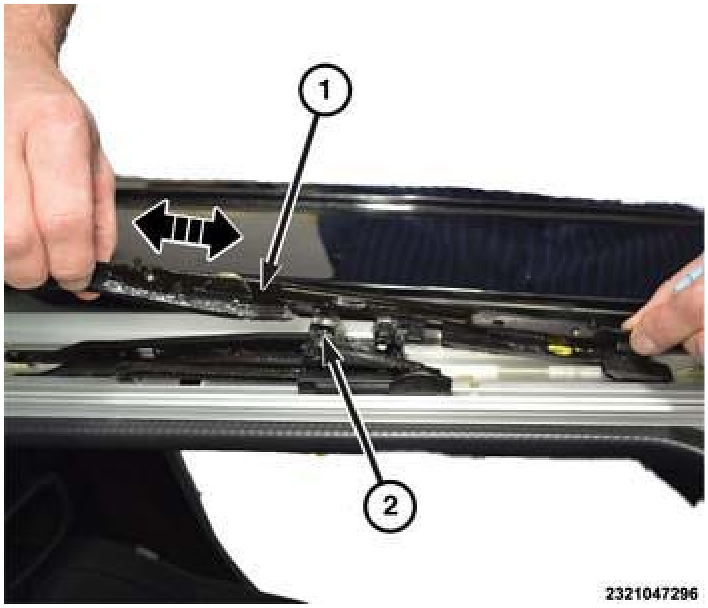

Fig. 395: Glass Guide & Locking Lever
Courtesy of CHRYSLER GROUP, LLC

1. Insert the front foot of the glass guide (1) into the track assembly and slide it forward until it sits into the locking lever (2).

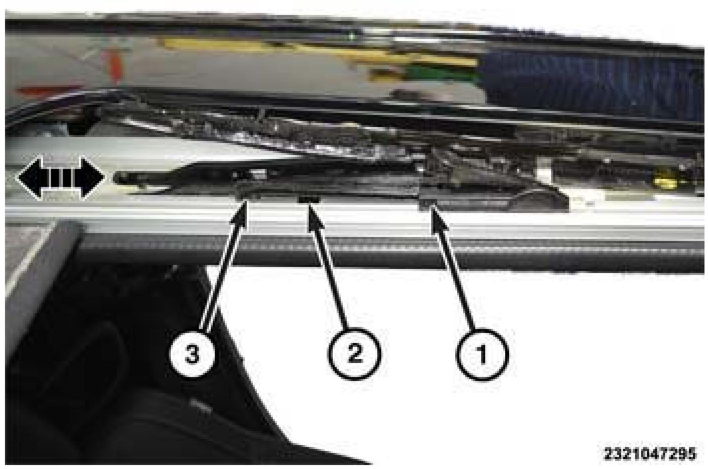

Fig. 396: Glass Guide/Guide Carriage Assembly, Notch & Locking Tab
Courtesy of CHRYSLER GROUP, LLC

2. Slide the glass guide/guide carriage assembly (1) forward until the locking tab (3) it fully engaged into the notch (2).

NOTE: **The guide carriage assembly should move together with the glass guide. If the guide carriage assembly does not move with the glass guide, repeat the alignment procedure in step 1.**

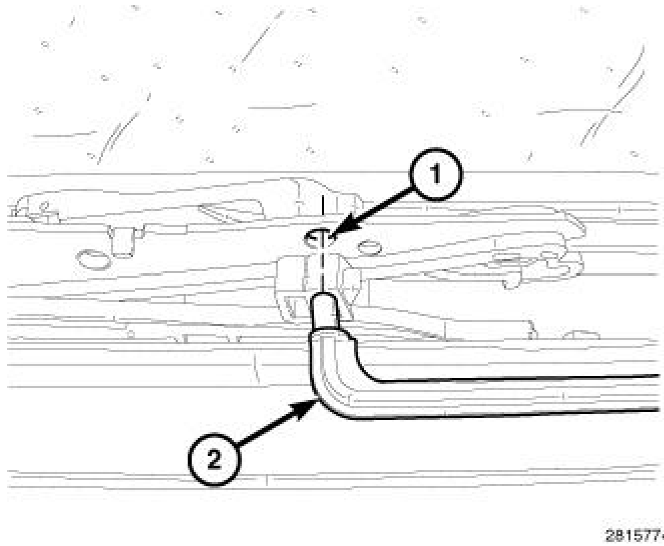

Fig. 397: Installing Drain Channel Arms Into Mechanism Holes
Courtesy of CHRYSLER GROUP, LLC

3. Install the drain channel arms (2) into the mechanism holes (1) one at a time.

CAUTION: Do not push the guide arms at the same time or you could break the guide mechanism. Do not use excessive force to install.

4. Connect the negative battery cable and turn the key to the accessory run position.
5. Cycle the mechanism through all the functions to verify proper operation.
6. Install the sunroof glass. Refer to **GLASS, SUNROOF, INSTALLATION**.

MOTOR, SUNROOF

DESCRIPTION

DESCRIPTION

For service information. Refer to **DESCRIPTION** .

SUNSHADE, SUNROOF

REMOVAL

REMOVAL

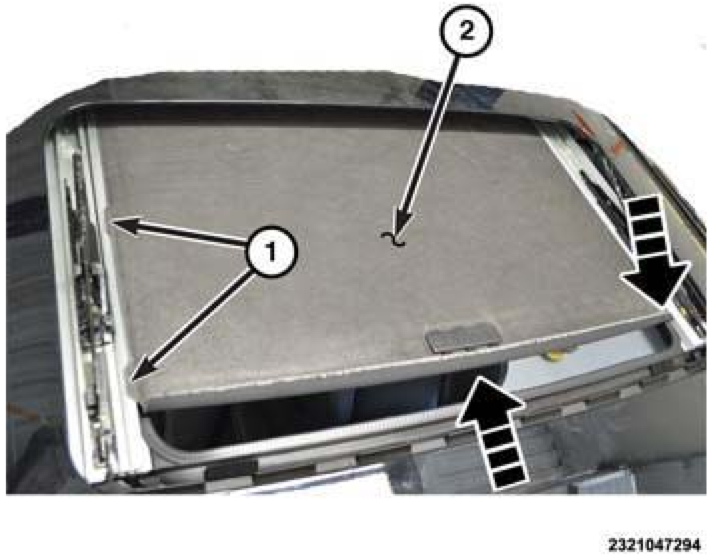

Fig. 398: Sunshade & Sunshade Feet
Courtesy of CHRYSLER GROUP, LLC

1. Remove the sunroof drain channel. Refer to **CHANNEL, SUNROOF DRAIN, REMOVAL**.
2. Cycle the sunroof motor to the vent position.
3. Move the sunshade (2) towards the closed position stopping three to four inches from the closed position.
4. Push up the front center of the sunshade (2) and push down on one side to pop out the two feet (1) on one side.

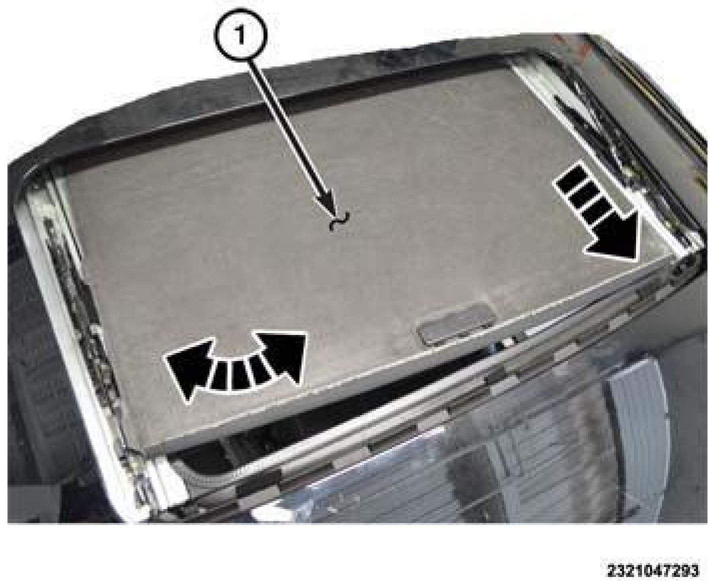

Fig. 399: Sunshade
Courtesy of CHRYSLER GROUP, LLC

5. Lift and rotate the sunshade (1) to remove it from the guide track.

INSTALLATION

INSTALLATION

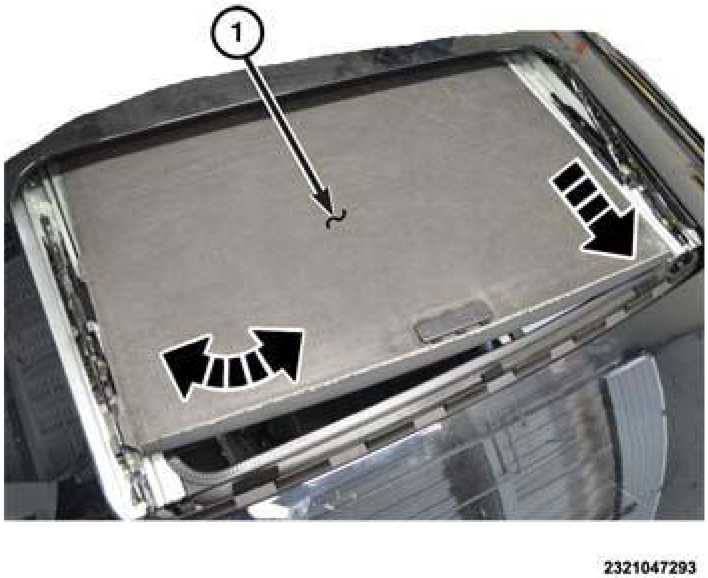

Fig. 400: Sunshade
Courtesy of CHRYSLER GROUP, LLC

1. Rotate the sunshade (1) into the guide track so that only the front two feet on one side are not installed fully.

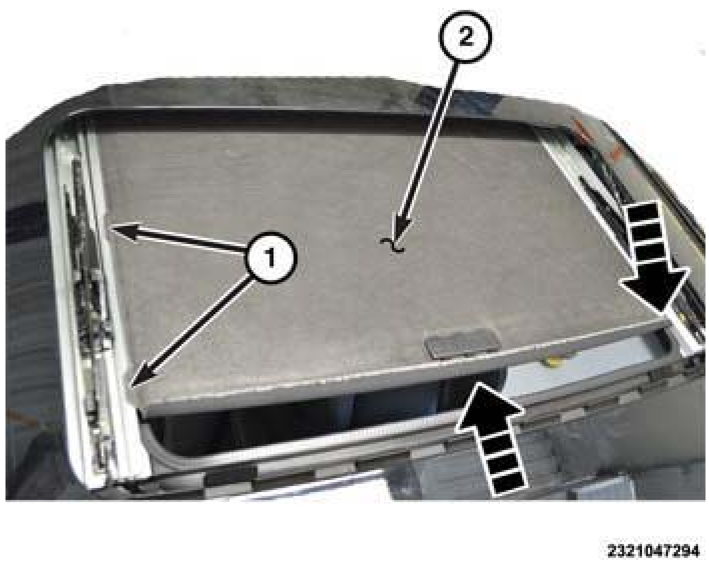

Fig. 401: Sunshade & Sunshade Feet
Courtesy of CHRYSLER GROUP, LLC

2. Arc the sunshade (2) in the middle to allow the feet on the opposite side (1) to go into the track.
3. Verify that the sunshade moves open and closed properly.
4. Install the sunroof drain channel. Refer to **CHANNEL, SUNROOF DRAIN, INSTALLATION**.

SWITCH, SUNROOF

DESCRIPTION

DESCRIPTION

For service information. Refer to **SWITCH, SUNROOF, DESCRIPTION** .

TUBE, SUNROOF DRAIN

REMOVAL

REMOVAL

FRONT DRAIN TUBE

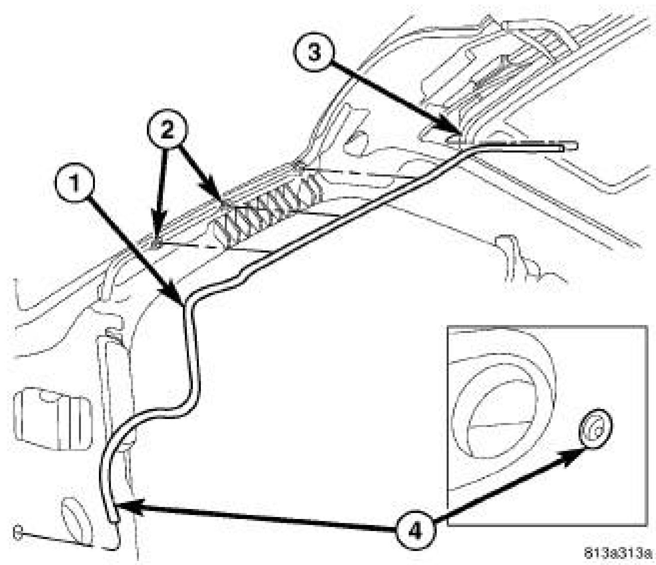

Fig. 402: Sunroof Drain Front Tube & Clips
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The front drain tube is a two-piece assembly consisting of an upper tube and lower tube.**

The upper tube can be serviced without removing the instrument panel.

1. Lower the headliner. Refer to **HEADLINER, REMOVAL**.
2. Disconnect the front drain tube (1) from the sunroof (3).
3. Remove the front drain tube from the retaining clips (2).
4. Separate the upper tube from the lower tube and remove.
5. If it is necessary to remove the lower tube, remove the instrument panel. Refer to **PANEL, INSTRUMENT, REMOVAL**.
6. Separate the grommet (4) from the body and remove the lower tube.

REAR DRAIN TUBE

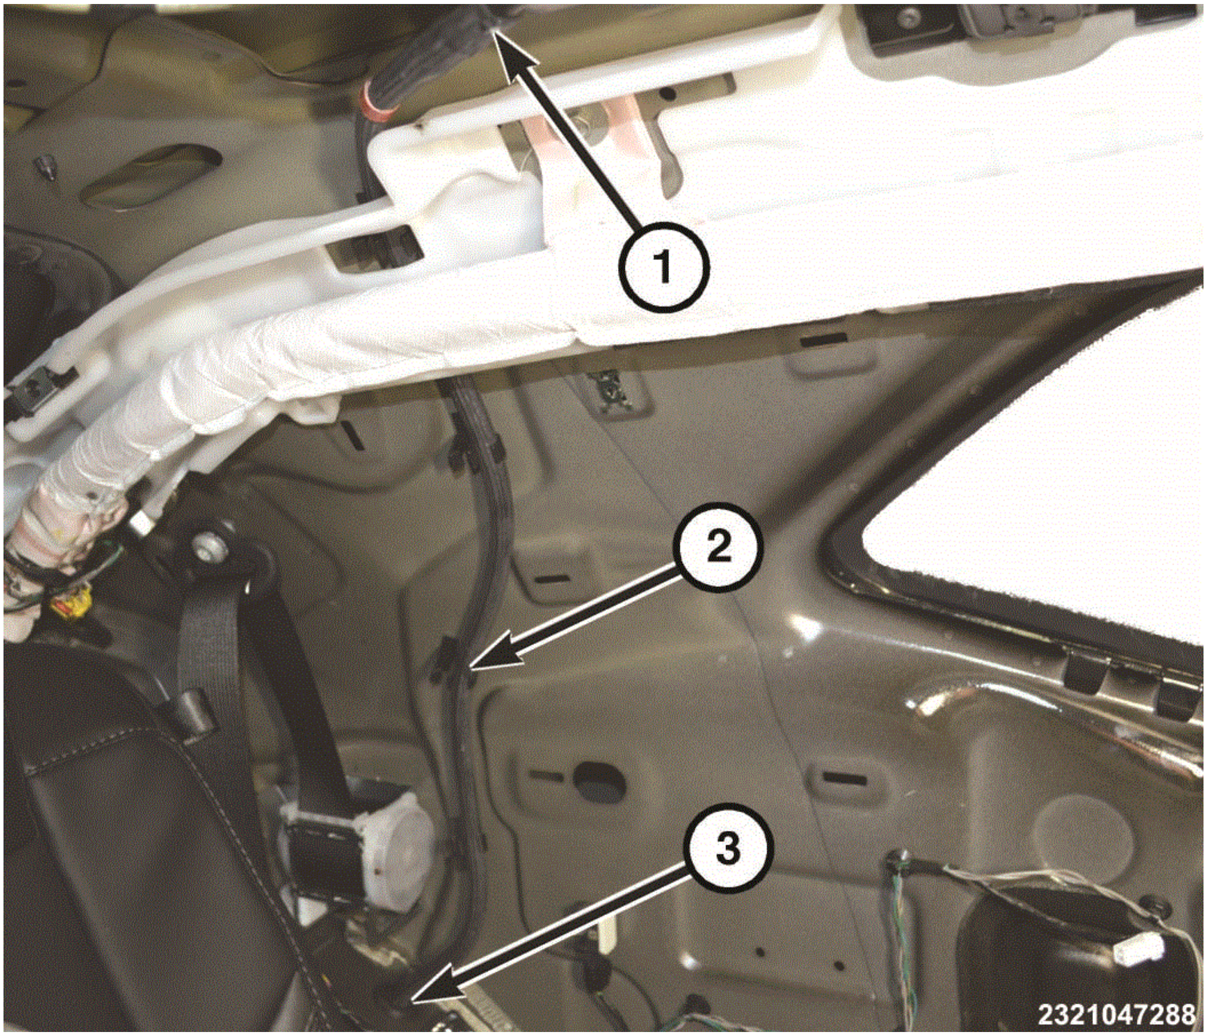

Fig. 403: Sunroof, Retaining Clips & Drain Tube Grommet
Courtesy of CHRYSLER GROUP, LLC

1. Lower the headliner in vehicle. Refer to **HEADLINER, REMOVAL**.
2. Remove the drain tube grommet (3) out of the rear quarter panel.
3. Disconnect the rear drain tube from the sunroof (1).
4. Remove the rear drain tube from the retaining clips (2) and remove.

INSTALLATION

INSTALLATION

FRONT DRAIN TUBE

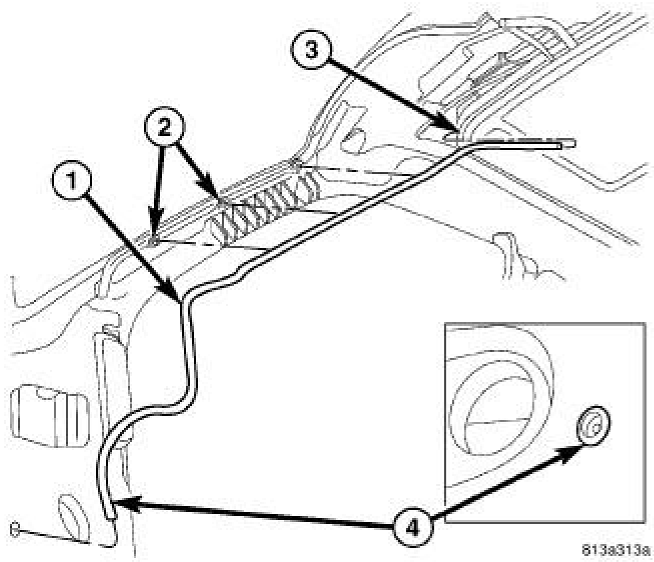

Fig. 404: Sunroof Drain Front Tube & Clips
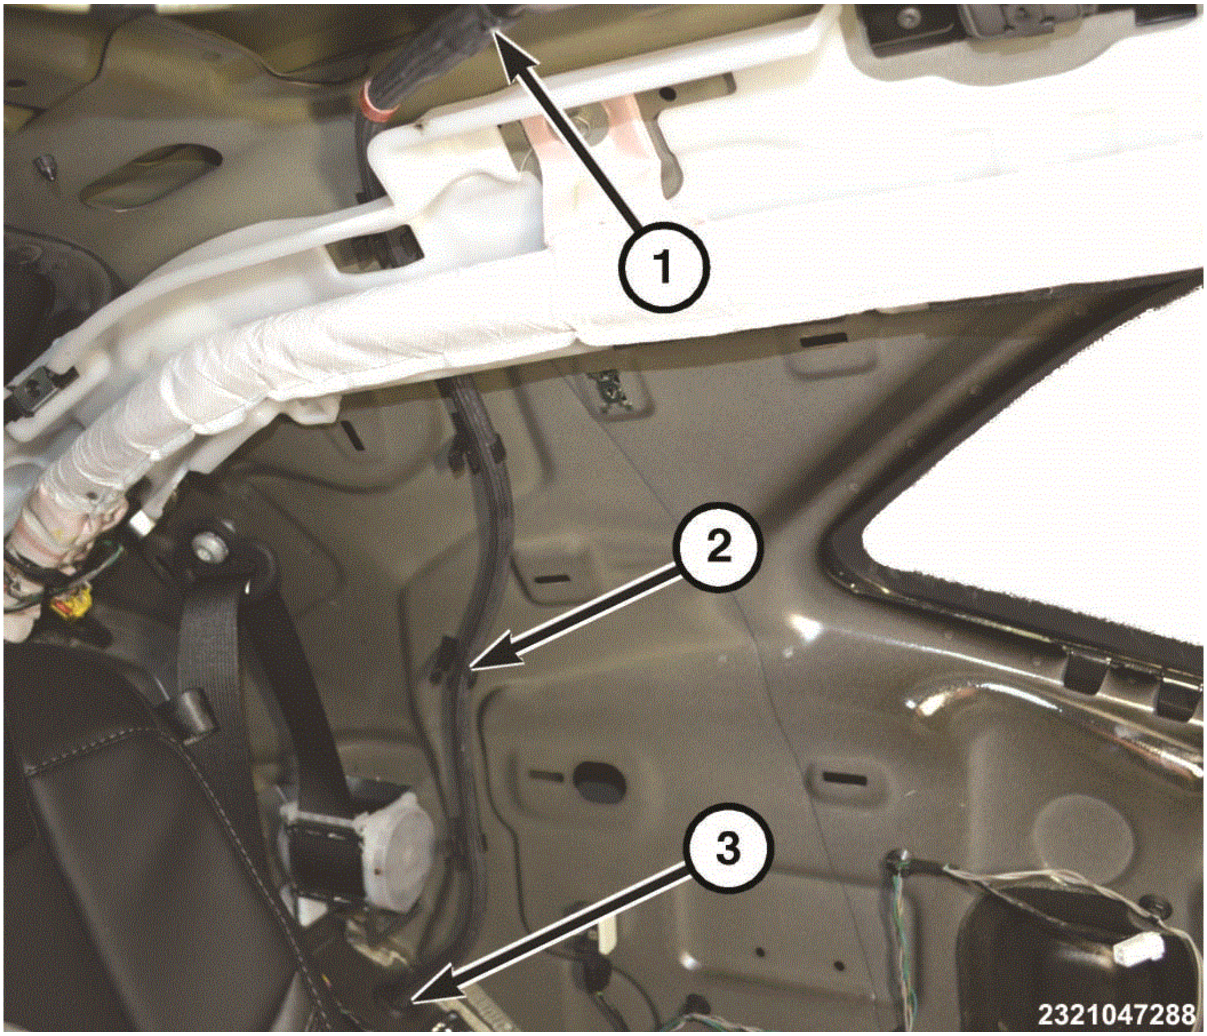
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The front drain tube is a two-piece assembly consisting of an upper tube and lower tube.**

The upper tube can be serviced without removing the instrument panel.

1. Route the front drain tube (1) and install the grommet (4) into the body. Make sure the grommet is fully seated.
2. Connect the front drain tube to the sunroof.
3. Install the front drain tube into the retaining clips (2).
4. Install the instrument panel, if necessary. Refer to **PANEL, INSTRUMENT, INSTALLATION**.
5. Install the headliner. Refer to **HEADLINER, INSTALLATION**.

REAR DRAIN TUBE



[Fig. 405: Sunroof, Retaining Clips & Drain Tube Grommet]
Courtesy of CHRYSLER GROUP, LLC

1. Route the rear drain tube and install the grommet (3) into the body. Make sure the grommet is fully seated.
2. Connect the rear drain tube to the sunroof (1).
3. Install the rear drain tube into the retaining clips (2).
4. Install the headliner. Refer to **HEADLINER, INSTALLATION**.

Article GUID: A00735855

WARNING

WARNING

WARNING: To avoid serious or fatal injury, eye protection should be used when servicing any glass components.

WARNING: To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.

CAUTION: Do not contaminate the glass of halogen bulbs with fingerprints or allow contact with other possibly oily surfaces. Reduced bulb life will result.

CAUTION: Do not use bulbs with higher candle power than indicated in the Bulb Application table. In addition, do not use fuses, circuit breakers or relays having greater amperage value than indicated on the fuse panel or in the Owner's Manual. Damage to lamps, lenses, wiring and other related electrical components can result.

DESCRIPTION

DESCRIPTION

The exterior lighting system for this model includes the following exterior lamp units:

- **Center High Mounted Stop Lamp** - A Light-Emitting Diode (LED) Center High Mounted Stop Lamp (CHMSL) is centered near the top of the vertical surface of the deck lid at the rear of the vehicle.
- **Front Fog Lamps** - Vehicles equipped with this option have a front fog lamp unit mounted near each outboard end of the front fascia, below the front lamp units.

- **Front Lamp Units** - Standard equipment includes a bi-functional, single filament halogen front lamp unit. A bi-functional High Intensity Discharge (HID) front lamp unit is optional. The front lamp units are mounted at the front of each front fender panel at the outboard side of the grille opening.
- **License Plate Lamp** - A LED rear license plate lamp is mounted to the rear fascia, just above the license plate tub formation.
- **Rear Lamp Units** - An outboard rear lamp unit incorporating multiple LED units to serve tail, stop and turn signal functions is mounted to the rear of each quarter panel on either side of the deck lid opening. A center rear lamp unit incorporates multiple LED units to serve as an auxiliary tail lamp and backup (reverse) lamps.
- **Side Marker Lamp Units** - Side marker lamp units are mounted to the outboard end of both the front and rear fascia. All four marker lamps are LED units.

These exterior lighting lamps and their controls are combined to provide the following exterior lighting features:

- **Automatic Headlamps** - Automatic headlamps are standard equipment on this vehicle. The headlamp switch includes an **A** (Automatic) position and an automatic headlamp sensor senses ambient light levels. The automatic headlamp sensor is integral to the sun load sensor located on the top of the instrument panel. When the **A** position of the headlamp switch is selected, the headlamps are turned ON and OFF automatically as ambient light levels dictate. On EXPORT vehicles, the Sun Sensor is not used in this function. The Light Rain Sense Module is responsible for light level acquisition.
- **Backup Lamps** - The backup (or reverse) lamps include multiple LED unit, reflector and clear lens that are integral to rear center lamp unit.
- **Brake Lamps** - The brake (or stop) lamps include multiple LED units, a reflector and a red lens that are integral to each rear lamp unit, and the red lens and multiple LED units of the CHMSL.
- **Daytime Running Lamps / Turn Signal** - A 15 amber LED unit light pipe integral to each front lamp unit is illuminated when appropriate to serve as both the Daytime Running Lamps (DRL) and the turn signals. Hazard Warning flashes these LEDs. The DRL is preset to Off (except Canada) and can be enabled through the Electronic Vehicle Information Center (EVIC).
- **Park / Signature Lamps** - Two light pipes with a total of four white LEDS comprise the Signature / Park lamp integral to each front lamp unit and the rear tail lamps include the multiple LED units, a reflector and a red lens integral to combination rear lamp units. The LED array is at high intensity mode in Signature mode and low intensity in Park mode.
- **Exterior Lamp Fail-Safe Operation** - The Instrument Cluster (IC) and the Body Control Module (BCM) (also known as the Common Body Controller/CBC) provide a fail-safe feature which will automatically turn ON the low beam headlamps and all park lamps when the ignition switch is in the ON position and there is no detected input from either the headlamp switch or the multi-function switch, no communication from the Steering Column Control Module (SCCM) or Steering Angle Sensor (SAS) or when the Controller Area Network (CAN) data bus is inoperative.
- **Exterior Lamp Load Shedding** - The BCM provides a battery saver feature which will automatically turn OFF all exterior lamps that remain ON with the ignition switch in the LOCK position after a timed interval of about eight minutes.
- **Front Fog Lamps** - The optional front fog lamps include the bulb, reflector and projector lens of each adjustable front fog lamp unit.
- **Hazard Warning Lamps** - The hazard warning lamps include the Light Emitting Diode (LED) units and

lenses of each lamp in the right and left, front and rear turn signal circuits.

- **Headlamp Delay** - When this feature is enabled the low or high beam headlamps remain illuminated for a programmable delay interval of 0 (disabled), 30, 60 or 90 seconds after the ignition switch has been turned to the OFF position. This feature is customer programmable using the U-Connect Touch™ screen module in the Integrated Center Stack (ICS).
- **Headlamps** - Two headlamp systems are available on this vehicle for domestic markets. The standard halogen headlamp system includes a bi-functional single filament halogen bulb in each front lamp unit for low or high beam headlamps. The optional HID headlamp system includes a bi-functional single HID lighting element/igniter unit for low or high beam headlamps. In either halogen or HID form, an electric solenoid motor and mechanism internal to the front lamp unit closes a shutter for low beams and opens the shutter for high beams. HID headlamps are standard equipment for all vehicles manufactured for export markets. The HID front lamp units each include an electronic ballast module. Both headlamp systems also include an adjustable projector and clear lens integral to each front lamp unit.
- **Headlamps With Wipers** - When this feature is enabled and the **AUTO** position of the headlamp switch is selected, the headlamps are turned ON automatically whenever the windshield wipers are turned ON; and, if the headlamps were turned ON automatically when the wipers were turned ON and the appropriate ambient light conditions exist, they will also turn OFF automatically when the wipers are turned OFF. This feature is customer programmable using the U-Connect Touch™ screen module in the Integrated Center Stack (ICS).
- **Optical Horn** - Also known as flash-to-pass, the beam selection function of the multi-function switch control stalk has a momentary intermediate position that allows the headlamp high beams to be flashed momentarily, without changing the headlamp beam selection.
- **Turn Signal Lamps** - The LED front turn signal is included in the front lamp unit common with the daytime running lamps. The LED rear turn signals are common with the brake lamps located in the combination LED tail lamp.

Other components of the exterior lighting system for this vehicle include:

- **Backup Lamp Switch** - A Transmission Range Sensor (TRS) integral to the solenoid pack on the valve body of the electronic automatic transmission performs the backup lamp switch function for this vehicle.
- **Body Control Module** - The BCM is located beneath the instrument panel on the passenger side of the vehicle. Refer to MODULE, BODY CONTROL, DESCRIPTION .
- **Brake Lamp Switch** - A lever-actuated brake pedal position sensor serves as the brake lamp switch in this vehicle. The brake pedal position sensor is located on the brake pedal support bracket under the instrument panel and is actuated by a pin on the brake pedal arm when the brake pedal is depressed.
- **Antilock Brake System Module** - A Anti-lock Brake System (ABS) module is located in the engine compartment below the brake master cylinder. Refer to MODULE, ANTI-LOCK BRAKE SYSTEM, DESCRIPTION .
- **Electronic Ballast Module** - Vehicles equipped with the HID headlamps have an electronic ballast module secured to the side of each front lamp unit. Each module controls the HID lighting element/igniter within the front lamp unit to which it is mounted.
- **Hazard Switch** - A latching push button-actuated hazard switch is integral to the instrument panel switch bank in the lower vehicle feature controls module (also known as the Integrated Center Stack/ICS) located in the center stack area of the instrument panel.
- **Headlamp Switch** - A rotary knob-actuated headlamp switch is located in the headlamp switch bezel of

the instrument panel. The headlamp switch is used to select the park lamps, headlamps or fog lamps.

- **Instrument Cluster** - The IC is located in the instrument panel above the steering column opening, directly in front of the driver. Refer to **DESCRIPTION** .
- **Instrument Panel Switch Bank** - The instrument panel switch bank contains the hazard switch. The switch bank is located in the lower vehicle feature controls module (also known as the Integrated Center Stack/ICS) located in the center stack area of the instrument panel.
- **Multi-Function Switch** - The multi-function switch is located on the steering column, just below the steering wheel. A control stalk that extends from the left side of the switch is used to select the turn signal lamps (right or left) and to select the headlamp beam (low, high or optical horn).
- **Steering Column Control Module** - The Steering Column Control Module (SCCM) microcontroller is located within the SCCM on the top of the steering column, just below the steering wheel.
- **Turn Signal Cancel Cam** - The turn signal cancel cam is integral to the clockspring. The turn signal cancel cam provides automatic turn signal cancellation as the steering wheel is rotated back to its centered position following a vehicle turning maneuver.

Hard wired circuitry connects the exterior lighting system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the exterior lighting components through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

Following are paragraphs that briefly describe the operation of each of the major exterior lighting systems. The lamps and the hard wired circuits between components related to the exterior lighting system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, details of wire harness routing, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the exterior lighting system or the electronic controls or communication between modules and other devices that provide some features of the exterior lighting system. The most reliable, efficient and accurate means to diagnose the exterior lighting system or the electronic controls and communication related to exterior lighting system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

AUTOMATIC HEADLAMP

The two optional automatic headlamp systems can include the headlamp switch, the Body Control Module (BCM), the HVAC module. The auto headlamp system has two available sensors that give the BCM feedback for lamp control. The light rain sensor and the twilight sensor on the top of the instrument panel are the two available sensors.

If the vehicle is not equipped with a light rain sensor, the twilight sensor provides the ambient light level input

to the HVAC module whenever the ignition switch status is ON. The HVAC module responds to this input by sending the appropriate electronic **light level** messages to the BCM over the Controller Area Network (CAN) data bus. When the **AUTO** (Automatic) position is selected with the headlamp switch, the BCM receives a hard wired multiplex input from the headlamp switch. The BCM also receives electronic messages over the CAN data bus from the Powertrain Control Module (PCM) (also known as the Engine Control Module/ECM) indicating the engine is running. **The twilight sensor is only used for auto headlamp operation when the vehicle is not equipped with an optional light rain sensor.** If the vehicle is equipped with a light rain sensor, the light rain sensor communicates to the BCM via LIN bus. The BCM responds to either input condition by automatically controlling a Pulse-Width Modulated (PWM) voltage output to the selected headlamp bulb filaments through the right and left low or high beam driver circuits to illuminate the headlamps. The BCM also remembers which beams (low or high) were selected when the headlamps were last turned OFF, and energizes those beams and lamps again the next time it turns the headlamps ON.

BRAKE LAMPS

Each combined brake lamp / rear turn signal LED unit and the Center High Mounted Stop Lamp (CHMSL) have a path to ground at all times through a takeout and eyelet terminal of the body wire harness that is secured by a ground screw to the body sheet metal within the passenger compartment. The Antilock Brake System (ABS) module monitors a hard wired input from the brake pedal position sensor, which is actuated by movement of the brake pedal arm. When the ABS module receives an input from the brake pedal position sensor indicating movement of the brake pedal arm, it responds by sending the appropriate electronic **brake lamp switch** status message to the BCM over the CAN data bus. The BCM then controls brake lamp and CHMSL illumination through High Side Drivers (HSD) on the left and right brake lamp control circuits. When the turn signals are active, the signal takes precedence over the brake lamp.

DAYTIME RUNNING LAMPS

Vehicles equipped with this option or manufactured for sale in Canada illuminate multiple Light-Emitting Diode (LED) units in both front lamp units when the engine is running, the parking brake is released and the exterior lamps are turned OFF. The BCM must be programmed appropriately for this feature to be enabled. Once enabled, anytime the Body Control Module (BCM) receives electronic messages over the CAN data bus from the Powertrain Control Module (PCM) indicating the engine is running, a hard wired multiplex input from the headlamp switch indicating the status of the headlamp switch is OFF and a hard wired input from the park brake switch indicating that the parking brake is released, the BCM provides an output to the appropriate LED units to produce illumination. If a turn signal is activated while the DRL units are active, the DRL for the same side of the vehicle as the indicated turn is extinguished until the turn signal is cancelled to permit clear signal visibility. Hazard Warning flashes these LED units.

FRONT FOG LAMPS

Vehicles equipped with optional front fog lamps include a front fog lamp switch integral to the headlamp switch on the instrument panel. The front fog lamps have a path to ground at all times through their connection to the Front End Module (FEM) wire harness and a takeout with an eyelet terminal that is secured to the body sheet metal.

Fog Lamp Activation

- The headlamp switch needs to be in either park lamps or low beams before activating the front fog lamps.
- The headlamp switch is a momentary switch that sends an analog command to the BCM indicating that

the fog lamps are selected, The BCM controls front fog lamp operation by providing a battery voltage output to the fog lamps through the right and left front fog lamp control circuits.

- The BCM also sends the appropriate electronic front fog lamp status messages to the Instrument Cluster (IC) to illuminate or extinguish the front fog lamp indicator.

Fog Lamp Dropout with High Beam Activation - If the front fog lamps are active and the vehicle's high beams turn ON, then the front fog lamp outputs will turn OFF and the IC indicator will also turn off and remain off until the high beams are turned OFF. If vehicle high beams are active and the front fog lamp command is operated, the IC indicator will remain OFF. The BCM will keep track of a fog lamp request and honor the request when the high beams are turned OFF.

Battery Saver - The BCM also provides a battery saver (load shedding) feature for the front fog lamps, which will turn these lamps OFF if they are left ON for more than about eight minutes when the status of the ignition switch is LOCK, if there is a charging system failure or if the electrical system voltage falls below about 11.75 volts for more than about 30 seconds.

HAZARD WARNING LAMPS

The hazard warning system includes the IC, the BCM and the hazard switch in the instrument panel switch bank of the Integrated Center Stack (ICS) module located in the center stack area of the instrument panel. The hazard switch provides a hard wired input to the BCM. When the BCM receives an input from the hazard switch, it controls hazard warning system operation and flash rate by controlling battery voltage outputs through high side drivers on the front and rear, right and left turn signal control circuits.

The BCM also sends the appropriate electronic messages to the IC over the CAN data bus to control the illumination and flash rate of the right and left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the IC electronic circuit board that emulates the sound emitted by a conventional electromechanical hazard warning flasher.

HEADLAMPS

The headlamp system includes the Instrument Panel Cluster (IPC), the Steering Column Control Module (SCCM), the Body Control Module (BCM), the headlamp switch and the multi-function switch on the steering column. The headlamp bulbs have a path to ground at all times through their connection to the FEM wire harness. The FEM harness has takeouts with eyelet terminals that are secured to the front end sheet metal within the engine compartment. The BCM will store a Diagnostic Trouble Code (DTC) for any shorts or opens in the headlamp circuits.

The BCM monitors a hard wired multiplex input to determine the status of the headlamp switch. The BCM also monitors electronic headlamp beam select switch status messages received from the SCCM over the CAN data bus. The BCM responds to these inputs by providing a pulse width modulated voltage output to the headlamp through high side drivers on the right and left headlamp feed circuits to illuminate the headlamps, and controls the high and low beam shutter operation through high side drivers on the right and left high beam feed circuits. The BCM also sends the appropriate electronic headlamp beam status messages to the IPC to control the illumination of the high beam indicator.

The BCM also remembers which beams (LOW or HIGH) were selected when the headlamps were last turned OFF, and energizes those beams again the next time the headlamps are turned ON. The BCM provides a battery saver (load shedding) feature for the headlamps, which will turn these lamps OFF if they are left ON for more

than about eight minutes when the ignition switch status is LOCK. The SCCM and the BCM each provide a fail-safe feature for the headlamps, which will cause the BCM to turn the low beam headlamps ON automatically if there is no input available from the headlamp switch or the multi-function switch. The BCM also provides a fail-safe feature for the headlamps that will turn the headlamps ON automatically whenever a loss of CAN bus communication is detected when the ignition switch status is ON.

Each headlamp includes an integral reflector adjustment screw to be used for static aiming of the headlamps.

HEADLAMP TIME DELAY

The headlamp time delay feature includes the headlamp switch and the BCM. This feature is customer programmable using the Electronic Vehicle Information Center (EVIC) switches and the U-Connect Touch™ screen module in the Integrated Center Stack (ICS). If the headlamp switch is in the **AUTO** (Automatic) position when the ignition switch is moved from the ON position to any position except ON, then the headlamps will remain illuminated until after the selected delay interval has elapsed. The park lamps will not stay ON during the headlamp time delay interval. The default delay interval is 90 seconds, but can be reprogrammed by the customer using through the Uconnect™ options menu.

PARK LAMPS

The park lamps system includes the headlamp switch on the instrument panel and the BCM. The LED front park lamp and LED unit marker lamps each have a path to ground at all times through their connection to the headlamp and dash wire harness. The headlamp and dash wire harness has takeouts with eyelet terminals that are secured to the body sheet metal. The LED rear park/tail lamp and side marker LED units and the license plate lamp bulbs each have a path to ground at all times through a takeout and eyelet terminal of the body wire harness that is secured by a ground screw to the body sheet metal.

The BCM monitors a hard wired multiplex input from the headlamp switch. The BCM responds to this input by controlling a battery voltage output to the appropriate lamps through high side drivers on the front and rear, right and left lamp driver and control circuits.

The BCM provides a battery saver (load shedding) feature for the park lamps, which will turn these lamps OFF if they are left ON for more than about eight minutes with the ignition switch in the LOCK position. The BCM also provides a fail-safe feature for the park lamps, which will turn the park lamps and low beam headlamps ON automatically if there is no input available from the headlamp switch. The BCM also provides a fail-safe feature for the park lamps that will turn the park lamps and low beam headlamps ON automatically whenever a loss of CAN bus communication is detected with the ignition switch in the ON position.

REVERSE LAMPS

Automatic Transmission - The Body Control Module monitors the CAN C bus PRNDL status signal. Once this signal indicates that the reverse gear is active, the BCM activates the reverse LED lamps by providing a battery voltage output to the reverse lamps on the reverse lamp control output circuit.

Manual Transmission - The BCM monitors the manual transmission reverse switch. When the reverse switch outputs an active signal, the BCM activates the reverse lamps by providing a battery voltage output to the reverse LED lamps on the reverse lamp control output circuit.

SMARTBEAMĀ® SYSTEM

The optional SmartBeamĀ® (auto high beam) system includes the SmartBeamĀ® module with digital imager

camera and electronic circuitry integral to the electrochromic inside rear view mirror, the Steering Column Control Module (SCCM), the Body Control Module (BCM), the Instrument Cluster (IC), the headlamp switch and the multi-function switch. First, the **Auto High Beams** option must be enabled through the radio. Then the **AUTO** (Automatic) position must be selected using the rotary knob of the headlamp switch, the headlamp beam selector switch must be in the high beam position and the appropriate ambient light conditions must be present. Finally, the vehicle speed must be greater than 32 kph (20 mph).

Once all of these prerequisites have been met, the SmartBeamÂ® camera and its circuitry within the electrochromic mirror automatically sends the appropriate electronic **headlamp beam select switch status** messages to the BCM over the Local Interface Network (LIN) data bus. The BCM then responds to these messages by providing an output to the headlamp bulbs or the lighting elements through the right and left low and high beam feed circuits to illuminate the headlamps. The BCM also sends the appropriate electronic messages back to the IC to control the illumination of the high beam indicator.

The SCCM continues to monitor the multi-function switch, and will send the appropriate electronic messages to the BCM, which relays these messages to the SmartBeamÂ® circuitry in the inside rear view mirror to manually invoke the beam select switch momentary optical horn (flash-to-pass) feature or, when a detent switch position is selected to override SmartBeamÂ® operation.

TURN SIGNAL LAMPS

CONTROL MODULE RESPONSIBILITY

- BCM - Turn signal lights request from the Steering Control Module (SCCM), received from the turn signal multi-function switch.
- BCM - Turn signal lights powering (left and right sides).
- BCM - Turn signal light status transmittal over CAN-B.
- BCM - Combined lighting turn/stop and park/turn lamp management.
- IPC - Obtain turn signal lamp status from CAN-B.
- IPC - Turn signal lights signaling management.
- IPC - Turn signal lights fail signaling management.
- SCCM - Turn signal output acquisition from the multi-function switch.
- SCCM - Turn signal activation request to Body Control Module (BCM) over CAN-C.

The left or right direction signals are activated using the left stalk switch input to the SCCM. These commands are codified using a resistive divider, into the analogical command that is read by the SCCM and then sent to the BCM over CAN-C.

The turn signal lamps system includes the multi-function switch on the steering column, the SCCM, the Instrument Panel Cluster (IPC) and the BCM. The front turn signal lamp LED array has a path to ground at all times through their connection to the combination park/turn lamp and dash wire harness. The combination park/turn lamp and dash wire harness has takeouts with eyelet terminals that are secured to the body sheet metal. The rear turn signal lamps are LED elements within the rear outer tail lamp housing.

The SCCM monitors a hard wired multiplex input from the multi-function switch to determine the status of the turn signal switch, then sends the appropriate electronic turn signal switch status messages to the BCM over the CAN data bus. The BCM responds to these messages by controlling a battery voltage output and the flash rate

for either the right or left turn signal lamps through high side drivers on the appropriate front and rear, right or left turn signal control circuits. The BCM also sends the appropriate electronic messages to the IPC to control the illumination and flash rate of the right or left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the IPC electronic circuit board that emulates the sound emitted by a conventional electromechanical turn signal flasher.

The BCM also provides a Turn Signal ON warning that will send a request message to the IPC over the CAN bus that causes the IPC to generate repetitive chimes to indicate that a turn signal has been active continuously for 1.6 kilometers (1 mile) with the vehicle speed greater than 22 kilometers-per-hour (15 miles-per-hour). The chime will continue until the turn signal input becomes inactive or until the vehicle speed message indicates that the speed is less than 22 kilometers-per-hour (15 miles-per-hour), whichever occurs first.

SNA Definition - Signal Not Acquired (SNA). If the SCCM detects an issue (stuck switch, etc) and sets an active fault, the SCCM shall broadcast the SNA state to the BCM. BCM will default to an idle state and keep all turn signal outputs OFF until a valid request is received.

Combined Rear Lighting - Some models will be equipped with combined rear lighting. The stop lamp and the turn signal lamp share the same single bulb filament. When the turn signal is activated, the SCCM recognizes the signal switch request. The SCCM sends this message over the CAN C bus to the BCM for processing. The BCM then actuates the LED array for signal operation only until the stalk is reset back to the neutral position.

Lane Change Function - If either of the turn signals are actuated for a time equal to or less than 500 ms, the BCM will activate the requested turn signal light and will blink for three blinks. At the same time the signals are switched ON, the BCM will also activate the internal signal corresponding with the selected side. The internal signal will show ON for the entire period of the turn signal event and will not show to be blinking. The internal signal is synchronous with the signal activation and will turn OFF at the end of the event. After 3 blink cycles, the BCM switches OFF the turn signals, the CAN-B signals, and the internal signals corresponding to the selected side.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - EXTERIOR LIGHTING

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS). Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

WARNING: **To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of**

burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.

NOTE: **When diagnosing the exterior lighting circuits, remember that high generator output can burn out bulbs rapidly and repeatedly; and, that dim or flickering bulbs can be caused by low generator output or poor battery condition. If one of these symptoms is a problem on the vehicle, be certain to diagnose the battery and charging system, then repair as necessary.**

NOTE: **A good ground is necessary for proper lighting operation. If a lighting problem is being diagnosed that involves multiple symptoms, systems, or components, the problem can often be traced to a loose, corroded, or open ground.**

The lamps and the hard wired circuits between components related to the exterior lighting system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls or communication between modules and other devices that provide some features of the exterior lighting system. The most reliable, efficient, and accurate means to diagnose the exterior lighting system or the electronic controls and communication related to exterior lighting system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

ACRONYMS USED IN THE FOLLOWING SERVICE INFORMATION	
Body Control Module	BCM
Center High-Mounted Stop Lamp	CHMSL
Controller Antilock Brake	CAB
Controller Area Network	CAN
Daytime Running Lamps	DRL
Diagnostic Trouble Code	DTC
Instrument Cluster	IC
Integrated Center Stack	ICS
Light-Emitting Diode	LED
Local Interface Network	LIN
Steering Angle Sensor	SAS
Steering Column Control Module	SCCM
Transmission Range Sensor	TRS

AUTOMATIC HEADLAMPS

NOTE: **Be certain that the headlamps can be turned ON and OFF manually before attempting to diagnose and repair the Automatic Headlamps. If not, diagnose and repair those problems before attempting to repair the Automatic Headlamps.**

NOTE: **The Automatic Headlamp switch is integral to the headlamp switch itself, which communicates with the Body Control Module (BCM) over via data bus. Before performing any of the following tests, determine whether the other functions of the headlamp are operational. If the other functions are ineffective, diagnose and repair that problem before attempting to repair the Automatic Headlamps.**

CONDITION	POSSIBLE CAUSES	CORRECTION
AUTO HEADLAMPS INEFFECTIVE	1. Feature not enabled.	1. Enable **Auto Low** or **Auto Low/High** using the customer programmable features function of the Electronic Vehicle Information Center (EVIC).
	2. Ineffective headlamp switch.	2. Test and replace switch if required.
	3. Ineffective circuits between sun load sensor and air conditioner - heater control.	3. Test and repair sun sensor and sun sensor return circuits if required.
	4. Ineffective sun load sensor (except with automatic wipers). If vehicle is export, then LRSM is 100% in control of light identification and not the Sun Sensor.	4. Test and replace sun load sensor if required. Connect the scan tool and monitor the sensor voltage while covering and uncovering the sensor. A covered sensor voltage should read approximately 4.6V and an uncovered sensor should read approximately 2.3V.
	5. Ineffective Light Rain Sensor Module (LRSM) (with automatic wipers).	5. Use a diagnostic scan tool to test and replace the LRSM if required. Refer to the appropriate diagnostic information.
	6. Ineffective BCM inputs or outputs.	6. Use a diagnostic scan tool to check and configure BCM if required.

BRAKE LAMPS

NOTE: **The rear lamp units and the CHMSL are illuminated by several LED units that are soldered to the electronic circuit boards within the lamp housings. The brake lamps are powered by high side drivers within the BCM based upon an input to the ABS module from the brake pedal position sensor. If all of the LED units within the CHMSL fail to operate, diagnose and repair the brake lamps before attempting to repair the CHMSL. If the brake lamp LED units in the rear lamps operate but none of the CHMSL LED units illuminate, test and repair the CHMSL ground or feed circuit if required. If some of the rear lamp or CHMSL LED units operate and others do not, the outer rear lamp or CHMSL assembly must be replaced with a new unit.**

CONDITION	POSSIBLE CAUSES	CORRECTION
BRAKE LAMP DOES NOT ILLUMINATE	1. Ineffective ground circuit.	1. Use the scan tool to check for fault codes. If fault codes are found, repair as needed and retest. If no fault codes are present, perform the diagnostics steps listed for code **C0042-28-BRAKE PEDAL POSITION SENSOR - SIGNAL BIAS LEVEL OUT OF RANGE / ZERO ADJUSTMENT FAILURE** . Refer to **DIAGNOSIS AND TESTING** .
	2. Ineffective fuse.	
	3. Ineffective feed circuit.	
	4. Ineffective brake pedal position sensor.	
	5. Ineffective ABS module inputs or outputs.	
	6. Ineffective BCM inputs or outputs.	
BRAKE LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Use the scan tool to check for fault codes. If fault codes are found, repair as needed and retest. If no fault codes are present, perform the diagnostics steps listed for code **C0042-2A-BRAKE PEDAL POSITION SENSOR - STUCK. Refer to DIAGNOSIS AND TESTING .**
	2. Ineffective brake pedal position sensor.	
	3. Ineffective ABS module inputs or outputs.	
	4. Ineffective BCM inputs or outputs.	

DAYTIME RUNNING LAMPS

CONDITION	POSSIBLE CAUSES	CORRECTION
DAYTIME RUNNING LAMPS WILL NOT ILLUMINATE	1. DRLs not enabled.	1. Using the EVIC, verify that the DRLs are enabled.
	2. Incorrect BCM configuration.	2. Use a diagnostic scan tool to check and configure BCM if required.
	3. Automatic transmission in PARK position.	3. Place the transmission gear selector lever in any position except PARK.
	4. Parking brake applied.	4. Release the parking brake.
	5. Engine not running.	5. Start the engine.
	6. Ineffective BCM inputs or outputs.	6. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
	7. Ineffective LED units.	7. Replace the front lamp unit if required.

FRONT FOG LAMPS

CONDITION	POSSIBLE CAUSES	CORRECTION
FRONT FOG LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb or ineffective LED lamp unit.	1. Test and replace front fog lamp bulb if required or test and replace the front fog lamp LED lamp unit.
	2. Ineffective ground circuit.	2. Test and repair open front fog lamp ground circuit if required.

CONDITION	POSSIBLE CAUSES	CORRECTION
	3. Ineffective feed circuit.	3. Test and repair open front fog lamp feed circuit if required.
	4. Ineffective switch.	4. Test and replace headlamp switch if required.
	5. Ineffective BCM inputs or outputs.	5. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
FRONT FOG LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted front fog lamp feed circuit if required.
	2. Ineffective switch.	2. Test and replace the headlamp switch if required.
	3. Ineffective BCM inputs or outputs.	3. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

HAZARD WARNING LAMPS

NOTE: **The hazard switch is integral to the instrument panel switch bank, which provides a hard wired output to the BCM. Before performing any of the following tests, confirm whether the left and right turn signals operate satisfactorily. Then determine whether the other functions of the instrument panel switch bank are operational. If the turn signals are ineffective or operate improperly, or if the other instrument panel switch bank functions are ineffective, diagnose and repair those problems before attempting to repair the hazard warning lamps system.**

CONDITION	POSSIBLE CAUSES	CORRECTION
HAZARD WARNING LAMPS DO NOT FLASH	1. Ineffective instrument panel switch bank.	1. Test and replace instrument panel switch bank if required.
	2. Ineffective BCM inputs or outputs.	2. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
HAZARD WARNING LAMPS DO NOT STOP FLASHING	1. Ineffective instrument panel switch bank.	1. Test and replace instrument panel switch bank if required.
	2. Ineffective BCM inputs or outputs.	2. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

HEADLAMPS

NOTE: **As part of the exterior lighting fail safe feature, upon ignition ON all exterior park lamps and the headlamp low beams will illuminate regardless of the headlamp switch control knob position if the IC cannot detect an input from the headlamp switch, or if there is a loss of communication between the multi-function switch/SCCM and the BCM. Diagnose and repair those problems before attempting to repair the headlamps. In addition, the BCM will store a DTC**

for an open or shorted headlamp circuit.

CONDITION	POSSIBLE CAUSES	CORRECTION
HEADLAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb.	1. Test and replace headlamp bulb if required.
	2. Ineffective ground circuit.	2. Test and repair open headlamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open headlamp low beam or high beam feed circuit if required.
	4. Ineffective switch.	4. Test and replace the headlamp switch if required.
	5. Ineffective BCM inputs or outputs.	5. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
HEADLAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted headlamp low beam or high beam feed circuit if required.
	2. Ineffective switch.	2. Test and replace headlamp switch if required.
	3. Ineffective BCM inputs or outputs.	3. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
HEADLAMPS ILLUMINATE WITH IGNITION ON AND HEADLAMP SWITCH OFF (FAIL-SAFE OPERATION)	1. Loss of LIN or CAN data bus communication.	1. Test and repair the LIN or CAN data bus if required. Refer to the appropriate diagnostic information.
HEADLAMPS WILL NOT SWITCH FROM HIGH TO LOW BEAMS, OR FROM LOW TO HIGH BEAMS	1. Ineffective SCCM microcontroller inputs or outputs.	1. Use a diagnostic scan tool and the appropriate diagnostic information for further SCCM microcontroller diagnosis.
	2. Ineffective BCM inputs or outputs.	2. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

PARK LAMPS

NOTE: **As part of the exterior lighting fail-safe feature, upon ignition ON all exterior park lamps and the headlamp low beams will illuminate regardless of the headlamp switch control knob position if the IC cannot detect an input from the headlamp switch, or if there is a loss of communication between the multi-function switch/SCCM and the BCM. Diagnose and repair those problems before attempting to repair the Park Lamps. In addition, the BCM will store a DTC for an open or shorted park lamps circuit.**

CONDITION	POSSIBLE CAUSES	CORRECTION

CONDITION	POSSIBLE CAUSES	CORRECTION
PARK LAMP DOES NOT ILLUMINATE	1. Ineffective LED unit.	1. Test and replace the front lamp unit if required.
	2. Ineffective ground circuit.	2. Test and repair open park lamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open park lamp feed circuit if required.
	4. Ineffective BCM inputs or outputs.	4. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
PARK LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted park lamp feed circuit if required.
	2. Ineffective BCM inputs or outputs.	2. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

REVERSE LAMPS

CONDITION	POSSIBLE CAUSES	CORRECTION
REVERSE LAMP DOES NOT ILLUMINATE	1. Ineffective LED lamp.	1. Test and replace reverse lamp LED assembly if required.
	2. Ineffective ground circuit.	2. Test and repair open reverse lamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open reverse lamp feed circuit if required.
	4. Stuck switch.	4. Remove the switch and check for debris. Clean and retest. Replace the switch if no improvement.
	5. Ineffective switch.	5. Test and replace reverse lamp switch (manual transmission) or TRS (automatic transmission) if required.
	6. Ineffective BCM inputs or outputs.	6. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
REVERSE LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted reverse lamp feed circuit if required.
	2. Stuck switch.	2. Remove the switch and check for debris. Clean and retest. Replace the switch if no improvement.
	3. Ineffective switch.	3. Test and replace reverse lamp switch (manual transmission) or TRS (automatic transmission) if required.
	4. Ineffective BCM inputs or outputs.	4. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

SIGNATURE LAMPS

CONDITION	POSSIBLE CAUSES	CORRECTION
SIGNATURE LAMP DOES NOT ILLUMINATE	1. Ineffective LED unit.	1. Test and replace the front lamp unit if required.
	2. Ineffective ground circuit.	2. Test and repair open lamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open signature lamp feed circuit if required.
	4. Ineffective BCM inputs or outputs.	4. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
SIGNATURE LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair shorted signature lamp feed circuit if required.
	2. Ineffective BCM inputs or outputs.	2. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.

SMARTBEAMĀ®

NOTE: **For SmartBeamĀ® to operate, the Auto High Beam option must be enabled using the customer programmable features function of the radio. Also, the Body Control Module (BCM) must be properly configured for the automatic headlamps option using a diagnostic scan tool. Refer to the appropriate diagnostic information.**

CONDITION	POSSIBLE CAUSES	CORRECTION
SMARTBEAMĀ® INEFFECTIVE AND RED LED ON INSIDE REAR VIEW MIRROR NOT ON	1. Feature not enabled.	1. Enable **Auto Dim High Beams** using the customer programmable features function of the radio.
	2. Automatic headlamps are not turned ON.	2. Turn automatic headlamps ON using the control knob of the headlamp switch.
	3. Headlamp high beams are not selected.	3. Turn high beam headlamps ON using the beam selector function of the multi-function switch control stalk.
	4. Vehicle speed is below 32 kilometers-per-hour (20 miles-per-hour).	4. Increase vehicle speed. SmartBeamĀ® is not designed to operate at speeds below 32 kilometers-per-hour (20 miles-per-hour).
	5. Ineffective ElectroChromic (EC) mirror inputs or outputs.	5. Use a diagnostic scan tool and the appropriate diagnostic information for further EC mirror diagnosis.
	6. Incorrect BCM configuration.	6. Use a diagnostic scan tool to check and correct the BCM configuration settings if required. Refer to the

CONDITION	POSSIBLE CAUSES	CORRECTION
		appropriate diagnostic information.
	7. SmartBeamÃ® imager lens dirty or obstructed.	7. Clean imager lens and windshield or remove obstructions from the windshield glass if required.
	8. Ineffective ground circuit.	8. Test and repair open ground circuit to inside rear view mirror as required.
	9. Ineffective feed circuit.	9. Test and repair open fused run relay output circuit to inside rear view mirror if required.
	10. Loss of CAN data bus or LIN data bus communication.	10. Use a diagnostic scan tool and the appropriate diagnostic information for further CAN data bus or LIN data bus diagnosis.
	11. Internal faults in imager camera or EC mirror circuitry.	11. Use a diagnostic scan tool and the appropriate diagnostic information for further imager camera and EC mirror (AHBM) diagnosis.
SMARTBEAMÃ® INEFFECTIVE AND RED LED ON INSIDE REAR VIEW MIRROR FLASHING CONTINUALLY	1. SmartBeamÃ® calibration lost.	1. Replace the EC mirror.

TURN SIGNAL LAMPS

NOTE: **The turn signal switch is integral to the multi-function switch/Steering Column Control Module (SCCM), which communicates with the Body Control Module (BCM) over the CAN data bus. Before performing any of the following tests, determine whether the other functions of the multi-function switch/SCCM are operational. If the other multi-function switch/SCCM functions are ineffective, diagnose and repair that problem before attempting to repair the Turn Signal Lamps.**

CONDITION	POSSIBLE CAUSES	CORRECTION
ONE TURN SIGNAL LAMP DOES NOT ILLUMINATE	1. Ineffective LED unit.	1. Test and replace front lamp unit or rear tail lamp unit as required.
	2. Ineffective ground circuit.	2. Test and repair open LED circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open right or left turn signal feed circuit if required.
	4. Ineffective BCM inputs or outputs.	4. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
ALL RIGHT SIDE OR ALL LEFT SIDE TURN SIGNAL LAMPS	1. Ineffective feed circuit.	1. Test and repair open right or left turn signal feed circuit if required.

CONDITION	POSSIBLE CAUSES	CORRECTION
(OR BOTH SIDES) DO NOT FLASH	2. Ineffective SCCM inputs or outputs.	2. Use a diagnostic scan tool and the appropriate diagnostic information for further SCCM diagnosis.
	3. Ineffective BCM inputs or outputs.	3. Use a diagnostic scan tool to test the BCM inputs and outputs. Refer to the appropriate diagnostic information.
ALL RIGHT SIDE OR ALL LEFT SIDE TURN SIGNALS FLASH TOO RAPIDLY (MORE THAN 100 FLASHES PER MINUTE)	1. Ineffective LED unit.	1. Test and replace front lamp unit or rear tail lamp unit as required.
	2. Ineffective ground circuit.	2. Test and repair open LED ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair open right or left turn signal feed circuit if required.
TURN SIGNALS DO NOT AUTOMATICALLY CANCEL	1. Ineffective cancel cam.	1. Inspect and replace the turn signal cancel cam (SCCM) if required.
	2. Ineffective cancel actuator.	2. Inspect and replace the turn signal cancel actuator (SCCM) if required.

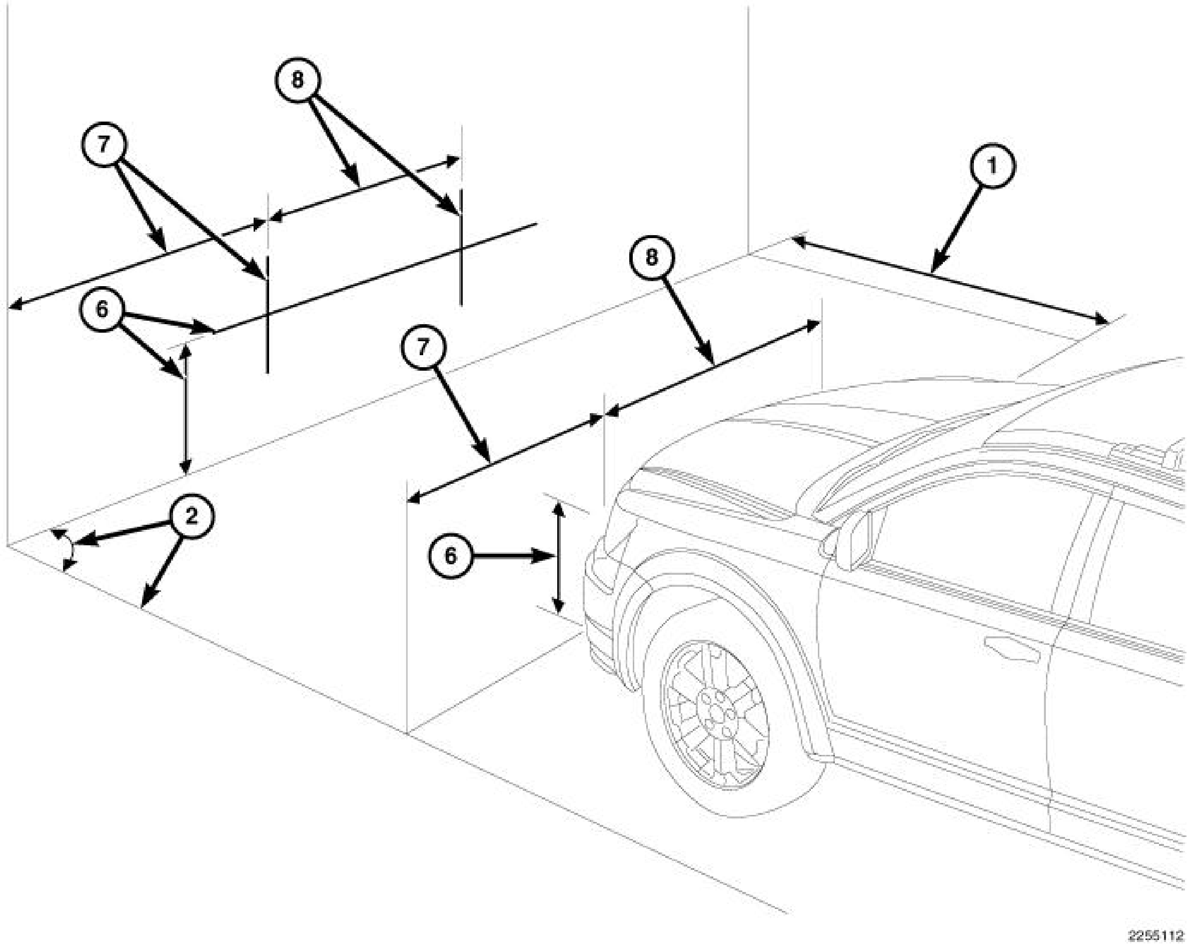
STANDARD PROCEDURE

STANDARD PROCEDURE - FRONT LAMP AIMING

VEHICLE PREPARATION FOR LAMP ALIGNMENT

1. Check for and correct any burnt out bulbs.
2. Repair or replace any faulty, worn or damaged body or suspension components that could hinder proper lamp alignment.
3. Verify proper tire inflation pressures.
4. Remove any accumulations of mud, snow or ice from the vehicle underbody and clean the front lamp lenses.
5. Verify that there is no load in the vehicle (cargo or passengers), except for the driver.
6. The fuel tank should be Full. Add 2.94 kilograms (6.5 pounds) of weight over the fuel tank for each estimated gallon of missing fuel.
7. Verify correct vehicle suspension height.

LAMP ALIGNMENT SCREEN PREPARATION



[**Fig. 1: Lamp Alignment Screen Preparation**]
Courtesy of CHRYSLER GROUP, LLC

The procedure that follows will prepare a suitable front lamp alignment screen.

1. Tape a line on a level floor 7.62 meters (25 feet) away from and parallel to the flat wall that will be used as the lamp alignment screen. The level floor will be used as the horizontal zero reference.
2. An adjacent wall or floor member that is perpendicular to the alignment screen can be used as the vertical zero reference. If there is no adjacent wall or floor member that is perpendicular to the screen, tape a second line on the floor perpendicular to both the alignment screen and the first line, and outboard of either side of where the vehicle will be positioned. This will be used as the vertical zero reference.
3. Position the vehicle so that the side of the vehicle is parallel to the vertical zero reference, and so that the front of the lamp lenses are in the vertical plane of the parallel line taped on the floor 7.62 meters (25 feet) away from the screen.
4. Rock the vehicle side-to-side three times to allow the suspension to stabilize.
5. Jounce the front suspension three times by pushing downward on the front bumper and releasing.
6. There is a small circle mark on the lamp lens indicating the optical center. Measure the distance between the optical center of one of the lamps being aimed (head or fog) and the floor (horizontal zero reference). Transfer this measurement to the alignment screen with a piece of tape placed horizontally to the floor. This line will be used as the lamp horizontal reference.
7. Measure the distance between the vertical zero reference and the optical center of the nearest lamp being

aimed (head or fog). Transfer this measurement to the alignment screen with a piece of tape placed vertically across the appropriate (head or fog) lamp horizontal reference. This is the centerline reference for the first lamp.

8. Measure the distance on center between the first and the second lamp being aimed. Transfer this measurement to the alignment screen with a second piece of tape placed vertically across the appropriate (head or fog) lamp horizontal reference. This is the centerline reference for the second lamp.

HEADLAMP ALIGNMENT

1. Turn the headlamps ON and select the LOW beams for vehicles in all markets.
2. Use a screwdriver to rotate the headlamp vertical adjustment screw.

FOG LAMP ALIGNMENT

Fig. 2: Fog Lamp Adjustment Screw
Courtesy of CHRYSLER GROUP, LLC

The fog lamp adjustment screw (1).

1. Turn the fog lamps ON.
2. Rotate the fog lamp vertical adjustment screw on each lamp to adjust the beam height as required.

BALLAST, HIGH INTENSITY DISCHARGE (HID)

DESCRIPTION

DESCRIPTION

[Fig. 3: Electronic Ballast Module & Screws]
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional High Intensity Discharge (HID) headlamps have an electronic ballast module (1) mounted to the side of each front lamp unit. The electronic circuitry of the module is contained within a die cast aluminum module housing, which is secured by three screws (2) through integral mounting tabs to the molded plastic front lamp unit housing.

The sealed connector receptacle of the module is integral to the side of the housing that mates to the front lamp unit. The connector receptacle contains terminal pins that connect the module to the vehicle electrical system, to the high tension HID cable and to the front lamp unit through dedicated take outs and connectors of the front lamp unit wire harness.

The electronic ballast module cannot be adjusted or repaired and, if damaged or ineffective, it must be replaced.

OPERATION

OPERATION

The electronic ballast module operates on battery current and ground received directly from the Body Control Module (BCM). Each module controls operation of the High Intensity Discharge (HID) igniter and lighting element for the front lamp unit on which it is installed. The BCM monitors a hard wired input from the headlamp switch to determine the proper control outputs to the electronic ballast module, which then provides a controlled voltage to operate the HID lamp igniter as appropriate.

The BCM also monitors electronic message inputs received from the Steering Column Control Module (SCCM) over the Controller Area Network (CAN) Interior High Speed (IHS) data bus based upon multi-function switch inputs and, if the vehicle is so equipped, from the Automatic High Beam Module (AHBM) and the Light/Rain Sensor Module (LRSM) to determine the proper lighting outputs to provide to the ballast module.

When a proper 12 volt Direct Current (DC) control output is received from the BCM, the HID electronic ballast module activates the HID igniter integral to the lighting element through a high-tension cable to provide a high voltage (up to about 800 volts Alternating Current/AC) surge. The igniter further steps up this AC voltage to up to about 25, 000 volts, which creates a light arc between the lighting element electrodes. Once the igniter and

electronic ballast module detect a suitably stable light arc, they switch over to a power-limiting mode to sustain the light arc, which requires only about 85 volts to sustain proper lighting element output.

The hard wired electronic ballast module circuits may be diagnosed using conventional diagnostic tools and procedures. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic ballast module or the electronic controls and communication that provide some features of the HID lamp system. Proper diagnosis of the electronic ballast module, the BCM, the SCCM, the SmartBeamÃ®, the LRSM, the CAN data bus and the electronic communication related to electronic ballast module operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: **To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.**

NOTE: **Before replacing a High Intensity Discharge (HID) ballast due to an inoperative HID lamp, be certain that the HID lamp is receiving power from the Body Control Module (BCM). See the appropriate wiring information.**

Fig. 4: Electronic Ballast Module & Screws
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the front lamp unit from the vehicle. Refer to **UNIT, FRONT LAMP, REMOVAL**.
3. Remove the three screws (2) that secure the electronic ballast module (1) to the side of the front lamp unit housing.

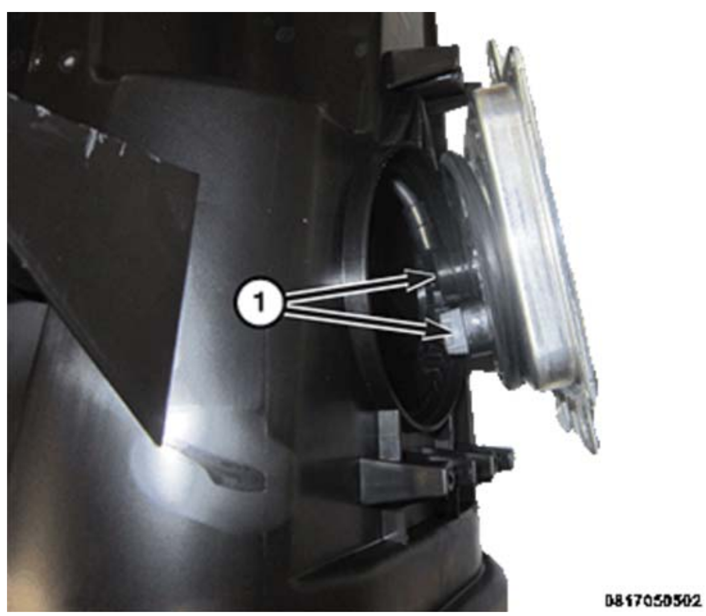

Fig. 5: Ballast Module Wire Harness Connections
Courtesy of CHRYSLER GROUP, LLC

4. Pull the ballast module away from the front lamp unit far enough to access and disconnect the wire harness connections (1) within the front lamp unit.

Fig. 6: Front Lamp Unit Wire Harness Connections
Courtesy of CHRYSLER GROUP, LLC

5. Remove the electronic ballast module from the lamp.

INSTALLATION

INSTALLATION

WARNING: **To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.**

[Fig. 7: Front Lamp Unit Wire Harness Connections](#)

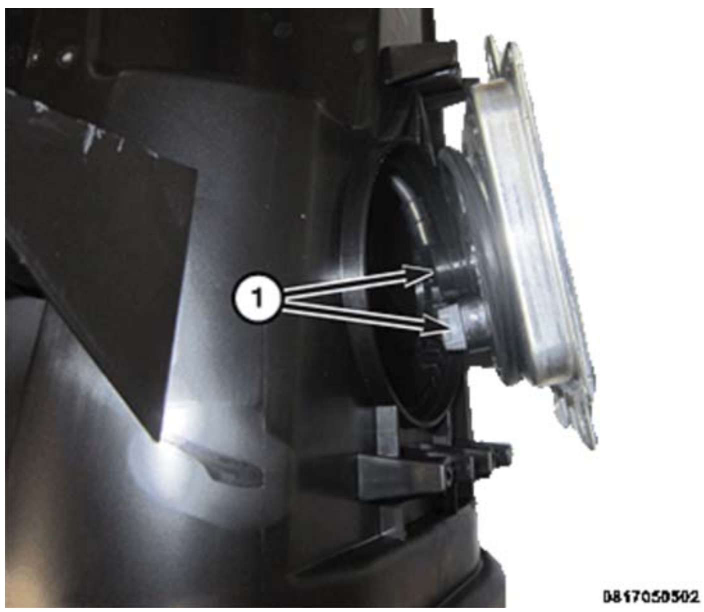
1. Gently pull the harness connectors out from the ballast mounting location on the front lamp unit. Be careful to not pull too hard.



[Fig. 8: Ballast Module Wire Harness Connections](#)
Courtesy of CHRYSLER GROUP, LLC

2. Position the electronic ballast module to the side of the front lamp unit housing.
3. Connect the wire harness connections within the front lamp unit (1) to the module connector receptacles.

Fig. 9: Electronic Ballast Module & Screws
Courtesy of CHRYSLER GROUP, LLC

4. Install and tighten the three screws (2) that secure the module (1) to the housing. Tighten the screws securely.
5. Install the front lamp unit into the vehicle. Refer to **UNIT, FRONT LAMP, INSTALLATION**.
6. Connect the battery negative cable.

CAM, TURN SIGNAL CANCEL

DESCRIPTION

DESCRIPTION

The turn signal cancel cam is concealed within the clockspring integral to the Steering Column Control Module (SCCM) on the steering column. The turn signal cancel cam consists of integral eccentrics on the outer circumference of the molded plastic clockspring rotor. The clockspring mechanism provides turn signal cancellation as well as a constant electrical connection between the rotating electrical components on the steering wheel and the instrument panel wire harness on the steering column. The SCCM and the housing of the clockspring are secured to the steering column and remain stationary. The rotor of the clockspring, including the turn signal cancel cam lobes, rotates with the steering wheel.

The turn signal cancel cam is serviced as a unit with the SCCM and cannot be repaired. If ineffective or damaged, the entire SCCM must be replaced.

OPERATION

OPERATION

When the multi-function switch control stalk is moved to a latched turn signal ON position, a turn signal cancel actuator is extended from the inside surface of the switch housing through a small opening on the left side of the clockspring case toward the turn signal cancel cam. As the steering wheel is rotated to complete the turn, one of the cam eccentrics will contact the actuator, automatically cancelling the turn signal event and releasing the

latched multi-function switch control stalk to the neutral or OFF position.

LAMP, CENTER HIGH MOUNTED STOP

REMOVAL

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Lower the back of the headliner. Refer to HEADLINER, REMOVAL .

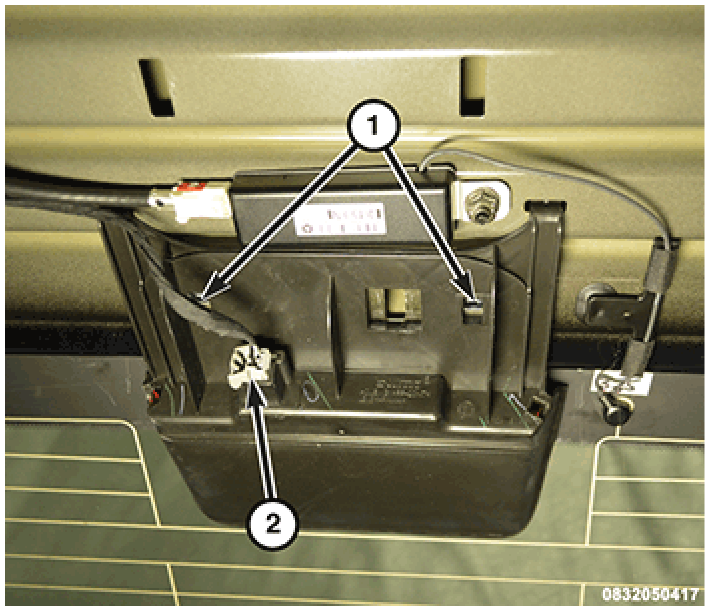


Fig. 10: Wire Harness Connector & Retaining Clips
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the body wire harness connector (2) from the connector receptacle integral to the back of the Center High Mounted Stop Lamp (CHMSL) housing.
4. If the vehicle is so equipped, disconnect the body wire harness connector from the Passive Entry (PE) deck lid release switch pigtail wire connector on the back of the CHMSL housing.
5. If the vehicle is so equipped, disconnect the body wire harness connector from the rear view camera connector receptacle on the back of the CHMSL housing.
6. Pull the CHMSL in a downward motion until the assembly is released from the retaining clips (1).
7. Remove the CHMSL from the vehicle.

INSTALLATION

INSTALLATION

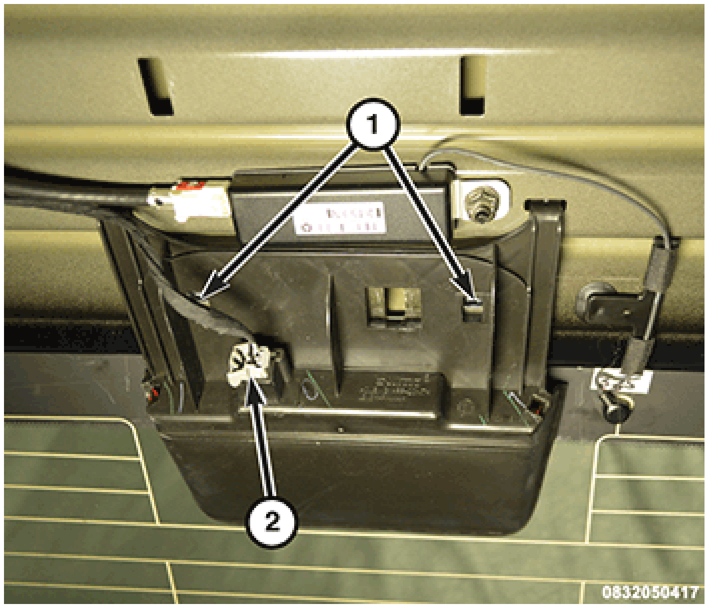

Fig. 11: Wire Harness Connector & Retaining Clips
Courtesy of CHRYSLER GROUP, LLC

1. Insert the two legs of the CHMSL to their roof opening mounting holes.
2. Once the legs are inserted, push the CHMSL into position until the two integral latch tabs (2) snap into place
3. Connect the body wire harness connector (2) to the connector receptacle integral to the back of the CHMSL housing.
4. If the vehicle is so equipped, connect the body wire harness connector to the Passive Entry (PE) deck lid release switch pigtail wire connector on the back of the CHMSL housing.
5. If the vehicle is so equipped, connect the body wire harness connector to the rear view camera connector receptacle on the back of the CHMSL housing.
6. Install the lowered back portion of the headliner. Refer to HEADLINER, INSTALLATION .
7. Connect the battery negative cable.

LAMP, FOG

REMOVAL

BULB

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

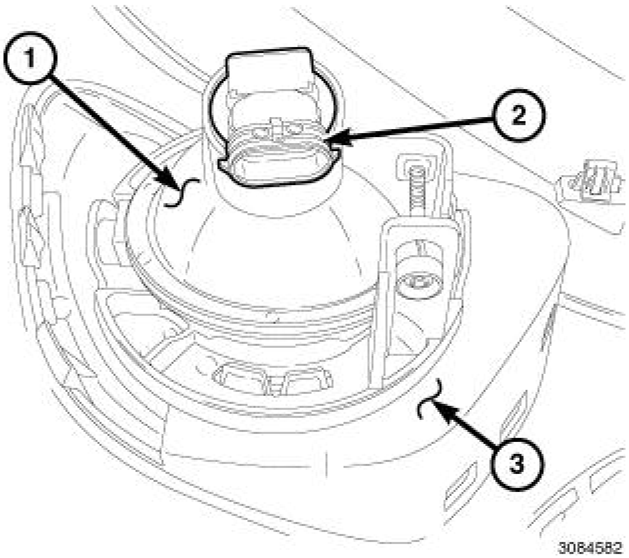

Fig. 12: Front Fascia, Connector Receptacle & Front Fog Lamp Housing
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Raise and support the vehicle.
3. Loosen the front belly pan from the underbody far enough to access the back of the fog lamp on the back of the fascia fog lamp seat (3). Refer to **BELLY PAN, REMOVAL** or **BELLY PAN, ENGINE, REMOVAL** .
4. Reach behind the front fascia to access and disconnect the headlamp and dash wire harness connector from the front fog lamp bulb connector receptacle (2).
5. Firmly grasp the bulb on the back of the front fog lamp housing (1) and rotate it counterclockwise about 30 degrees to unlock it.
6. Pull the bulb straight out from the keyed opening in the housing.

LAMP

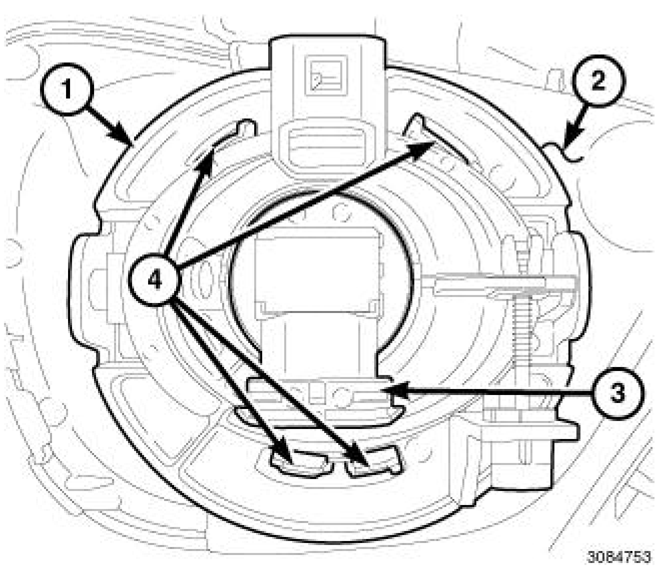

Fig. 13: Front Fascia, Connector Receptacle, Latch Features & Front Fog Lamp Mounting Ring
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Raise and support the vehicle.
3. Remove the front belly pan from the underbody. Refer to **BELLY PAN, REMOVAL** or **BELLY PAN, ENGINE, REMOVAL** .
4. Reach behind the front fascia (2) to access and disconnect the headlamp and dash wire harness connector from the front fog lamp bulb connector receptacle (3).
5. Using a trim stick or another suitable wide flat-bladed tool, carefully pry between the front fog lamp mounting ring (1) and the back of the front fascia as necessary to disengage the four latch features (4) integral to the back of the fog lamp seat in the fascia from the slots in the mounting ring.
6. Remove the front fog lamp unit from the back of the fascia.

INSTALLATION

BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

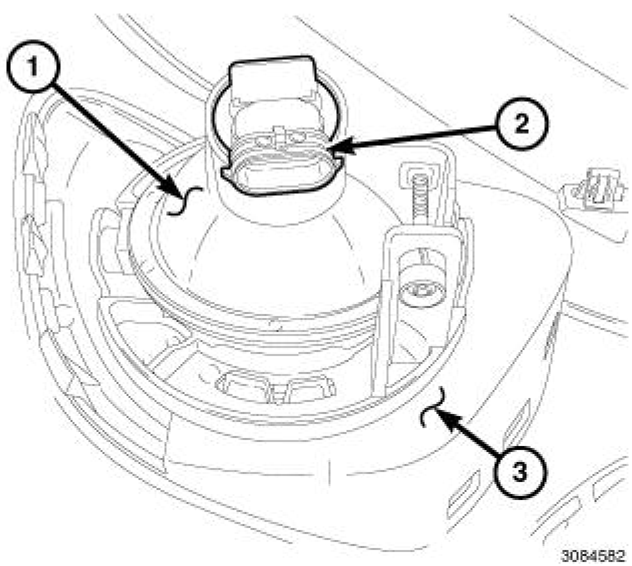

Fig. 14: Front Fascia, Connector Receptacle & Front Fog Lamp Housing
Courtesy of CHRYSLER GROUP, LLC

1. From behind the front fascia fog lamp seat (3), align the front fog lamp bulb with the keyed opening on the back of the front fog lamp housing (1).
2. Insert the bulb into the housing until the base is firmly seated.
3. Rotate the bulb clockwise about 30 degrees to lock it into place. The bulb connector receptacle (2) should be pointed straight downward.
4. Reconnect the headlamp and dash wire harness connector to the bulb connector receptacle.
5. Reinstall the front belly pan to the underbody. Refer to **BELLY PAN, INSTALLATION** or **BELLY**

PAN, ENGINE, INSTALLATION .

6. Lower the vehicle.
7. Reconnect the battery negative cable.

LAMP

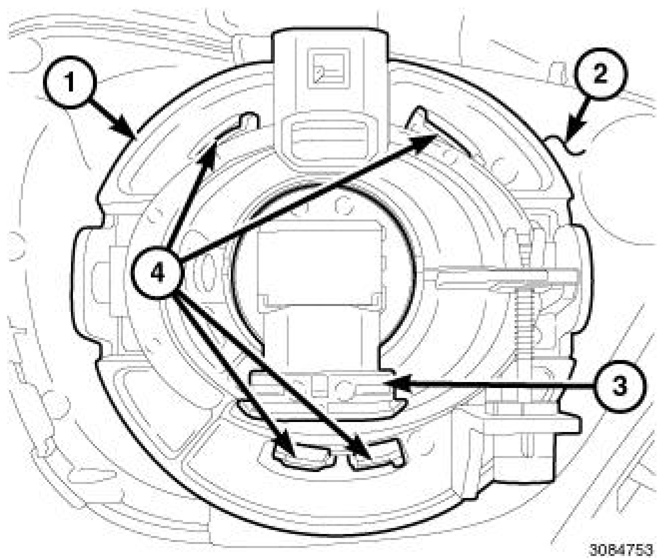

Fig. 15: Front Fascia, Connector Receptacle, Latch Features & Front Fog Lamp Mounting Ring
Courtesy of CHRYSLER GROUP, LLC

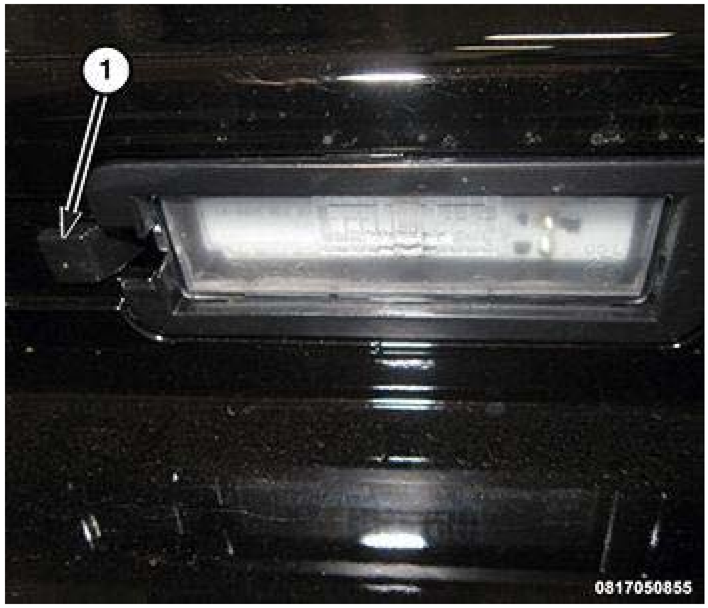
1. Reach behind the front fascia to position the front fog lamp and mounting ring unit (1) to the back of the fog lamp seat in the front fascia (2).
2. Align the four slots in the front fog lamp mounting ring with the four latch features (4) integral to the back of the fog lamp seat.
3. Press firmly and evenly on the fog lamp mounting ring until the four latch features snap into place through the mounting ring slots.
4. Reconnect the headlamp and dash wire harness connector to the front fog lamp bulb connector receptacle (3).
5. Reinstall the front belly pan to the underbody. Refer to **BELLY PAN, INSTALLATION** or **BELLY PAN, ENGINE, INSTALLATION** .
6. Lower the vehicle.
7. Reconnect the battery negative cable.
8. Confirm proper front fog lamp alignment. Refer to **STANDARD PROCEDURE**.

LAMP, LICENSE PLATE

REMOVAL

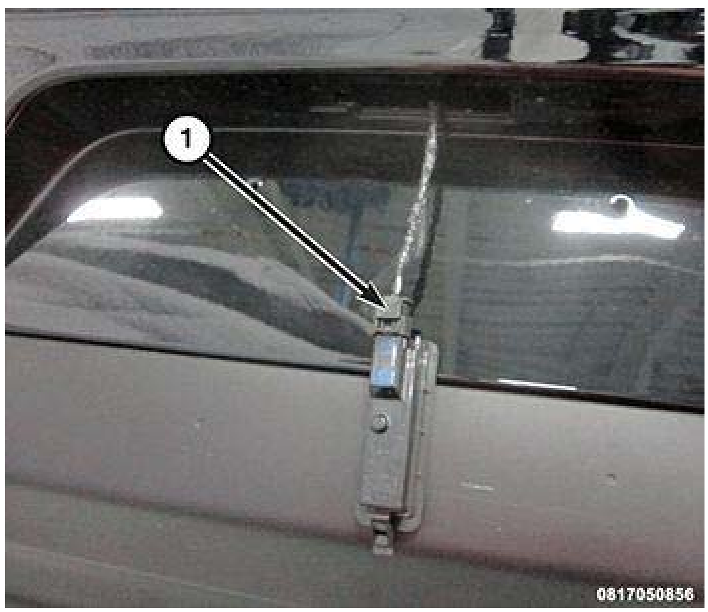
LAMP

1. Disconnect and isolate the battery negative cable.



[**Fig. 16: License Plate Lamp Release**]
Courtesy of CHRYSLER GROUP, LLC

2. Using a trim stick, release (1) the license plate lamp from the rear fascia.

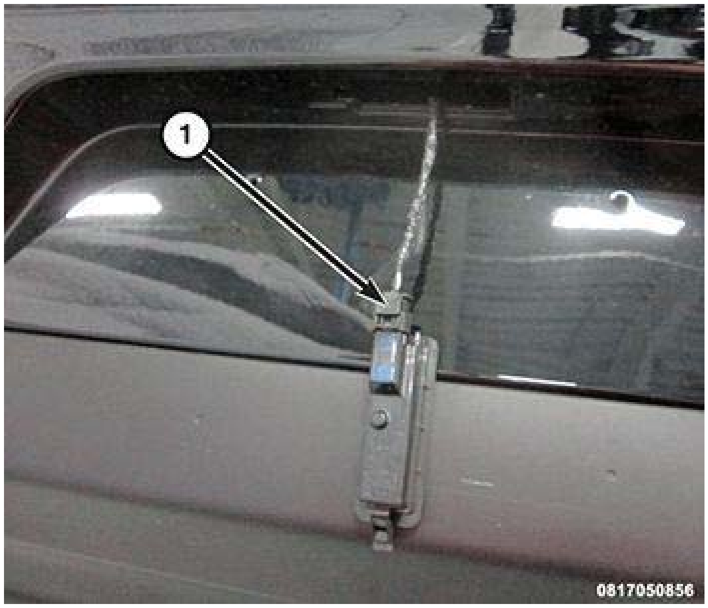


[**Fig. 17: License Plate Lamp Connector**]
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the license lamp from the wiring harness connector.

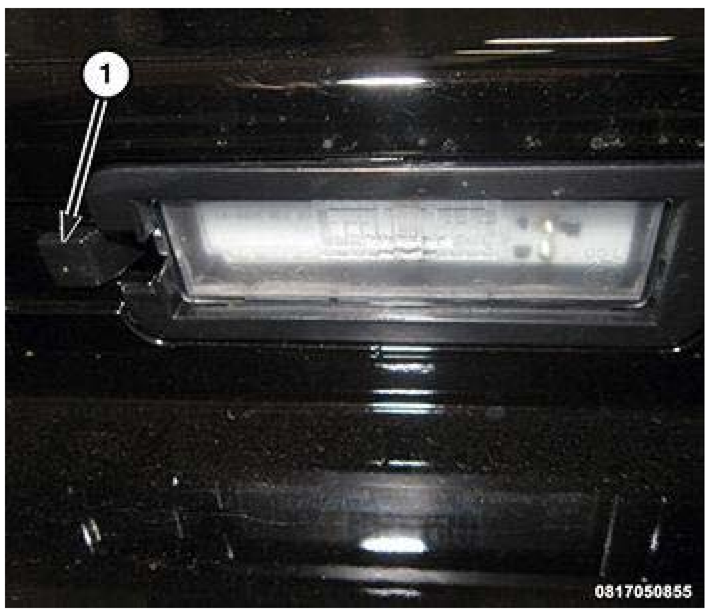
INSTALLATION

LAMP



[Fig. 18: License Plate Lamp Connector](#)
Courtesy of CHRYSLER GROUP, LLC

1. Connect the wiring harness connector (1) to the license plate lamp.



[Fig. 19: License Plate Lamp Release](#)
Courtesy of CHRYSLER GROUP, LLC

2. Insert the license plate lamp to the rear fascia until firmly seated.
3. Connect the battery negative cable.

LAMP, REAR COMBINATION

REMOVAL

INNER COMBINATION LAMP

1. Disconnect and isolate the battery negative cable.

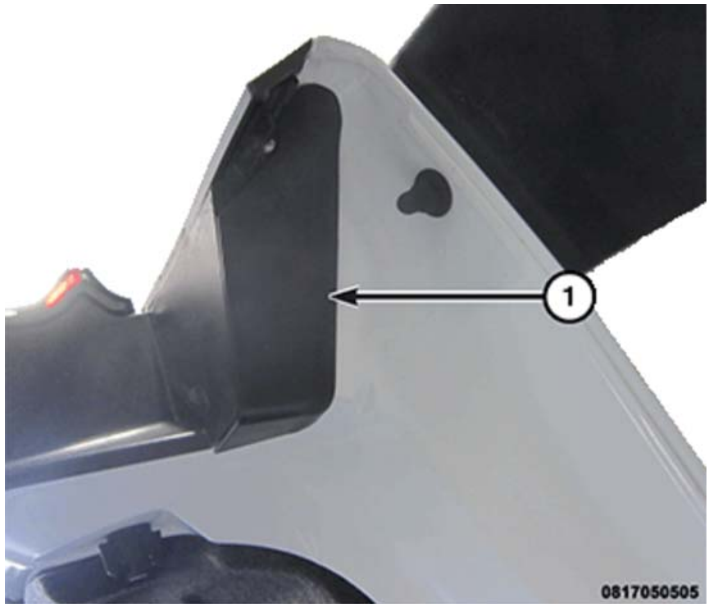


Fig. 20: Close Out Panel Cover
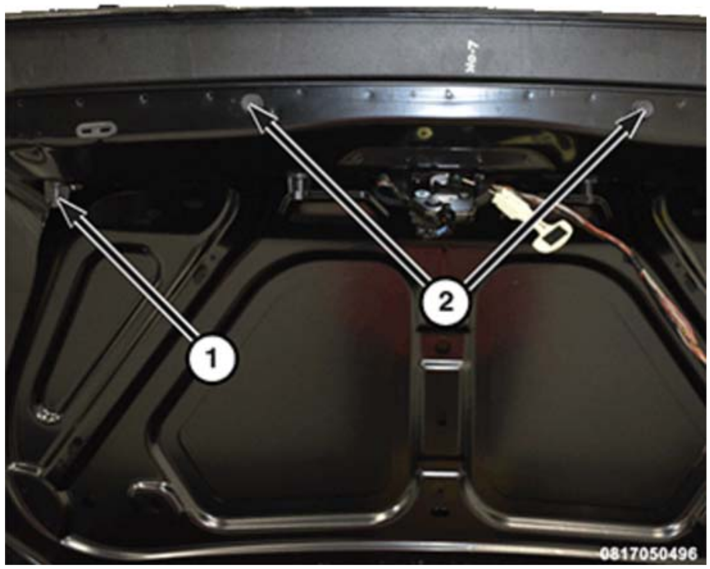
Courtesy of CHRYSLER GROUP, LLC

2. Open the decklid to access and remove the close out panel cover (1) on both sides on each side of the decklid.

Fig. 21: Inboard Screw
Courtesy of CHRYSLER GROUP, LLC

3. Remove the inboard screw (1) on each side of the decklid.

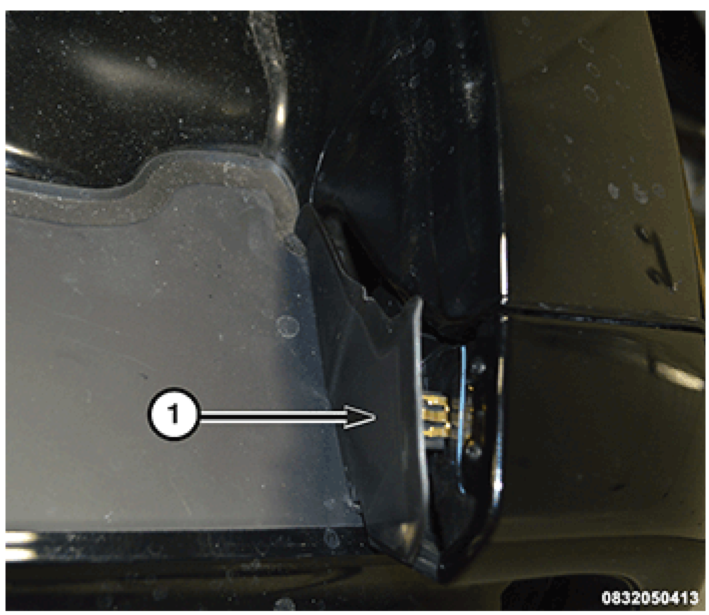


[Fig. 22: Push Pins & Plastic Wing-Nuts](#)
Courtesy of CHRYSLER GROUP, LLC

4. Remove two push pins (2) and four plastic wing-nuts (1).
5. Pull the lamp applique out far enough to disconnect the wiring harness connection.
6. Remove the lamp applique from the vehicle.

OUTER COMBINATION LAMP

1. Disconnect and isolate the negative battery cable.



[Fig. 23: Rear Quarter Close Out Trim](#)
Courtesy of CHRYSLER GROUP, LLC

2. Remove the rear quarter close out trim (1).
3. Open the deck lid and remove the inboard plastic wing-nut, then pull carpet back and remove other plastic

wing nut.

4. Disconnect the wiring harness connector (1) from the back of the combination lamp.
5. Remove the combination lamp from the vehicle.

INSTALLATION

INNER COMBINATION LAMP

1. Position the inner combination lamp to the vehicle close enough in order to the connect the wiring harness connector to the back of the assembly.

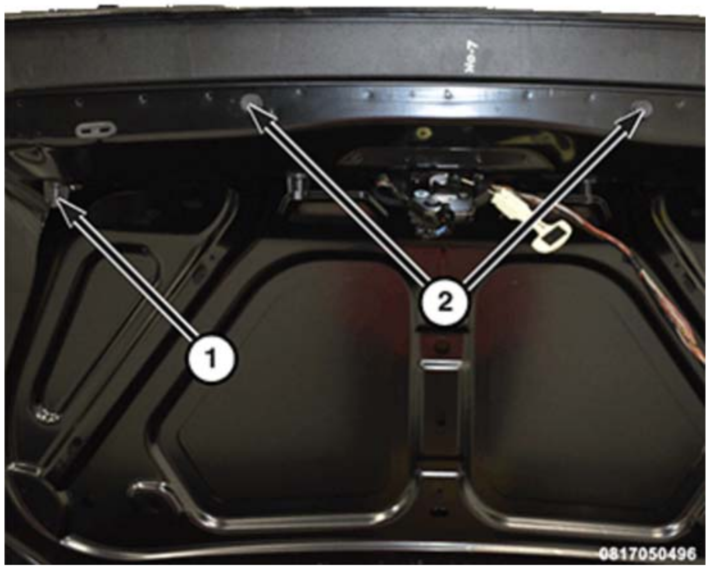


Fig. 24: Push Pins & Plastic Wing-Nuts
Courtesy of CHRYSLER GROUP, LLC

2. Install four wing-nut retainers (1) and two push pins (2) to secure the lamp to the deck lid.

Fig. 25: Inboard Screw

Courtesy of CHRYSLER GROUP, LLC

3. Install one inboard screw (1) as shown on each side.

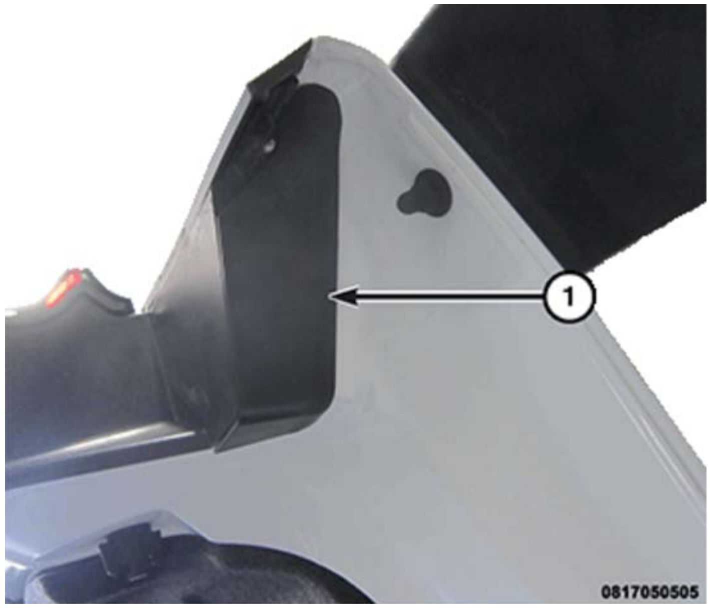

Fig. 26: Close Out Panel Cover
Courtesy of CHRYSLER GROUP, LLC

4. Install the close out panel cover on both sides of the deck lid.
5. Connect the negative battery cable.

OUTER COMBINATION LAMP

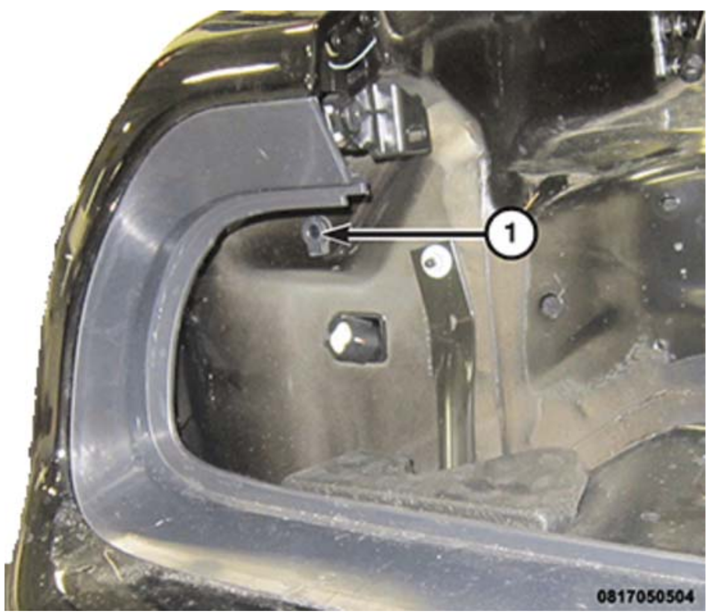

Fig. 27: Inside Trunk Wire Harness Connector
Courtesy of CHRYSLER GROUP, LLC

1. Align the ball stud on the back of the combination lamp to the lamp seat. Using hand pressure, push firmly and evenly on the outboard top and bottom of the lamp until the ball stud snaps into the grommet.

2. From the inside of the trunk, connect the wiring harness connector (1) to the back of the combination lamp.
3. From the inside of the trunk, install the one plastic wing nut that secure the studs of the tail lamp to the lamp seat.
4. Restore the trunk carpeting to cover the back side of the lamp seat and then install the one plastic wing nut that secure the studs of the tail lamp to the lamp seat.
5. Connect the negative battery cable.

SENSOR, STOP LAMP

DESCRIPTION

DESCRIPTION

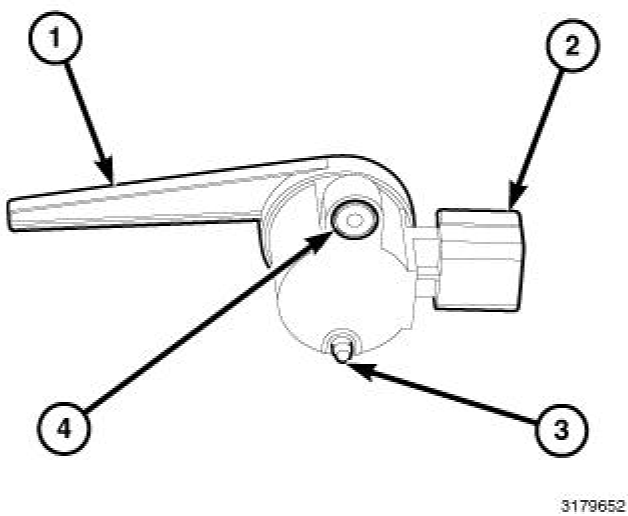

Fig. 28: Spring-Loaded Mechanical Lever Arm, Pin, Mounting Tab & Receptacle
Courtesy of CHRYSLER GROUP, LLC

The brake pedal position sensor is used in place of the brake (or stop) lamp switch in this vehicle. This sensor has a spring-loaded mechanical lever arm (1) that is actuated by a pin integral to the brake pedal arm. The sensor is secured by an integral locating pin (3) and a single screw through a metal insert in an integral mounting tab (4) to the brake pedal support bracket under the instrument panel on the driver side of the vehicle.

The molded plastic sensor housing has an integral connector receptacle (2) containing three terminal pins. The switch is connected to the vehicle electrical system through a dedicated take out of the body wire harness. A cavity in the center of the molded plastic sensor housing contains the electronic circuitry of the sensor. The sensor housing is sealed to enclose and protect the internal electronic circuitry and components.

The brake pedal position sensor cannot be repaired. If the sensor is damaged or ineffective it must be replaced with a new unit.

OPERATION

OPERATION

The brake pedal position sensor monitors changes in the brake pedal position relative to the brake pedal

mounting bracket. The sensor circuitry is energized by the Antilock Brake System (ABS) module and provides hard wired analog (potentiometer) inputs back to the ABS module. The ABS module uses the sensor inputs directly as additional logic for many of the ABS, Electronic Stability Control (ESC) and Brake Assist System (BAS) features.

The ABS module also sends electronic **brake lamp switch status** messages to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. Other electronic modules use this information as an additional logic input for controlling many other vehicle functions and features, including the Body Control Module (BCM) for control of the brake (or stop) lamps.

The hard wired circuits between the brake pedal position sensor and the ABS module may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the brake pedal position sensor or the electronic controls and communication that provide some features related to brake pedal position sensor operation. The most reliable, efficient and accurate means to diagnose the brake pedal position sensor or the electronic controls and communication related to sensor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS). Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

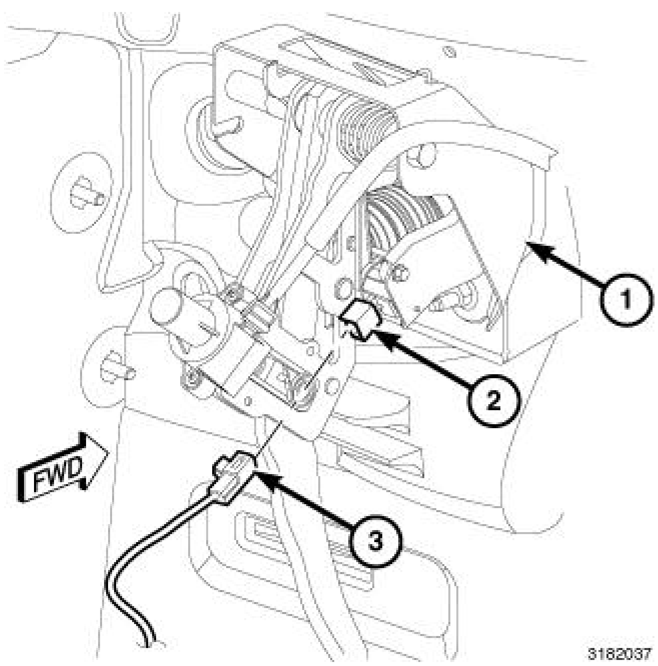

Fig. 29: Brake Pedal Position Sensor, Brake Pedal Support Bracket & Connector

Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. If equipped, remove the silencer pad from below the steering column.
3. Locate the brake pedal position sensor (2) on the brake pedal support bracket (1) under the instrument panel.
4. Disconnect the body wire harness connector (3) from the sensor.

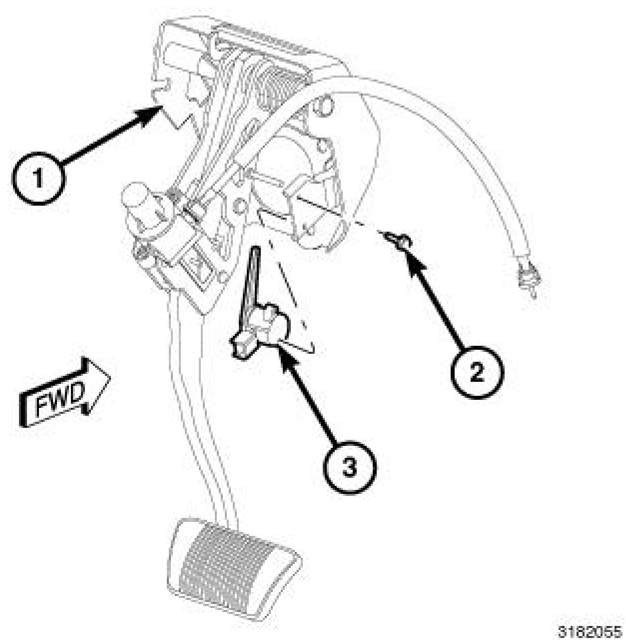

Fig. 30: Screw, Brake Pedal Position Sensor & Brake Pedal Support Bracket
Courtesy of CHRYSLER GROUP, LLC

5. Depress and hold the brake pedal in the depressed position.
6. Remove the screw (2) that secures the brake pedal position sensor (3) to the sensor bracket on the brake pedal support bracket (1).
7. Disengage the sensor locating pin from the locating hole in the sensor bracket.
8. Pull the sensor straight rearward from the pedal support bracket to remove it from the sensor bracket.
9. Release the brake pedal.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS). Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

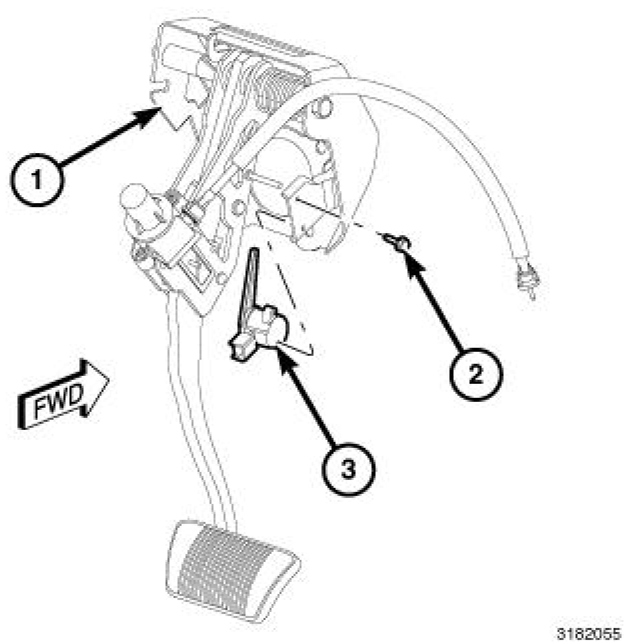

Fig. 31: Screw, Brake Pedal Position Sensor & Brake Pedal Support Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Depress and hold the brake pedal in the depressed position.
2. Position the brake pedal position sensor (3) to the sensor bracket on the brake pedal support bracket (1).
3. Engage the sensor locating pin into the locating hole in the sensor bracket.
4. Install and tighten the screw (2) that secures the sensor to the sensor bracket. Tighten the screw securely.

CAUTION: Brake booster damage may occur if the brake pedal pull exceeds about 9 kilograms (20 pounds).

5. Release the brake pedal. Then pull the pedal lightly upward to be certain the pedal is in its normal at-rest position.

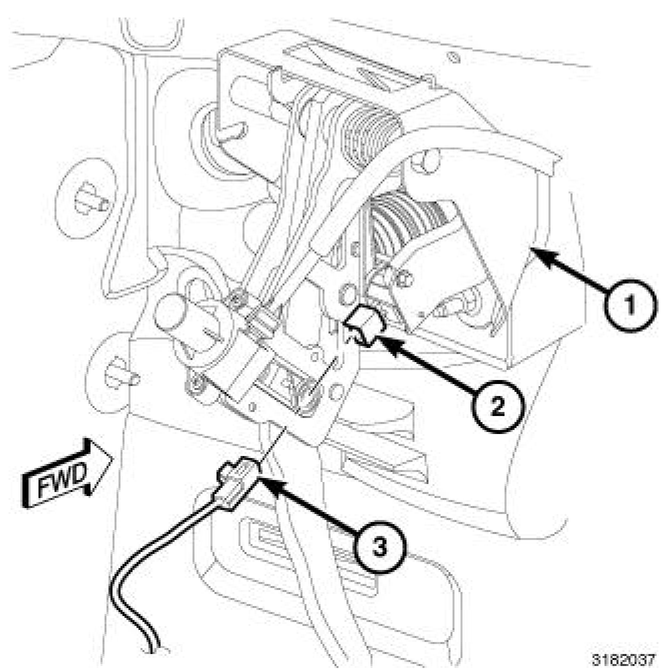

Fig. 32: Brake Pedal Position Sensor, Brake Pedal Support Bracket & Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Be certain the brake pedal position sensor is fully seated in the sensor bracket before completing the electrical connection.**

6. Reconnect the body wire harness connector (3) to the connector receptacle on the sensor (2).
7. If equipped, reinstall the silencer pad below the steering column.
8. Reconnect the battery negative cable.

NOTE: **Whenever the brake pedal position sensor is removed and reinstalled or replaced with a new unit, it is necessary for the Antilock Brake System (ABS) module to calibrate the reinstalled or the new sensor. Follow the programming steps outlined in the diagnostic scan tool for the "ABS Initialize" routine under "Miscellaneous Functions" for the "ABS Module" menu item as appropriate.**

SMART BEAM

DESCRIPTION

DESCRIPTION

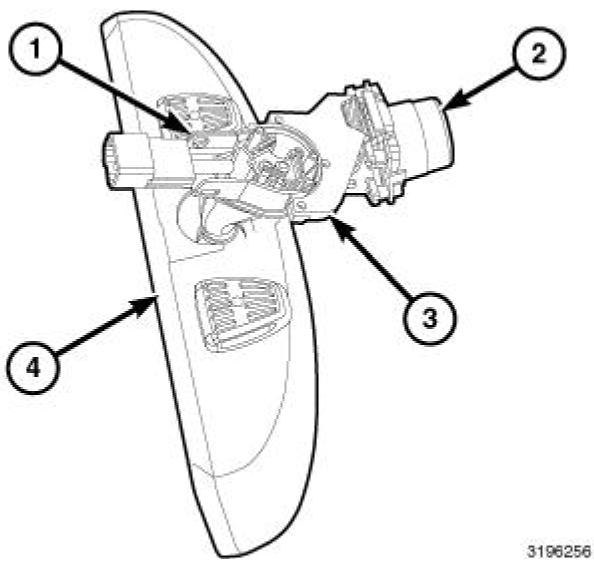

Fig. 33: Rear View Mirror, Camera Pod, Bracket
Courtesy of CHRYSLER GROUP, LLC

SmartBeamÂ® automatic high beam headlamp control is an available option on this vehicle when it is also equipped with the automatic headlamps, automatic wipers and the electrochromic inside rear view mirror (4) options. SmartBeamÂ® enhances the headlamp system of the vehicle by assisting the driver with the task of turning the headlamp high beams ON and OFF according to surrounding traffic conditions. The only visible component of SmartBeamÂ® is the camera pod (2) and the rectangular forward-facing clear lens. Because the SmartBeamÂ® camera looks through the windshield, the system may not function properly if this area of the glass is covered with ice, dirt, haze or any other obstruction.

The camera pod is secured to a bracket (3) that extends from the integral mounting bracket (1) of the

electrochromic inside rear view mirror. Within the camera pod is the circuit board and circuitry of the camera. The camera pod and bracket as well as the Light Rain Sensor Module (LRSM) (also known as the Rain Sensor Module/RSM or Light Sensor Module/LSM) are located just below the rear view mirror mounting button on the inside of the windshield glass, where they are both concealed from view within the vehicle interior behind a two piece clamshell-like mirror bracket trim cover.

The digital imager camera is aimed so as to view a predetermined area in the path directly ahead of the vehicle. If the camera is not properly aimed the system performance may be diminished or altered. For optimal system performance, the SmartBeamĀ® camera must be calibrated (aimed) by the dealer to insure that the camera aim is properly centered on the road ahead of the vehicle whenever the inside rear view mirror, the SmartBeamĀ® camera, the windshield glass or the mirror mounting button are replaced or reinstalled.

The microcontroller-based electronics of SmartBeamĀ® (also known as the Auto High Beam Module/AHBM) are integral to the circuit board contained within the electrochromic mirror. A short pigtail wire connects the camera circuit board directly to the electrochromic mirror circuit board, and a connector receptacle secured to the mount of the electrochromic mirror connects the mirror to the vehicle electrical system through a dedicated take out and connector of the overhead wire harness.

The SmartBeamĀ® is serviced as a unit with the electrochromic inside rear view mirror. If the SmartBeamĀ® camera, lens, circuitry or bracket is damaged or ineffective, the entire electrochromic inside rear view mirror must be replaced.

OPERATION

OPERATION

The SmartBeamĀ® automatic high beam control system uses digital light-sensing technology to monitor the lighting and traffic conditions in front of the vehicle. It helps improve forward visibility during nighttime driving by initiating high beam usage as ambient lighting and traffic conditions warrant. SmartBeamĀ® is also a Local Interface Network (LIN) slave node and communicates over a LIN data bus with the Body Control Module (BCM) (also known as the Common Body Controller/CBC), which is a LIN master node. The BCM is also a gateway to the Controller Area Network (CAN) data bus, which allows bus communication with other electronic modules in the vehicle and the diagnostic scan tool.

SmartBeamĀ® may be enabled or disabled by using the customer programmable features function of the EVIC and selecting or deselecting the **AUTO DIM HIGH BEAMS** feature. Then the headlamp switch control knob, located on the instrument panel, must be in the **AUTO** (Automatic) position and the high beams must be selected using the beam selector function of the multi-function switch control stalk for SmartBeamĀ® to be operational. An **AUTO HIGHBEAM ON** or **AUTO HIGHBEAM OFF** textual message will temporarily appear in the Integrated Center Stack (ICS) display to confirm the current system status.

When the SmartBeamĀ® system is enabled, ambient light levels are low enough to require the use of high beams, the vehicle is moving over 34 kilometers-per-hour (21 miles-per-hour) and no other traffic is present; SmartBeamĀ® will automatically turn the high beams ON. When the system detects the headlamps of an approaching vehicle or the tail lamps of a preceding vehicle, the high beams will automatically turn OFF. If the high beams are ON while decelerating and approaching a full stop, the system will turn them OFF automatically at below approximately 30 kilometers-per-hour (18 miles-per-hour).

SmartBeamĀ® will switch the high beams ON or OFF instantaneously. The high beam indicator in the instrument cluster will illuminate as soon as the high beams come ON, and will remain illuminated until the

high beams are OFF. SmartBeamÂ® will instantaneously turn the high beams OFF if the system detects the sudden presence of vehicle lights ahead. The vehicle operator can also override the SmartBeamÂ® selection at any time manually using the beam selection function of the multi-function switch control stalk to select the low beams, and the flash-to-pass (optical horn) feature is still functional with SmartBeamÂ®.

SmartBeamÂ® senses lighting conditions directly ahead of the vehicle. In certain situations, such as hills or winding roads, it may be more comfortable manually overriding the system because the vehicles in front may not be in the SmartBeamÂ® imaging camera field of view. However, it is not likely that your high beams will cause discomforting glare to other drivers in this situation.

SmartBeamÂ® may not function properly if its field of view is obscured. Because it looks through the windshield, the system may not function properly if this area is covered with ice, dirt, haze or any other obstruction. For optimal system performance, the lens of the imager camera must be cleaned periodically, as it may haze over due to the air quality in the vehicle passenger compartment. Spray a small amount of glass cleaner onto a soft cloth and gently clean the lens. Do not spray the glass cleaner directly onto the lens.

SmartBeamÂ® uses a red Light Emitting Diode (LED) unit to indicate certain faults it detects in the imager camera and circuitry. A slow (once-per-second) continual flashing of this LED indicates the SmartBeamÂ® camera requires aiming. A constantly (solid) illuminated LED indicates the camera has failed factory aim. The LED is located to the right of the rearward facing ElectroChromic (EC) inside rear view mirror photo sensor, behind the top center of the mirror glass. This LED is only clearly visible when it is illuminated.

The BCM will store a DTC for any SmartBeamÂ® fault that is detected. The hard wired inputs and outputs of the EC mirror may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SmartBeamÂ® unit, the EC mirror or the electronic controls or communication between modules and other devices that provide some features of the automatic high beam system. The most reliable, efficient, and accurate means to diagnose the SmartBeamÂ®, the EC mirror or the electronic controls and communication related to automatic high beam system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

STANDARD PROCEDURE

STANDARD PROCEDURE - SMART BEAM CALIBRATION

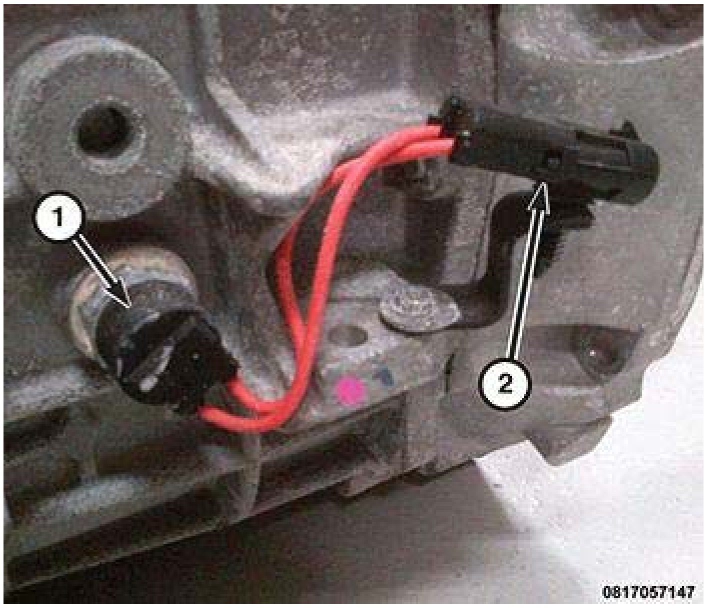
New and unused replacement SmartBeamÂ® units are shipped in calibration mode. Replace the mirror assembly if a loss of calibration is experienced.

SWITCH, BACKUP LAMP

DESCRIPTION

DESCRIPTION

Vehicles with an electronic automatic transmission have a Transmission Range Sensor (TRS) (2) that is used to perform several functions, including that of the backup lamp switch. The TRS is an integral component to the valve body assembly and is only serviced with a valve body replacement.



[Fig. 34: Back-Up Lamp Switch & Connector](#)
Courtesy of CHRYSLER GROUP, LLC

The manual transmission back-up lamp plunger style switch (1) is connected to a 3 inch wire pigtail connector (2) that clips to the side of the transmission case. The switch itself screws into the right hand side of the transmission case. It activates off of the offset lever which interacts within an area of the shift rails. When going into the reverse gate, the plunger depresses which turns on the reverse lamps.

SWITCH, HAZARD WARNING

DESCRIPTION

DESCRIPTION

[Fig. 35: Hazard Switch](#)
Courtesy of CHRYSLER GROUP, LLC

The hazard switch (2) is integral to the instrument panel switch bank (3) in the vehicle feature controls module (1) (also known as the Integrated Center Stack/ICS), which is secured to the lower instrument panel center stack just below the U-Connect Touch™ screen module. A red, stencil-like International Control and Display Symbol icon for **Hazard Warning** identifies the hazard switch button. The remainder of the hazard switch circuitry is concealed within the instrument panel switch bank.

The hazard switch button has panel lamps dimmer controlled illumination for night visibility. The switch button latches to a slightly lowered position when the hazard warning system is activated and unlatches to a position flush with the other push buttons in the switch bank when the hazard warning is deactivated.

All of the circuitry and components of the hazard switch are contained within the molded plastic vehicle feature controls module. A single connector receptacle is integral to the back of the module. The switch is connected to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

The hazard switch cannot be adjusted or repaired and, if ineffective or damaged, the entire instrument panel switch bank and vehicle features control module unit must be replaced.

OPERATION

OPERATION

The status of the hazard switch is continually monitored by the circuitry within the instrument panel switch bank in the Integrated Center Stack (ICS). The switch receives battery voltage at all times through a fused battery feed circuit, and a path to ground at all times through the instrument panel wire harness.

Whenever the hazard switch is in its latched and lowered position, the hazard warning system is selected and the switch bank circuitry provides a hard wired output to the Body Control Module (BCM). When the BCM receives a hazard switch input, it then controls hazard warning system operation and flash rate by controlling battery voltage outputs through high side drivers on the right and left, front and rear turn signal feed circuits.

The BCM also sends the appropriate electronic messages to the Instrument Cluster (IC) over the Controller Area Network (CAN) data bus to control the illumination and flash rate of the right and left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the IC electronic circuit board that emulates the sound emitted by a conventional hazard warning flasher.

The hard wired circuits for the instrument panel switch bank may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the hazard warning switch or the electronic controls and communication between other modules and devices that provide some features of the hazard warning system. The most reliable, efficient, and accurate means to diagnose the hazard switch or the electronic controls and communication related to hazard warning system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

SWITCH, HEADLAMP

DESCRIPTION

DESCRIPTION

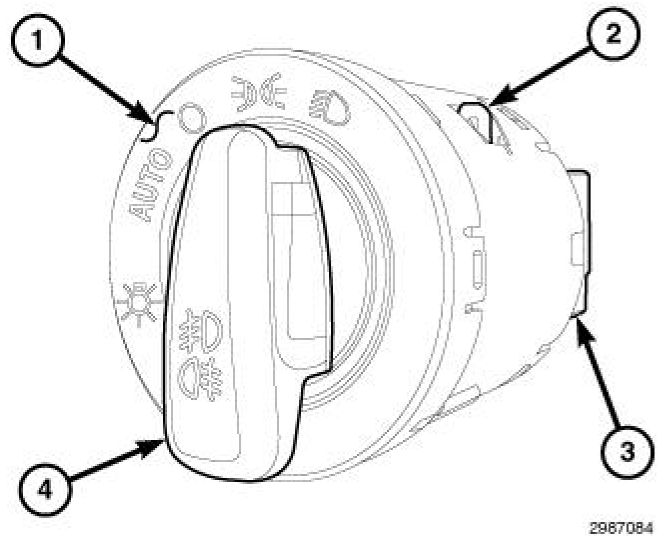


Fig. 36: Headlamp Switch, Retainers & Receptacle
Courtesy of CHRYSLER GROUP, LLC

The headlamp switch (1) is located on the instrument panel, in a cylinder-like mounting hole molded into the steering column opening cover to the left of the steering column. Several different switches are used, depending upon equipment and market requirements. The standard switch features a three-position rotary knob (4) for exterior lighting control. An optional switch has a fourth position added to the rotary knob for automatic headlamps and a momentary PUSH function added to the rotary knob for front fog lamp control.

Each of these switches is constructed of molded plastic. On vehicles with optional fog lamps the rotary knob also has the International Control and Display Symbol icon for **Front Fog Light** applied to it. The switch face plate is also labeled with graphics and icons to clearly identify the many functions of the rotary knob.

The switch housing is secured within the mounting hole of the instrument panel bezel by two spring loaded, pivoting pawl-like retainers (2), one near the bottom and another near the top. These pawls can be retracted for removal of the switch from the face of the instrument panel using a specific rotary knob actuation sequence. Refer to **SWITCH, HEADLAMP, REMOVAL**.

The back of the switch housing has an integral connector receptacle (3) containing terminal pins that connect the switch to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness. A panel dimmer controlled Light Emitting Diode (LED) unit soldered to the circuit board within the switch provides back lighting for visibility at night, but is not serviceable.

The headlamp switch cannot be repaired and, if ineffective or damaged, it must be replaced.

OPERATION

OPERATION

The headlamp switch uses a single resistor multiplexed output to control the many functions and features it provides. The switch receives a clean ground from the Body Control Module (BCM) on a headlamp switch MUltipleX (MUX) return circuit. The BCM then reads the switch outputs using an internal pull up on the headlamp/fog lamp switch signal circuit to control the exterior lighting functions.

The switch illumination circuit receives a path to ground at all times through an instrument panel ground circuit.

The illumination level is controlled by a Pulse-Width Modulated (PWM) output received from the BCM on a panel lamps driver circuit. The BCM controls this output based upon the panel lamps dimmer signal circuit input from the interior lighting thumbwheel switch in the dimmer module. Refer to **SWITCH, DIMMER, OPERATION** .

The headlamp switch operates as follows:

- **Exterior Lighting Control** - The rotary knob on the headlamp switch is rotated to a detent position to activate or deactivate the exterior lighting. The headlamp switch provides the appropriate resistor multiplexed output to the BCM over the headlamp/fog lamp switch signal circuit, and the BCM responds by energizing or de-energizing the right and left park lamp feed circuits and the right and left high or low beam driver circuits through internal HSDs and by sending an electronic confirmation message to the IC over the CAN data bus, which controls the high beam indicator as appropriate. The BCM also remembers which headlamp beams were last selected with the lamp switch, and energizes those beams by default the next time the headlamps are turned ON. If the vehicle is equipped with optional automatic headlamps and the AUTO (Automatic) position is selected, the BCM monitors an electronic ambient light level message received over the Local Interface Network (LIN) data bus from the Light Rain Sensor Module (LRSM) to turn the exterior lighting ON and OFF automatically while the ignition switch status is ON. If vehicle is not equipped with a RLSM,/LSM/RSM but is equipped with auto head lamps, the BCM also monitors for an electronic ambient light level message received over the CAN data bus from the air conditioner - heater control module based upon a hard wired input from the sun sensor.
- **Fog Lamps Control** - For vehicles so equipped, the rotary knob on the headlamp switch is depressed to activate or deactivate the optional fog lamps. If the vehicle is equipped with both front and rear fog lamps, the rotary knob is depressed once to activate only the front fog lamps, a second time to activate the rear fog lamps, a third time to deactivate the rear fog lamps and a fourth time to deactivate the front fog lamps. The rear fog lamps can only be illuminated in combination with the front fog lamps. The headlamp switch provides the appropriate resistor multiplexed output to the BCM over the headlamp/fog lamp switch signal circuit, and the BCM reads and responds to this input by energizing or de-energizing the right and left front and rear fog lamp control circuits through internal HSDs and by sending an electronic confirmation message to the Instrument Cluster (IC) over the Controller Area Network (CAN) data bus, which controls the front and rear fog lamp indicators as appropriate.

The headlamp switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HEADLAMP SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS). Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

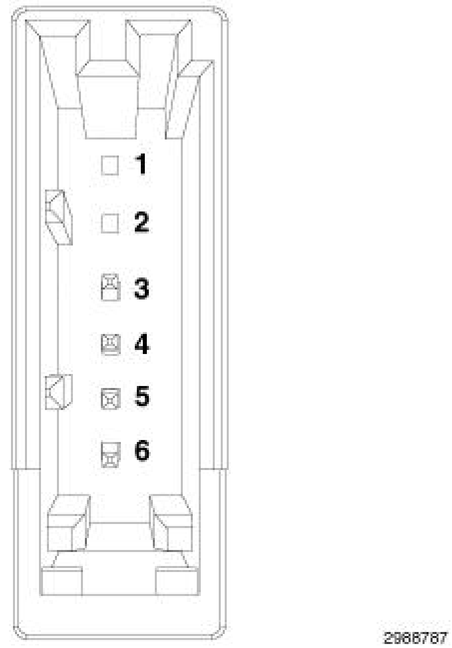

Fig. 37: Terminals Of The Switch
Courtesy of CHRYSLER GROUP, LLC

1. Remove the headlamp switch from the instrument panel. Refer to **SWITCH, HEADLAMP, REMOVAL**.
2. Disconnect the instrument panel wire harness connector from the back of the headlamp switch.
3. Using an ohmmeter, test the resistance between the terminals of the switch as shown in the HEADLAMP SWITCH TESTS TABLE.

HEADLAMP SWITCH TESTS	
SWITCH POSITION (PINS)	***RESISTANCE RANGE (OHMS)**
AUTO (3 and 6)	4028.0 - 4452.0
OFF (3 and 6)	1938.0 - 2142.0
PARK (3 and 6)	1073.5 - 1186.5
HEADLAMP (3 and 6)	627.0 - 693.0
FOG LAMP - AUTO (3 and 6)	347.2 - 383.8
FOG LAMP - OFF (3 and 6)	317.7 - 351.1
FOG LAMP - PARK (3 and 6)	280.6 - 310.1
FOG LAMP - HEADLAMP (3 and 6)	236.6 - 261.5
SWITCH ILLUMINATION (4 and 5)	LEDs - SET MULTIMETER TO DIODE MODE - CONNECT PIN 4 TO PLUS (+), CONNECT PIN 5 TO MINUS (-) - LEDs SHOULD BARELY GLOW
*All resistance values are plus or minus 5%.	

4. If the switch fails any of the tests, replace the ineffective headlamp switch as required.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS). Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

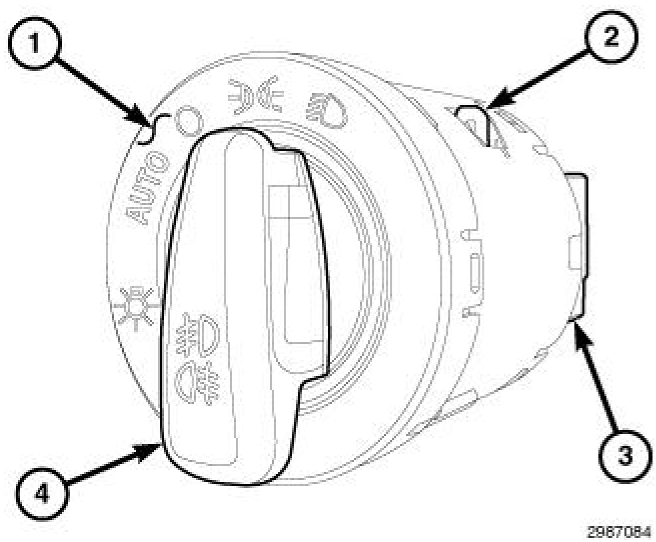

Fig. 38: Headlamp Switch, Retainers & Receptacle
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Place the headlamp switch (1) rotary knob (4) in the OFF (**O**) position.
3. Push in on the rotary knob to engage the switch retainer (2) retractor mechanism.
4. Still holding the switch rotary knob depressed, rotate the knob clockwise toward the park lamps ON position to retract the two switch retainers. The retainers will be fully retracted before the rotary knob actually reaches the park lamps ON position.
5. With the switch rotary knob still in the retainer retractor position, pull the switch out of the cylinder-like mounting hole far enough to access and disconnect the instrument panel wire harness connector from the connector receptacle (3) on the back of the switch housing.
6. Remove the headlamp switch from the instrument panel steering column opening cover.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS). Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further

diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

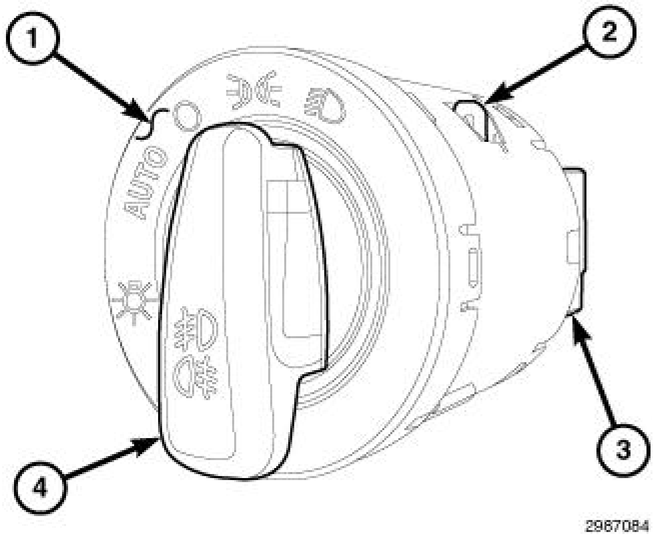

Fig. 39: Headlamp Switch, Retainers & Receptacle
Courtesy of CHRYSLER GROUP, LLC

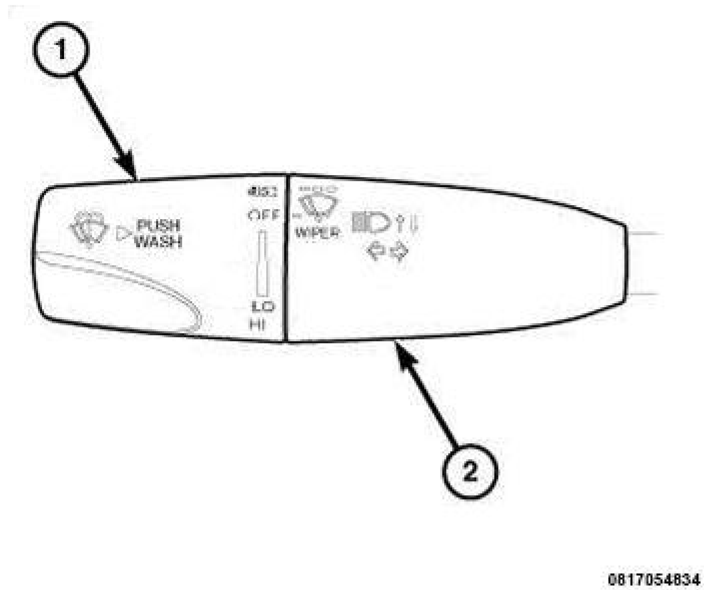
NOTE: **Before attempting to install the headlamp switch (1), be certain that both pawl-like retainers (2) are extended outward from the body of the switch. If the retainers are in the retracted position, rotating the headlamp switch rotary knob (4) to the OFF (O) position should disengage the retainer retractor mechanism causing the retainers to spring outward from the switch body.**

1. Position the headlamp switch (1) close enough to the cylinder-like switch mounting hole in the instrument panel steering column opening cover to reconnect the instrument panel wire harness connector to the connector receptacle (3) on the back of the switch housing.
2. Position and align the switch in the center of the switch mounting hole of the steering column opening cover on the instrument panel.
3. Using hand pressure, press the switch firmly and evenly into the mounting hole until it is fully seated. An indication that the switch is fully seated will be a light audible click as each of the two pawl-like retainers (2) snap into place within the mounting hole.
4. Reconnect the battery negative cable.

SWITCH, MULTIFUNCTION

DESCRIPTION

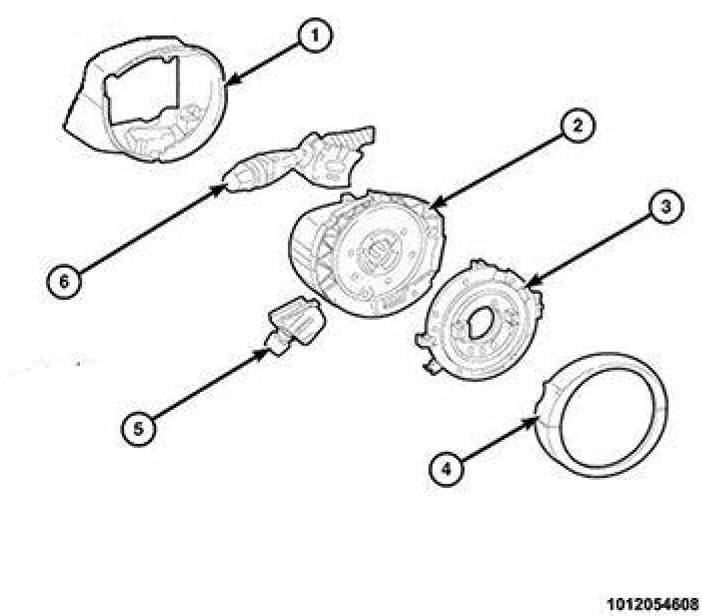
DESCRIPTION



[Fig. 40: Control Stalk & Knob](#)
Courtesy of CHRYSLER GROUP, LLC

The multi-function switch is located on the left side of the steering column, just below the steering wheel. This switch is the primary control for the front wiper and washer systems, the turn signals and headlamp beam selection. The only visible components of the switch are the control stalk (2) and control knob (1) that extend through the steering column shrouds on the left side of the column. The remainder of the switch including its mounting provisions, its electrical connections and the turn signal cancel actuator are concealed beneath the shrouds.

The switch housing and controls are constructed of molded black plastic. Each of the switch controls has white International Control and Display Symbol graphics applied to it, which clearly identify its many functions. The multi-function switch for this vehicle is integral to the Steering Column Control Module (SCCM).



[Fig. 41: Exploded View Of Steering Column Control Module](#)
Courtesy of CHRYSLER GROUP, LLC

The SCCM is located near the top of the steering column below the steering wheel. The SCCM includes the steering column shroud (1), the Steering Angle Sensor (SAS) (2), the clockspring (3), the multi-function switch (6), a steering column power tilt and telescope switch (5) for vehicles so equipped, a trim cover (4) and the SCCM microcontroller. The SCCM includes an integral connector receptacle that faces toward the instrument panel and is connected to the vehicle electrical system through a single take out and connector of the instrument panel wire harness.

The multi-function switch provides the vehicle operator with a control interface for the following functions:

- **Front Washer Control** - The multi-function switch control knob provides a momentary WASH position for washer system operation.
- **Front Wiper Control** - The multi-function switch control knob provides detent switching for two continuous wipe switch positions, LO speed or HI speed, and an intermittent wipe mode with four delay interval positions. The four delay positions become four sensitivity positions for vehicles equipped with the optional automatic wiper system. The control knob also has a momentary MIST or pulse wipe feature switch position.
- **Headlamp Beam Selection** - The multi-function switch control stalk provides detent switching for selection of the headlamp HIGH or LOW beams.
- **Headlamp Optical Horn** - The multi-function switch control stalk includes momentary switching of the headlamp high beam circuits to provide an optical horn feature (sometimes referred to as flash-to-pass), which allows the vehicle operator to momentarily flash the headlamp high beams as an optical signalling device.
- **Turn Signal Control** - The multi-function switch control stalk provides both momentary non-detent (lane change) switching or detent switching with automatic cancellation for both the left and right turn signals.

The multi-function switch cannot be adjusted or repaired. If any function of the switch is ineffective, or if the switch is damaged, the entire SCCM unit must be replaced.

OPERATION

OPERATION

The multi-function switch uses resistor multiplexing to control the many functions and features it provides using a minimal number of hard wired circuits. The switch receives clean grounds from the Steering Column Control Module (SCCM) microcontroller internal to the SCCM, then provides resistor multiplexed return outputs to the SCCM to indicate the selected switch positions. The SCCM then sends electronic **switch status** messages over the Controller Area Network (CAN) data bus to the Body Control Module (BCM) and to other electronic modules in the vehicle.

If the SCCM microcontroller detects no inputs from the multi-function switch, it transmits an electronic **Signal Not Available (SNA)** status message over the CAN data bus. The SNA status signals other electronic modules to implement a fail-safe or default mode of operation. For the exterior lighting system, the multi-function switch fail-safe mode automatically selects LOW beams when the headlamps are turned ON. For the wiper system, the multi-function switch fail-safe mode will maintain the last selected wiper system operation for the remainder of the current ignition cycle, after which the wiper system will default to OFF.

Some of the hard wired inputs and outputs of the SCCM and multi-function switch unit may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, the most

reliable, efficient and accurate means to diagnose the SCCM, the SCCM microcontroller and the multi-function switch requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

Following are descriptions of how the multi-function switch is operated to control the functions and features it provides:

- **Front Washer Control** - The control knob on the end of the multi-function switch control stalk is depressed toward the steering column to the momentary WASH detent position to activate the washer pump/motor in the FRONT WASH mode. The washer pump/motor will continue to operate for as long as the control knob is held in this position. The SCCM microcontroller reads the resistor multiplexed input from the multi-function switch and sends an electronic **front washer switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.
- **Front Wiper Control** - The control knob on the end of the multi-function switch control stalk is rotated to one of the two continuous wiper detents (LO or HI), to one of four intermittent delay or sensitivity wiper detents, or to the OFF position to select the FRONT WIPER mode. The SCCM microcontroller reads the resistor multiplexed input from the multi-function switch and sends electronic **front wiper switch status** messages over the CAN data bus to the BCM and to other electronic modules in the vehicle.
- **Front Wiper Mist Mode** - The control knob on the end of the multi-function switch control stalk is rotated to the momentary MIST position to activate the wiper MIST mode. The wiper motor will continue to operate, one complete cycle at a time, for as long as the control knob is held in this position. The SCCM microcontroller reads the resistor multiplexed input from the multi-function switch and sends an electronic **front wiper switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.
- **Headlamp Beam Selection** - The headlamp high beams are selected when the multi-function switch control stalk is pushed forward to the high beam selection detent position. The low beams are selected when the control stalk is pulled rearward to the low beam selection detent position. The SCCM microcontroller reads the resistor multiplexed input from the multi-function switch and sends an electronic **beam select switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.
- **Headlamp Optical Horn** - The headlamp optical horn is selected each time the multi-function switch control stalk is pulled fully rearward to a momentary position. The headlamp HIGH beams will remain illuminated for as long as the control stalk is held in this momentary position and the LOW beams will be restored when the control stalk is released. The SCCM microcontroller reads the resistor multiplexed input from the multi-function switch and sends an electronic **beam select switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.
- **Turn Signal Control** - The turn signals are requested when the multi-function switch control stalk is moved downward (LEFT signal) or upward (RIGHT signal). The control stalk has a detent position in each direction that provides turn signals with automatic cancellation, and an intermediate, momentary position in each direction that automatically provides three turn signal blinks as a LANE CHANGE feature when the control stalk is tapped or will energize the turn signals for as long as the control stalk is held in the momentary position. When the control stalk is moved to a detent turn signal switch position, a cancel actuator extends from the multi-function switch housing through an opening in the side of the clockspring case toward the center of the steering column. A turn signal cancel cam that is integral to the clockspring rotor rotates with the steering wheel and the cam lobes contact the cancel actuator when it is extended from the multi-function switch. When the steering wheel is rotated during a turning maneuver, one of the turn signal cancel cam lobes will contact the turn signal cancel actuator. The cancel actuator

latches against the cancel cam rotation in the direction opposite that which is signaled. If the LEFT turn signal detent is selected, the lobes of the cancel cam will ratchet past the cancel actuator when the steering wheel is rotated to the left, but will unlatch the cancel actuator as the steering wheel rotates to the right and returns to center, which will cancel the turn signal event and release the control stalk from the detent so it returns to the neutral OFF position. The SCCM microcontroller reads the resistor multiplexed input from the multi-function switch and sends an electronic **turn signal switch status** message over the CAN data bus to the BCM and to other electronic modules in the vehicle.

REMOVAL

REMOVAL

NOTE: **The multi-function switch for this vehicle is integral to the Steering Column Control Module (SCCM). If any function of the switch is ineffective, or if the switch is damaged, the entire SCCM unit must be replaced. Refer to MODULE, STEERING COLUMN CONTROL, REMOVAL .**

INSTALLATION

INSTALLATION

NOTE: **The multi-function switch for this vehicle is integral to the Steering Column Control Module (SCCM). If any function of the switch is ineffective, or if the switch is damaged, the entire SCCM unit must be replaced. Refer to MODULE, STEERING COLUMN CONTROL, INSTALLATION .**

SWITCH, PARKING BRAKE

DESCRIPTION

DESCRIPTION

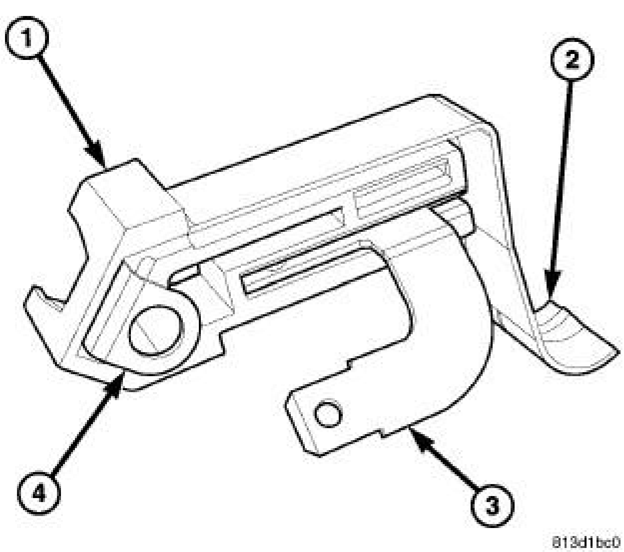


Fig. 42: Identifying Park Brake Switch
Courtesy of CHRYSLER GROUP, LLC

The park brake switch (1) is located on the park brake lever mechanism on the left cowl side inner panel below the instrument panel, outboard of the steering column. This switch includes a spade-type output terminal (3) that connects the switch to the vehicle electrical system through a dedicated take out and connector of the body wire harness. The output terminal is integral to the stationary contact within a molded plastic insulator.

A locating tab on the insulator engages a slot in the park brake lever mechanism for positive switch location. External to the insulator is a movable leaf contact with an integral grounding lug (4) on one end and an integral actuating lever and follower (2) on the opposite end. The switch is secured to and grounded by a single screw to the park brake lever mechanism.

The park brake switch cannot be adjusted or repaired and, if ineffective or damaged, it must be replaced.

OPERATION

OPERATION

The park brake switch is a normally closed, mechanically actuated leaf contact switch that is operated by the park brake lever mechanism. The switch is grounded through its mounting to the park brake lever mechanism and provides a ground input to the Instrument Cluster (IC) on a park brake switch sense circuit whenever the park brake is applied, and opens this circuit whenever the park brake is released. The park brake switch sense input to the IC is used as an additional logic input by the IC for control of the brake indicator and may also be used as a logic input for other electronic features in the vehicle.

The park brake switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between other modules and devices that rely upon inputs from the park brake switch. The most reliable, efficient, and accurate means to diagnose the electronic controls and communication related to park brake switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - PARKING BRAKE SWITCH

WARNING:	**To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS). Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**
NOTE:	**If the brake indicator stays ON with the ignition switch in the ON position and the park brake released, or comes ON while driving, the brake system must be diagnosed and repaired prior to performing the following tests. If no brake system problem is found, the following procedures will help to locate a shorted or open park brake switch sense circuit, or an ineffective park brake switch.**

INDICATOR ILLUMINATES DURING BULB TEST, BUT DOES NOT WHEN PARK BRAKE APPLIED

1. Disconnect and isolate the battery negative cable. Disconnect the body wire harness connector for the park brake switch from the switch terminal. Apply the parking brake. Check for continuity between the park brake switch terminal and a good ground. There should be continuity. If OK, go to 2. If not OK, replace the ineffective park brake switch.
2. Disconnect the instrument panel wire harness connector for the Instrument Cluster (IC) from the cluster connector receptacle. Check for continuity between the park brake switch sense circuit cavities of the body wire harness connector for the park brake switch and the instrument panel wire harness connector for the IC. There should be continuity. If not OK, repair the open park brake switch sense circuit between the park brake switch and the IC as required.

INDICATOR REMAINS ILLUMINATED - BRAKE SYSTEM CHECKS OKAY

1. Disconnect and isolate the battery negative cable. Disconnect the body wire harness connector for the park brake switch from the switch terminal. Check for continuity between the terminal of the park brake switch and a good ground. There should be no continuity with the park brake released, and continuity with the park brake applied. If OK, go to 2. If not OK, replace the ineffective park brake switch.
2. Disconnect the instrument panel wire harness connector for the IC from the cluster connector receptacle. Check for continuity between the park brake switch sense circuit cavity of the body wire harness connector for the park brake switch and a good ground. There should be no continuity. If not OK, repair the shorted park brake switch sense circuit between the park brake switch and the IC as required.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS). Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

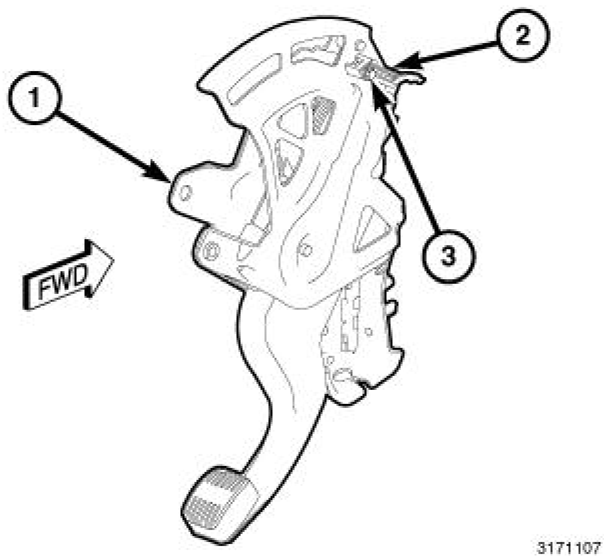

Fig. 43: Park Brake Switch, Park Brake Lever Mechanism & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Apply the parking brake.
3. Reach under the left end of the instrument panel to access and disconnect the body wire harness connector from the terminal of the park brake switch (2) located on the park brake lever mechanism (1) on the left cowl side inner panel.
4. Remove the screw (3) that secures the park brake switch to the park brake lever mechanism.
5. Remove the switch from the park brake lever mechanism.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS). Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

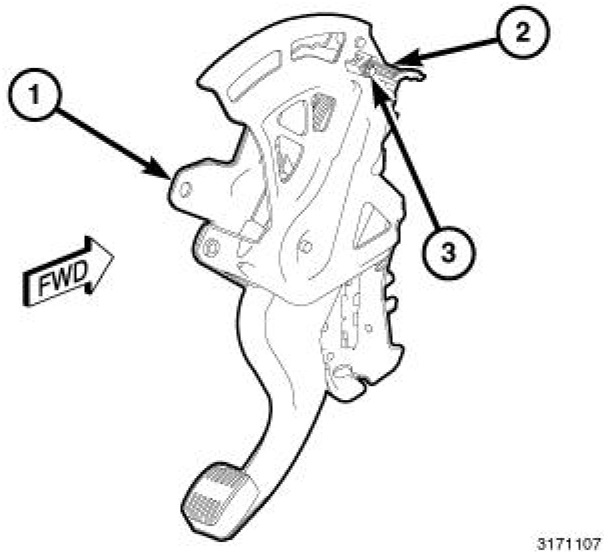

Fig. 44: Park Brake Switch, Park Brake Lever Mechanism & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Reach under the left end of the instrument panel to position the park brake switch (2) onto the park brake lever mechanism (1) on the left cowl side inner panel. Be certain to engage the locating pin on the back of the switch insulator into the locating slot in the lever mechanism bracket.
2. Install and tighten the screw (3) that secures the park brake switch to the park brake lever mechanism. Tighten the screw securely.
3. Reconnect the body wire harness connector to the terminal of the park brake switch.
4. Reconnect the battery negative cable.
5. Turn the ignition switch to the ON position and check for proper brake indicator operation with the parking brake applied, then release the parking brake and check that the brake indicator extinguishes.

UNIT, FRONT LAMP

STANDARD PROCEDURE

LAMP LENS DEFOGGING

Some customers may report that on occasion, vehicle exterior lamp assemblies are fogged with a light layer of condensation on the inside of the lenses. This may be reported after the lamps have been turned on and brought up to operating temperature, turned off, and then rapidly cooled by cold water (such as rain, or the water from a car wash). Lens fogging can also occur under certain atmospheric conditions after a vehicle has been parked outside overnight (i.e., a warm humid day followed by clear cool night). This will usually clear as atmospheric conditions change to allow the condensation to change back into a vapor. Turning the lamps on will usually accelerate this process.

A lamp that exhibits condensation/fogging should be evaluated in a service bay environment by first drying all water from the outside surface of the lens and operating the lamp for 20 minutes. If the condensation/fogging has begun to clear from the lamp lens after 20 minutes with the lamps operating, this indicates the lamp sealing has not been breached, and the lamp does not need to be replaced.

If the condensation/fogging has not begun to clear after 20 minutes with the lamps operating, or the lamp has

large amounts of water droplets visible on most internal surfaces, this indicates a problem with the lamp sealing that has allowed water to enter the lamp. In this instance, the customer is also likely to report that moisture in the lamp is always present and never disappears. A lamp that exhibits internal moisture permanently should be replaced.

REMOVAL

HEADLAMP

WARNING: To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.

1. Disconnect and isolate the battery negative cable.
2. Remove the front fascia from the vehicle. Refer to **FASCIA, FRONT, REMOVAL** .

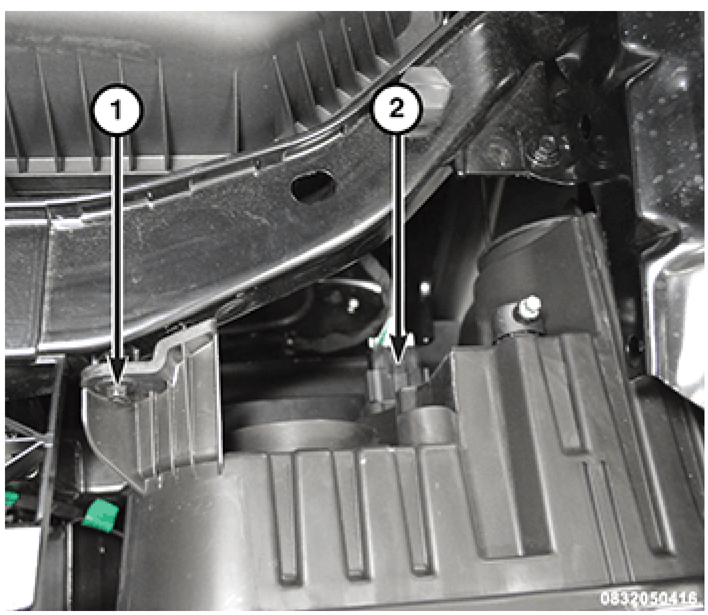

Fig. 45: Upper Screw & Wire Harness Connection
Courtesy of CHRYSLER GROUP, LLC

3. Remove the upper screw (1) securing the front lamp unit to the mounting bracket of the FEM support

structure.

4. Disconnect the wire harness connection (2) on the back of the lamp housing.

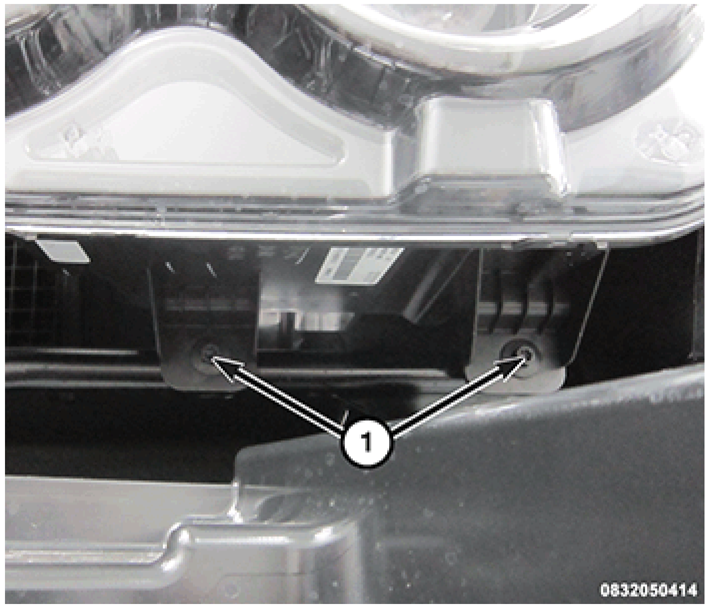

Fig. 46: Front Lamp Unit Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Remove the two lower bolts securing the front lamp unit.
6. Remove the front lamp unit from the vehicle.

HEADLAMP BULB

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

1. Disconnect and isolate the battery negative cable.
2. Loosen the front wheel house splash shield on the side needed to access the lamp assembly. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .

Fig. 47: Headlamp Bulb Access Cover
Courtesy of CHRYSLER GROUP, LLC

3. Firmly grasp the headlamp bulb access cover (1) on the outboard back of the front lamp unit housing and rotate it counterclockwise about 30 degrees to unlock it.
4. Remove the access cover from the lamp housing.
5. Firmly grasp the bulb base on the back of the projector within the front lamp unit housing and rotate it counterclockwise about 30 degrees to unlock it.
6. Pull the bulb and base straight out from the keyed opening in the projector.

NOTE: **Take care to prevent the wire harness and connector from falling back into the headlamp housing after disconnecting it from the headlamp bulb.**

7. Disconnect the front lamp unit wire harness connector from the bulb connector receptacle.
8. Remove the bulb from the back of the front lamp unit.

HIGH INTENSITY DISCHARGE (HID) LIGHTING ELEMENT

WARNING: **To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and**

protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.

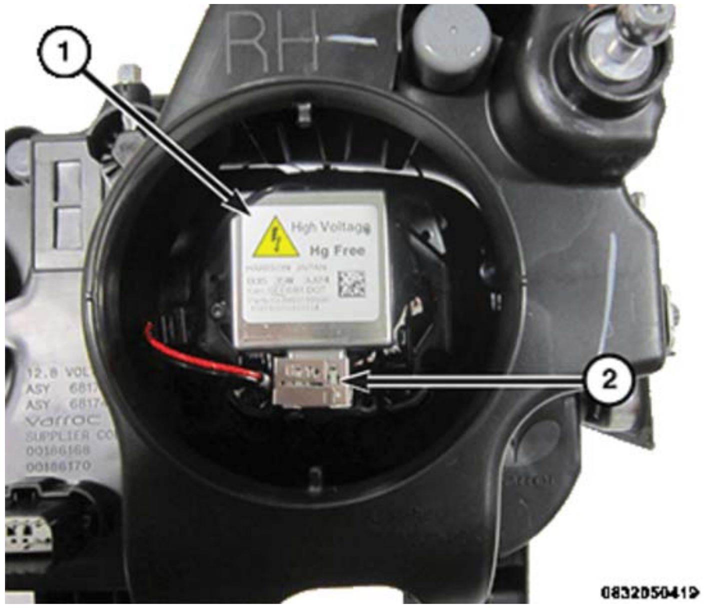
CAUTION: **Do not contaminate the lighting element glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened lighting element life will result.**

1. Disconnect and isolate the battery negative battery cable.
2. Loosen the front wheel house splash shield on the side needed to access the lamp assembly. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** .

Fig. 48: Headlamp Bulb Access Cover
Courtesy of CHRYSLER GROUP, LLC

3. Firmly grasp the High Intensity Discharge (HID) igniter and lighting element access cover (1) on the outboard back of the front lamp unit housing and rotate it counterclockwise about 30 degrees to unlock it.
4. Remove the access cover from the lamp housing.

NOTE: **Take care to prevent the high tension cable from falling back into the lamp housing after disconnecting it from the HID igniter.**



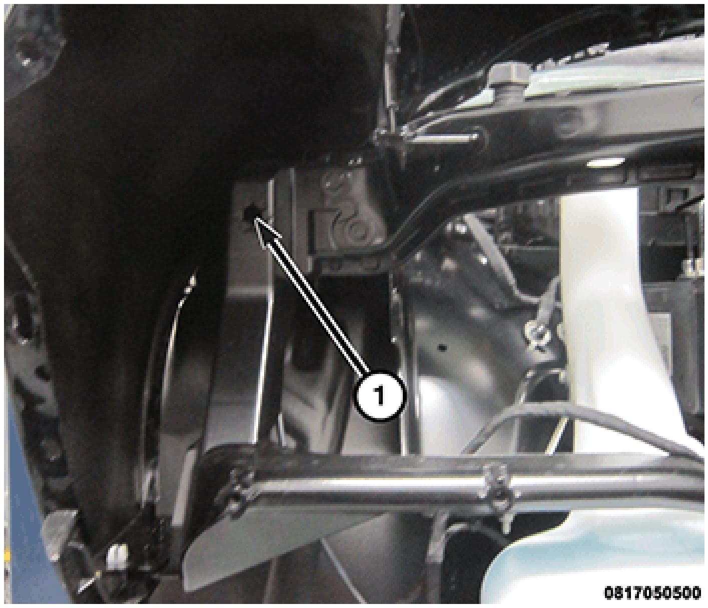
[Fig. 49: High Tension Cable Connector & HID Igniter](#)
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the high tension cable wire harness connector (2) from the HID igniter (1) connector receptacle.
6. Pull the HID igniter and lighting element straight out from the keyed opening in the projector.
7. Remove the igniter and lighting element from the back of the front lamp unit.

INSTALLATION

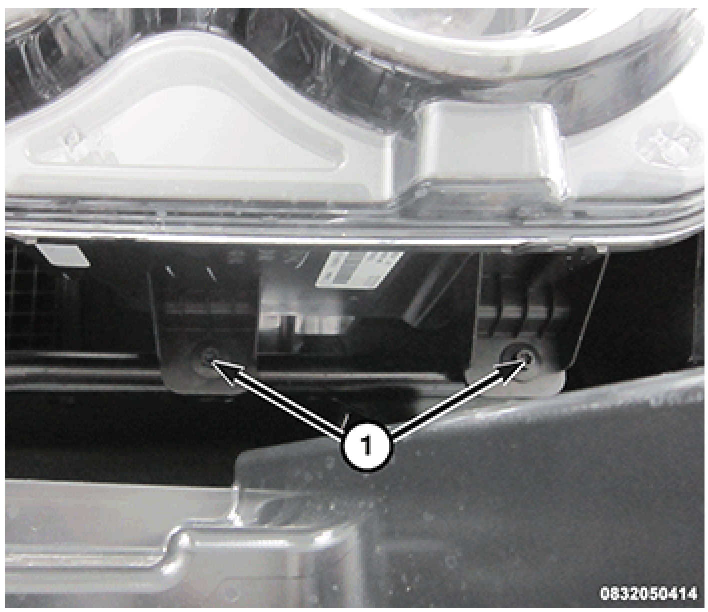
HEADLAMP

WARNING: To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.



[Fig. 50: FEM Guide Pin Hole & Lamp]
Courtesy of CHRYSLER GROUP, LLC

1. Position the lamp (2) to the lamp housing of the FEM. Line up the headlamp guide pin with the FEM guide pin hole (1) and seat the headlamp for lower bolt installation.



[Fig. 51: Front Lamp Unit Screws]
Courtesy of CHRYSLER GROUP, LLC

2. Install and tighten the two screws (1) that secure the lower a mounting brackets to the lamp housing of the FEM.

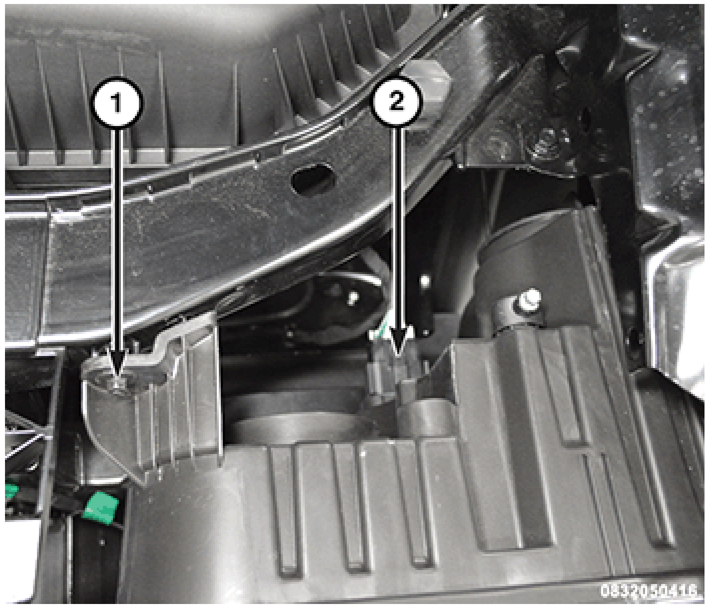


Fig. 52: Upper Screw & Wire Harness Connection
Courtesy of CHRYSLER GROUP, LLC

3. Install the upper screw (1) to secure the lamp to the upper FEM bracket.
4. Connect the wiring harness connector (2) to the back of the lamp assembly.
5. Install the fascia onto the FEM. Refer to **FASCIA, FRONT, INSTALLATION** .
6. Connect the battery negative cable.
7. Confirm proper headlamp alignment. Refer to **STANDARD PROCEDURE**.

HEADLAMP BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

CAUTION: Do not contaminate the bulb glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened bulb life will result.

1. Position the headlamp bulb close enough to the back of the front lamp unit housing to access and connect the lamp wire harness connector to the bulb connector receptacle.
2. Align the bulb with the keyed opening on the back of the front lamp unit projector.
3. Insert the bulb into the projector opening until the base is firmly seated.
4. Rotate the base clockwise about 30 degrees to lock it into place.

Fig. 53: Headlamp Bulb Access Cover
Courtesy of CHRYSLER GROUP, LLC

5. Position the headlamp bulb access cover (1) onto the outboard back of the front lamp unit housing and rotate it clockwise about 30 degrees to lock it into place.
6. Connect the battery negative cable.

HIGH INTENSITY DISCHARGE (HID) LIGHTING ELEMENT

WARNING: To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of fatal injury caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.

CAUTION: Always use the correct lighting element size and type for replacement. An incorrect size or type may overheat and cause damage to the lamp or the lamp wiring.

CAUTION: Do not contaminate the lighting element glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened lighting element life

will result.

1. Align and insert the High Intensity Discharge (HID) igniter and lighting element unit straight into the opening in the front lamp unit projector as a unit.
2. Press the igniter firmly and evenly toward the projector until the base is firmly seated.
3. Insert the HID igniter into the headlamp projector. Be sure the igniter is fully seated in the projector.

WARNING

WARNING

WARNING:	**To avoid serious or fatal injury, eye protection should be used when servicing any glass components.**
CAUTION:	**Do not use bulbs with higher candle power than indicated in the Bulb Application table. In addition, do not use fuses, circuit breakers or relays having greater amperage value than indicated on the fuse panel or in the Owner's Manual. Damage to lamps, lenses, wiring and other related electrical components can result.**

DESCRIPTION

DESCRIPTION

The interior lighting system for this vehicle includes both incandescent and Light Emitting Diode (LED) unit lighting on several separate circuits. The lamps in the interior lighting system include:

- **Center Floor Console Cup Holder Lamps** - The cup holders in the center floor console include a standard equipment light pipe around their inside perimeter illuminated by LED lamp units to assist visibility at night. These lamps are controlled by the panel lamps dimmer circuit and illuminate whenever the exterior lighting is turned ON.
- **Center Floor Console Forward Storage Bin Lamp** - The forward storage bin in the center floor console on some models is illuminated by an LED lamp unit located in the overhead console to assist visibility at night. This lamp is controlled by the exterior lighting circuit and illuminates whenever the exterior lighting is turned ON.
- **Center Floor Console Universal Serial Bus Connector Lamp** - The Universal Serial Bus (USB) connector in the center floor console on some models includes an LED lamp unit to assist visibility at night. This lamp is controlled by the courtesy lamp circuit and illuminates whenever the interior courtesy lamps are turned ON.
- **Door Entry And Exit Lamps** - Door entry and exit lamps (also known as puddle lamps) on some models include an incandescent lamp unit on the underside of each door trim panel that illuminate the ground outside the opened doors to assist visibility at night. These lamps are controlled by the courtesy lamps circuit and illuminate whenever the interior courtesy lamps are turned ON.
- **Door Inside Handle Lamps** - Door inside latch release handle pockets on models with the ambient lighting package include an LED lamp unit to assist visibility at night. These lamps are controlled by both the ambient lamps dimmer circuit and the courtesy lamps circuit. These lamps are illuminated whenever the ambient lighting or the courtesy lighting is turned ON, and are dimmable only when the ambient lighting is turned ON while the exterior lighting is also turned ON.
- **Door Map Pocket Lamps** - Door trim panel map pockets on models with the ambient lighting package

include an LED lamp unit to assist visibility at night. These lamps are controlled by both the ambient lamps dimmer circuit and the courtesy lamps circuit. These lamps are illuminated whenever the ambient lighting or the courtesy lighting is turned ON, and are dimmable only when the ambient lighting is turned ON while the exterior lighting is also turned ON.

- **Front Dome Lamps** - Front seat driver side and passenger side incandescent dome lamps are located behind a lens shared with the LED map/reading lamps in the overhead console. The dome lamps are controlled by the courtesy lamp circuit and by independent lens-actuated switches.
- **Front Map/Reading Lamps** - Front seat driver side and passenger side LED map/reading lamps are located behind a lens shared with the incandescent dome lamps in the overhead console. The map/reading lamps are controlled by the courtesy lamp circuit and by independent push button switches in the overhead console.
- **Glove Box Lamp** - A standard glove box lamp with an integral plunger-actuated switch is located at the upper outboard corner of the instrument panel lower glove box opening and illuminates whenever the glove box door is opened.
- **Instrument Panel Courtesy Lamps** - Vehicles equipped with the optional instrument panel courtesy lamps have two LED lamp units mounted to the closeout panel located under each side of the instrument panel. These lamps are controlled by the courtesy lamps circuit and illuminate whenever the interior courtesy lamps are turned ON.
- **Rear Map/Reading Lamps** - Optional rear seat incandescent map/reading lamps are located behind a lens integral to the grab handle unit located on each roof side rail above the door openings. The map/reading lamps are controlled by the courtesy lamp circuit and by independent lens-actuated switches.
- **Trunk Lamps** - Standard trunk lamps are located in the right and left trunk trim panels and are activated automatically whenever the deck lid is opened to illuminate the trunk of the vehicle.
- **Vanity Lamps** - Optional single-intensity vanity lamps are located on both sides of a covered mirror on both the right and left sun visors. These lamps are controlled by an integral vanity mirror cover-actuated switch.

Most controls on the instrument panel and elsewhere in the interior of the vehicle are illuminated by the panel lamps dimmer circuit for night visibility. All have miniature incandescent bulbs, LED units or a combination of the two lighting types that are soldered to internal circuit boards and are not serviceable.

Other components of the interior lighting system for this vehicle include:

- **Body Control Module** - The Body Control Module (BCM) is located beneath the instrument panel on the passenger side of the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Dimmer Module** - A dimmer module is located on the left side of the instrument panel, below and outboard of the steering column just inboard from the headlamp switch. The dimmer module features a vertical thumbwheel for selecting the panel lamps dimming level, a PARADE mode to illuminate all Vacuum Fluorescent Display (VFD) units at full brightness for visibility when driving in daylight with the exterior lighting turned ON. There are also detent positions to turn ON all interior courtesy lighting, and a DEFEAT position that overrides door ajar switch control of interior lighting. On vehicles equipped with the ambient lighting option the dimmer module includes a second thumbwheel dedicated to the ambient lighting, which allows the selection of the ambient lighting dimming level while the exterior lighting is turned ON and includes a detent position that turns the ambient lighting OFF.
- **Door Ajar Switches** - A door ajar switch is integral to the door latch mechanism of each door.
- **Door Module** - An electronic door control module is concealed behind the front door trim panel where it

is secured through two integral mounting tabs to the inner door panel. Refer to **MODULE, DOOR, DESCRIPTION** .

- **Trunk Ajar Switch** - A trunk ajar switch is integral to the deck lid latch mechanism.

Hard wired circuitry connects the interior lighting system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the interior lighting components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

All internal lights (except for the trunk lamp) are powered by the Inadvertent Lighting Feed. That inadvertent Lighting Feed is controlled via the SBMT Relay located in the Body Control Module (BCM). Power for the trunk lighting function is sourced by a dedicated high side relay in the BCM.

The lamps and the hard wired circuits between components related to the interior lighting system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the interior lighting system or the electronic controls or communication between modules and other devices that provide some features of the interior lighting system. The most reliable, efficient, and accurate means to diagnose the interior lighting system or the electronic controls and communication related to interior lighting system operation requires the use of a diagnostic scan tool. Refer to the appropriate Diagnostic & Testing article.

AMBIENT LIGHTING

Ambient Lighting Components

- Front Overhead Flood Lamp
- Front Remote Handles
- Rear Remote Handles
- Front Map Pockets
- Rear Map Pockets

Power and Ground

- The primary power feed for ambient lighting is supplied by a 0.9A PWM high side driver located in the BCM.
- Ambient lighting located in each front door is supplied power by a 0.2A PWM high side driver in each

respective door module.

Ambient Lighting Operation

- The ambient lighting thumbwheel provides a resistor multiplexed input to the BCM.
- The BCM controls the front door ambient lighting using electronic messages sent to the door modules over the CAN data bus.
- The door modules then regulate the voltage output to the front door ambient lighting LED units accordingly.
- The BCM provides direct hard wired outputs to control the door ambient lighting LED units.

Thumbwheel Control Operation

- Vehicles equipped with the ambient lighting option have a second, dedicated ambient lighting thumbwheel located in the dimmer module.
- This thumbwheel controls the Light Emitting Diode (LED) units in the inside door latch release handle pockets and the door map pockets.
- The ambient lighting can be turned ON at full brightness or OFF using the ambient lighting thumbwheel.
- When the exterior lighting is turned ON, the ambient lighting can be dimmed using the ambient lighting thumbwheel.
- The ambient lighting is also controlled by the courtesy lamp circuit and will be turned ON at full brightness whenever the other courtesy lamps are turned ON, regardless of the ambient lighting thumbwheel setting.

COURTESY LIGHTING

The courtesy lamp circuit includes the dome/reading lamps located on the headliner near the center of the windshield opening upper header and front courtesy footwell lamps. The lamps in the courtesy lamp circuit are provided with battery voltage and ground by the Body Control Module (BCM) using internal low side drivers through two ground circuits based upon hard wired inputs from the ignition switch and the door ajar switches. The BCM also uses electronic message inputs received from other electronic modules in the vehicle over the Controller Area Network (CAN) data bus to control these outputs.

The BCM also provides courtesy lamp operation based upon certain inputs received from the ignition switch (also known as the Keyless Ignition Node/KIN), Remote Keyless Entry (RKE) transmitter and the Radio Frequency (RF) Hub to provide an Illuminated Entry feature and in response to certain electronic message inputs received from the Occupant Restraint Controller (ORC) or the Powertrain Control Module (PCM) over the CAN data bus.

For those lamps in the courtesy lamp circuit with independent switching such as the dome/reading lamps, the BCM provides a second feed to the switches using another internal low side driver through a separate load shed circuit. The BCM provides a battery saver (load shedding) feature for these lamps, which will automatically turn the lamps OFF if they are left ON for more than about fifteen minutes with the ignition switch in the OFF position.

PANEL LAMPS DIMMER CIRCUIT

Panel Lamp Dimmer Components

- Headlamp Switch Backlighting
- Dimmer Module Backlighting
- Automatic Transmission Gear Selector Bezel Lamp
- Cup Holder Lamps

Power and Ground

- All lamps in the panel lamps dimmer circuits are provided a path to ground at all times through a hard wired ground circuit.
- These lamps are illuminated by a 12-volt PWM output of the BCM or the door control modules through several panel lamps dimmer circuits.

Panel Lamp Dimmer Circuit Operation

- The shared PWM output synchronizes the selected illumination intensity level of all the lamps in the panel lamps dimmer circuits.
- The BCM uses hard wired resistor multiplexed inputs from the rotary exterior lighting control knob of the headlamp switch to determine when the exterior lighting is turned ON and from the thumbwheel of the dimmer module to determine the dimming level selection.
- Then the BCM provides the appropriate PWM outputs through the panel lamps dimmer circuits as well as electronic **dimming level** messages over the CAN data bus to other electronic modules in the vehicle
- The Instrument Cluster (IC) and the Integrated Center Stack (ICS) use the electronic **dimming level** messages to control the illumination intensity of their own back lighting, controls and display units.
- In addition, when the interior lighting thumbwheel of the dimmer module is moved to the PARADE (or funeral) mode detent position, all of the electronic display units are illuminated at their full intensity levels for increased visibility when the vehicle is driven during daylight hours with the exterior lighting turned ON. The PARADE mode has no effect on the illumination intensity of incandescent panel lamps.

SWITCHED/CONVENIENCE LIGHTING FUNCTION

Switched/Convenience Lighting Components

- Lower Glovebox
- Drivers Vanity Mirror
- Passenger Vanity Mirror
- Front Overhead Ready Lamp
- Rear Overhead Reading Lamp (Side Rails)
- Front Puddle Lamps
- Rear Puddle Lamps

Power and Ground

- The primary power feed for switched/convenience lighting is supplied by a 7.5A PWM high side driver located in the BCM.
- The primary feed for the front door puddle lamps is supplied by its dedicated door module. Whereas, the rear puddle lamps are fed directly by BCM.

Switched Convenience Lighting Operation

- The BCM provides a battery saver (load shedding) feature for the reading lamp circuit as well as the courtesy lamp circuit, which will automatically turn these lamps OFF if they are left ON for more than about 10 minutes after the electronic **ignition status** message transitions to OFF. If any reading lamp input is received subsequent to a 10 minute load shed and prior to a new ignition cycle, the courtesy lamps will turn OFF after 90 seconds.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - INTERIOR LIGHTING

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: When diagnosing the interior lighting circuits, remember that high generator output can burn out bulbs rapidly and repeatedly; and, that dim or flickering bulbs can be caused by low generator output or poor battery condition. If one of these symptoms is a problem on the vehicle, be certain to diagnose the battery and charging system, then repair as necessary.

NOTE: A good ground is necessary for proper lighting operation. If a lighting problem is being diagnosed that involves multiple symptoms, systems, or components, the problem can often be traced to a loose, corroded, or open ground.

The hard wired circuits between components related to the operation of the interior lighting system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the interior lighting system or the electronic controls or communication between modules and other devices that provide some features of the interior lighting system. The most reliable, efficient, and accurate means to diagnose the interior lighting system or the electronic controls and communication related to interior lighting system operation requires the use of a diagnostic scan tool. Refer to the appropriate Diagnostic & Testing article.

ACRONYMS USED IN THE FOLLOWING SERVICE INFORMATION	
Body Control Module	BCM
Light-Emitting Diode	LED

COURTESY AND READING LAMP CIRCUITS

CONDITION	POSSIBLE CAUSES	CORRECTION
A SINGLE LAMP IN THE COURTESY LAMP CIRCUIT DOES NOT ILLUMINATE	1. Ineffective or missing bulb (except LED lamps).	1. Test and replace the courtesy lamp bulb if required.
	2. Ineffective lamp switch.	2. Test and replace a dome lamp switch, dome/reading lamp switch, glove box lamp switch or vanity lamp switch if required.
	3. Ineffective ground circuit.	3. Test and repair the open ground circuit if required.
	4. Ineffective feed circuit.	4. Test and repair the open feed circuit if required.
ALL LAMPS IN THE COURTESY LAMP CIRCUIT DO NOT ILLUMINATE	1. Courtesy DEFEAT feature turned ON.	1. Turn courtesy DEFEAT feature OFF.
	2. Ineffective ground circuit.	2. Test and repair the open ground circuit if required.
	3. Ineffective or missing fuse.	3. Test and replace the fuse if required.
	4. Ineffective courtesy lamp control circuit.	4. Test and repair the courtesy lamp control circuit if required.
	5. Ineffective dimmer module.	5. Test and replace the dimmer module if required.
	6. Ineffective BCM inputs or outputs.	6. Use a diagnostic scan tool and the appropriate diagnostic information for further BCM diagnosis.
A SINGLE LAMP IN THE COURTESY LAMP CIRCUIT DOES NOT EXTINGUISH	1. Ineffective lamp switch.	1. Test and replace a dome/reading lamp switch, glove box lamp switch or vanity lamp switch if required.
ALL LAMPS IN THE COURTESY LAMP CIRCUIT DO NOT EXTINGUISH	1. Ineffective ajar switch.	1. Test and replace a door ajar or liftgate ajar switch if required.
	2. Ineffective ajar switch sense circuit.	2. Test and repair the shorted ajar switch sense circuit if required.
	3. Ineffective dimmer module.	3. Test and replace the dimmer module if required.
	4. Ineffective BCM inputs or outputs.	4. Use a diagnostic scan tool and the appropriate diagnostic information for further BCM diagnosis.

PANEL LAMPS DIMMER CIRCUIT

NOTE: **As part of the exterior lighting fail-safe feature, upon ignition ON all of the panel lamps dimmer circuit lamps will illuminate at full intensity and the exterior park lamps and headlamp low beams will illuminate regardless of the multi-function switch control knob and stalk positions if the Steering Column Control Module (SCCM) microcontroller cannot detect an input from the multi-function switch, or if there is a loss of data bus communication.**

CONDITION	POSSIBLE CAUSES	CORRECTION

CONDITION	POSSIBLE CAUSES	CORRECTION
A SINGLE LAMP DOES NOT ILLUMINATE	1. Ineffective or missing bulb or Light Emitting Diode (LED) unit.	1. Test and replace the lamp bulb or LED unit if required.
	2. Ineffective ground circuit.	2. Test and repair the open lamp ground circuit if required.
	3. Ineffective feed circuit.	3. Test and repair the open lamp feed circuit if required.
A SINGLE LAMP DOES NOT EXTINGUISH	1. Ineffective feed circuit.	1. Test and repair the shorted lamp feed circuit if required.
ALL LAMPS DO NOT ILLUMINATE	1. Ineffective ground circuit.	1. Test and repair the open lamp ground circuit if required.
	2. Ineffective feed circuit.	2. Test and repair the open lamp feed circuit if required.
	3. Ineffective BCM inputs or outputs.	3. Use a diagnostic scan tool and the appropriate diagnostic information for further BCM diagnosis.
ALL LAMPS ILLUMINATE AT FULL INTENSITY AT IGNITION ON	1. Ineffective dimmer module.	1. Test and replace the dimmer module if required.
	2. Ineffective IC inputs or outputs.	2. Use a diagnostic scan tool and the appropriate diagnostic information for further IC diagnosis.
	3. Loss of data bus communication.	3. Use a diagnostic scan tool to test the data bus. Refer to the appropriate Diagnostic & Testing article.

LAMP, COURTESY, CUPHOLDER

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable.

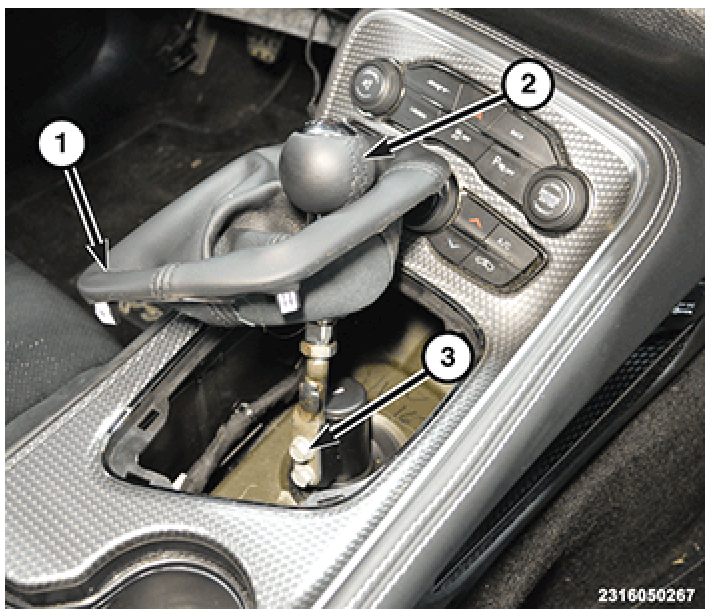

Fig. 1: Manual Shifter
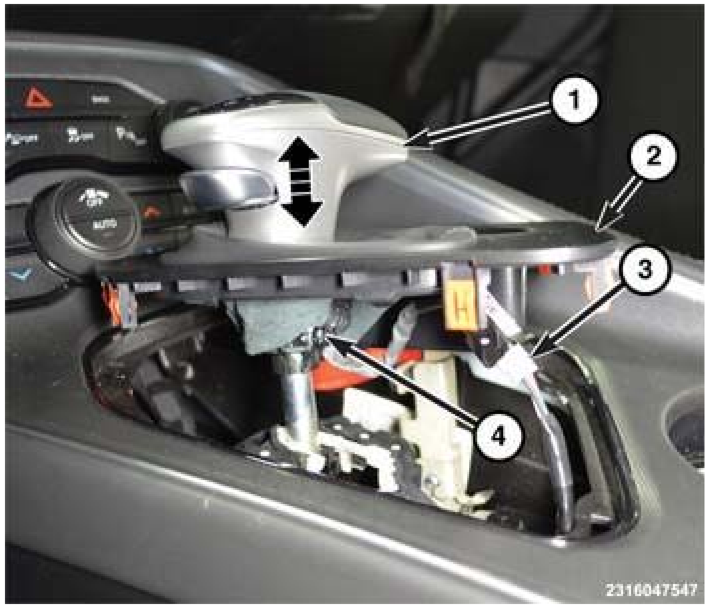
Courtesy of CHRYSLER GROUP, LLC

2. For manual shifter using a trim stick or equivalent, carefully release the retaining clips and lift the shifter boot (1).
3. Remove the bolts (3) then the shift lever (2).

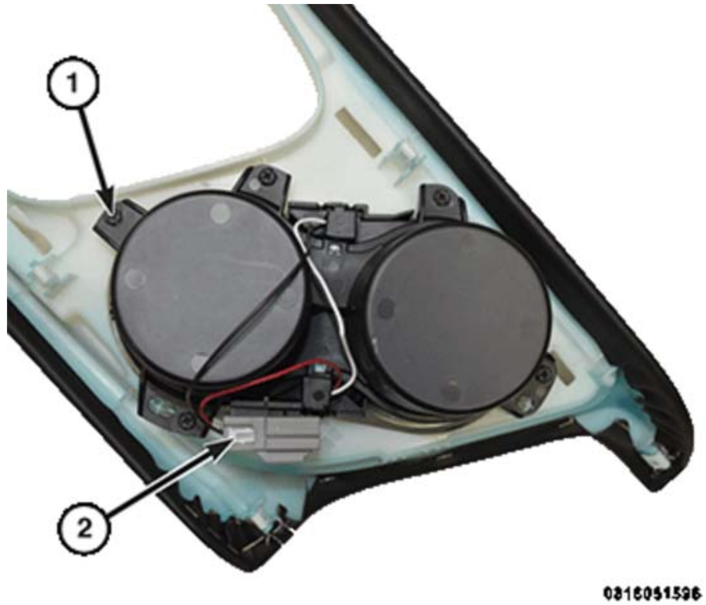


[Fig. 2: Automatic Shifter](#)
Courtesy of CHRYSLER GROUP, LLC

4. For automatic shifter, place the shifter in the Neutral position.
5. Using a trim stick or equivalent, carefully release the retaining clips and lift the shifter bezel (2).
6. Remove the screw (4) then lift the shifter knob (1) and remove.

[Fig. 3: Removing/Install Console Bezel Panel](#)
Courtesy of CHRYSLER GROUP, LLC

7. Using a trim stick or equivalent, starting at the rear carefully release the retaining clip and lift the shifter bezel panel (1). Disconnect the wire harness connectors and remove.



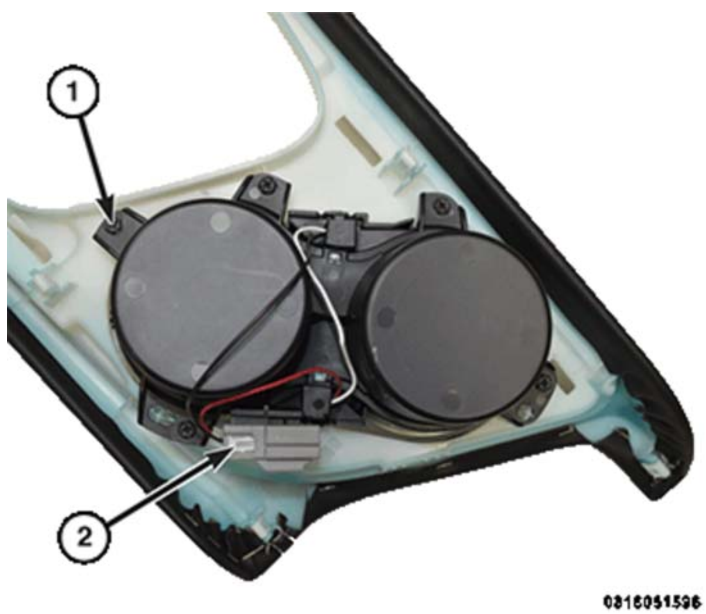
[Fig. 4: Wiring Harness Connector & Screws]
Courtesy of CHRYSLER GROUP, LLC

8. Working from the backside of the shifter bezel panel, remove the screws (1) that secure the cup holder to the bezel.
9. Disconnect the wiring harness connector (2) from the cup holder.

INSTALLATION

INSTALLATION

1. Position the cup holder to the shifter bezel panel.



[Fig. 5: Wiring Harness Connector & Screws]
Courtesy of CHRYSLER GROUP, LLC

2. Install the screws (1) securing the cup holder to the bezel.

3. Connect the wiring harness connector to the cup holder (2).

Fig. 6: Removing/Install Console Bezel Panel
Courtesy of CHRYSLER GROUP, LLC

4. Install the shifter bezel panel.

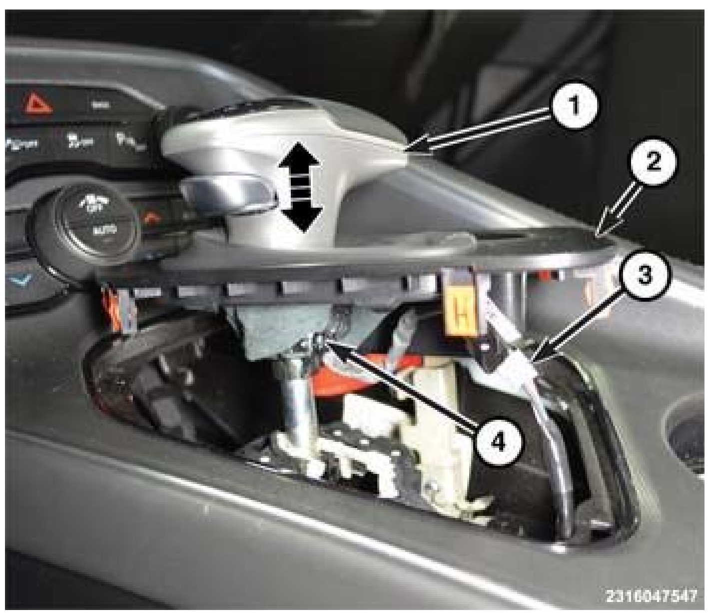


Fig. 7: Automatic Shifter
Courtesy of CHRYSLER GROUP, LLC

5. For automatic shifter, install the shifter knob and install the screw (4). Tighten the screw securely.
6. Connect the wire harness connector (3).
7. Position the shifter bezel (2) and engage the retaining clips.

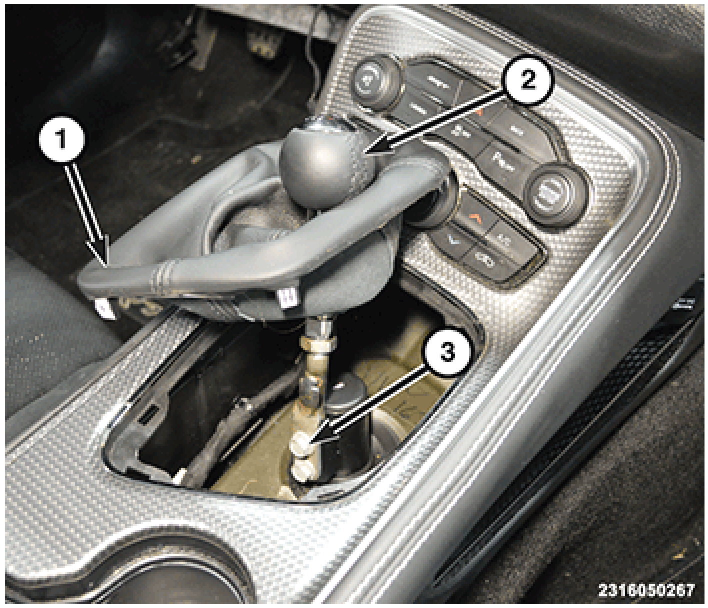

Fig. 8: Manual Shifter
Courtesy of CHRYSLER GROUP, LLC

8. For manual shifter, install the shift lever (2) and the bolts (3). Tighten the shift lever bolts to the proper **SPECIFICATIONS** .
9. Position the shifter boot (1) and engage the retaining clips.
10. Connect the battery negative cable.

LAMP, DOME

REMOVAL

BULB

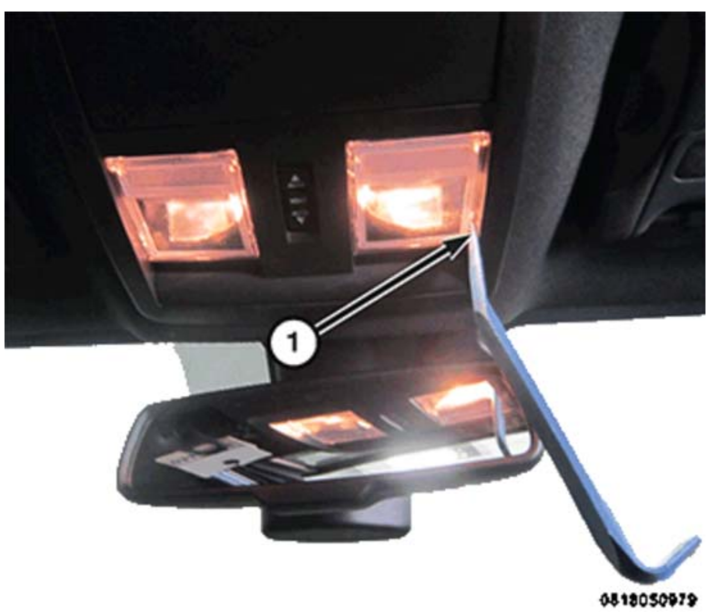

Fig. 9: Lens Cover
Courtesy of CHRYSLER GROUP, LLC

1. Using a trim stick or equivalent, insert the tip of the tool as shown to remove the lens cover (1).
2. Pull the bulb holder and bulb straight out of the housing.

INSTALLATION

BULB

1. Place lamp bulb into lamp unit.
2. Position dome lamp lens cover and firmly snap into place.

LAMP, ENTRY AND EXIT

REMOVAL

BULB

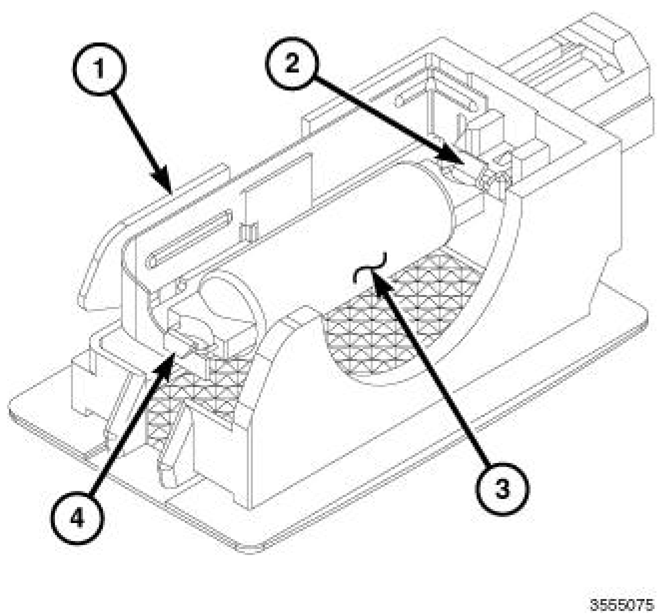

Fig. 10: Exit Lamp Unit, Bulb Holder & Bulb
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the entry and exit lamp unit (1) (also known as the puddle lamp) from the bottom of the door trim panel. Refer to **LAMP, ENTRY AND EXIT, REMOVAL**.
3. Gently press the movable bulb holder (4) and the bulb (3) towards the fixed bulb holder (2) far enough to disengage the wire loop terminal of the bulb from the hook of the fixed bulb holder.
4. Disengage the wire loop terminal of the bulb from the hook on the movable bulb holder.
5. Remove the bulb from the lamp.

LAMP

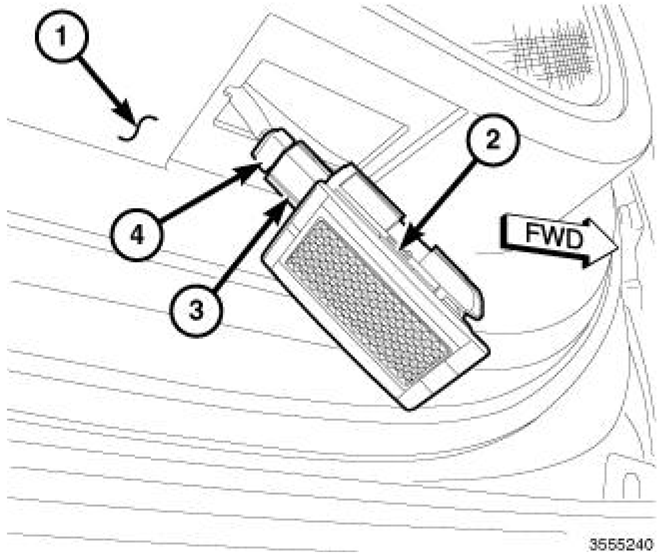

Fig. 11: Rear Door Trim Panel, Lens, Door Wire Harness Connector & Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Using a trim stick or another suitable flat wide-bladed tool, gently pry the forward (notched) edge of the entry and exit lamp (also known as the puddle lamp) lens (2) down from the mounting hole in the lower horizontal surface of the trim panel (1).
3. Disconnect the door wire harness connector (4) from the connector receptacle (3) integral to the lamp housing.
4. Remove the lamp from the vehicle.

INSTALLATION

BULB

CAUTION: Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.

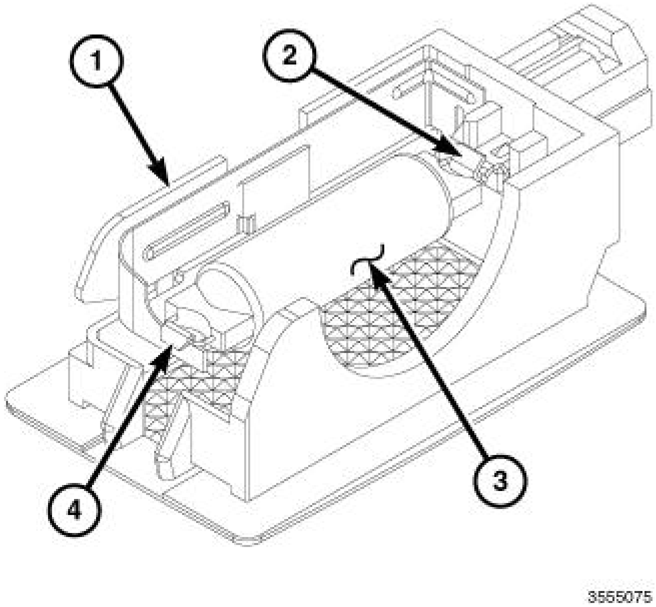

Fig. 12: Exit Lamp Unit, Bulb Holder & Bulb
Courtesy of CHRYSLER GROUP, LLC

1. Engage the wire loop terminal on one end of the bulb (3) over the hook on the movable bulb holder (4).
2. Gently press the movable bulb holder and bulb towards the fixed bulb holder (2) far enough to engage the wire loop terminal over the hook on the fixed bulb holder, then release the movable bulb holder.
3. Reinstall the entry and exit lamp unit (1) (also known as the puddle lamp) into the bottom of the door trim panel. Refer to **LAMP, ENTRY AND EXIT, INSTALLATION**.
4. Reconnect the battery negative cable.

LAMP

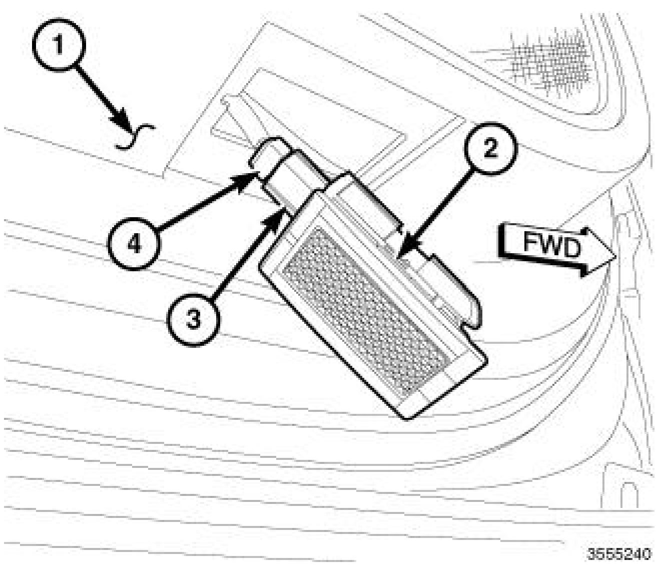

Fig. 13: Rear Door Trim Panel, Lens, Door Wire Harness Connector & Connector Receptacle
Courtesy of CHRYSLER GROUP, LLC

1. Position the entry and exit lamp (also known as the puddle lamp) to the mounting hole in the lower

horizontal surface of the door trim panel (1).

2. Reconnect the door wire harness connector (4) to the connector receptacle (3) integral to the lamp housing.
3. Insert the connector end of the lamp into the rearward end of the mounting hole in the door trim panel far enough to engage the fixed retention tabs with the edge of the mounting hole.
4. Using hand pressure, press the front (notched) edge of the lamp lens (2) upward until the movable retention tabs snap into place and the lens is just proud of the trim panel.
5. Reconnect the battery negative cable.

LAMP, TRANSMISSION RANGE INDICATOR

REMOVAL

REMOVAL

1. Disconnect the battery negative cable.
2. Remove shift console trim ring and shift console trim panel. Refer to **CONSOLE, FLOOR, REMOVAL** .

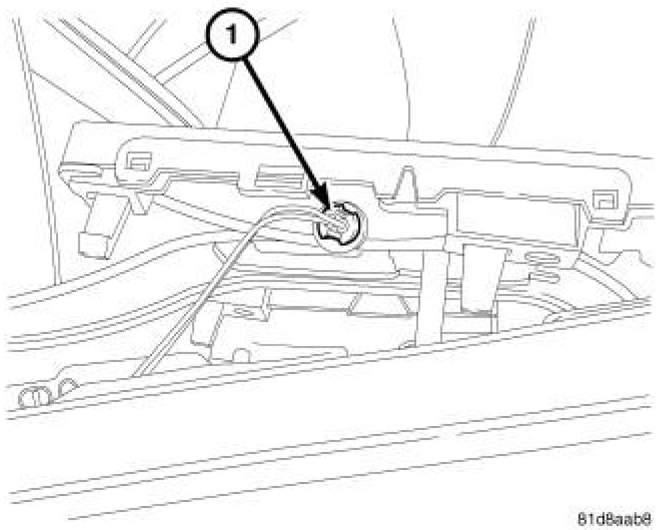

Fig. 14: Bulb Socket
Courtesy of CHRYSLER GROUP, LLC

3. Using a trim stick or equivalent, gently pry up the shifter bezel lock tabs.
4. Grasp the bulb socket (1) and turn counter clockwise to remove from the shifter assembly.
5. Pull the bulb from the bulb socket.

INSTALLATION

INSTALLATION

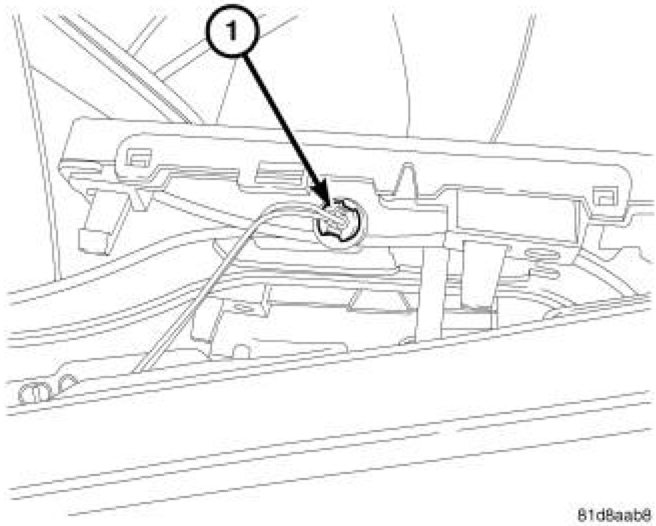

Fig. 15: Bulb Socket
Courtesy of CHRYSLER GROUP, LLC

1. Insert new bulb into bulb socket.
2. Install socket into shifter assembly.
3. Snap shifter assembly back into the center console.
4. Install shifter console trim panel and shift console trim ring. Refer to **CONSOLE, FLOOR, INSTALLATION** .
5. Connect battery negative cable.

LAMP, TRUNK

REMOVAL

BULB

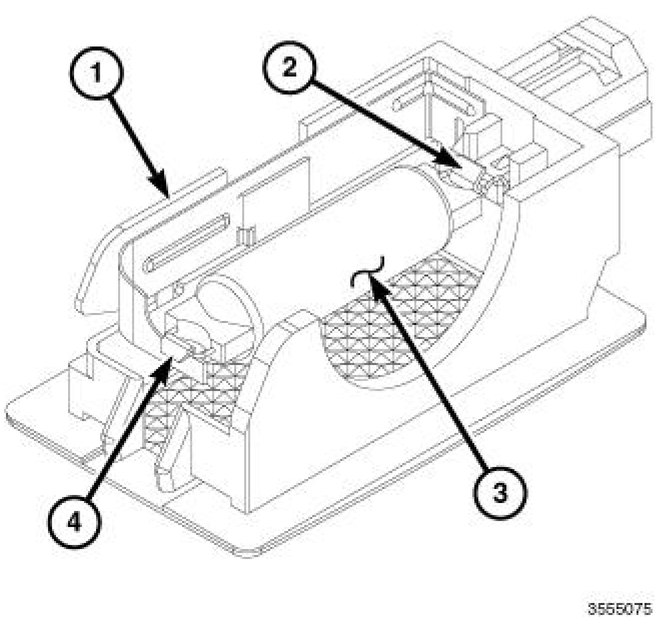

Fig. 16: Exit Lamp Unit, Bulb Holder & Bulb
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the trunk lamp unit (1) from the right or left trunk trim panel. Refer to **LAMP, TRUNK, REMOVAL**.
3. Gently press the movable bulb holder (4) and the bulb (3) towards the fixed bulb holder (2) far enough to disengage the wire loop terminal of the bulb from the hook of the fixed bulb holder.
4. Disengage the wire loop terminal of the bulb from the hook on the movable bulb holder.
5. Remove the bulb from the lamp.

LAMP

4. Using small needle-nose pliers, carefully grasp the bulb (2) and pull the base out of the lamp socket.

INSTALLATION

INSTALLATION

CAUTION: **Always use the correct bulb size and type for replacement. An incorrect bulb size or type may overheat and cause damage to the lamp, the socket or the lamp wiring.**

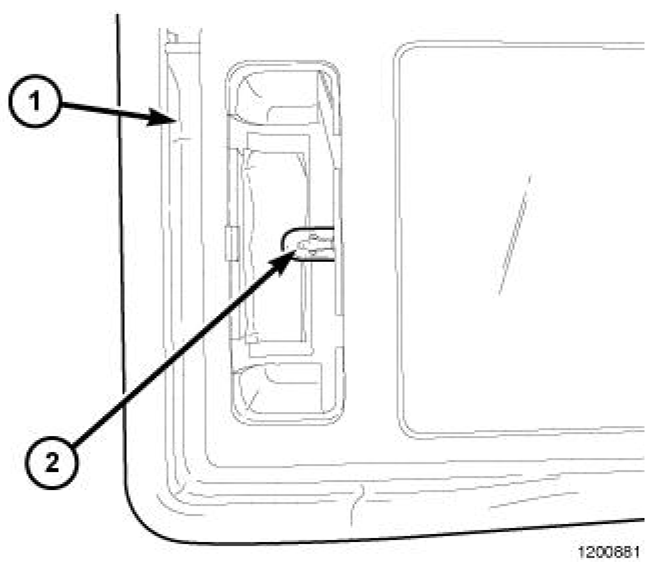

Fig. 22: Vanity Lamp Bulb
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Vehicles equipped with optional vanity lamps have a single lamp at each side of the covered mirror that is integral to each sun visor. Each lamp is independently controlled by an integral switch that is automatically actuated by**

the mirror cover. The lamp housings, the switch, the mirror and the mirror cover are serviced only as a unit with the sun visor. The bulb types and service procedures are identical for each of these lamp bulbs.

1. Using small needle-nose pliers, carefully grasp the vanity lamp bulb (2) and align the base of the bulb with the socket in the lamp housing of the sun visor (1).
2. Push the bulb straight into the socket until the base is fully seated.

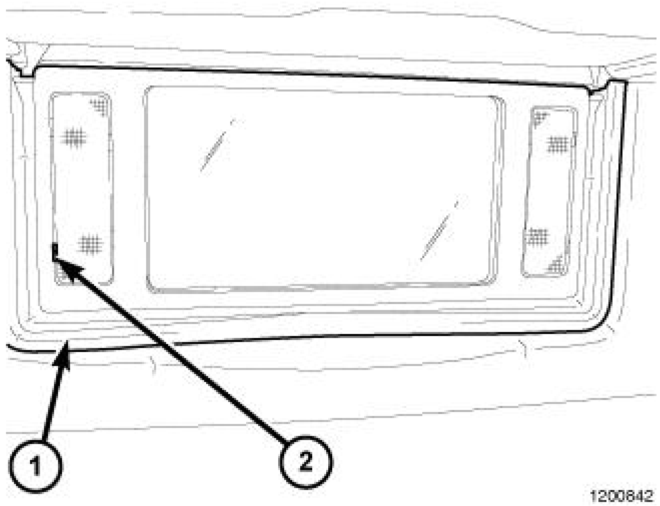

Fig. 23: Vanity Lamp
Courtesy of CHRYSLER GROUP, LLC

3. Insert one tab on the top or the bottom of the lens (2) into the appropriate slot at the top or bottom of the lamp housing.
4. Flex the lens far enough to engage the loose tab into its slot in the lamp housing.
5. Reconnect the battery negative cable.

SWITCH AND LAMP, GLOVE BOX

REMOVAL

BULB

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

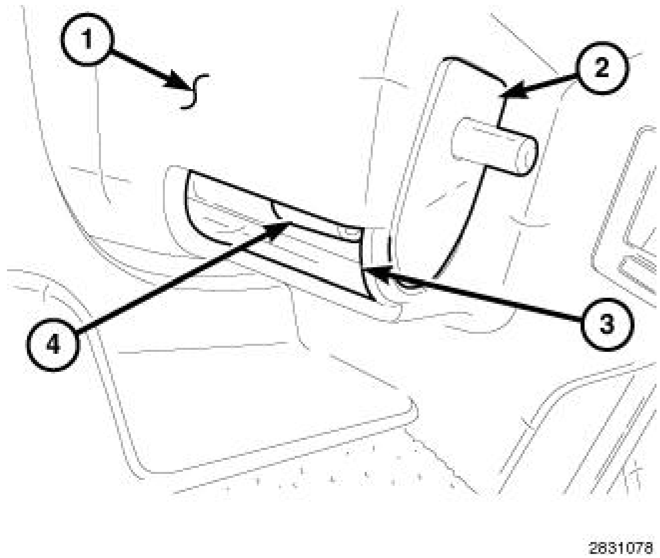

Fig. 24: Window, Glove Box Housing, Bulb & Switch Unit
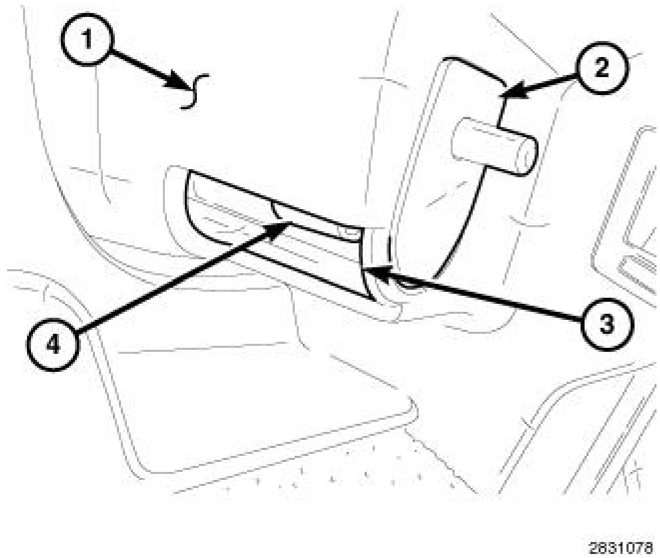
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Open the glove box.
3. Reach through the window (3) in the instrument panel glove box housing (1) to access the bulb (4) on the lower side of the glove box lamp and switch unit (2).
4. Pull the base of the bulb straight out of the bulb holder and out through the window.

LAMP/SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.



[Fig. 25: Window, Glove Box Housing, Bulb & Switch Unit]
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Open the glove box.
3. Reach through the window (3) in the instrument panel glove box housing (1) to access and depress the latch feature on either side of the glove box lamp and switch unit (2).
4. While holding the retaining latch depressed, push the glove box lamp and switch unit out through the mounting hole in the face of the instrument panel glove box housing.
5. Disconnect the wire harness connector from the glove box lamp and switch.
6. Remove the lamp and switch unit from the instrument panel.

INSTALLATION

BULB

WARNING:	**To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. [Fig. 27: Window, Glove Box Housing, Bulb & Switch Unit]

Courtesy of CHRYSLER GROUP, LLC

1. Position the glove box lamp and switch unit (2) to the instrument panel glove box housing (1).
2. Reconnect the wire harness connector to the lamp and switch unit.
3. Feed the wire harness back through the switch mounting hole.
4. Align the lamp and switch unit with the mounting hole in the instrument panel glove box housing.
5. Using hand pressure, push the lamp and switch unit firmly and evenly into the mounting hole until it is fully seated.
6. Close the glove box.
7. Reconnect the battery negative cable.

SWITCH, DIMMER

DESCRIPTION

DESCRIPTION

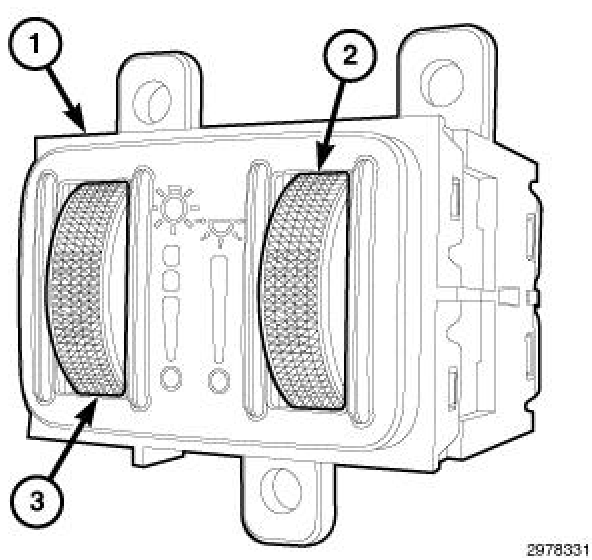

Fig. 28: Dimmer Module, Thumbwheel & Second Thumbwheel
Courtesy of CHRYSLER GROUP, LLC

This vehicle has a separate dimmer module (1) that is located on the instrument panel, in a mounting hole inboard of the headlamp switch mounting hole, outboard of the steering column. The standard dimmer module features a single thumbwheel (3) for panel lamps dimming and interior lighting control. There are also two optional switches with a second thumbwheel (2). The second thumbwheel is used for ambient (also known as halo) lighting control in vehicles with the ambient lighting option, or for headlamp leveling control in vehicles manufactured for certain markets where headlamp leveling is required.

The dimmer module is constructed of molded plastic. The thumbwheel is molded plastic and knurled around its circumference to ease operator control. The dimmer module face plate is labeled with graphics and International Control and Display Symbol icons to clearly identify the functions of the thumbwheel or optional thumbwheels.

The dimmer module housing is secured within the mounting hole of the instrument panel by three screws, two on the top and one on the bottom. The back of the dimmer module housing has an integral connector receptacle containing terminal pins that connect the module to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness. Panel dimmer controlled Light Emitting Diode (LED) units soldered to the circuit board within the module provide back lighting for visibility at night, but are not serviceable.

The dimmer module cannot be repaired and, if ineffective or damaged, it must be replaced.

OPERATION

OPERATION

The dimmer module uses a single resistor multiplexed output for each switch thumbwheel to control the many functions and features it provides. The switch receives a clean ground from the Body Control Module (BCM) on a multifunction switch MUX return circuit. It then provides outputs to the BCM on a panel lamps dimmer signal circuit to control panel dimmer and interior lighting functions, or on a dimmer environmental lighting circuit to control ambient (halo) lighting functions.

On vehicles equipped with a remote manual headlamp leveling system, the dimming module also receives a battery voltage input on a park/tail/running lamps feed circuit whenever the exterior lighting is turned ON. It then provides outputs to the BCM on a headlamp leveling switch to module signal circuit to control the headlamp leveling function.

The dimmer module illumination circuit receives a path to ground at all times through an instrument panel ground circuit. The illumination level is controlled by a Pulse-Width Modulated (PWM) output received from the BCM on a panel lamps driver circuit. The BCM controls this output based upon the panel lamps dimmer signal circuit input from the dimmer module.

The dimmer module operates as follows:

- **Ambient (Halo) Lighting Control -** On vehicles so equipped, the right thumbwheel on the dimmer module is rotated to the ambient DEFEAT or one of the six ambient dimmer detent positions to control the ambient (halo) lighting level. The dimmer module provides the appropriate resistor multiplexed output to the BCM over the dimmer environmental lighting circuit. The BCM reads and responds to this input by providing the appropriate control outputs through internal HSDs over the liftgate courtesy feeds

driver circuit.

- **Headlamp Leveling Control** - On vehicles so equipped, the right thumbwheel on the dimmer module is rotated to the 0, 1 or 2 detent positions to provide the appropriate resistor multiplexed output to the BCM over the headlamp leveling switch to module signal circuit. The BCM reads and responds to this input by providing the appropriate control outputs to the headlamp leveling motors.
- **Interior Lighting Control** - The left thumbwheel on the dimmer module is rotated to the dome DEFEAT, dome ON, PARADE mode, or one of the six panel dimmer detent positions to control the interior courtesy/dome and panel lamps. The dimmer module provides the appropriate resistor multiplexed output to the BCM over the panel lamps dimmer signal circuit. The BCM reads and responds to this input by providing the appropriate control outputs through internal HSDs over the courtesy lamps, panel lamps and reading lamps driver circuits, and by sending appropriate electronic **dimming level** messages to other electronic modules over the CAN data bus.

The dimmer module as well as the hard wired inputs and outputs of the module may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - DIMMER SWITCH

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

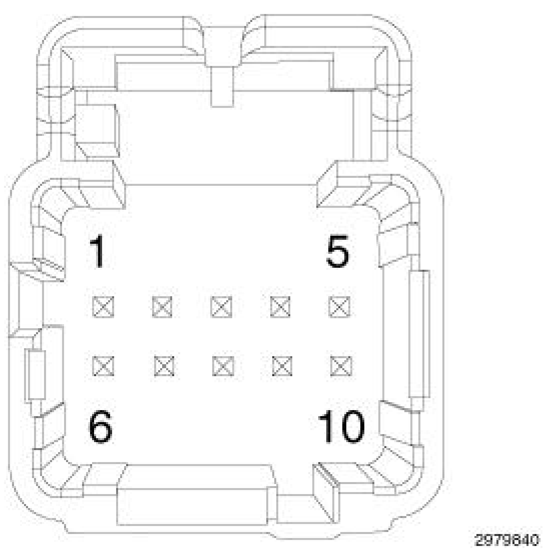

Fig. 29: Dimmer Switch Connector Terminal Identification
Courtesy of CHRYSLER GROUP, LLC

1. Remove the dimmer module from the instrument panel. Refer to SWITCH, DIMMER, REMOVAL.
2. Disconnect the instrument panel wire harness connector from the back of the dimmer module.

3. Using an ohmmeter, test the resistance between the terminals of the module as shown in the Dimmer Module Tests chart .

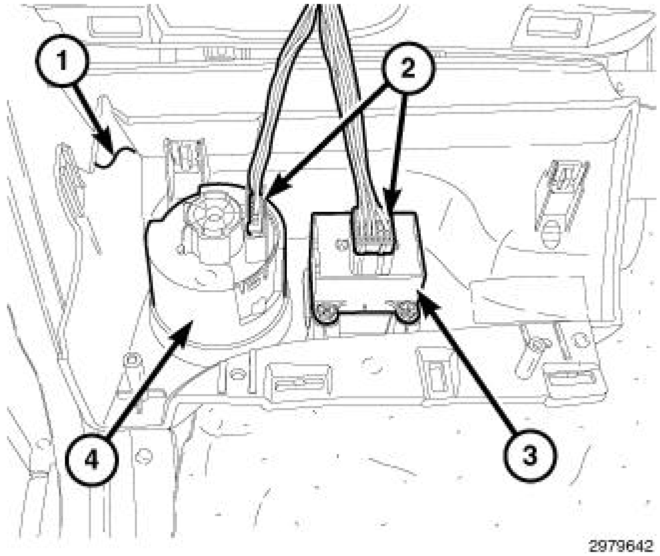
DIMMER MODULE TESTS	
SWITCH POSITION (PINS)	**RESISTANCE RANGE (OHMS)**
DOME DEFEAT (1 and 4)	8645 - 9555
PANEL DIMMER 1 (1 and 4)	2565 - 2835
PANEL DIMMER 2 (1 and 4)	1140 - 1260
PANEL DIMMER 3 (1 and 4)	646 - 714
PANEL DIMMER 4 (1 and 4)	417.78 - 426.22
PANEL DIMMER 5 (1 and 4)	256.5 - 283.5
PANEL DIMMER 6 (1 and 4)	180.18 - 183.82
PARADE MODE (1 and 4)	135.63 - 138.37
DOME ON (1 and 4)	172.26 - 175.74
AMBIENT DOME DEFEAT (1 and 5)	8645 - 9555
AMBIENT DIMMER 1 (1 and 5)	2565 - 2835
AMBIENT DIMMER 2 (1 and 5)	1140 - 1260
AMBIENT DIMMER 3 (1 and 5)	646 - 714
AMBIENT DIMMER 4 (1 and 5)	417.78 - 426.22
AMBIENT DIMMER 5 (1 and 5)	256.5 - 283.5
AMBIENT DIMMER 6 (1 and 5)	494.01 - 503.99
HEADLAMP LEVELING 0 (7 and 8)	172.26 - 175.74
HEADLAMP LEVELING 1 (7 and 8)	198 - 202
HEADLAMP LEVELING 2 (7 and 8)	575.19 - 586.81
SWITCH ILLUMINATION (2 and 3)	LEDs - SET MULTIMETER TO DIODE MODE - CONNECT PIN 3 TO PLUS (+), CONNECT PIN 2 TO MINUS (-) - LEDs SHOULD BARELY GLOW

4. If the module fails any of the tests, replace the ineffective dimmer module as required.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.



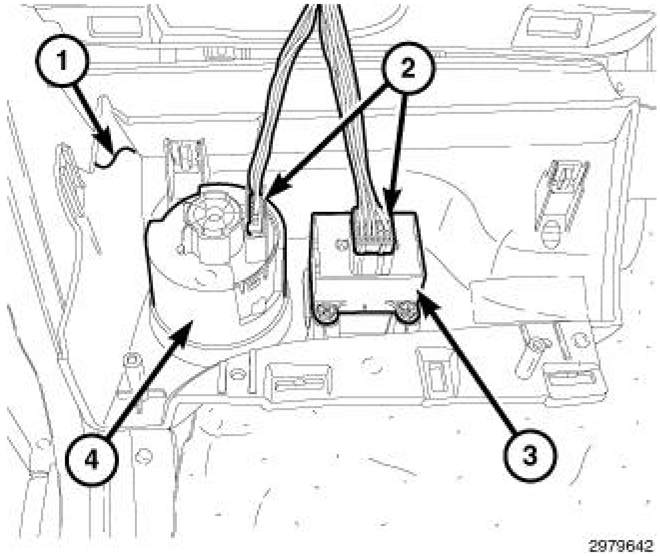
[Fig. 30: Trim Molding, Wire Harness Connector & Dimmer Module](#)
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Using a trim stick or another suitable wide flat-bladed tool, gently and evenly pry around the perimeter of the instrument panel trim molding outboard of the steering column to unsnap the molding from the instrument panel.
3. Pull the trim molding (1) away from the instrument panel far enough to access and disconnect the instrument panel wire harness connector (2) from the dimmer module (3) connector receptacle.
4. Remove the three screws that secure the dimmer module to the back of the instrument panel trim molding.
5. Remove the dimmer module from the trim molding.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.



[Fig. 31: Trim Molding, Wire Harness Connector & Dimmer Module]

Courtesy of CHRYSLER GROUP, LLC

1. Position the dimmer module (3) onto the back of the driver side outboard instrument panel trim molding (1).
2. Install and tighten the three screws that secure the dimmer module to the trim molding. Tighten the screws securely.
3. Reconnect the instrument panel wire harness connector (2) to the dimmer module connector receptacle.
4. Align the snap clips on the back of the trim molding with the receptacles in the instrument panel outboard of the steering column. Using hand pressure, press firmly and evenly on the bezel until the clips snap into place.
5. Reconnect the battery negative cable.

SWITCH, DOOR AJAR

DESCRIPTION

DOOR

This vehicle has door ajar switches for each door. Each switch is concealed within and integral to its respective door latch unit. The switches are momentary leaf contact-type micro switch units that are actuated by the mechanisms internal to the door latch. An integral connector receptacle on each door latch connects the door ajar switch and the power lock motor to the vehicle electrical system through its respective door wire harness.

The door ajar switches cannot be adjusted or repaired and, if ineffective or damaged, the door latch unit must be replaced.

DECK LID

A deck lid ajar switch is standard equipment on this vehicle. The switch is concealed within and integral to the deck lid latch unit. The switch is a momentary leaf contact-type micro switch unit that is actuated by the deck lid latch mechanism. An integral connector receptacle on the deck lid latch connects the deck lid ajar switch to the vehicle electrical system through the body wire harness.

The deck lid ajar switch cannot be adjusted or repaired and, if ineffective or damaged, the deck lid latch unit must be replaced. Refer to **LATCH, REMOVAL** .

OPERATION

DOOR

The door ajar switches are actuated by the mechanisms internal to the door latch. When a door is closed and properly latched, its door ajar switch is an open circuit. When a door is open or only partially latched, the door ajar switch is a closed circuit. The door ajar switches are hard wired in series between a body ground and the Body Control Module (BCM). The BCM reads the hard wired door ajar switch inputs through internal pull-ups, then uses these inputs to control many electronic functions and features of the vehicle. The BCM also sends electronic **door ajar switch status** messages to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus.

The door ajar switches as well as the hard wired inputs and outputs of the switches may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article.

DECK LID

The deck lid ajar switch is actuated by the deck lid latch mechanism. When the deck lid is closed and properly latched, the deck lid ajar switch is an open circuit. When the deck lid is open or only partially latched, the deck lid ajar switch is a closed circuit. The deck lid ajar switch is hard wired in series between a body ground and the Body Control Module (BCM). The BCM reads the hard wired liftgate ajar switch input through an internal pull-up, then uses this input to control many electronic functions and features of the vehicle. The BCM also sends electronic **deck lid ajar switch status** messages to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus.

The deck lid ajar switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article.

.

REMINDER INDICATOR (RESET PROCEDURES)

Chrysler / Dodge / Plymouth / RAM - 1978-17

EMISSIONS MAINTENANCE REMINDER (EGR)

NOTE: **To determine the appropriate reset procedure, refer to EMISSIONS MAINTENANCE REMINDER RESET INDEX. Only vehicles listed in this index have an EGR/Maintenance Required Warning Light reset.**

EMISSIONS MAINTENANCE REMINDER RESET INDEX

Model & Year	Reset Procedure
Colt & Colt Vista	
1978-94	Emissions Maintenance Reminder Reset - Procedure 1
Ram-50	
1985-93	Emissions Maintenance Reminder Reset - Procedure 1

EMISSIONS MAINTENANCE REMINDER RESET - PROCEDURE 1

1. On some models, an EGR or MAINTENANCE REQUIRED warning light in dash will come on as a reminder to have EGR system serviced (each 50,000 miles), oxygen sensor replaced (each 80,000 miles), or evaporative carbon canister replaced (100,000 miles).
2. After servicing or replacing components, reset mileage counter. Reset switch is located on back of instrument cluster. See **Fig. 1**, **Fig. 2** and **Fig. 3** . Slide switch to opposite side to reset indicator light.
3. Remove light bulb after 120,000 mile service on Ram-50.

EMISSIONS MAINTENANCE REMINDER (EMR MILEAGE)

NOTE: **To determine the appropriate reset procedure, refer to EMISSIONS MAINTENANCE REMINDER RESET INDEX. Only vehicles listed in this index have a Emission Maintenance Reminder (EMR) mileage reset.**

EMISSIONS MAINTENANCE REMINDER RESET INDEX

Model & Year	Reset Procedure
Light Duty Trucks & Vans	
1989-92	Emissions Maintenance Reminder Reset - Procedure 1

EMISSIONS MAINTENANCE REMINDER RESET - PROCEDURE 1

NOTE: **If any other scan tool is used, use scan tool manufacturer's instructions.**

1. Attach DRB-II tester to diagnostic connector.
2. Turn ignition on but do not start engine.
3. Access SELECT SYSTEMS function of DRB-II tester.
4. Select appropriate engine.
5. Select with or without A/C.
6. Select FUEL & IGNITION.
7. Select ADJUSTMENTS.
8. Select RESET EMR LIGHT.
9. Reset EMR light.
10. When DRB-II is finished resetting light, DRB-II display will read EMR LIGHT IS RESET.

NOTE: **If Single Module Engine Controller (SMEC) or Single Board Engine Controller (SBEC) is replaced, vehicle mileage must be programmed back into the SMEC/SBEC. DRB-II tester MUST be used for this procedure. If the following procedure is not performed, EMR light will not turn on at the proper mileage intervals.**

EMISSIONS MAINTENANCE REMINDER (MAINT REQD OR CHECK EGR)

NOTE: **To determine the appropriate reset procedure, refer to EMISSIONS MAINTENANCE REMINDER RESET INDEX. Only vehicles listed in this index have a MAINT REQD OR CHECK EGR INDICATOR LIGHT reset.**

EMISSIONS MAINTENANCE REMINDER RESET INDEX

1988	Emissions Maintenance Reminder Reset - Procedure 1
RWD Vans	
1988	Emissions Maintenance Reminder Reset - Procedure 1

EMISSIONS MAINTENANCE REMINDER RESET - PROCEDURE 1

CAUTION: There is no test procedure for this system. Any attempt to test this system will damage system components.

The Service Reminder Indicator (SRI) module is not an emissions warning system. It is only a reminder to perform emissions servicing. Components to be serviced include the EGR system, PCV valve, oxygen sensor, delay valves, and bi-level purge valve.

The SRI module will illuminate the MAINT REQD or CHECK EGR light after a predetermined time. The light will remain on until the SRI module is reset by inserting a small screwdriver into the hole in the module (RWD only) and/or depressing the reset switch (FWD and RWD). Replace 9-volt battery (if equipped).

The SRI module is located on steering column, behind instrument panel on RWD vans and in instrument cluster, under fuel gauge, on FWD vans. See **Fig. 4** or **Fig. 5** . On light trucks except Dakota, SRI module is located behind the far right side of dash panel next to glove box. See **Fig. 6**. On Dakota models, module is located on bracket below headlight switch, on rear of instrument panel. See **Fig. 7**.

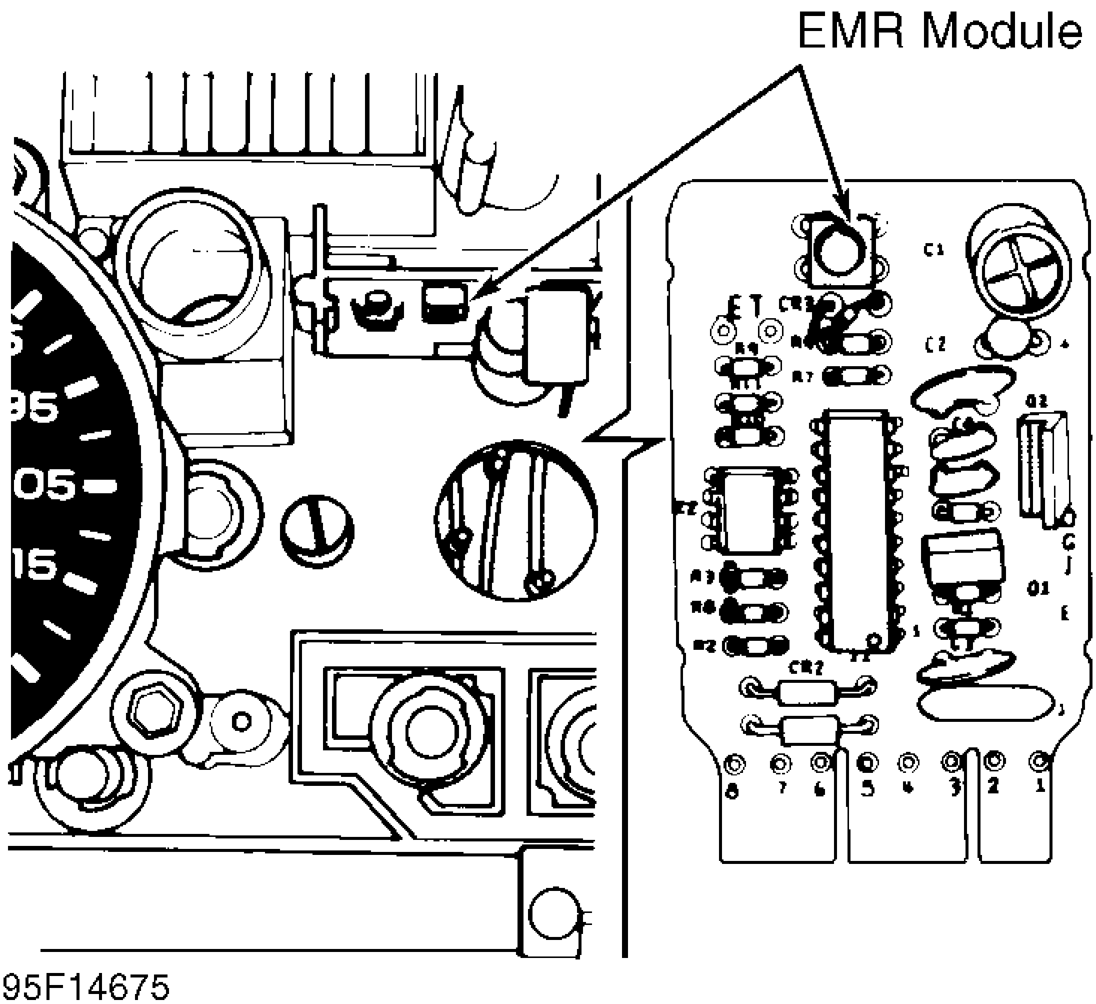

Fig. 4: Locating SRI Module (1987-88 FWD Vans)

EMISSIONS MAINTENANCE REMINDER (SRI)

NOTE: **To determine the appropriate reset procedure, refer to EMISSIONS MAINTENANCE REMINDER RESET INDEX. Only vehicles listed in this index have a MAINT REQD OR SRI LIGHT reset.**

EMISSIONS MAINTENANCE REMINDER RESET INDEX

Model & Year	Reset Procedure
Light Duty Trucks & Vans	
1993	Emissions Maintenance Reminder Reset - Procedure 1
Ram Pickup 2500/3500	
1994-02	Emissions Maintenance Reminder Reset - Procedure 2

EMISSIONS MAINTENANCE REMINDER RESET - PROCEDURE 1

The components to be serviced include the EGR system, PCV valve, oxygen sensor and some vacuum-operated components. SRI will illuminate after a predetermined mileage. To reset SRI, a Chrysler Diagnostic Readout Box (DRB) Tester or suitable scan tool is required.

1. Attach DRB tester to diagnostic connector. Turn ignition on, but do not start engine. Using DRB, perform Service Reminder Indicator (SRI) memory test. If DRB displays WRITE FAILURE, replace Powertrain Control Module (PCM).
2. If DRB displays WRITE REFUSED, go to step 4. If DRB displays SRI MILEAGE INVALID, update mileage and retest SRI memory. If DRB does not display SRI MILEAGE INVALID, compare SRI mileage stored with instrument panel odometer.
3. If mileage is same, retest SRI memory. If mileage is not same, update mileage and retest SRI memory.
4. PCM was busy. Using DRB, perform SRI memory test. Retest SRI memory 2 or more times, if necessary. If WRITE REFUSED trouble code returns, replace PCM. If WRITE REFUSED does not return, procedure is complete.

EMISSIONS MAINTENANCE REMINDER RESET - PROCEDURE 2

The components to be serviced include the EGR system, PCV valve, and oxygen sensor. The SRI or Maintenance Required will illuminate after a predetermined mileage. To reset the light, a Chrysler Diagnostic Readout Box (DRB) Tester or suitable scan tool is required. Follow scan tool manufacturer's information to reset SRI.

ENGINE OIL REPLACEMENT REMINDER

NOTE: **To determine the appropriate reset procedure, refer to ENGINE OIL REPLACEMENT REMINDER RESET INDEX. Only vehicles listed in this index have an Oil Change Required Message reset.**

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 1

NOTE: **On some vehicles Procedure 2 may also reset the Engine Oil Replacement Reminder.**

NOTE: The Oil Change Required message can be temporarily turned off by pressing and releasing the Trip Odometer button in instrument cluster.

To reset oil change indicator after performing scheduled maintenance:

1. Turn ignition to ON/RUN, with engine OFF.

   NOTE: On vehicles with keyless START, without pressing the brake pedal, push the ENGINE START/STOP button and cycle the ignition to the ON/RUN position (DO NOT START the engine).

2. Fully depress accelerator pedal slowly 3 times within 10 seconds.
3. Turn ignition to OFF/LOCK.

   NOTE: On vehicles with keyless START, without pressing the brake pedal, push the ENGINE START/STOP button once to return the ignition to the OFF/LOCK position.

4. Start engine. If indicator message illuminates when engine is started, repeat reset procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 2

NOTE: For vehicles NOT equipped with Passive Entry.

NOTE: The manufacturer describes this procedure as a "Secondary Method Of Navigating To The Oil Life Screen In The DID And Holding OK". This method may not be appropriate for all vehicles.

1. Without pushing the brake pedal, push the engine START/STOP button and cycle the ignition to the ON/RUN position (DO NOT START the engine).
2. Push and release the DOWN arrow button (steering wheel) to scroll downward through the main menu to "Vehicle Info".
3. Push and release the RIGHT arrow button to access the "Oil Life" screen.
4. Push and hold the OK button to reset of the Oil Life.

   NOTE: If conditions are met, the gauge and numeric display will update to show 100%. If conditions are not met a popup message of "To reset oil life engine must be off with ignition in run" will be displayed (for 5 seconds), and the user will remain at the Oil Life screen.

5. Push and release the UP arrow button to exit the screen.

NOTE: If the indicator message illuminates when you start the vehicle, the oil change indicator system did not reset. If necessary, repeat this procedure.

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 3

NOTE: For vehicles equipped with Passive Entry.

1. Without pushing the brake pedal, push the engine START/STOP button and cycle the ignition to the ON/RUN position (DO NOT START the engine).
2. Push and release the DOWN arrow button (steering wheel) to scroll downward through the main menu to "Vehicle Info".
3. Push and release the right arrow button to access the "Vehicle Info" screen, then scroll up or down to select "Oil Life".
4. Push and hold the right arrow button to select "Reset".
5. Push and release the down arrow button to select "Yes," then push and release the right arrow button to select reset of the Oil Life to 100%.
6. Push and release the up arrow button to exit the instrument cluster display screen.

NOTE: **If the indicator message illuminates when you start the vehicle, the oil change indicator system did not reset. If necessary, repeat this procedure.**

ENGINE OIL REPLACEMENT REMINDER RESET - PROCEDURE 4

The Flexible Service System (FSS) is a demand-activated engine oil service system. The FSS will illuminate a symbol (2) in the instrument cluster to indicate to the driver when a particular service is due. See **Fig. 8**. After a level has dropped below a warning threshold, the remaining distance or the remaining time and the tool symbol (2) are displayed in the panel of the odometer. The counter can be reset after the indicated service has been performed.

NOTE: **The FSS display can be called up for approximately ten seconds with the display illuminated by pressing the knob/button to the left of the display twice within one second.**

1. Turn the ignition key to the ON/RUN position.
2. Within one second press the knob/button to the left of the display twice. See **Fig. 8**.
3. The present status for days remaining or distance traveled is displayed. Within ten seconds turn the key to OFF.
4. Press and hold the knob/button to the left of the display, while turning the key to ON/RUN again. The present status for days remaining or distance traveled is displayed once more. Continue to hold the knob/button to the left of the display.
5. Release the knob/button to the left of the display. After approximately ten seconds, a tone sounds and the display shows 7,000 miles (11,000 km) for approximately ten seconds.

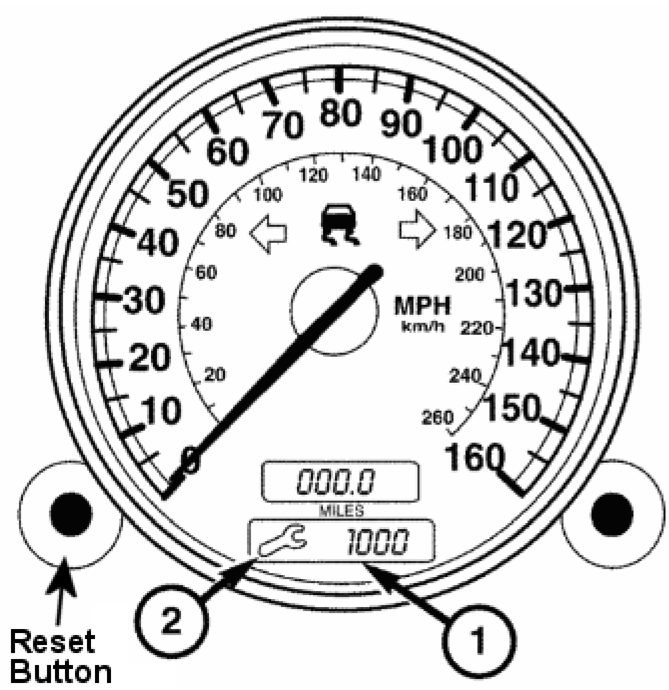

Fig. 8: Identifying FSS Display And Reset Button
Courtesy of CHRYSLER CORP

MAINTENANCE SERVICE REMINDER (ASSYST MAINTENANCE COMPUTER)

NOTE: **To determine the appropriate reset procedure, refer to MAINTENANCE SERVICE REMINDER RESET INDEX. Only vehicles listed in this index have an ASSYST Maintenance Computer reset.**

MAINTENANCE SERVICE REMINDER RESET INDEX

Model & Year	Reset Procedure
Sprinter	
2003-09	Maintenance Service Reminder Reset - Procedure 1

MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 1

When a service as been performed, the ASSYST maintenance computer can be reset as follow:

1. Turn the key to position 2 in the ignition lock and immediately press the "mi" ("km") button twice and hold. Keep the "mi" ("km") button pressed.
2. Within 10 seconds, return the key to position 0 in the ignition lock.
3. Continue to press and hold the "mi" ("km") button. Turn the key to position 2 in the ignition lock. Keep the "mi" ("km") button pressed.
4. The maintenance indicator with the current remaining time/distance is shown.
5. After about 10 seconds, an acoustic signal will sound and the maintenance indicator is displayed with the new remaining time/distance.
6. Release the "mi" ("km") button.

MAINTENANCE SERVICE REMINDER (PERFORM SERVICE)

NOTE: **To determine the appropriate reset procedure, refer to MAINTENANCE SERVICE REMINDER RESET INDEX. Only vehicles listed in this index have a Perform Service Message reset.**

PERFORM SERVICE MESSAGE RESET INDEX

Model & Year	Reset Procedure
300M	
2001-04	Maintenance Service Reminder Reset - Procedure 1
Caravan & Grand Caravan

2001	Maintenance Service Reminder Reset - Procedure 1
Dodge Pickup 1500	
2002	Maintenance Service Reminder Reset - Procedure 3
Town & Country	
2003-07	Maintenance Service Reminder Reset - Procedure 4

MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 1

The PERFORM SERVICE message is a warning message delivered from the Electronic Vehicle Information Center (EVIC). This indicates that regular maintenance is due. After regular required maintenance is performed, the counter is reset by pressing and holding the reset button for 3 seconds.

MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 2

1. The Electronic Vehicle Information Center (EVIC) displays a PERFORM SERVICE message when distance to service interval has been reached, indicating that regular service and maintenance is due. After performing necessary services, reset service distance by selecting a distance to service interval.
2. To program EVIC, turn ignition switch to ON position. Depress and release MENU push button until SERVICE INTV. = is displayed. Press and release STEP button to step through available options. The last selected distance option displayed becomes the service interval at which the PERFORM SERVICE message will be displayed.
3. If a new distance interval is selected, RESET SERVICE DISTANCE? with a yes or no option. When YES is selected, the accumulated distance since the last previous PERFORM SERVICE message will be reset to zero because the service interval has been changed. When NO is selected, the distance until the next PERFORM SERVICE message is reduced by the accumulated distance since the last pervious message.
4. EVIC exits programming mode and returns to its normal operation mode when the C/T button is depressed or when the end of the programmable feature menu list is reached, whichever occurs first.

MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 3

The Vehicle Information Center (VIC) displays a PERFORM SERVICE message. PERFORM SERVICE message is displayed when "miles/kms" to service is zero, indicating that regular service and maintenance is due. After performing necessary services, reset service distance by pressing the STEP button when in this display will select "Yes" or "No".

MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 4

1. The Electronic Vehicle Information Center (EVIC) displays a PERFORM SERVICE message when distance to service interval has been reached, indicating that regular service and maintenance is due. After performing necessary services, reset service distance by selecting a distance to service interval.
2. To program EVIC, turn ignition switch to ON position. Depress and release MENU push button until SERVICE INTV. = is displayed. Press and release STEP button to step through available options. The last selected distance option displayed becomes the service interval at which the PERFORM SERVICE message will be displayed.
3. If a new distance interval is selected, RESET SERVICE DISTANCE? with a yes or no option. When YES is selected, the accumulated distance since the last previous PERFORM SERVICE message will be reset to zero because the service interval has been changed. When NO is selected, the distance until the next PERFORM SERVICE message is reduced by the accumulated distance since the last pervious message.
4. EVIC exits programming mode and returns to its normal operation mode when the C/T button is depressed or when the end of the programmable feature menu list is reached, whichever occurs first.

MAINTENANCE SERVICE REMINDER (SERVICE REMINDER INDICATOR)

NOTE: **To determine the appropriate reset procedure, refer to MAINTENANCE SERVICE REMINDER RESET INDEX. Only vehicles listed in this index have a Service Reminder Indicator Light reset.**

SERVICE REMINDER INDICATOR LIGHT RESET INDEX

Model & Year	Reset Procedure
Models With Electronic Type Counter	
1980	Maintenance Service Reminder Reset - Procedure 1
Monaco	
1990-92	Maintenance Service Reminder Reset - Procedure 2

MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 1

NOTE: **This procedure is for models with Electronic Type Mileage Counter.**

A mileage counter activates the service reminder indicator between 12,000 and 30,000 mile intervals, depending on whether mechanical or electronic type is used. On 1987 Dakota models, mileage counter in the odometer will illuminate reminder light at 52,500, 82,500 and 105,000 miles.

The electronic type uses a 9-volt battery which supplies power to the electronic counter, preventing memory loss when vehicle battery is disconnected.

NOTE: **Vehicle battery must be connected during resetting procedure to prevent power loss to memory.**

To reset electronic type, locate Green, Red, White or Tan plastic case behind instrument panel in lower left cluster area. Slide case from bracket and open cover. Remove 9-volt battery, and insert a small rod or screwdriver into hole in switch, closing contacts. Replace battery with a new 9-volt alkaline type. Close case. Slide case back into bracket. See Fig. 9.

NOTE: **Some models use a non-resettable mileage counter. Replace it with a resettable type.**

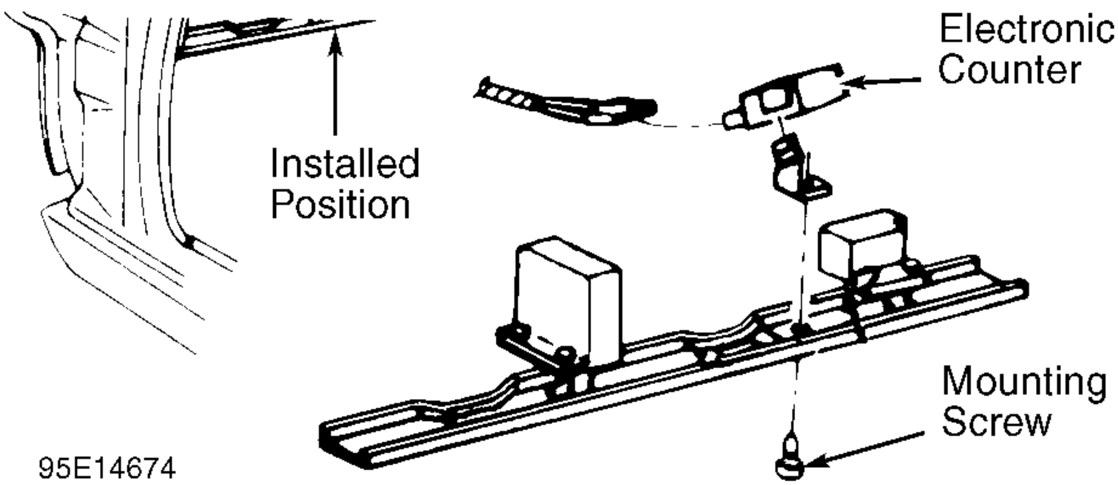

Fig. 9: Chrysler Electronic Type Reset Switch
Courtesy of CHRYSLER CORP.

MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 2

Every 7500 miles, a Vehicle Maintenance Monitor (VMM) will illuminate a SERVICE interval reminder indicator light. This indicates regular maintenance is due. After required service is performed, press RESET button on dash below VMM display. Hold button until a beep is heard. VMM display will now be clear.

MAINTENANCE SERVICE REMINDER (SERVICE REMINDER MESSAGE)

NOTE: **To determine the appropriate reset procedure, refer to MAINTENANCE SERVICE REMINDER RESET INDEX. Only vehicles listed in this index have a Service Reminder Message reset.**

MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 1

Every 7500 miles or 12 months which ever comes first, a service reminder message on Electronic Vehicle Information Center (EVIC) display will illuminate, indicating an oil change is due. The EVIC is an optional accessory located in the overhead console.

Pressing INFO button with the ignition on will activate a MONITORED SYSTEMS OK message on the display if all systems are operating properly. If service is required, SERVICE REMINDER message will be displayed. Pressing the RESET button after message has been displayed will clear the message.

MAINTENANCE SERVICE REMINDER RESET - PROCEDURE 2

Every 7500 miles or 12 months which ever comes first, a service reminder message on Electronic Vehicle Information Center (EVIC) display will illuminate, indicating an oil change is due. The EVIC is an optional accessory located in the overhead console.

Pressing INFO button with the ignition on will activate a MONITORED SYSTEMS OK message on the display if all systems are operating properly. If service is required, SERVICE REMINDER message will be displayed. To clear message, press INFO button and within 5 seconds, press SET button.

TIRE PRESSURE MONITOR SYSTEM REMINDER

NOTE: **To determine the appropriate reset procedure, refer to TPMS RESET INDEX. Only vehicles listed in this index have a TPMS reset.**

(1) Some early Dodge/RAM Pickup 3500 and Cab & Chassis models may not be equipped with TPMS.	

TPMS REMINDER RESET - PROCEDURE 1

NOTE: **Some early Dodge/RAM Pickup 3500 and Cab & Chassis models may not be equipped with TPMS.**

NOTE: **In a low tire pressure siuation, the TPMS indicator light (and message) will turn OFF only after the tires are inflated to the vehicles recommended cold placard pressure value. The vehicle may need to be driven for up to 20 minutes above 20 mph (32 km/h) in order for the TPMS to determine that the inflation pressures are correct.**

Once a sensor has been replaced and vehicle has remained stationary for more than 20 minutes, drive vehicle for a minimum of 20 minutes while maintaining a continuous speed above 20 mph (32 km/h). During this time, the system will learn the new sensor ID code and will clear any DTCs automatically. If a sensor cannot be trained, see appropriate manufacturer service information.

NOTE: **The sensor IDs can also be programmed using the TPM-RKE Analyzer Tool. Scan each TPM sensor at each road wheel, and store each Sensor ID in the correct location (Left Front, Left Rear, Right Front, and Right Rear). Connect the TPM-RKE Analyzer Tool to the Scan Tool. Then follow the programming steps outlined in the diagnostic Scan Tool for "Program Tire Pressure Sensor ID w/ TPM Tool".**

TPMS REMINDER RESET - PROCEDURE 2

TPMS Indicator Reset

Once a sensor has been replaced and vehicle has remained stationary for more than 20 minutes, drive vehicle for a minimum of 10 minutes while maintaining a continuous speed above 20 mph (32 km/h). During this time, the system will learn the new sensor ID code and will clear any DTCs automatically. If a sensor cannot be trained, see appropriate manufacturer service information.

Tire Sensors Programming

WARNING: **In the following procedure, Relearn Magnet (8821) is used. Death or serious injury can occur if magnetically sensitive devices are exposed to the retraining magnet used in the TPM system. Magnets can affect pacemakers.**

NOTE: **If a tire is changed (tire rotation), one or more tire pressure sensors fail, or if TPM module is replaced, the TPM system needs to relearn tire pressure sensor**

IDs. To perform this procedure, a Chrysler DRB-IIIÃ® scan tool and a Relearn Magnet (8821) must be used.

NOTE: **The vehicle's tires must not have been rotated above 5 mph (8 km/h) in the last 2 minutes prior to programming.**

1. Connect Chrysler DRB-IIIÃ® scan tool to vehicle's Data Link Connector (DLC), which is located beneath instrument panel, near steering column.
2. Using scan tool, access "CHASSIS SYSTEM".
3. Once in "CHASSIS SYSTEM", select "MISCELLANEOUS FUNCTIONS".
4. Select "TRAIN ALL MODE" from the menu selections. Select "YES" to continue.
5. Place Relearn Magnet (8821) over the valve stem for the left front wheel.
6. Each sensor/transmitter will automatically sense the presence of the magnet and begin transmitting. When the tire pressure sensor on each wheel has been programmed, the DRB-IIIÃ® will automatically beep and direct you to the next wheel to be programmed. Move the magnet to each of the remaining wheels as directed by scan tool.
7. Remove magnet from last tire to be programmed (left rear wheel).
8. Once "TRAINING COMPLETED" is displayed, exit the program function screen and use the following to verify TPM functionality:
   - Verify TPM module programming is complete by viewing the "INPUT/OUTPUT DISPLAY" selection of the DRB-IIIÃ® and confirming the tire pressure sensors are trained.
   - Verify TPM module programming is complete by viewing the "SENSOR DISPLAY" selection of the DRB-IIIÃ® and confirming the tire pressure sensor pressure readings are accurate.

TPMS REMINDER RESET - PROCEDURE 3

NOTE: **If a tire is changed (tire rotation), one or more tire pressure sensors fail, or if TPM module is replaced, the TPM system needs to relearn tire pressure sensor IDs. The procedure is similar to Tire Sensors Programming in TPMS RESET - PROCEDURE 2.**

When tire pressure is low, the "Low Tire" Pressure Indicator Lamp signal circuit will be pulsed to ground by the TPM module for two seconds on and then two seconds off, over and over. The BCM will then illuminate the "Low Tire" Pressure Indicator Lamp at the same rate and sound the audible chime as one single long tone.

When tire pressure is critical, the low tire pressure warning lamp signal circuit will be pulsed to ground by the low tire pressure warning module for one second on and then one second off, over and over. The BCM will then illuminate the "Low Tire" Pressure Indicator Lamp and sound the audible chime at the rate of one second on and one second off.

In either case, the TPM module will continue to pulse to ground the "Low Tire" Pressure Indicator Lamp signal circuit until the sensor/transmitter(s) transmits a pressure above the calibrated thresholds (and car is then driven above 20 mph (32 km/h)) or the ignition is turned off. If the conditions has not been corrected when the ignition is turned off, the indicator lamp will remain off when the ignition is turned on again until the vehicle reaches a speed of approximately 20 mph (32 km/h).

NOTE: **In the event a diagnostic trouble code (DTC) is set, the "Low Tire" Pressure Indicator Lamp will illuminate continuously until the ignition is turned off. A low tire pressure condition cannot set a diagnostic trouble code (DTC).**

TPMS REMINDER RESET - PROCEDURE 4

The TPMS will not turn off the indicator lamp until the tire pressure is at or above the Low Pressure (lamp) OFF threshold. The system will automatically update and the TPM indicator lamp will extinguish once the updated tire pressures have been received.

NOTE: **If a tire pressure sensor has been replaced, the TPM system needs to relearn tire pressure sensor IDs.**

Wireless Control Module (WCM): The WCM automatically learns and stores new sensor IDs while driving "within 10-20 minutes continuously above 15 mph (24 km/h)" after a sensor has been replaced. The learning sequence will initiate when the vehicle has been stopped for more then 20 minutes.

A new sensor ID can also be programmed directly into the WCM by using an RKE-TPM Analyzer in conjunction with a Scan Tool. Scan each TPM sensor at each road wheel, and store each Sensor ID in the correct location. (Left Front, Left Rear, Right Front, and Right Rear) Connect the TPM-RKE Analyzer Tool to the Scan Tool. Then follow the programming steps outlined in the diagnostic Scan Tool for "Program Tire Pressure Sensor ID w/ TPM Tool"

For further information, refer to the Owners Manual or the Appropriate Diagnostic Information.

TPMS REMINDER RESET - PROCEDURE 5

NOTE: **Some early Dodge/RAM Pickup 3500 and Cab & Chassis models may not be equipped with TPMS.**

There are two tire pressure monitoring systems available, a base system and a premium system. The base system does not specify how many tires are low or where they are located. The premium system does indicate which tire is low. Sensor types are the Tire Pressure Monitoring (TPM) module for the 2500/3500 series, or the Wireless Ignition Node (WIN) for the 1500 series.

Base Tire Pressure Monitoring System:

The TPMS will not turn off the indicator lamp until the tire pressure is at or above specified tire pressure. The system will automatically update and the TPM indicator lamp will extinguish once the updated tire pressures have been received.

Premium Tire Pressure Monitoring System:

If the TPMS detects that the tire pressure in any road tire is going low, a chime will sound and the indicator lamp will turn on. In addition to the chime and lamp, a graphic display of the pressure value(s) and position of the low tire(s) will flash in the Electronic Vehicle Information Center (EVIC). Once pressure in the suspect tire(s) raises above the specified tire pressure, and the TPM module receives a valid transmission from the sensor the lamp will go out. If a system fault is detected due to a missing sensor signal, in addition to a chime and a indicator lamp flashing, a "Check TPM System" text message will be displayed in the instrument cluster,

and the tire pressure graphic display will display "- -" in place of the pressure value. After the flash sequence the TPM indicator lamp will remain illuminated. The system will return to normal once the TPM module receives a valid transmission from that sensor location. If a system fault is detected, the indicator lamp will flash on/off for 75 seconds and then remain on solid.

Base and Premium Systems:

NOTE:	**If a tire pressure sensor has been replaced, the TPM system needs to relearn tire pressure sensor IDs.**

The WIN or TPM automatically learns and stores the sensor IDs while driving "within 10-20 minutes continuously above 15 mph (24 km/h)" after a sensor has been replaced. The learning sequence will initiate after the vehicle has been stopped for more than 20 minutes.

A new sensor ID can also be programmed directly into the WIN or TPM module by using a RKE-TPM Analyzer in conjunction with a Scan Tool. Once the new sensor ID has been programmed, the vehicle will need to be driven above 15 mph until the fault is no longer active (lamp extinguishes) and display is updated (for up to 20 minutes).

NOTE:	**The matching full size spare wheel and tire assembly (if equipped) has a TPM sensor. The spare can be used in place of any of the four road tires. The TPMS will only monitor the pressure in the full size spare when it is used in place of a road tire. Otherwise, a spare with pressure below the low-pressure limit will not cause the TPMS indicator light to illuminate or the chime to sound.**

TPMS REMINDER RESET - PROCEDURE 6

NOTE:	**If tires have been rotated or a tire pressure sensor has been replaced, the tire pressure sensors must be retrained. Refer to the following procedure to program the module for identification of one new or all tire pressure sensor/transmitters.**

NOTE:	**The vehicle's tires must not have been rotated above 5 mph (8 km/h) in the last two minutes prior to programming.**

1. Connect a DRBIIIÃ® scan tool to the vehicle's diagnostic connector beneath the instrument panel, to the right of the steering column.
2. Access the Chassis System using the DRBIII.
3. Once in the Chassis System, select Tire Pressure Monitor, followed by Miscellaneous.
4. Select the appropriate function from the next screen displaying the following options:
    - Program LF Pressure Sensor
    - Program RF Pressure Sensor
    - Program RR Pressure Sensor
    - Program LR Pressure Sensor
    - Program Module (4 Sensors)
    - Monitor

5. Place a magnet (or special tool 8821), at the valve stem for that wheel as directed by the DRBIII. If the Program Module function has been chosen, the DRBIII will direct you to the left front wheel pressure sensor/transmitter first.

NOTE: **When programming the module (all four sensor/transmitters), the magnet should be moved from wheel to wheel in a clockwise direction starting at the left front wheel.**

6. When that wheels pressure sensor/transmitter has been programmed, the DRBIII will display Program Transmitter Complete or will automatically direct you to the next wheel sensor/transmitter to be programmed.
7. Remove the magnet and if programming the entire module, move the magnet to each of the remaining wheels as directed by the DRBIII. Each sensor/transmitter will automatically sense the presence of the magnet and begin programming.
8. Once Program Transmitter Complete is displayed, exit the program function screen.
9. Verify that the module programming is complete by looking at the tire pressure sensor/transmitter ID's in the Sensor Display using the DRBIII.

2015-16 MANUAL TRANSMISSION

TR6060 - Service Information - 5.7L & 6.4L - Challenger

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - MANUAL TRANSMISSION - TR6060

LOW LUBRICANT LEVEL

A low transmission lubricant level is generally the result of a leak, inadequate lubricant fill, or an incorrect lubricant level check.

Leaks can occur at the mating surfaces of the gear case or from the front/rear seals. A suspected leak could also be the result of an overfill condition.

Leaks at the rear of the housing will be from the oil seals. Leaks at component mating surfaces will probably be the result of inadequate sealer, gaps in the sealer, incorrect bolt tightening, use of a non-recommended sealer or incorrect/damaged gasket(s), if equipped.

A leak at the front of the transmission will be from either the front bearing retainer or retainer seal. Lubricant may be seen dripping from the clutch housing after extended operation. If the leak is severe, it may also contaminate the clutch disc causing the disc to slip, grab, and/or chatter.

A correct lubricant level check can only be made when the vehicle is level. Also allow the lubricant to settle for a minute or so before checking. These recommendations will ensure an accurate check and avoid an underfill or overfill condition. Always check the lubricant level after any addition of fluid to avoid an incorrect lubricant level condition.

HARD SHIFTING

Hard shifting can be caused by a low lubricant level, improper or contaminated lubricants. The consequence of using non-recommended lubricants is noise, excessive wear, internal bind, and hard shifting. Substantial lubricant leaks can result in gear, shift rail, synchronizer, and bearing damage. If a leak goes undetected for an extended period, the first indications of component damage are usually hard shifting and noise.

Shift component damage, incorrect clutch adjustment or a worn or damaged clutch pressure plate or disc are additional probable causes of increased shift effort. If clutch problem is advanced, gear clash during shifts can result. Worn or damaged synchronizer rings can cause gear clash when shifting into any forward gear. In some new or rebuilt transmissions, new synchronizer rings may tend to stick slightly causing hard or noisy shifts. In most cases, this condition will decline as the rings wear-in.

TRANSMISSION NOISE

Most manual transmissions make some noise during normal operation. Gears can generate a rotational noise or rattle that is audible during idle in neutral, or generate a mild whine that is audible during regular driving. These conditions are normal and do not require repair.

Severe, highly audible transmission noise is generally the initial indicator of a lubricant problem. Insufficient, improper or contaminated lubricant will promote rapid wear of gears, synchros, shift rails, forks and bearings.

The overheating caused by a lubricant problem, can also lead to gear and bearing damage.

STANDARD PROCEDURE

STANDARD PROCEDURE - DRAIN AND FILL

CAUTION: Hypoid gear lube must not be used in this transmission. Use of hypoid gear lube will cause hard shifting effort/transmission failure.

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

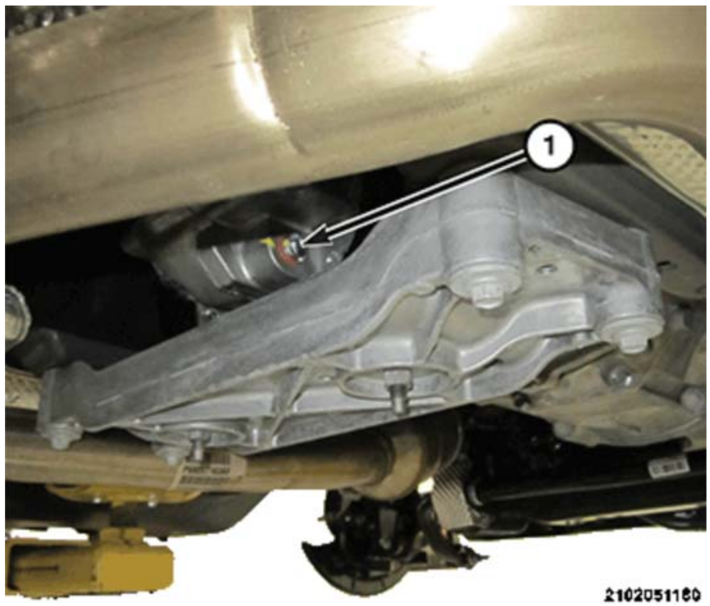

Fig. 1: Transmission Drain Plug
Courtesy of CHRYSLER GROUP, LLC

2. Remove transmission drain plug (1) and drain the transmission fluid.
3. Install transmission drain plug (1) and tighten to the proper **SPECIFICATIONS** .

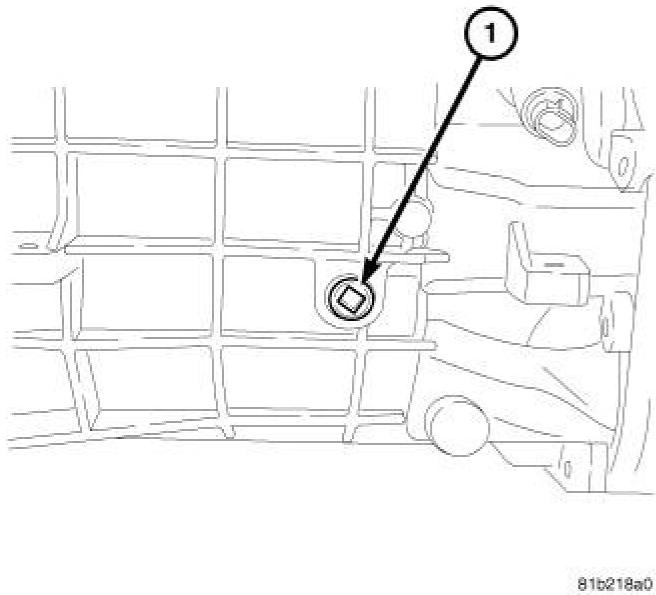

Fig. 2: Fill Plug
Courtesy of CHRYSLER GROUP, LLC

4. Remove the transmission fill plug (1).
5. Fill the transmission with the specified fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** . The transmission is full when the fluid level is 1/4 inch below the bottom of the fill hole on the left side of the transmission case.
6. Install the transmission fill plug (1) and tighten to the proper **SPECIFICATIONS** .

ADJUSTMENTS

ADJUSTMENTS

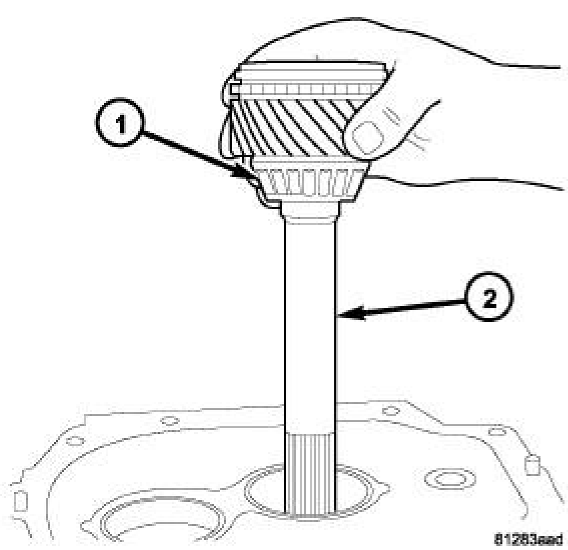

Fig. 3: Input Shaft
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The following procedure must be performed, when an input shaft (2) or tapered bearing (1) has been replaced. The measurement is performed with all shims removed from the front adapter.**

1. Install the input shaft (2) into the adapter.

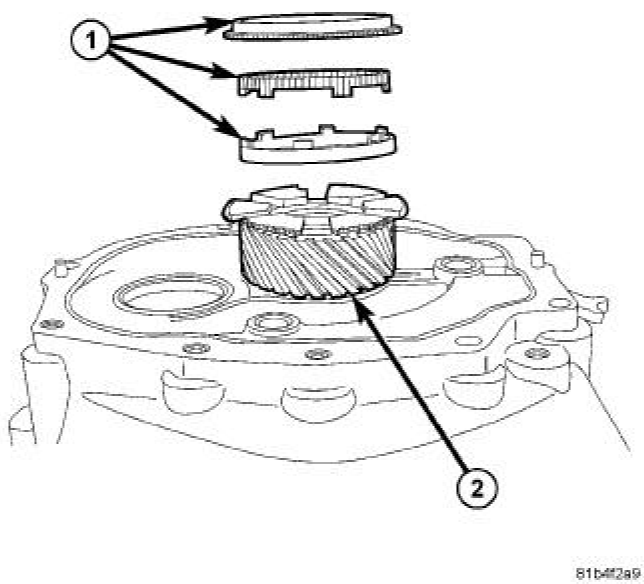

Fig. 4: Input Shaft & Fourth Gear Synchro Rings
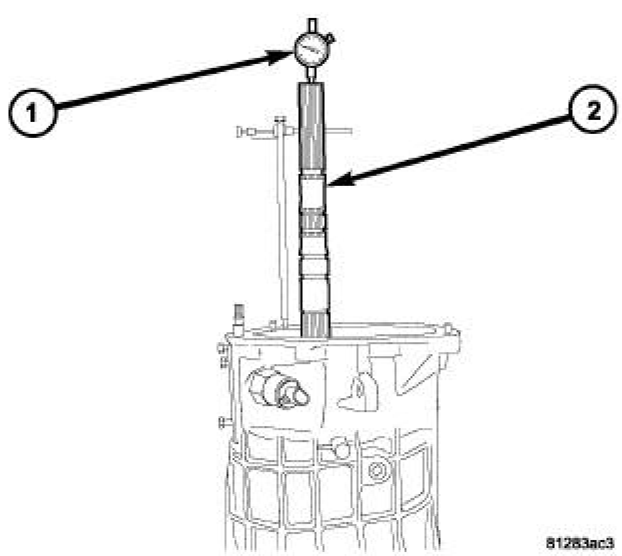
Courtesy of CHRYSLER GROUP, LLC

2. Install the fourth gear synchronizer rings (1) on the input shaft (2).
3. Install mainshaft and countershaft.
4. Install the case on the adapter and tighten the bolts to the proper **SPECIFICATIONS** .

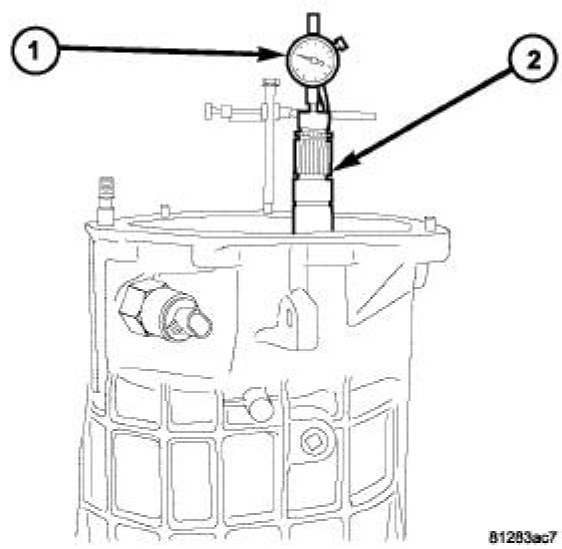
MAINSHAFT BEARINGS END-PLAY



[Fig. 5: Mainshaft & Dial Indicator]
Courtesy of CHRYSLER GROUP, LLC

1. Rotate input shaft/mainshaft several time to seat the bearings.
2. Screw dial indicator Stud (special tool #8161, Adapter Rod) into the case.
3. Attach a dial indicator (1) to the stud and set dial indicator (1) plunger on the end of the mainshaft (2).
4. Zero the dial indicator (1), then push up on the input shaft and record the dial indicator end-play measurement.
5. Subtract 0.0127 - 0.0889 mm (0.0005 - 0.0035 in.) from the recorded dial indicator end-play measurement. The remainder is the shim thickness needed behind the input shaft bearing cup in the front adapter.

COUNTERSHAFT BEARINGS END-PLAY



[Fig. 6: Identifying Countershaft & Dial Indicator]
Courtesy of CHRYSLER GROUP, LLC

1. Rotate countershaft several time to seat the bearings.
2. Screw Stud (special tool #8161, Adapter Rod) into the case.
3. Attach a dial indicator (1) to the stud and set dial indicator (1) plunger on the end of the countershaft (2).
4. Zero dial indicator, then pull up on the countershaft and record the dial indicator end-play measurement.
5. Subtract 0.0127 - 0.0889 mm (0.0005 - 0.0035 in.) from the recorded dial indicator end-play measurement. The remainder is the shim thickness needed behind the countershaft bearing cup in the front adapter.

5. Remove the mainshaft bearing cup (2) with Remover (special tool #7794-A, Remover, Seal) (1) and Slide Hammer (special tool #C-637, Slide Hammer, Universal).

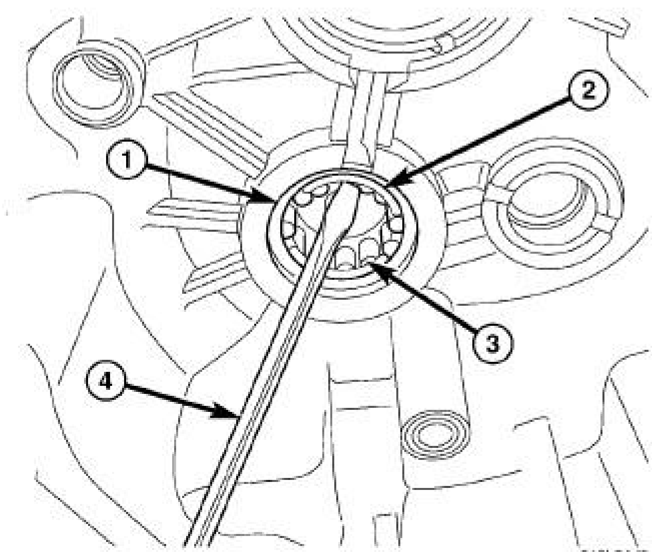

Fig. 104: Removing Countershaft Bearing Cage
Courtesy of CHRYSLER GROUP, LLC

6. Remove the countershaft bearing snap ring (1).
7. Remove the countershaft bearing plastic bearing cage (2) and remove roller bearings (3).

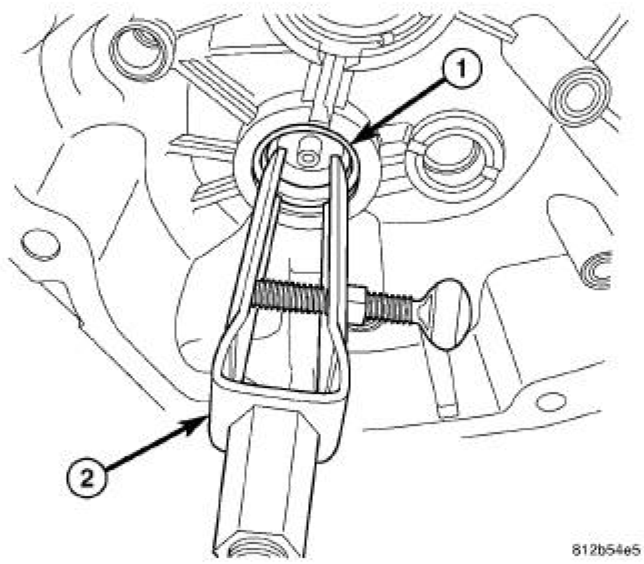

Fig. 105: Removing Countershaft Bearing Race
Courtesy of CHRYSLER GROUP, LLC

8. Remove the countershaft bearing cup (1) with Remover (special tool #7794-A, Remover, Seal) (2) and Slide Hammer (special tool #C-637, Slide Hammer, Universal).

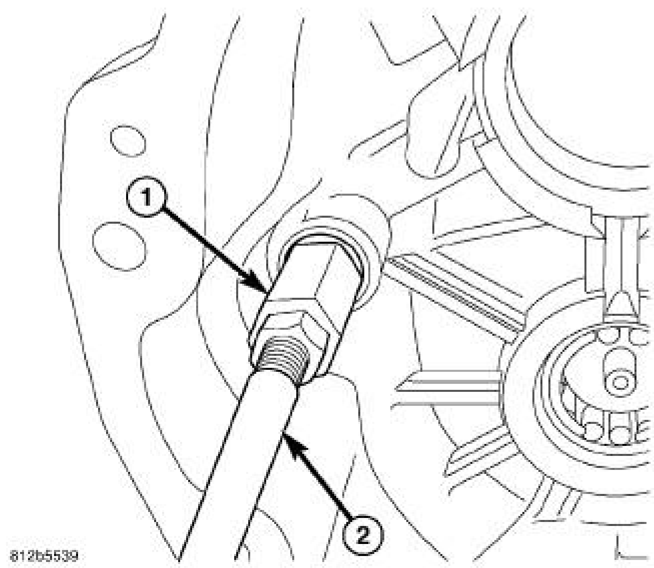

Fig. 106: Removing Shift Rail Bushing
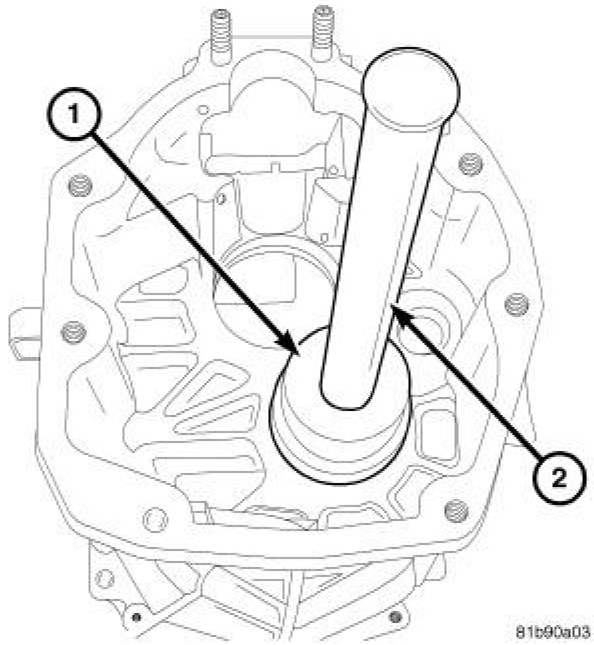
Courtesy of CHRYSLER GROUP, LLC

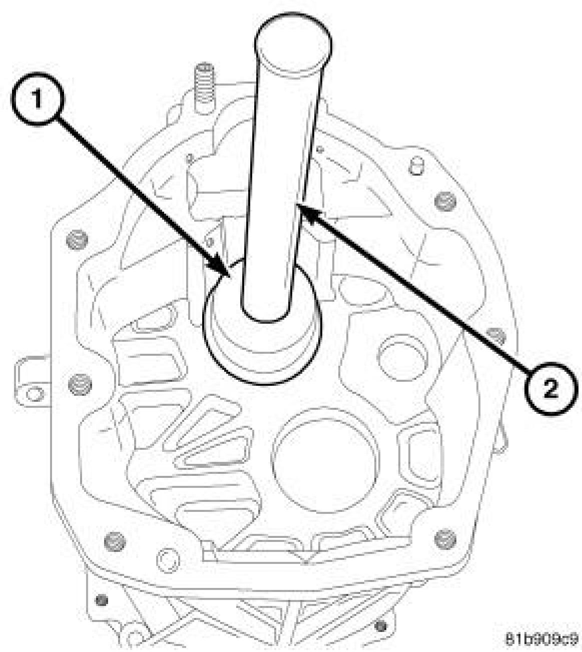
9. Remove the shift rail bushings with Remover (special tool #6786, Remover, Bushing) (1) and Slide Hammer (special tool #C-3752, Slide Hammers) (2).

TRANSMISSION CASE



[Fig. 107: Countershaft Bearing Cup](#)
Courtesy of CHRYSLER GROUP, LLC

1. Remove the countershaft bearing cups with Remover (special tool #9369, Remover, Bearing Cup) (1) and Handle (special tool #C-4171, Driver Handle, Universal) (2).



[Fig. 108: Mainshaft Bearing Cup](#)
Courtesy of CHRYSLER GROUP, LLC

2. Remove the mainshaft bearing cups with Remover (special tool #9369, Remover, Bearing Cup) (2) and Handle (special tool #C-4171, Driver Handle, Universal) (1).

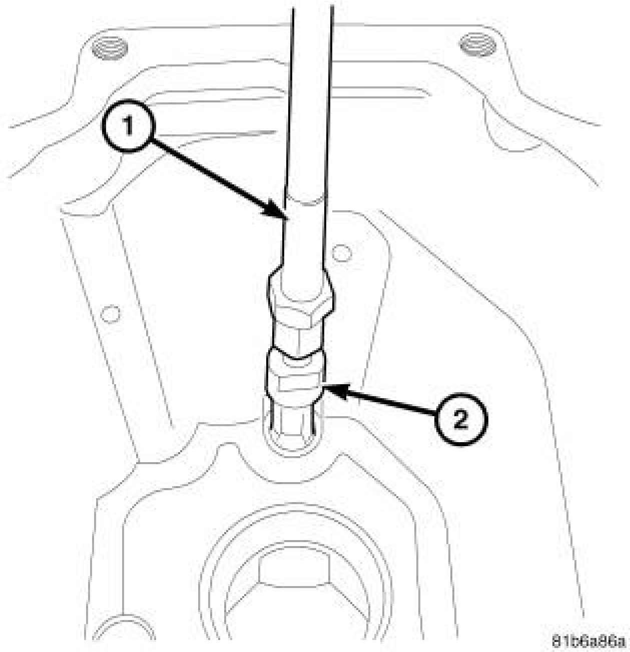


Fig. 109: Case Rail Bearing Remover
Courtesy of CHRYSLER GROUP, LLC

3. Remove the shift rail bearing with Slide Hammer (special tool #C-637, Slide Hammer, Universal) (1) and Remover (special tool #9609, Remover, Bearing) (2).

TRANSMISSION ADAPTER

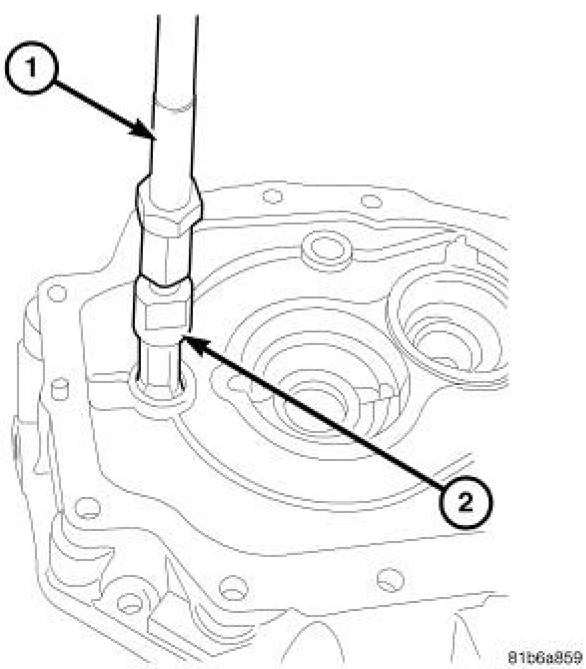

Fig. 110: Adapter Bearing Remover
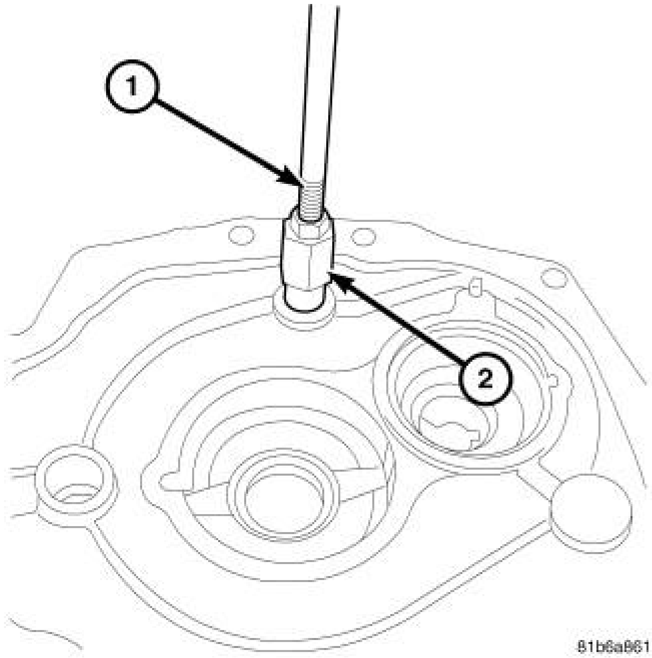
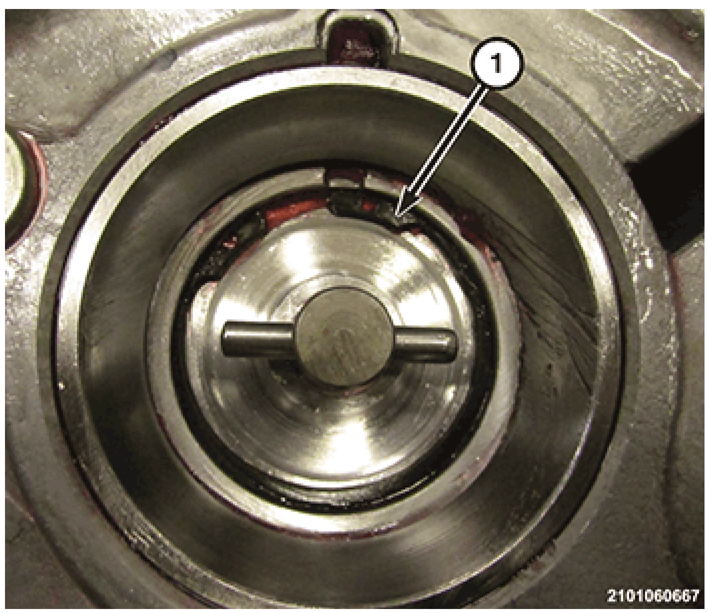
Courtesy of CHRYSLER GROUP, LLC

1. Remove the shift rail bearing with Slide Hammer (special tool #C-637, Slide Hammer, Universal) (1) and Remover (special tool #9609, Remover, Bearing) (2).



[Fig. 111: Adapter Bushing Remover](#)
Courtesy of CHRYSLER GROUP, LLC

2. Remove the shift rail bushing with Slide Hammer (special tool #C-3752, Slide Hammers) (1) and Remover (special tool #6786, Remover, Bushing) (2).



[Fig. 112: Transmission Oil Pump Snap Ring](#)
Courtesy of CHRYSLER GROUP, LLC

3. If equipped, remove the transmission oil pump snap ring.

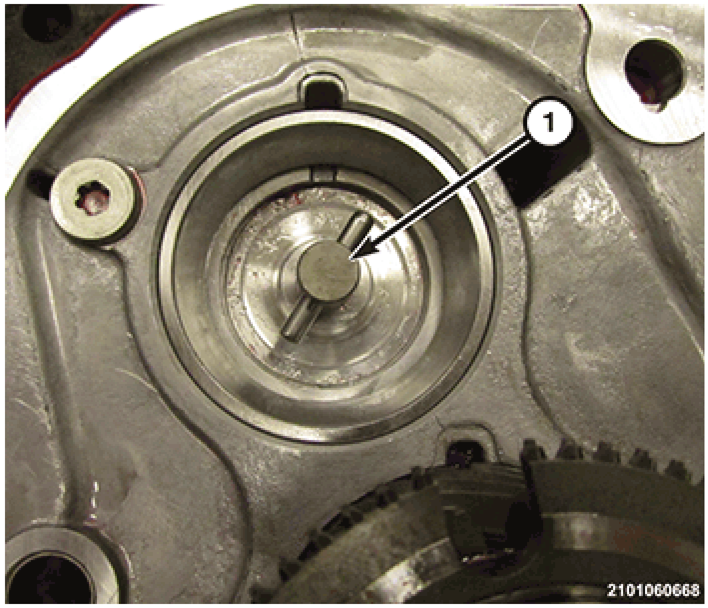


Fig. 113: Transmission Oil Pump
Courtesy of CHRYSLER GROUP, LLC

4. If equipped, remove the transmission oil pump.

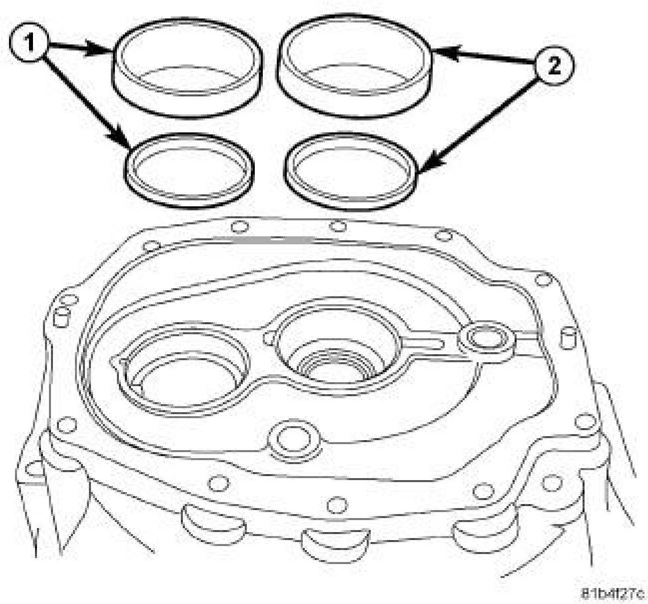

Fig. 114: Bearing Cups & Select Shims
Courtesy of CHRYSLER GROUP, LLC

5. Remove the countershaft bearing cup and select shim (1). Remove the mainshaft bearing cup and select shim (2).

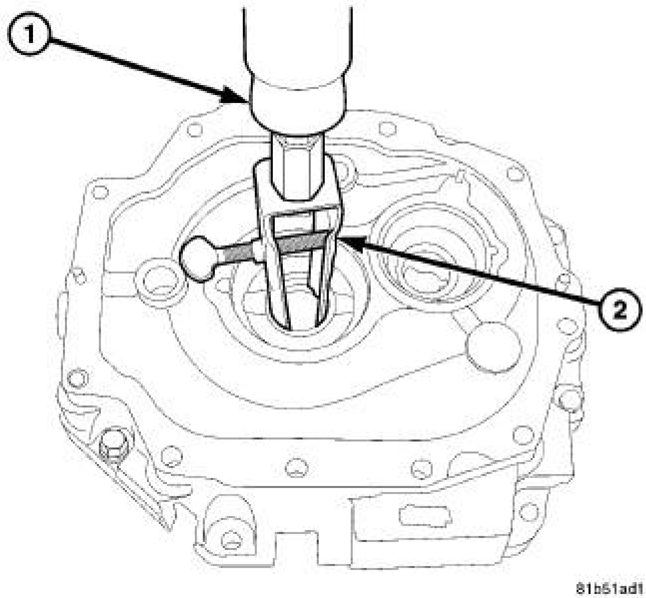

Fig. 115: Input Seal Puller
Courtesy of CHRYSLER GROUP, LLC

6. Remove the input shaft seal with Slide Hammer (special tool #C-637, Slide Hammer, Universal) (1) and Puller (special tool #7794-A, Remover, Seal) (2).

CLEANING

CLEANING

Clean the gears, bearings shafts, extension/adapter housing and gear case with solvent. Dry all parts except the bearings with compressed air. Allow the bearings to either air dry or wipe them dry with clean shop towels.

INSPECTION

INSPECTION

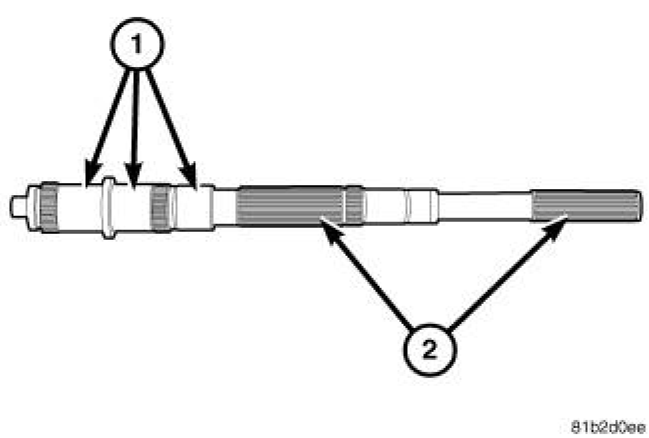

Fig. 116: Bearing Surfaces & Splines

Courtesy of CHRYSLER GROUP, LLC

NOTE: **Minor corrosion, nicks, or pitting can be smoothed with 400 grit emery and polished out with crocus cloth.**

Mainshaft: Inspect the bearing surfaces (1) for wear or flat-spots. Inspect the splines (2) and snap ring grooves for wear. Inspect the output seal surface for wear.

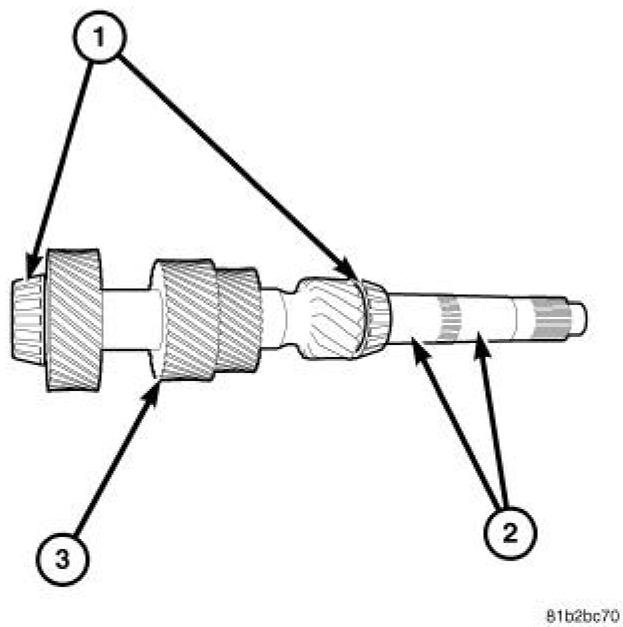

Fig. 117: Roller Bearings, Surfaces & Gear Teeth
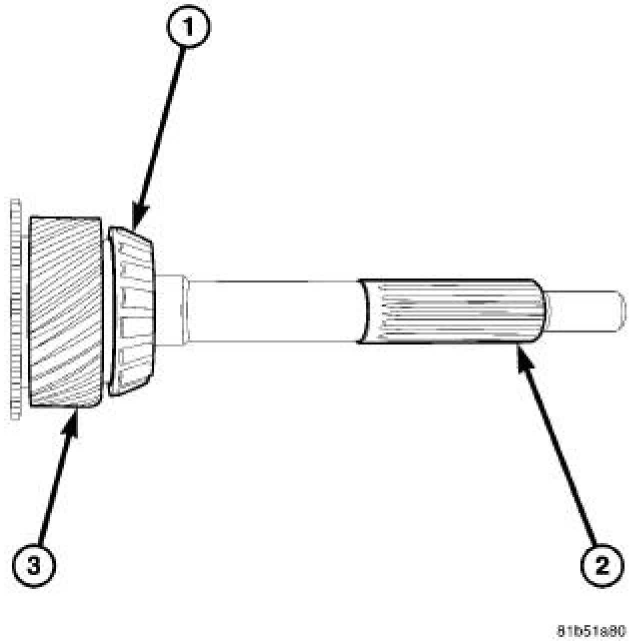
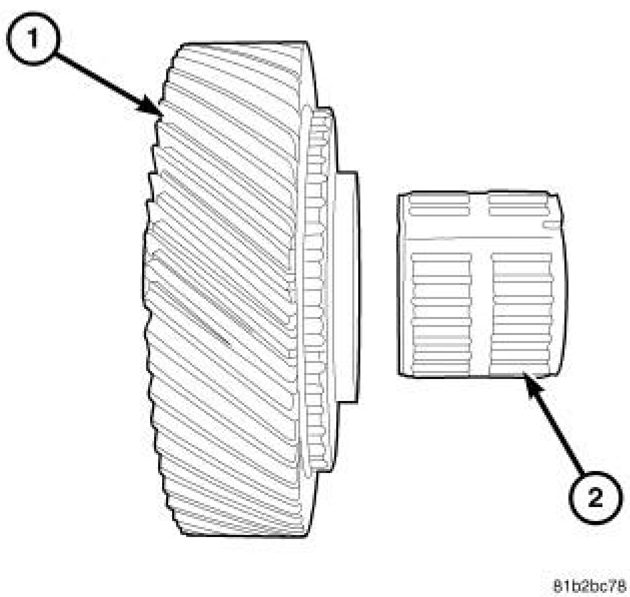
Courtesy of CHRYSLER GROUP, LLC

Countershaft: Inspect the roller bearings (1) for wear, peeling, pitting or flat-spots. Inspect the bearing surfaces (2) for wear or flat-spots. Inspect the gear teeth (3) for wear, chips or cracks. Inspect the splines and snap ring grooves for wear.



[Fig. 118: Input Shaft Bearing, Splines & Forth Gear](#)
Courtesy of CHRYSLER GROUP, LLC

Input Shaft: Inspect the input shaft bearing (1) for wear, peeling, pitting or flat-spots. Inspect the input shaft splines (2) for wear. Inspect the fourth gear (3) for worn, chipped, or cracked teeth. Inspect the input seal surface for wear.



[Fig. 119: Gear & Bearing](#)
Courtesy of CHRYSLER GROUP, LLC

Gears: Inspect the gears (1) for worn, chipped or cracked teeth and the bearing surfaces for wear, peeling, pitting or flat-spots. Inspect the gear bearings (2) for wear, peeling, pitting, flat-spots or damaged bearing cage.

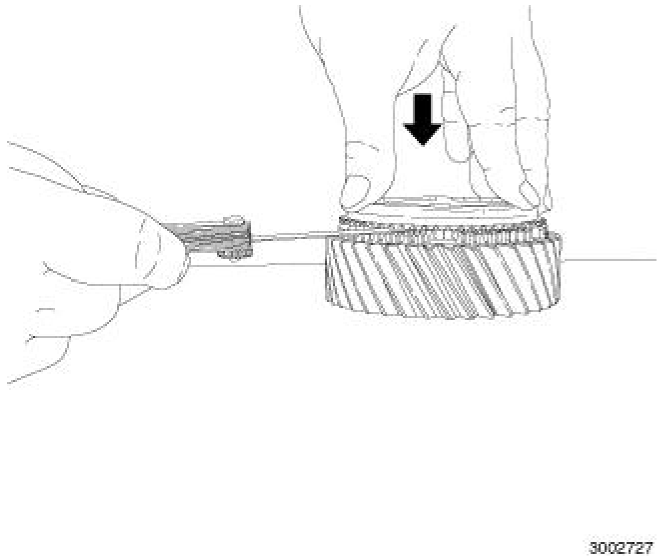


Fig. 120: measuring Clearance Between Blocker Ring & Gear
Courtesy of CHRYSLER GROUP, LLC

Synchronizer components: Inspect the synchronizer rings (1) for worn, chipped, or cracked teeth and burned or flaking friction material. Place the blocker rings on the gears. While applying pressure and rotating the blocker ring measure the clearance between the blocker ring and gear. If the clearance is less than 0.75 mm (0.030 in.) replace the blocker ring.**Synchronizer rings are serviced as an assembly.**

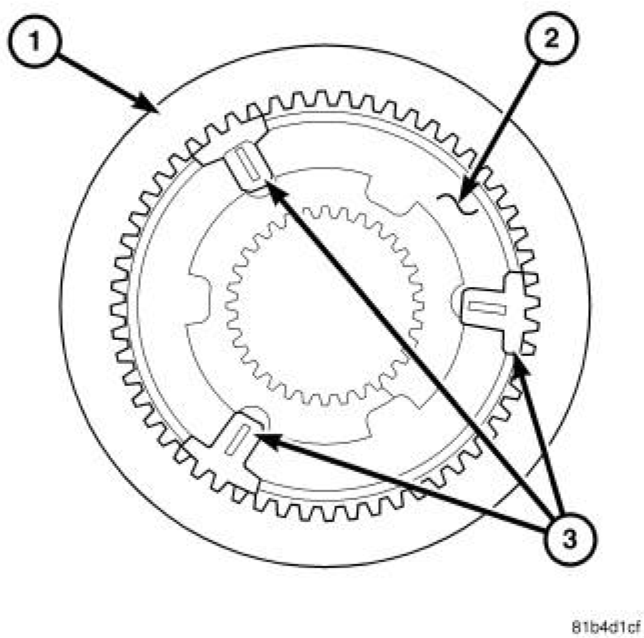

Fig. 121: Synchronizer Sleeve, Hub & Detents
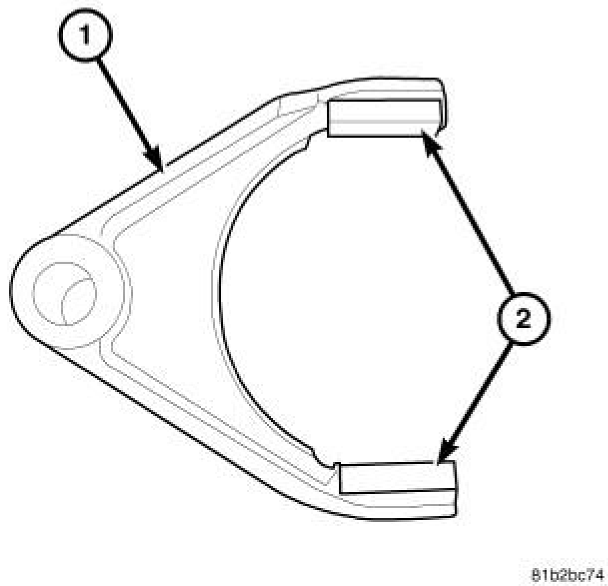
Courtesy of CHRYSLER GROUP, LLC

Inspect the synchronizer sleeve (1) and hub (2) for worn teeth. Inspect the synchronizer detents (3) for broken springs, missing balls or cracked/damaged housings.



[Fig. 122: Shift Forks & Shoes](#)

Courtesy of CHRYSLER GROUP, LLC

Shift Forks/Shift Rails: Inspect the shift forks (1) for distortion. Inspect the shift fork shoes (2) for wear or cracks. Fit the shoes in the synchronizer sleeve to ensure the parts fit and work smoothly. Inspect the shift rails for wear. Inspect the shift rail bushings and bearings for wear.

ASSEMBLY

ASSEMBLY

TRANSMISSION ADAPTER

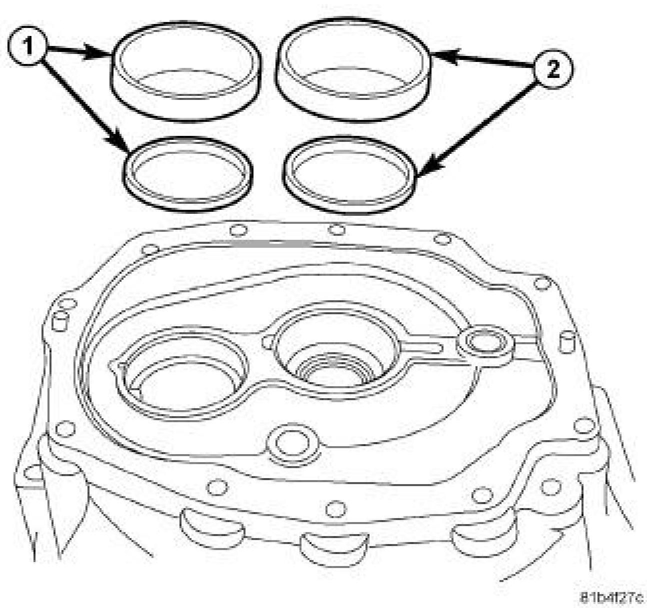


Fig. 123: Bearing Cups & Select Shims
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Refer to Adjustments for Mainshaft and Countershaft end play shim selection. Refer to ADJUSTMENTS .**

1. Install the countershaft select shim and bearing cup (1) into the adapter plate. Install the mainshaft select shim and bearing cup (2) into the adapter plate.

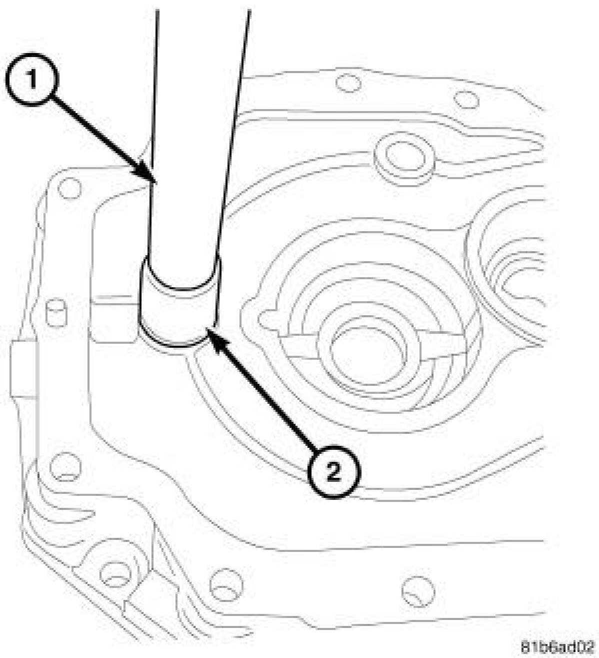

Fig. 124: Adapter Bearing Installer
Courtesy of CHRYSLER GROUP, LLC

2. Install the shift rail bearing with Handle (special tool #C-4171, Driver Handle, Universal) (1) and Installer (special tool #10028, Installer, Bearing) (2).

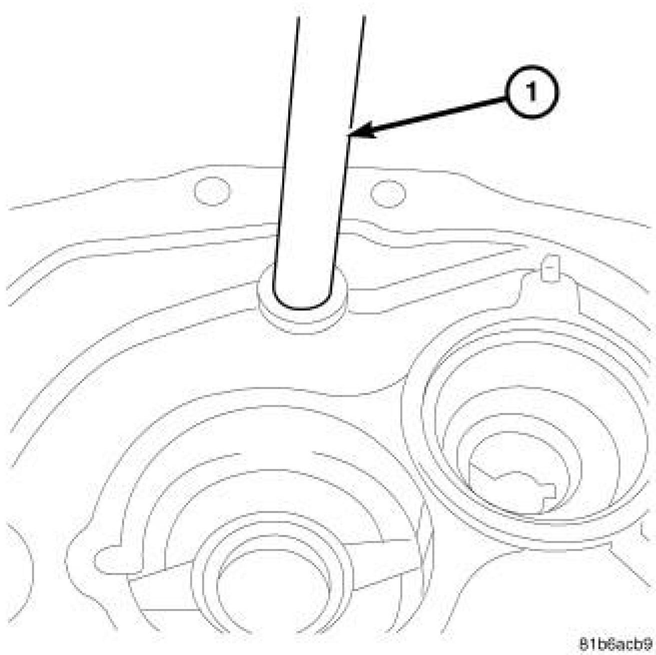

Fig. 125: Adapter Bushing Installer
Courtesy of CHRYSLER GROUP, LLC

3. Install the shift rail bushing with Installer (special tool #8475, Installer, Bushing) (1).

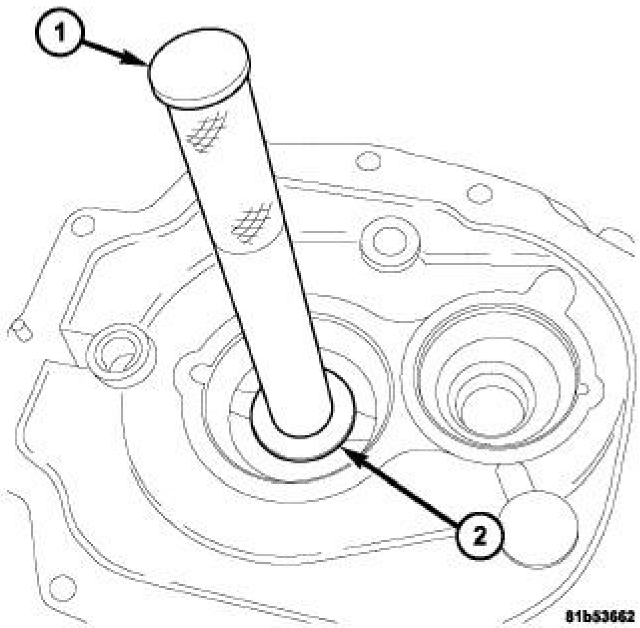

Fig. 126: Input Shaft Seal
Courtesy of CHRYSLER GROUP, LLC

4. Install the input shaft seal with Handle (special tool #C-4171, Driver Handle, Universal) (1) and Installer (special tool #9366, Installer, Seal) (2).

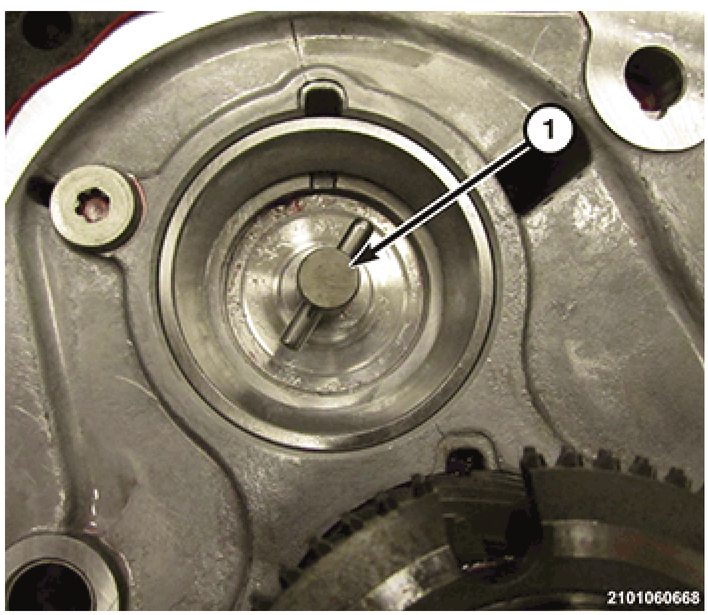

Fig. 127: Transmission Oil Pump
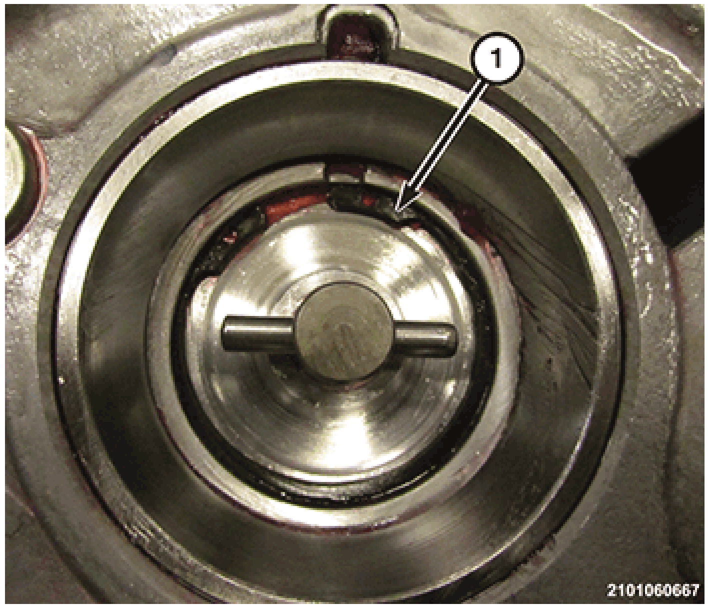
Courtesy of CHRYSLER GROUP, LLC

5. If equipped, install the transmission oil cooler pump.



[Fig. 128: Transmission Oil Pump Snap Ring](#)
Courtesy of CHRYSLER GROUP, LLC

6. If equipped, install the transmission oil cooler pump snap ring.
7. If equipped, install the transmission oil filter.

TRANSMISSION CASE

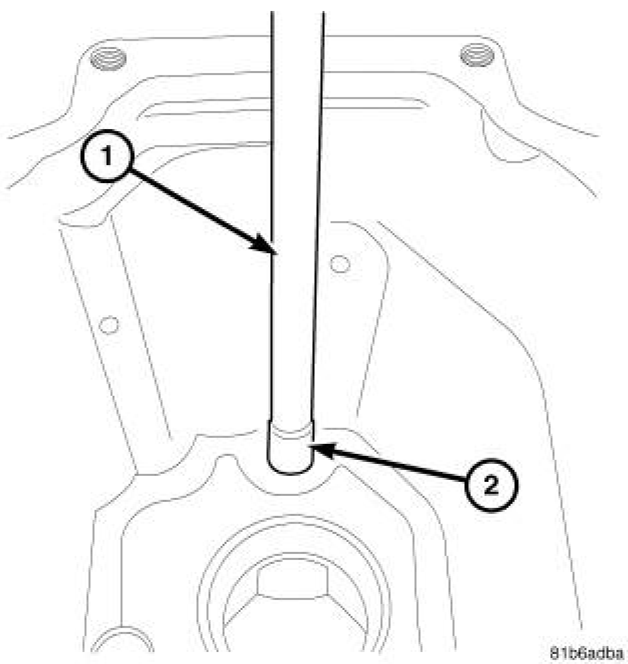


Fig. 129: Case Rail Bearing Installer
Courtesy of CHRYSLER GROUP, LLC

1. Install the shift rail bearing with Handle (special tool #C-4171, Driver Handle, Universal) (1) and Installer (special tool #10028, Installer, Bearing) (2).

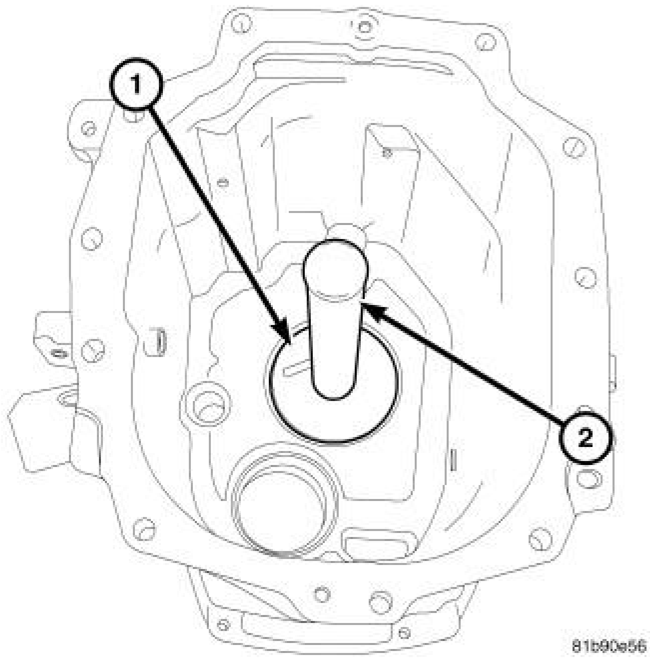

Fig. 130: Mainshaft Bearing Cup
Courtesy of CHRYSLER GROUP, LLC

2. Install the mainshaft bearing cup with Handle (special tool #C-4171, Driver Handle, Universal) (1) and Installer (special tool #9373, Installer, Bearing Cup) (2).

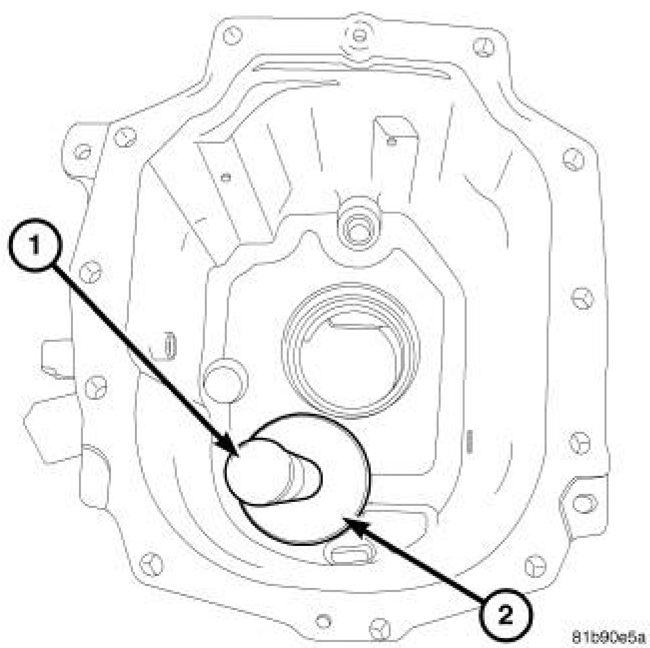

Fig. 131: Countershaft Bearing Cup
Courtesy of CHRYSLER GROUP, LLC

3. Install the countershaft bearing cup with Handle (special tool #C-4171, Driver Handle, Universal) (1) and Installer (special tool #9373, Installer, Bearing Cup) (2).

EXTENSION HOUSING

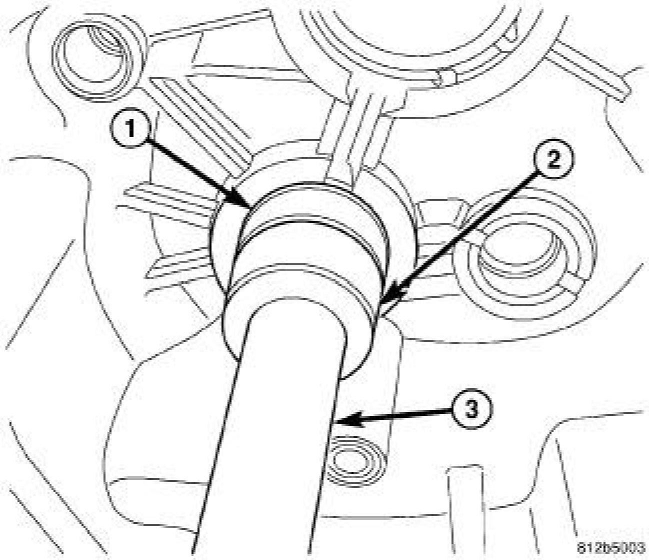

Fig. 132: Installing Countershaft Bearing
Courtesy of CHRYSLER GROUP, LLC

1. Install the countershaft bearing (1) with Installer (special tool #9394, Installer, Bearing) (2) and Handle (special tool #C-4171, Driver Handle, Universal) (3).
2. Install the countershaft bearing snap ring.

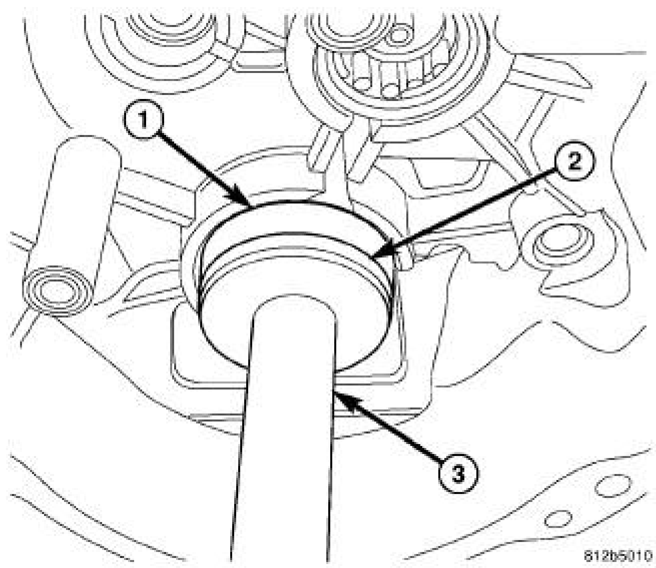

Fig. 133: Installing Mainshaft Bearing Race
Courtesy of CHRYSLER GROUP, LLC

3. Install the mainshaft bearing cup (1) with Installer (special tool #9392, Installer, Bearing Cup) (2) and Handle (special tool #C-4171, Driver Handle, Universal) (3).

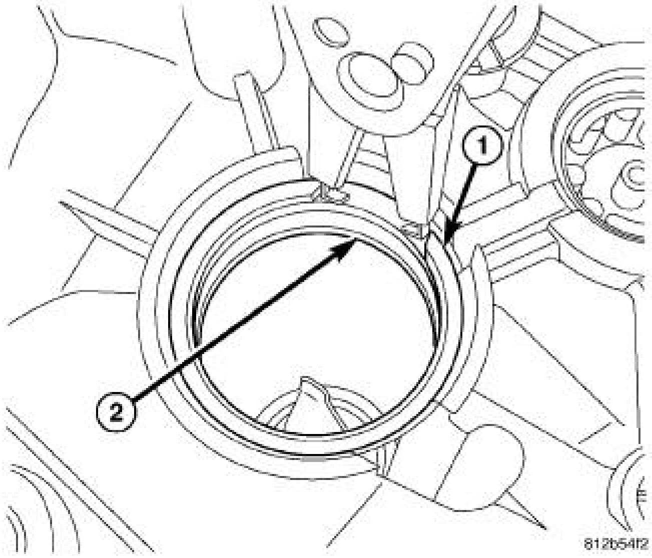

Fig. 134: Removing Mainshaft Race Snap Ring
Courtesy of CHRYSLER GROUP, LLC

4. Install the mainshaft bearing cup (2) snap ring (1).

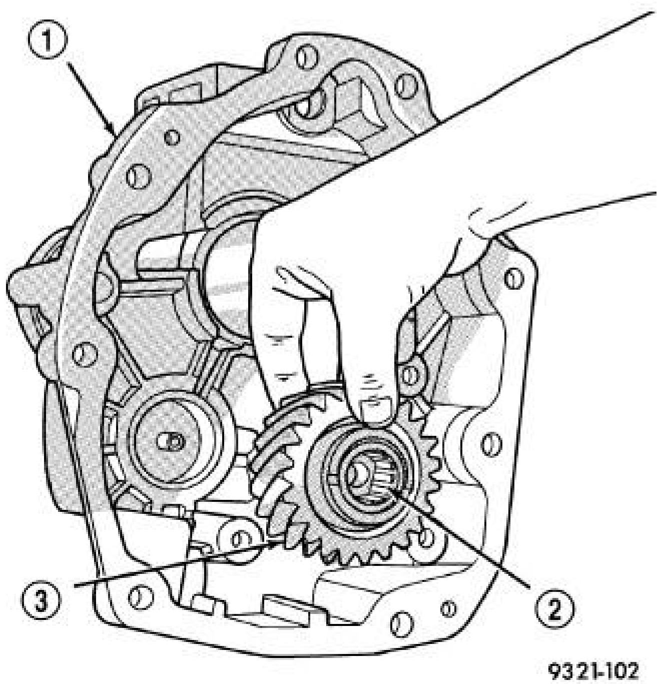

Fig. 135: Thrust Washer, Gear And Bearing
Courtesy of CHRYSLER GROUP, LLC

5. Install the reverse idler gear shaft in the extension housing (1).
6. Install the reverse idler gear bearing (2) and the idler gear (3).

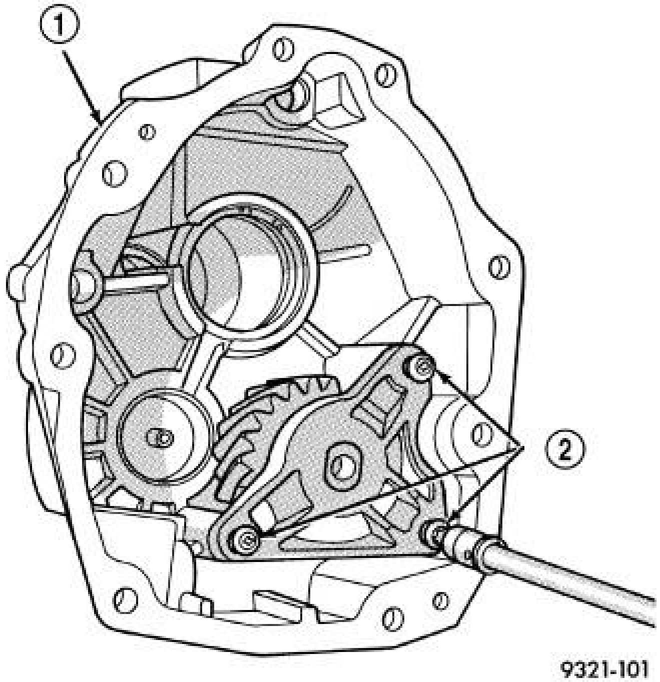

Fig. 136: Idler Gear Bracket Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Install the reverse idler gear bracket into the tail housing (1).
8. Apply Mopar Ā® Lock AND Seal Adhesive or equivalent on the idler gear bracket bolts (2). Install bolts (2) and tighten to the proper **SPECIFICATIONS** .

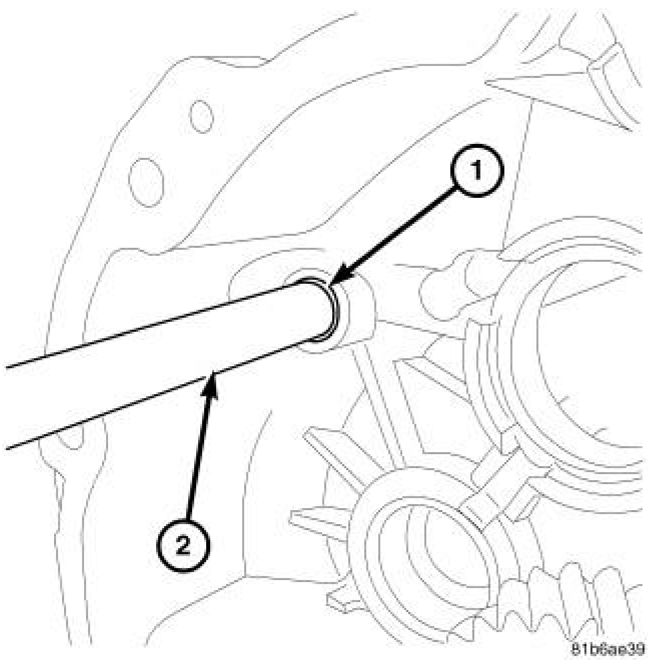

Fig. 137: Shift Rail Bushing Installer
Courtesy of CHRYSLER GROUP, LLC

9. Install the shift rail bushings (1) with Installer (special tool #8475, Installer, Bushing) (2).

INPUT SHAFT

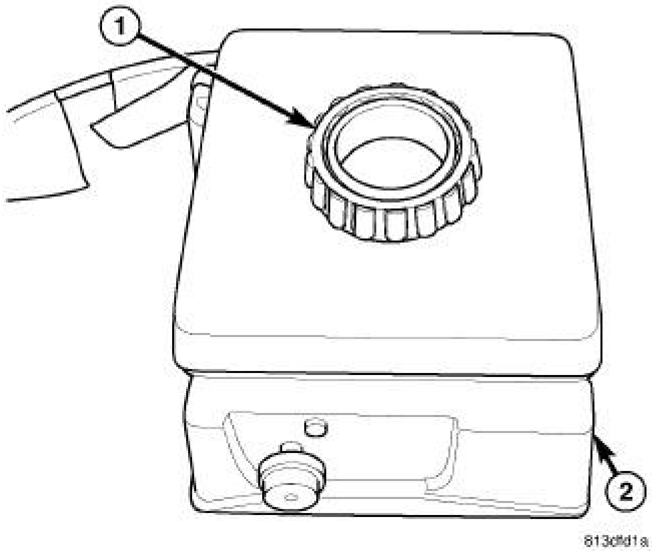

Fig. 138: Identifying Bearing Heater And Bearing
Courtesy of CHRYSLER GROUP, LLC

WARNING:	**Use tongs or welding gloves when handling heated components. Failure to follow these instructions will result in personal injury.**
CAUTION:	**Bearings (1) are installed using a Bearing Heater (2). Use only a bearing heater/hot plate and follow manufacture's instructions. Heat components to 100 - 149 Celsius (212Â° Min. - 300Â° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for an extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.**

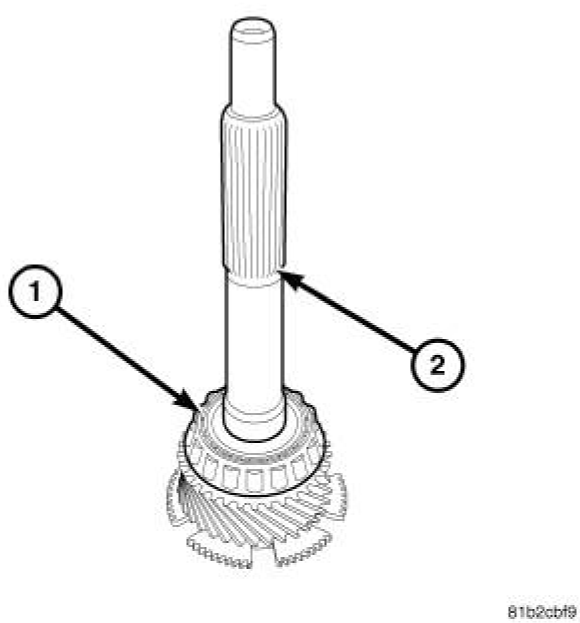

Fig. 139: Input Shaft Bearing

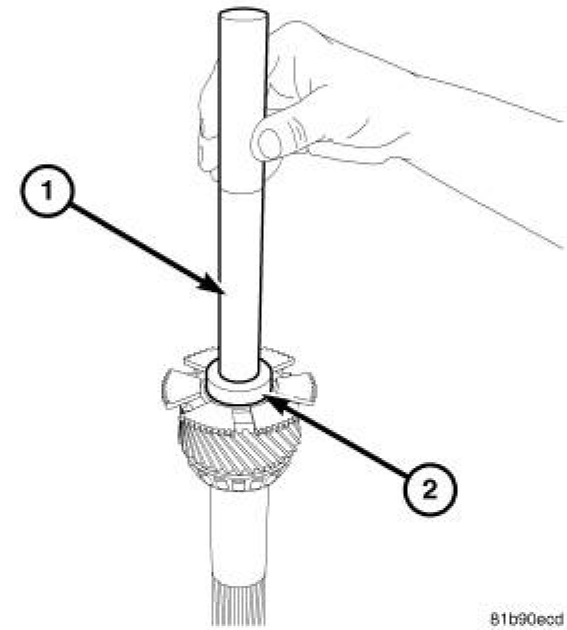
Courtesy of CHRYSLER GROUP, LLC

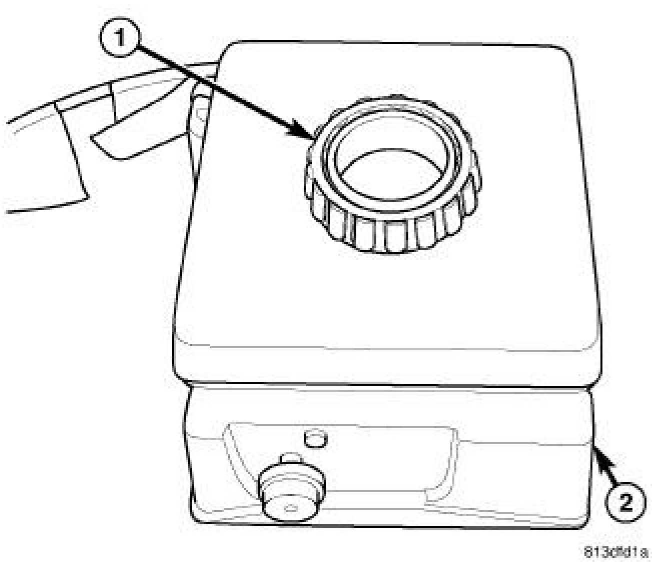
1. Heat the input shaft bearing to 100Ā° - 149Ā°C (212Ā° - 300Ā° F) and install the bearing (1) onto the input shaft (2) with tongs or welding gloves.



[**Fig. 140: Input Shaft Bearing Cup**]
Courtesy of CHRYSLER GROUP, LLC

2. Install the input shaft bearing cup with Handle (special tool #C-4171, Driver Handle, Universal) (1) and Installer (special tool #9380, Installer, Bearing Cup) (2).

COUNTERSHAFT



[**Fig. 141: Identifying Bearing Heater And Bearing**]

Courtesy of CHRYSLER GROUP, LLC

WARNING: **Use tongs or welding gloves when handling heated components. Failure to follow these instructions will result in personal injury.**

CAUTION: Bearings (1) are installed using a Bearing Heater (2). Use only a bearing heater/hot plate and follow manufacture's instructions. Heat components to 100 - 149 Celsius (212Â° Min. - 300Â° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for an extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.

21. Heat the mainshaft case bearing to 100Â° - 149Â° C (212Â° - 300Â°F) and install on the mainshaft with tongs or welding gloves.

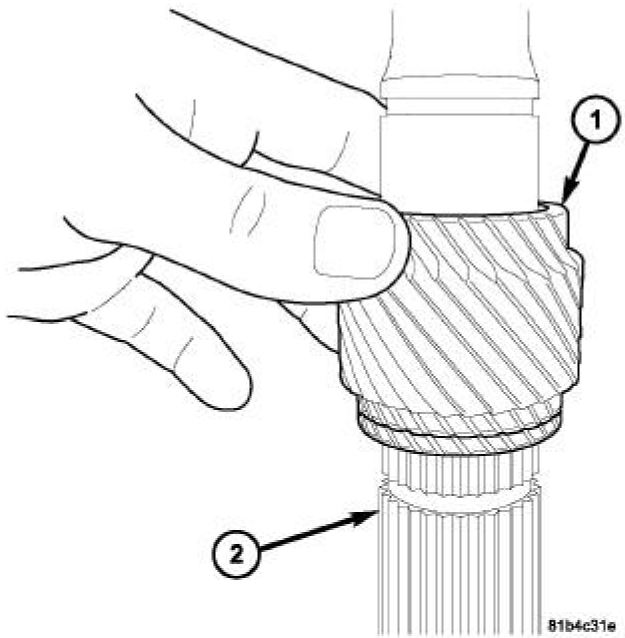

Fig. 164: Sixth Gear Mainshaft
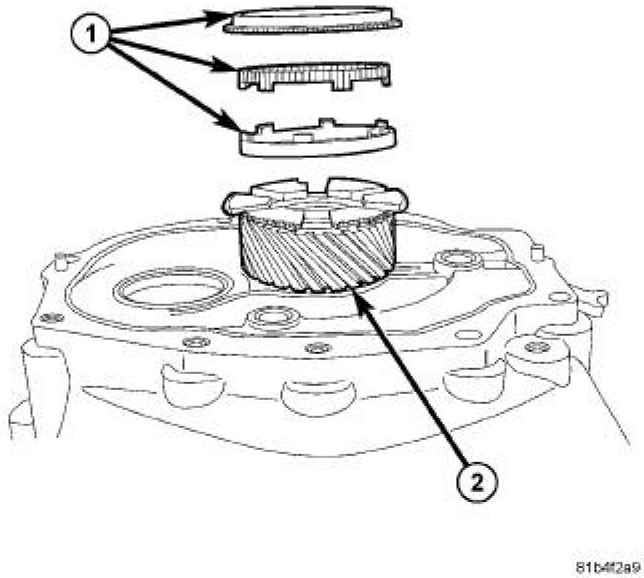
Courtesy of CHRYSLER GROUP, LLC

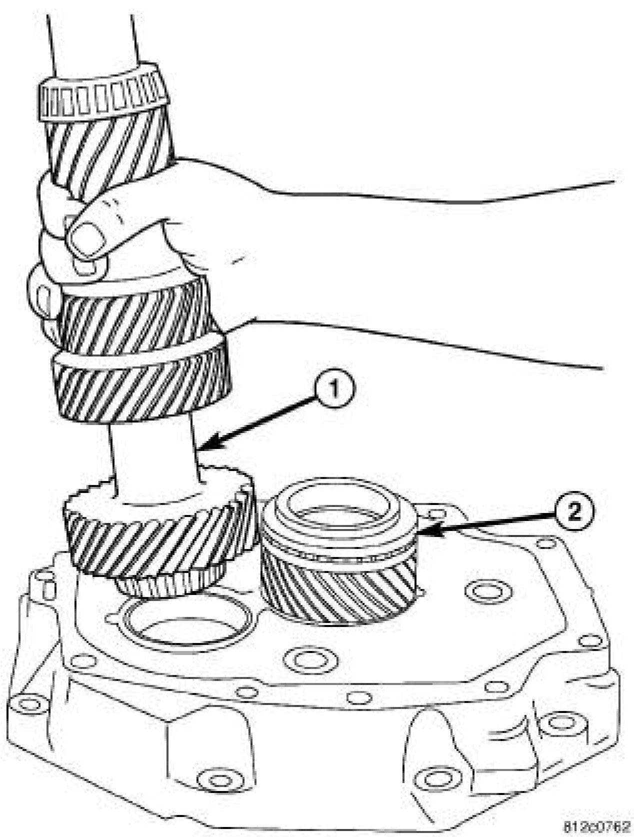
22. Position sixth gear (1) on the mainshaft (2).
23. Install sixth gear on the mainshaft with Installer (special tool #9391, Installer, Gear) and Coupler (special tool #9391-2, Adapter, Coupling).

TRANSMISSION HOUSING



[Fig. 165: Input Shaft & Fourth Gear Synchro Rings](#)
Courtesy of CHRYSLER GROUP, LLC

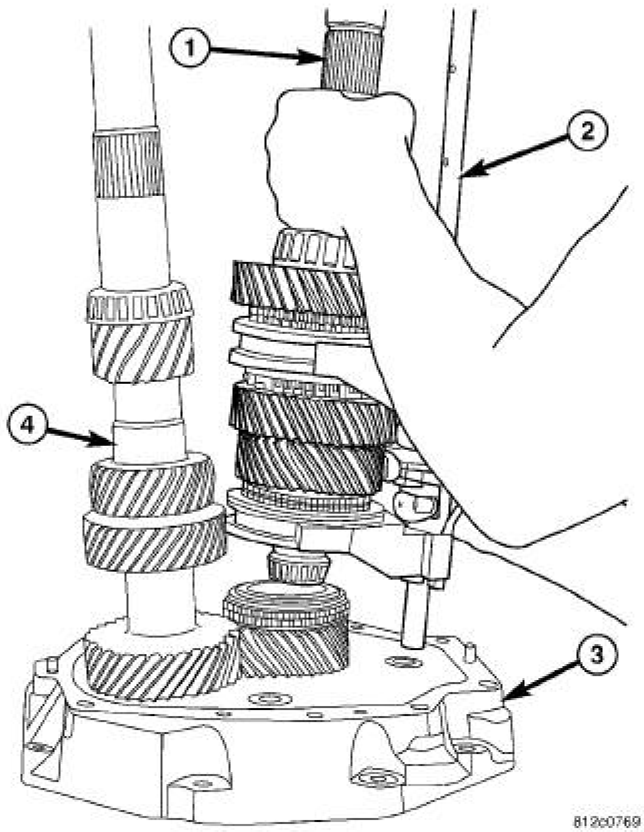
1. Install the input shaft (2) into the transmission adapter plate. Install the fourth gear synchronizer rings (1) on the fourth gear.



[Fig. 166: Removing/Installing Countershaft](#)

Courtesy of CHRYSLER GROUP, LLC

2. Install the countershaft (1) assembly into the transmission adapter.



[Fig. 167: Mainshaft, Shift Rail & Countershaft]
Courtesy of CHRYSLER GROUP, LLC

3. Tilt the countershaft (4) sideways then install the mainshaft (1) and shift rail (2) assemblies into the transmission adapter (3).

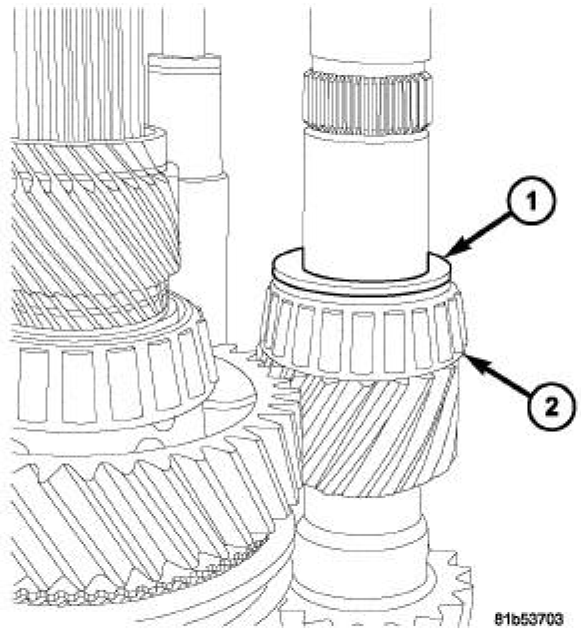


Fig. 168: Countershaft Washer
Courtesy of CHRYSLER GROUP, LLC

4. Install the countershaft thrust washer (1) on the countershaft (2).

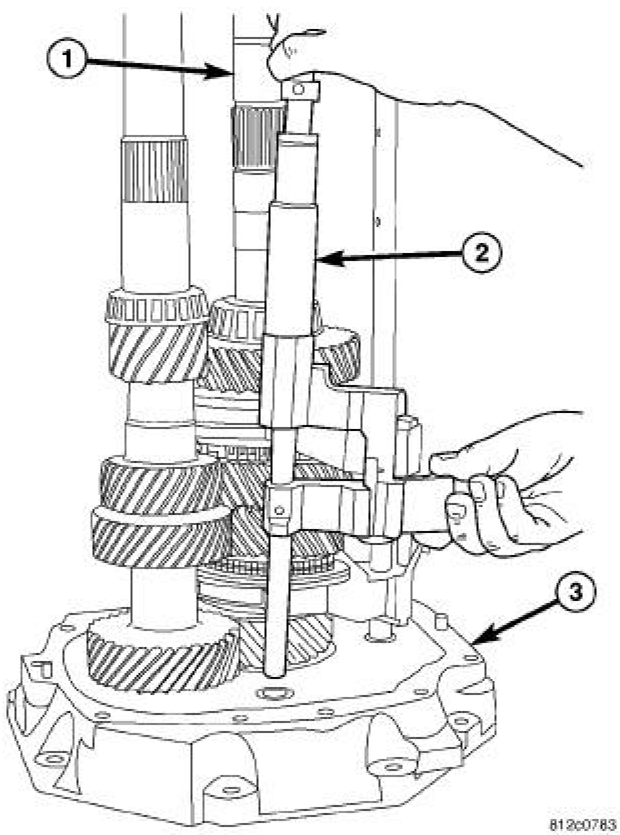

Fig. 169: Removing/Installing Reverse Shaft Rail Assembly
Courtesy of CHRYSLER GROUP, LLC

5. Install the reverse rail assembly (2) into the transmission adapter (3).

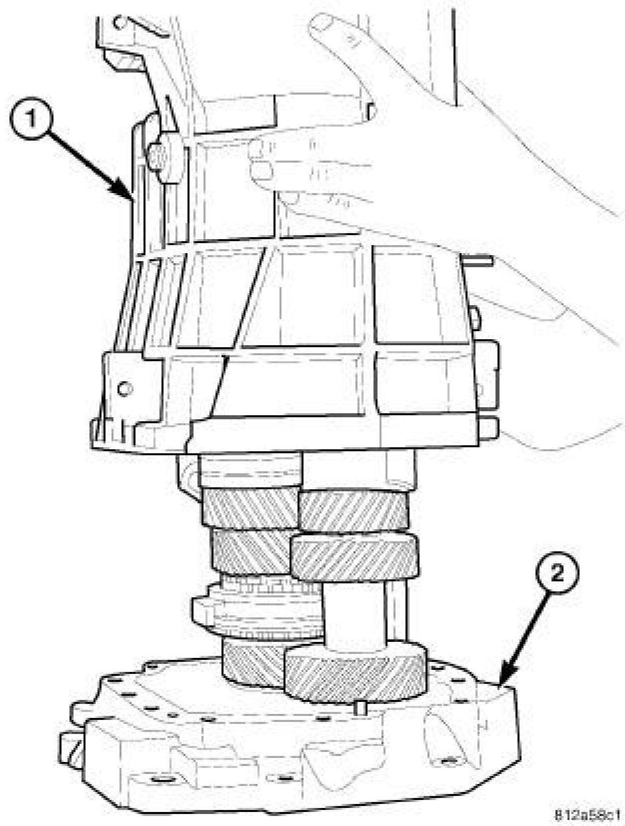

Fig. 170: Transmission Case
Courtesy of CHRYSLER GROUP, LLC

6. Apply Mopar Ā® ATF-RTV to the transmission adapter (2) sealing surface.
7. Install the transmission case (1) onto the gear set until the shift rail passes through the case bushing. Then install the skip shift lever on the shift rail and seat the transmission case on the adapter (2).

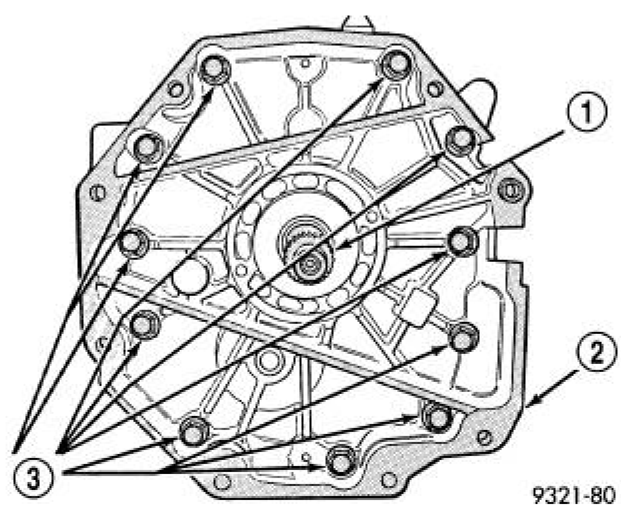

Fig. 171: Adapter Bolts Location
Courtesy of CHRYSLER GROUP, LLC

8. Install the transmission adapter (2) bolts (3) and tighten to the proper **SPECIFICATIONS** .

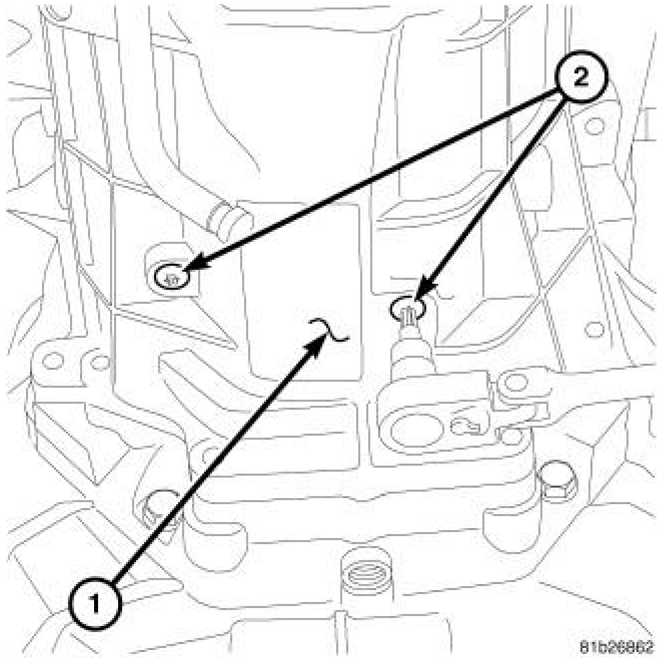

Fig. 172: Torx Screws
Courtesy of CHRYSLER GROUP, LLC

9. Apply Mopar Ā® Lock and Seal Adhesive to the shift lever guide bolts. Install the guide bolts (2) in the transmission case (1) and tighten to the proper **SPECIFICATIONS** .

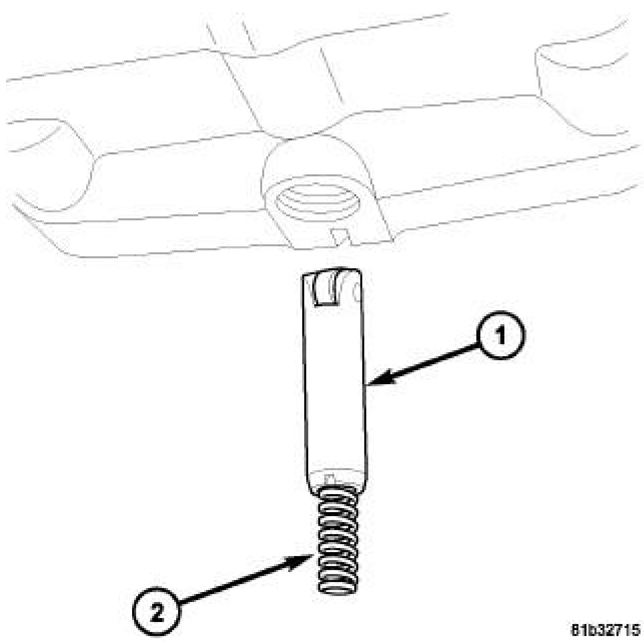

Fig. 173: Roller Detent & Spring
Courtesy of CHRYSLER GROUP, LLC

10. Install the roller detent (1) and spring (2) into the transmission adapter.

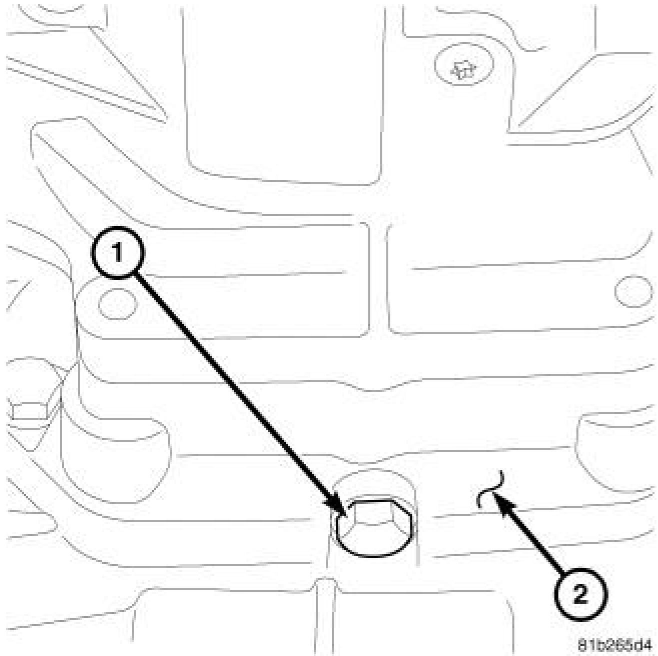

Fig. 174: Roller Detent Bolt & Transmission Adapter
Courtesy of CHRYSLER GROUP, LLC

11. Apply Mopar Ā® Lock and Seal to the roller detent bolt threads. Install the bolt (1) into the transmission adapter (2) and tighten to the proper **SPECIFICATIONS** .

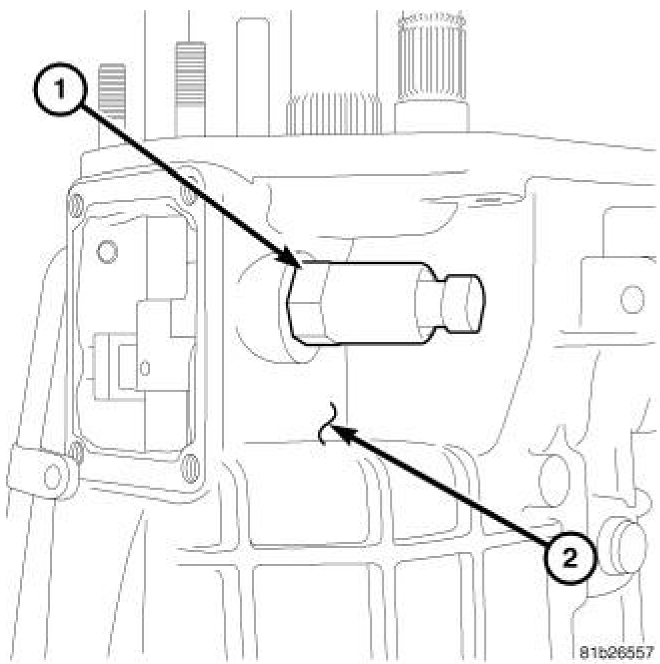

Fig. 175: Skip Shift Solenoid & Left Side Of Case
Courtesy of CHRYSLER GROUP, LLC

12. Install the skip shift solenoid (1) into the side of the case (2) and tighten to the proper **SPECIFICATIONS** .

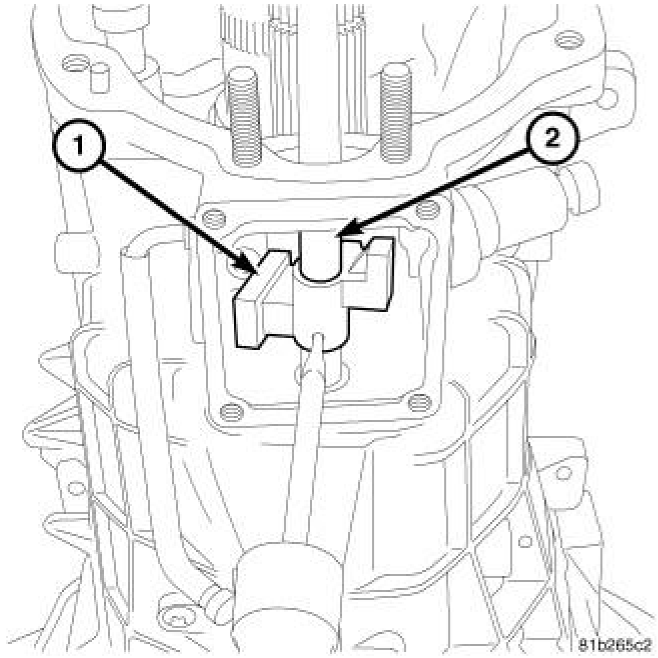

Fig. 176: Skip Shift Lever & Roll Pin
Courtesy of CHRYSLER GROUP, LLC

13. Install the skip shift lever (1) roll pin (2) with a hammer and punch.

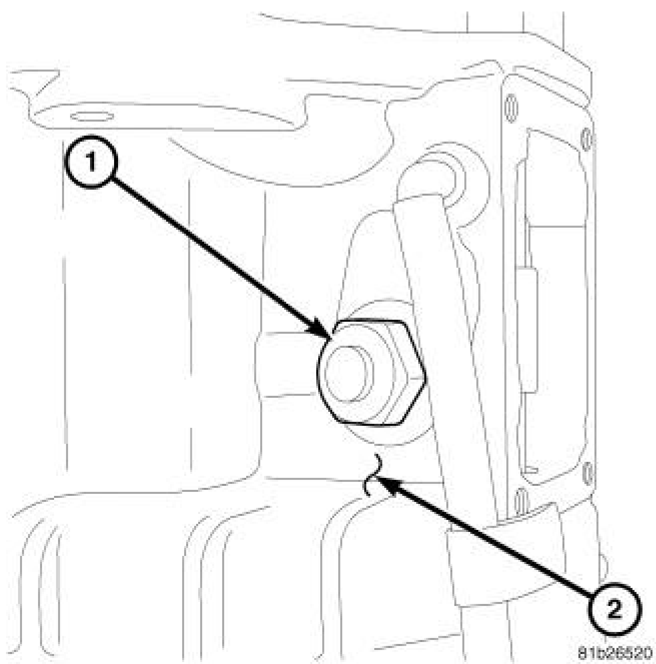

Fig. 177: Shift Detent & Right Side Of Case
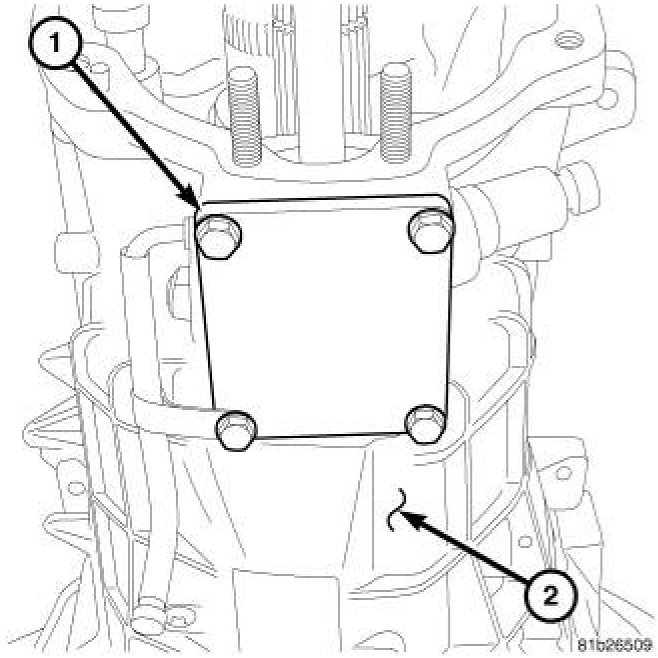
Courtesy of CHRYSLER GROUP, LLC

14. Install the side shift detent (1) into the case (2) and tighten to the proper **SPECIFICATIONS** .



[**Fig. 178: Top Cover, Bolts & Transmission Case**]
Courtesy of CHRYSLER GROUP, LLC

15. Apply Mopar Ā® ATF-RTV to the top cover sealing surface.
16. Install the top cover (1) on the case (2) and tighten the bolts to the proper **SPECIFICATIONS** .

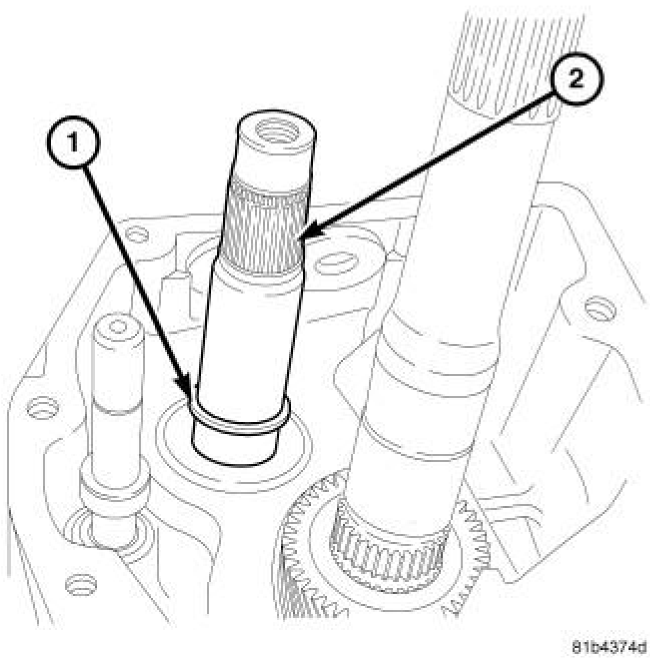


Fig. 179: 6th Gear Bearing Spacer & Countershaft
Courtesy of CHRYSLER GROUP, LLC

17. Install the sixth gear bearing spacer (1) on the countershaft (2).

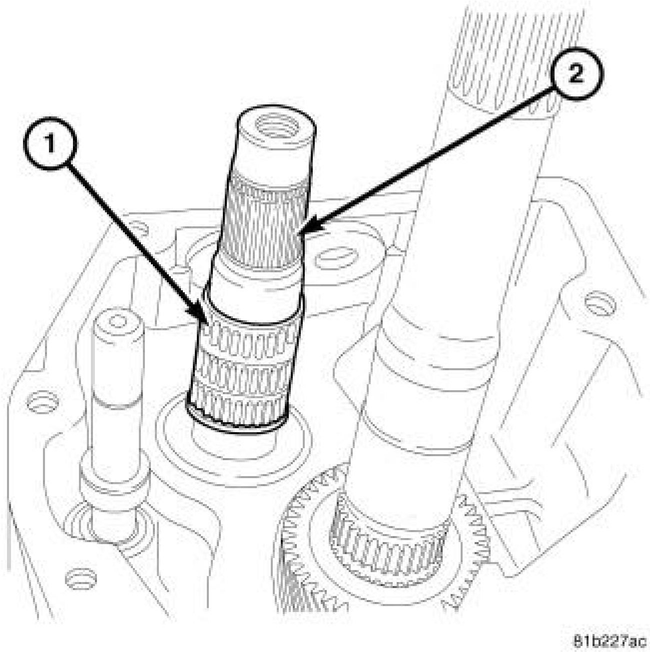

Fig. 180: 6th Gear Bearing & Countershaft
Courtesy of CHRYSLER GROUP, LLC

18. Install the sixth gear bearing (1) on the countershaft (2).

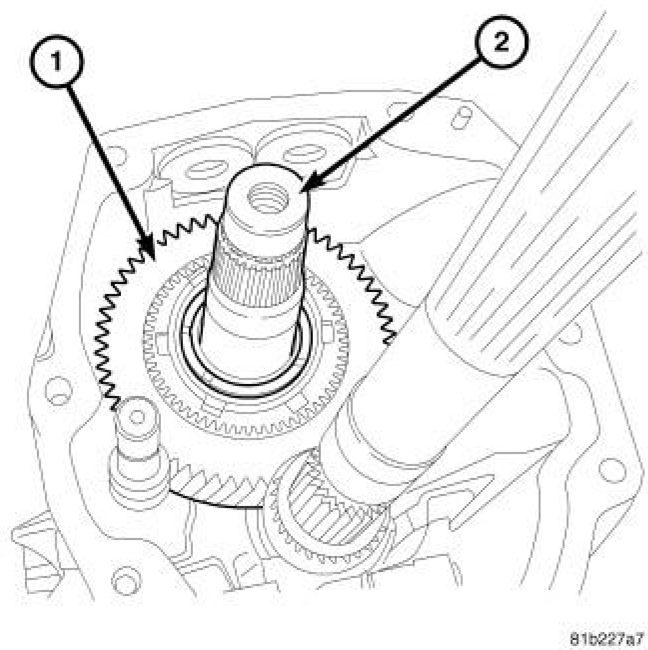

Fig. 181: 6th Gear & Countershaft
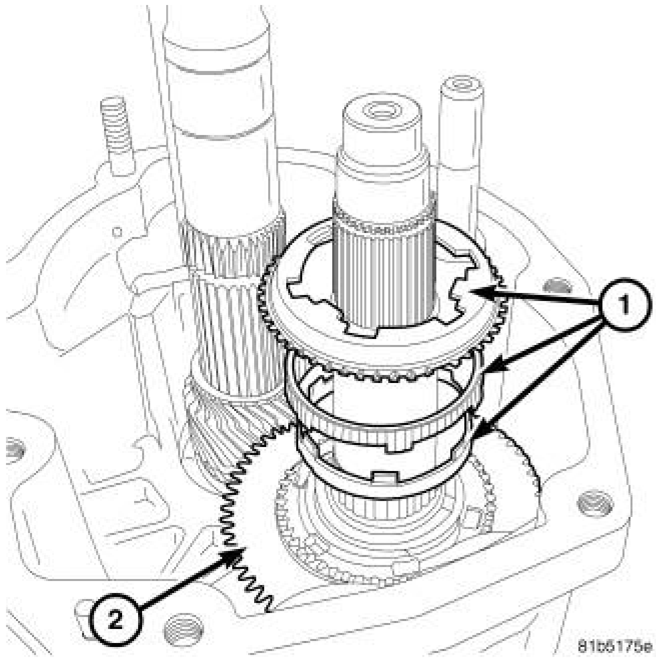
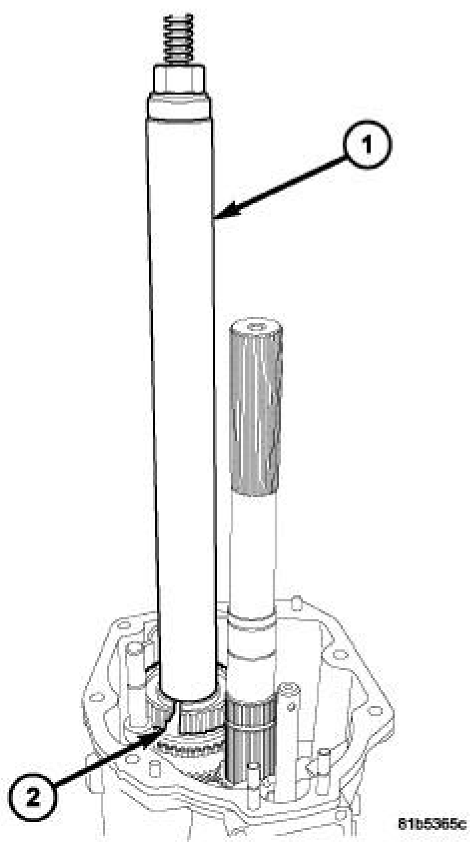
Courtesy of CHRYSLER GROUP, LLC

19. Install sixth gear (1) on the countershaft (2).



[Fig. 182: 6th Synchro Rings]
Courtesy of CHRYSLER GROUP, LLC

20. Install the sixth gear synchronizer rings (1) on the countershaft sixth gear (2).



[Fig. 183: 5-6 Hub Installer]
Courtesy of CHRYSLER GROUP, LLC

21. Install the fifth and sixth gear synchronizer hub (2) on the countershaft with Installer (special tool #9391, Installer, Gear) (1).

CAUTION: **Synchronizer rings must be aligned with synchronizer hub and sixth gear during installation. Failure to follow these instructions will result in damage to the synchronizer rings.**

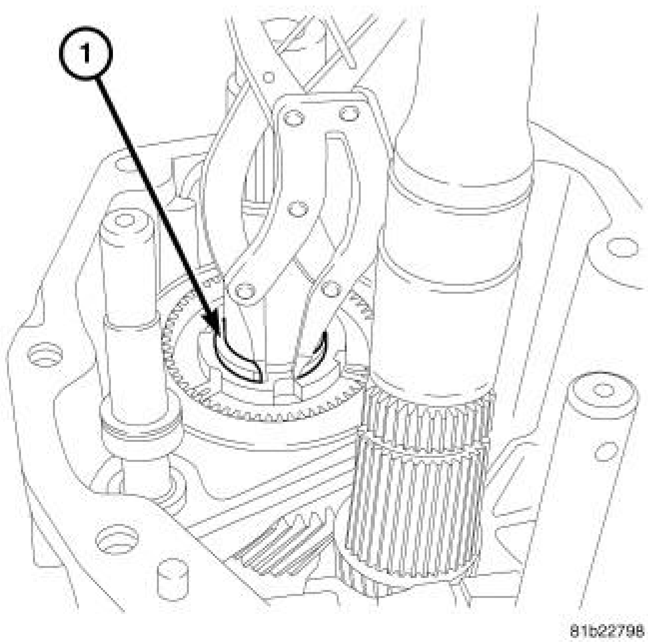


Fig. 184: 5-6 Hub Snap Ring
Courtesy of CHRYSLER GROUP, LLC

22. Install the fifth and sixth gear synchronizer hub (1) snap ring (2).

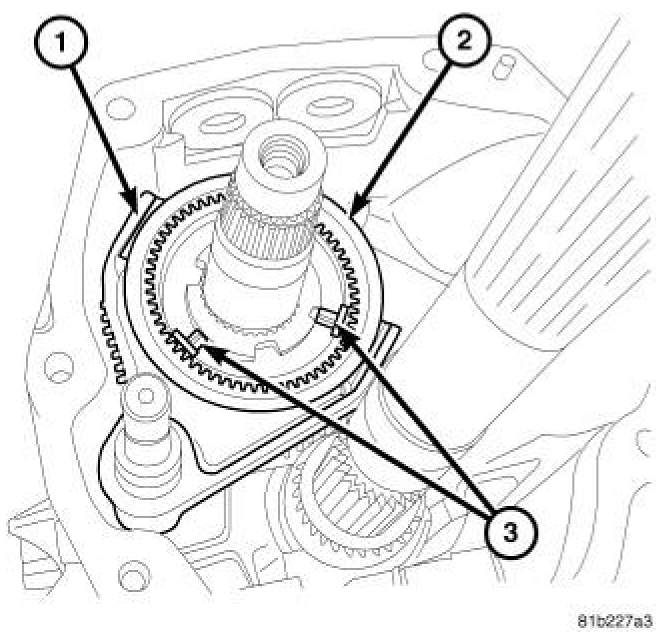

Fig. 185: 5-6 Fork & Sleeve
Courtesy of CHRYSLER GROUP, LLC

23. Install the fifth and sixth gear synchronizer shift fork (1) synchronizer sleeve (2) and the hub detents (3).

NOTE: **The fifth and sixth gear synchronizer detents and the reverse synchronizer detents are the same.**

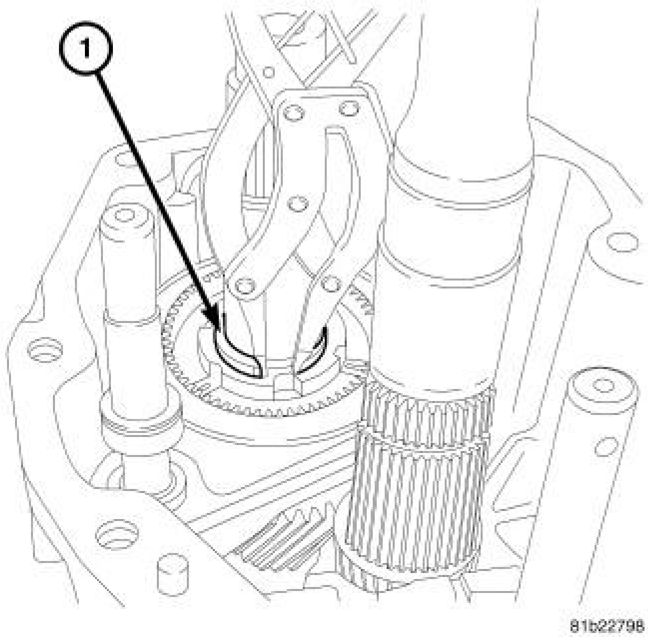

Fig. 186: 5-6 Hub Snap Ring
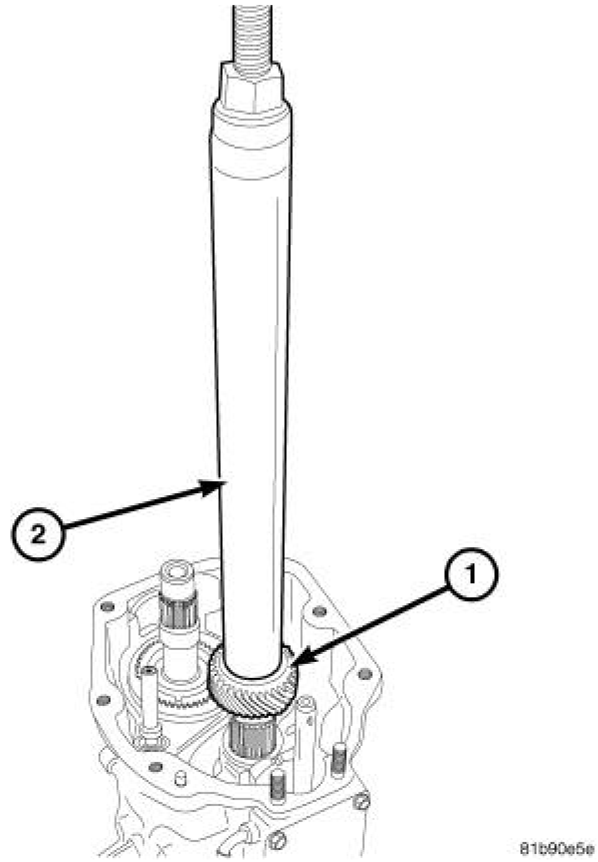
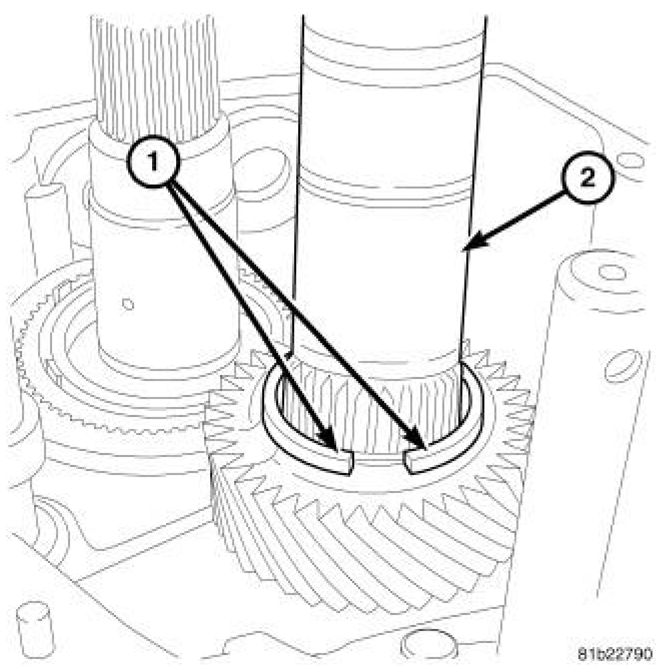
Courtesy of CHRYSLER GROUP, LLC

24. Install the fifth and sixth gear synchronizer hub snap ring (1).
25. Install a **NEW** fifth and sixth gear gear shift fork snap ring.



[**Fig. 187: 5th Gear Mainshaft**]
Courtesy of CHRYSLER GROUP, LLC

26. Install fifth gear (1) on the mainshaft with Installer (special tool #9391, Installer, Gear) (2) and Coupler (special tool #9391-2, Adapter, Coupling).



[**Fig. 188: 5th Gear Split Rings & Mainshaft**]
Courtesy of CHRYSLER GROUP, LLC

27. Install the fifth gear split rings (1) on the mainshaft (2).

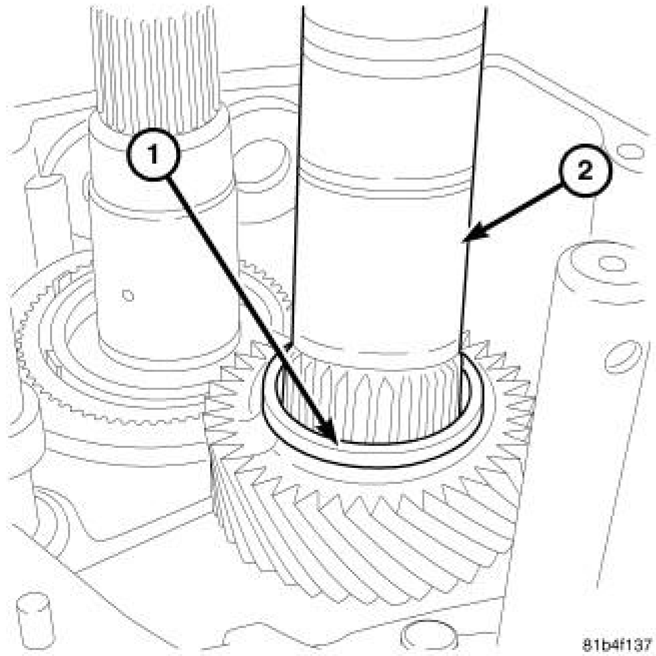


Fig. 189: 5th Gear Retainer Ring & Mainshaft
Courtesy of CHRYSLER GROUP, LLC

28. Install the fifth gear split ring retainer (1) on the mainshaft (2).

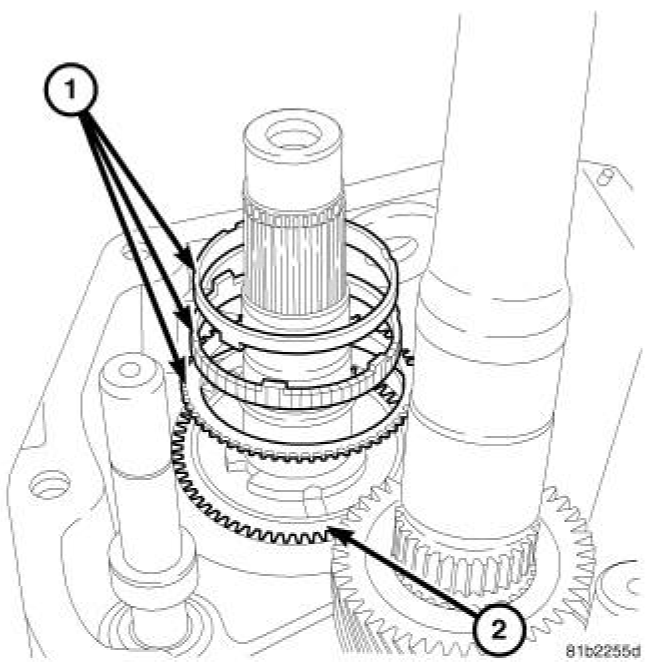

Fig. 190: Fifth Gear Synchro Rings & 5-6 Synchronizer Hub
Courtesy of CHRYSLER GROUP, LLC

29. Install the fifth gear synchronizer rings (1) on the fifth and sixth gear synchronizer hub (2).

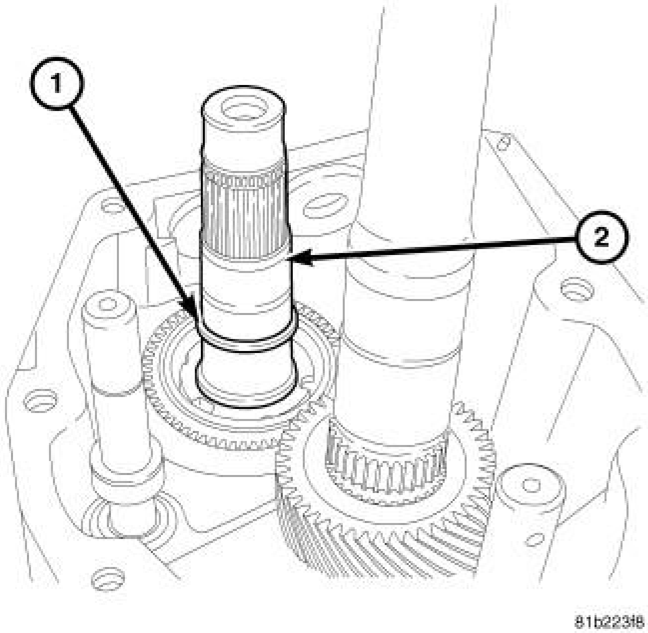

Fig. 191: 5th Gear Bearing Spacer & Countershaft
Courtesy of CHRYSLER GROUP, LLC

30. Install the fifth gear bearing spacer (1) on the countershaft (2).

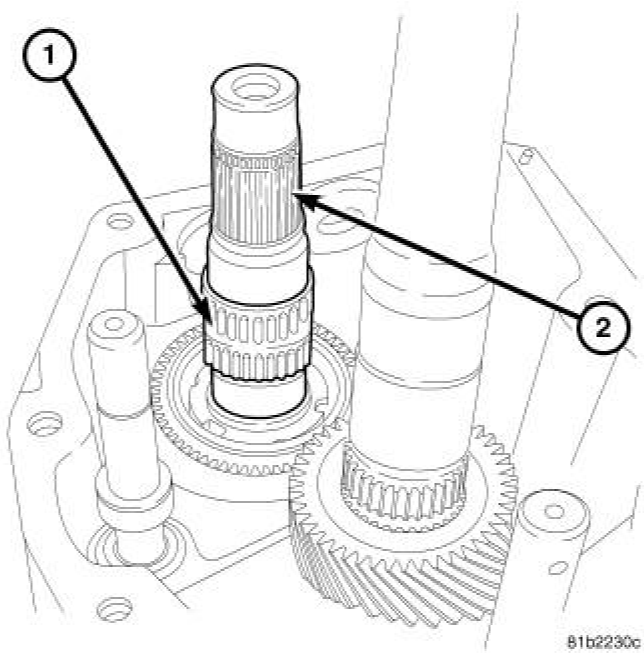

Fig. 192: 5th Gear Bearing & Countershaft
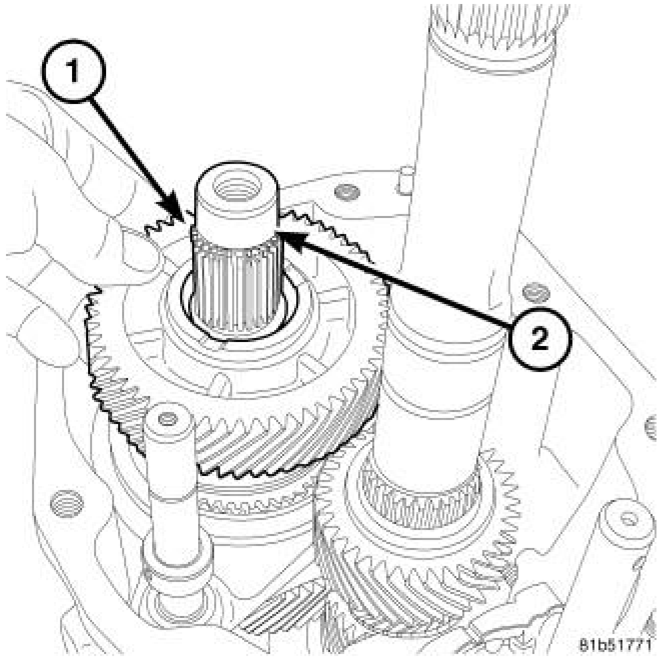
Courtesy of CHRYSLER GROUP, LLC

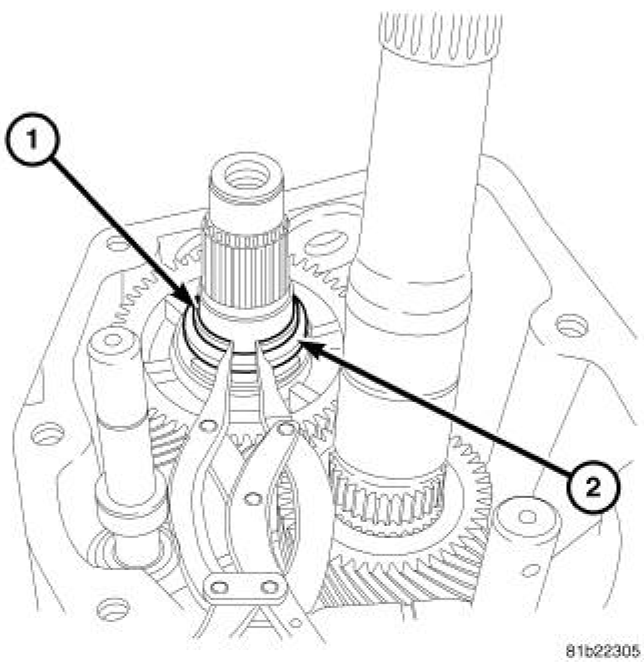
31. Install the fifth gear bearing (1) on the countershaft (2).



[Fig. 193: 5th Gear & Countershaft](#)
Courtesy of CHRYSLER GROUP, LLC

32. Install fifth gear (1) on the countershaft (2).

CAUTION: Synchronizer rings must be aligned with synchronizer hub and fifth gear during installation. Failure to follow these instructions will result in damage to the synchronizer rings.



[Fig. 194: 5th Gear Snap Ring & Countershaft](#)
Courtesy of CHRYSLER GROUP, LLC

33. Install the fifth gear thrust washer (2) and snap ring (1) on the countershaft.

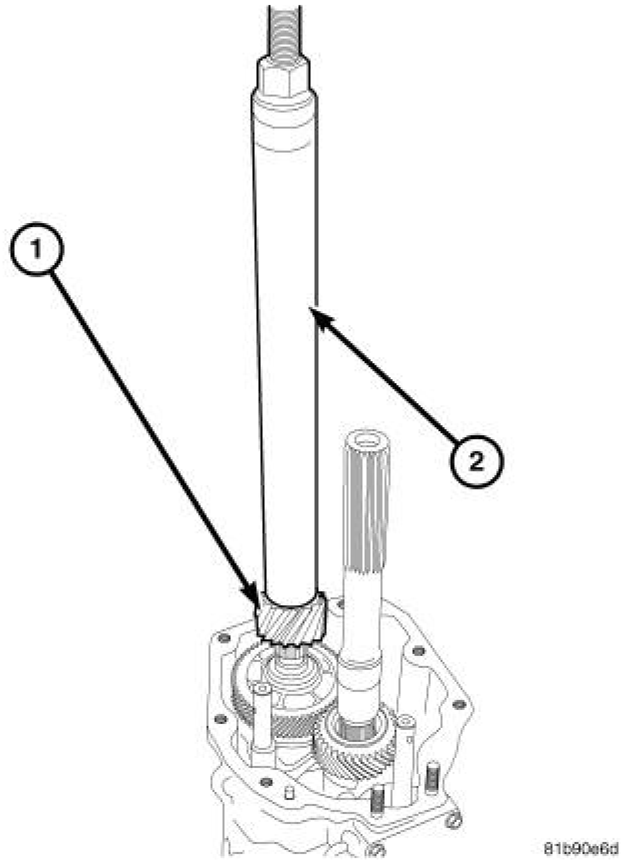


Fig. 195: Reverse Gear Countershaft
Courtesy of CHRYSLER GROUP, LLC

34. Install reverse gear (1) on the countershaft with Installer (special tool #9391, Installer, Gear) (2).

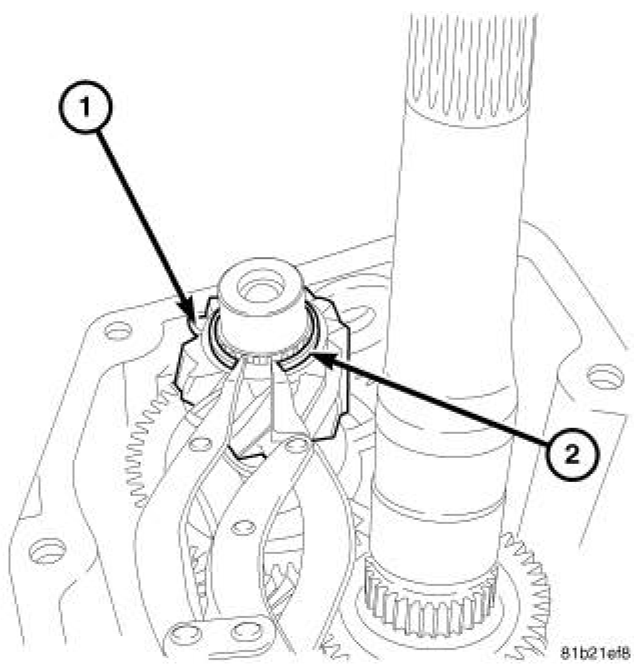

Fig. 196: Reverse Countershaft Snap Ring
Courtesy of CHRYSLER GROUP, LLC

35. Install the reverse gear (1) snap ring (2) on the countershaft.

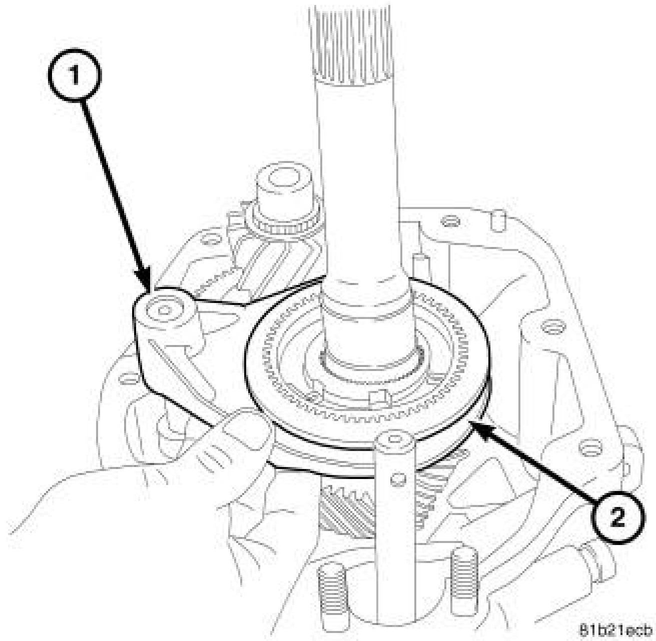

Fig. 197: Reverse Hub & Fork
Courtesy of CHRYSLER GROUP, LLC

36. Install the reverse gear shift fork (1), synchronizer hub with detents (2) and sleeve.

NOTE: **The fifth and sixth gear and the reverse gear synchronizer detents are the same.**

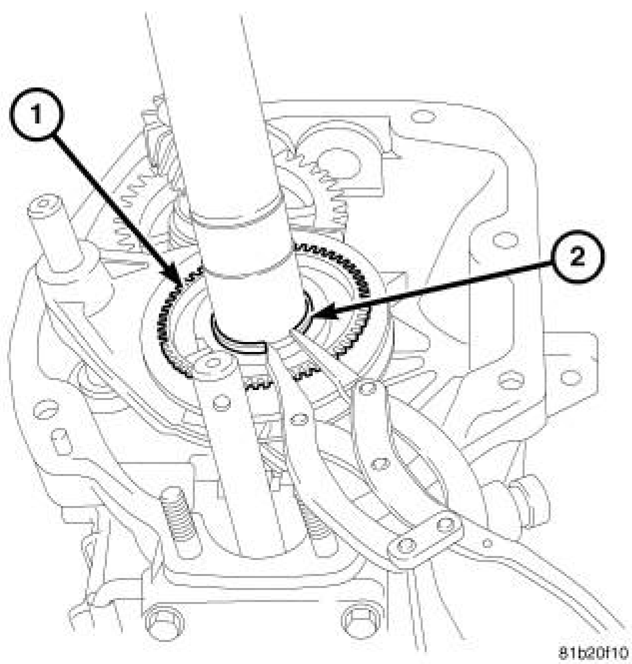

Fig. 198: Reverse Synchronizer Snap Ring
Courtesy of CHRYSLER GROUP, LLC

37. Install the reverse gear synchronizer hub (1) snap ring (2).

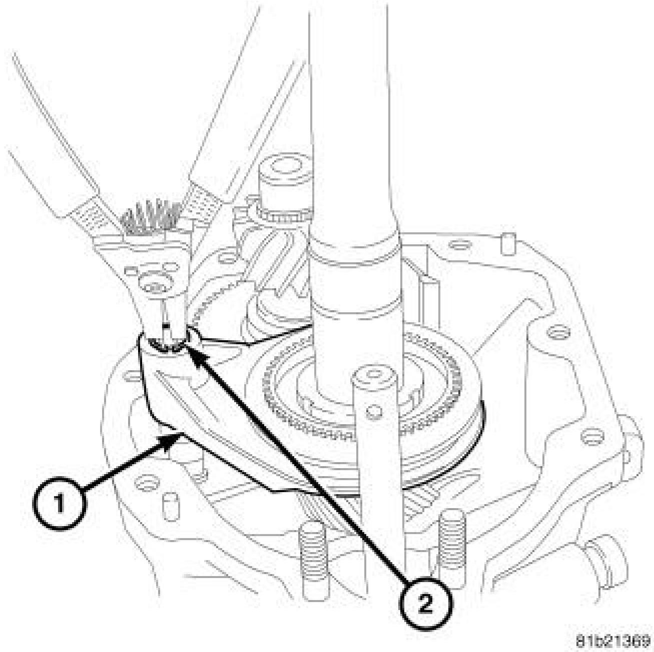

Fig. 199: Reverse Fork Snap Ring
Courtesy of CHRYSLER GROUP, LLC

38. Install a **NEW** reverse gear shift fork (1) snap ring (2).

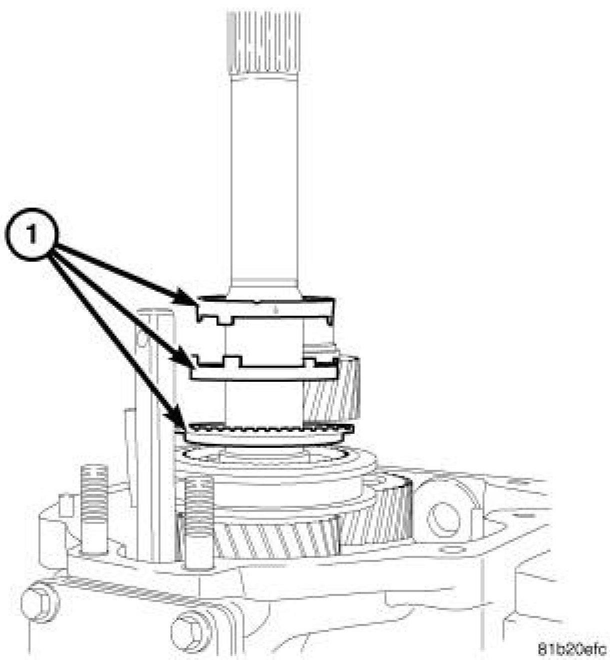

Fig. 200: Reverse Synchronizer Rings
Courtesy of CHRYSLER GROUP, LLC

39. Install the reverse gear synchronizer rings (1) on the reverse gear synchronizer hub.

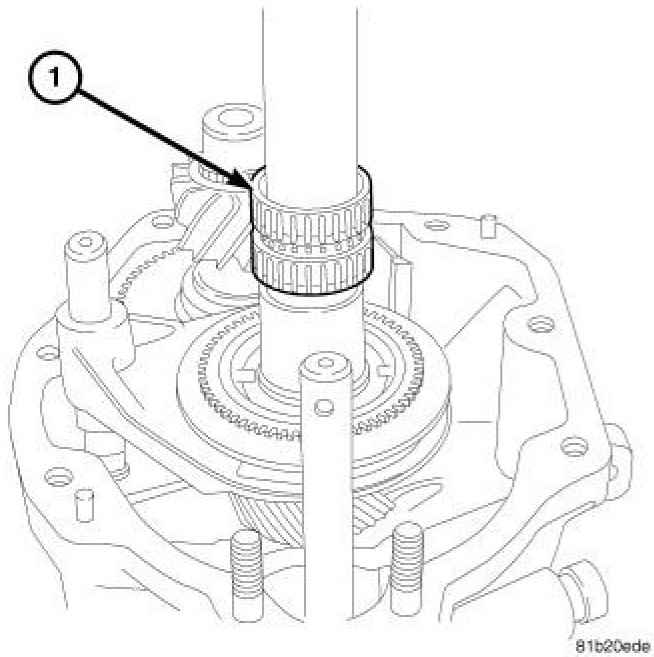

Fig. 201: Reverse Gear Bearing
Courtesy of CHRYSLER GROUP, LLC

40. Install the reverse gear bearing (1) on the mainshaft.

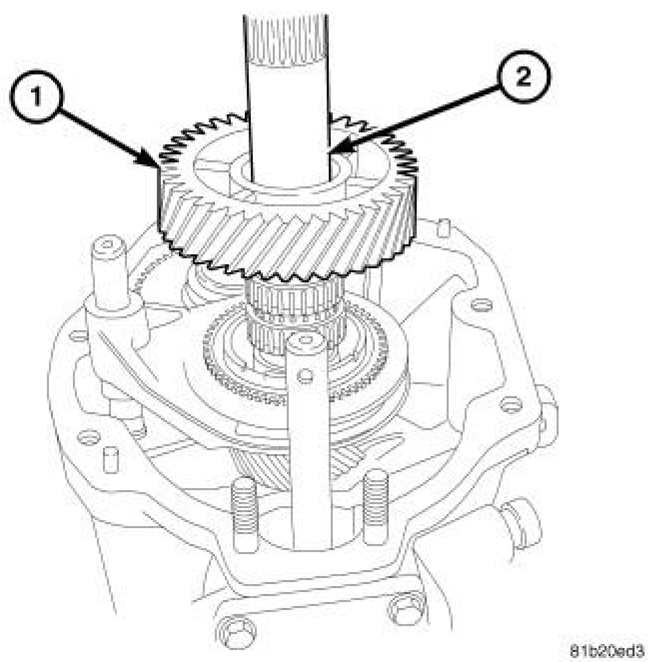

Fig. 202: Reverse Gear & Mainshaft
Courtesy of CHRYSLER GROUP, LLC

41. Install reverse gear (1) on the mainshaft (2).

CAUTION: Synchronizer rings must be aligned with synchronizer hub and reverse gear during installation. Failure to follow these instructions will result in damage to the synchronizer rings.

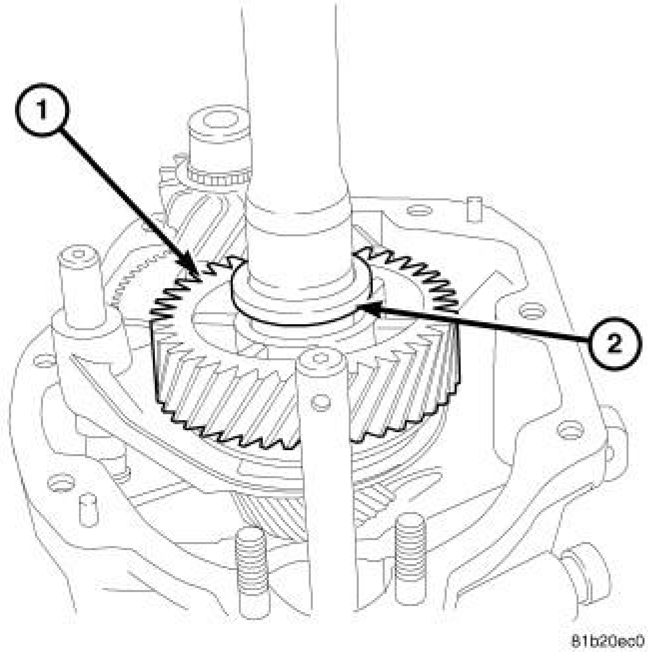

Fig. 203: Reverse Gear Thrust Washer
Courtesy of CHRYSLER GROUP, LLC

42. Install the reverse gear (1) thrust washer (2) on the mainshaft.

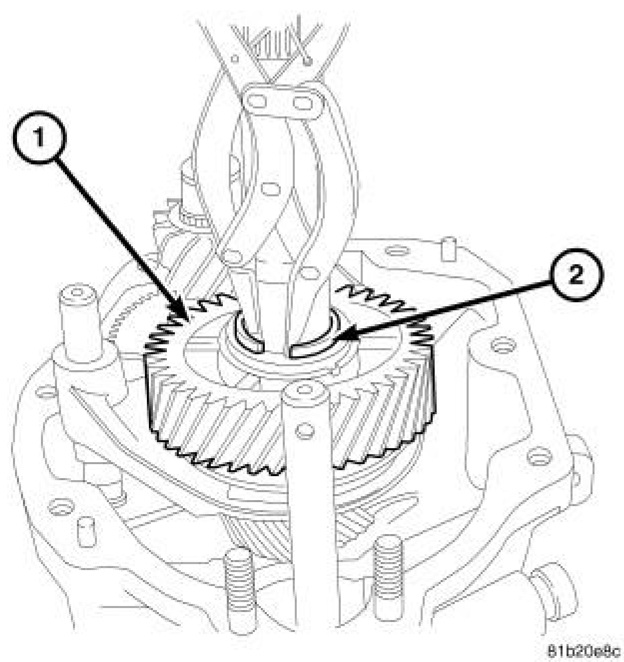

Fig. 204: Reverse Gear Snap Ring
Courtesy of CHRYSLER GROUP, LLC

43. Install the reverse gear (1) snap ring (2) on the mainshaft.

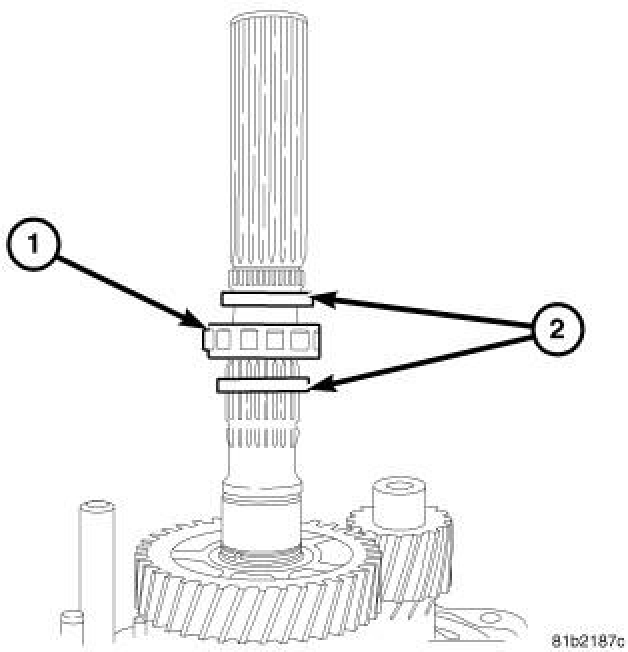

Fig. 205: Roller Bearing & Spacers
Courtesy of CHRYSLER GROUP, LLC

44. Install the mainshaft roller bearing (1) and spacers (2) on the mainshaft.

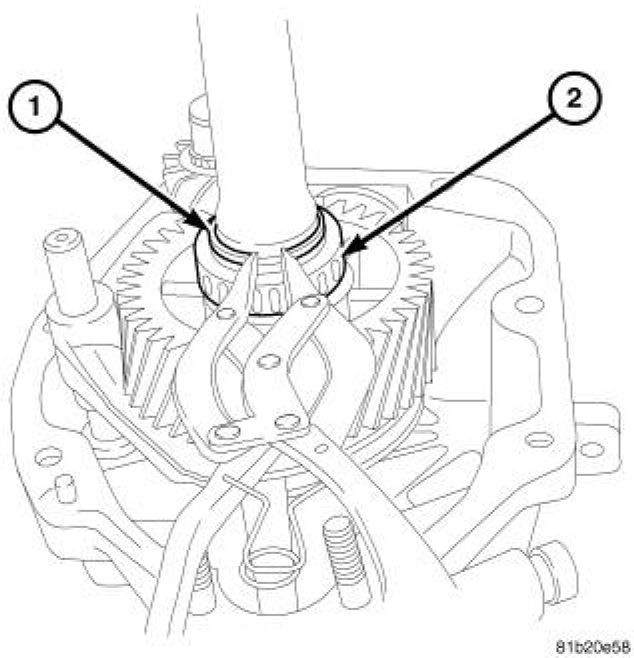

Fig. 206: Roller Bearing Snap-Ring
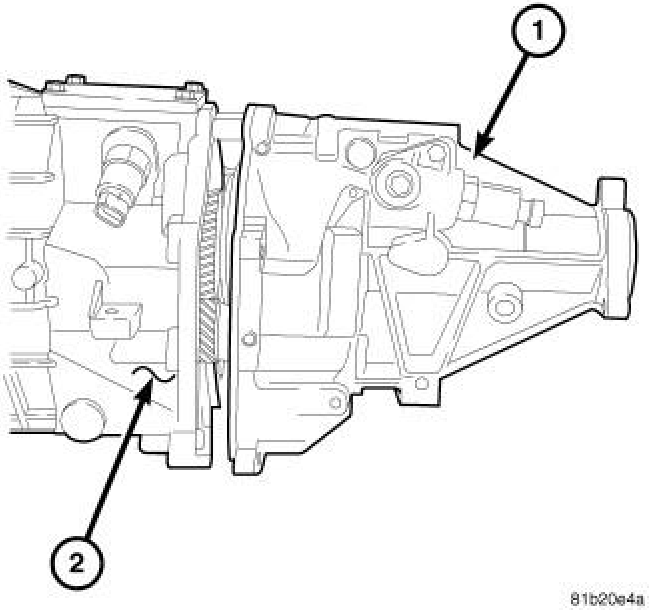
Courtesy of CHRYSLER GROUP, LLC

45. Install the mainshaft roller bearing (2) snap ring (1).

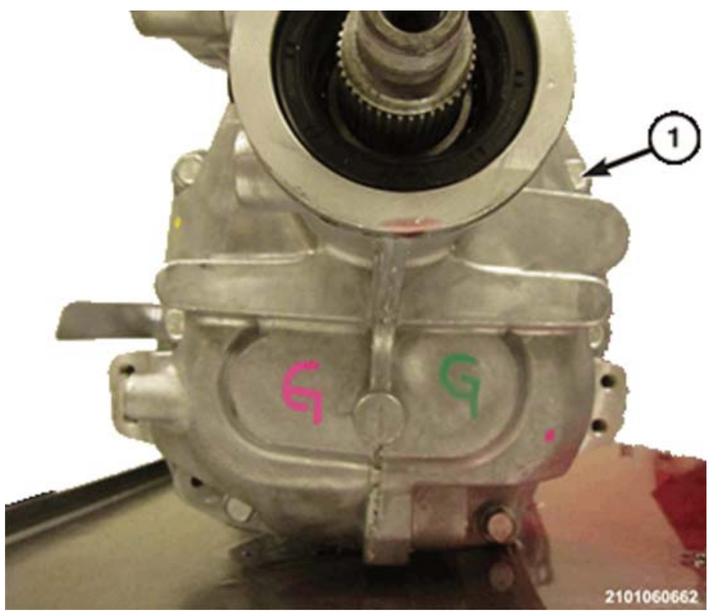


[Fig. 207: Removing/Installing Extension Housing](#)
Courtesy of CHRYSLER GROUP, LLC

46. If equipped, apply Mopar Ā® ATF-RTV to the extension housing sealing surface.

    If equipped with a gasket, install a **NEW** gasket.

47. Install the extension housing (1) on the transmission case (2).



[Fig. 208: Extension Housing Bolts](#)
Courtesy of CHRYSLER GROUP, LLC

48. Install the extension housing bolts (1) and tighten to the proper **SPECIFICATIONS** .

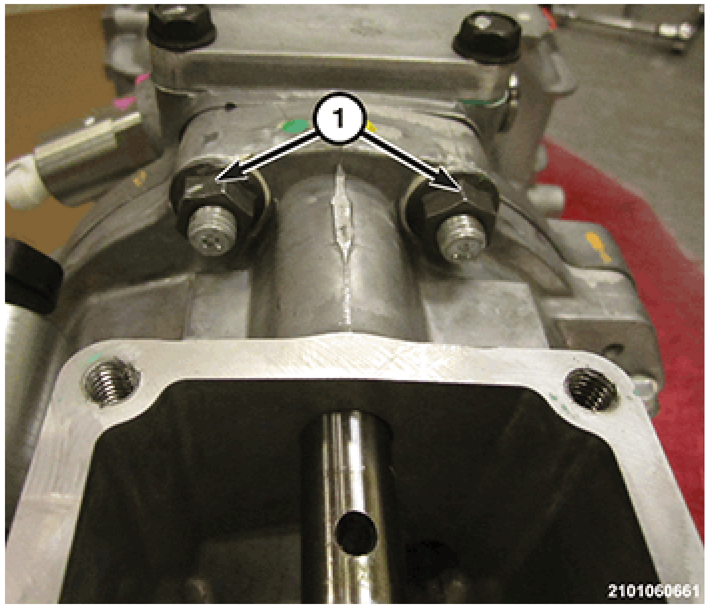


Fig. 209: Extension Housing Nuts
Courtesy of CHRYSLER GROUP, LLC

49. Install the extension housing nuts (1) and tighten to the proper **SPECIFICATIONS** .

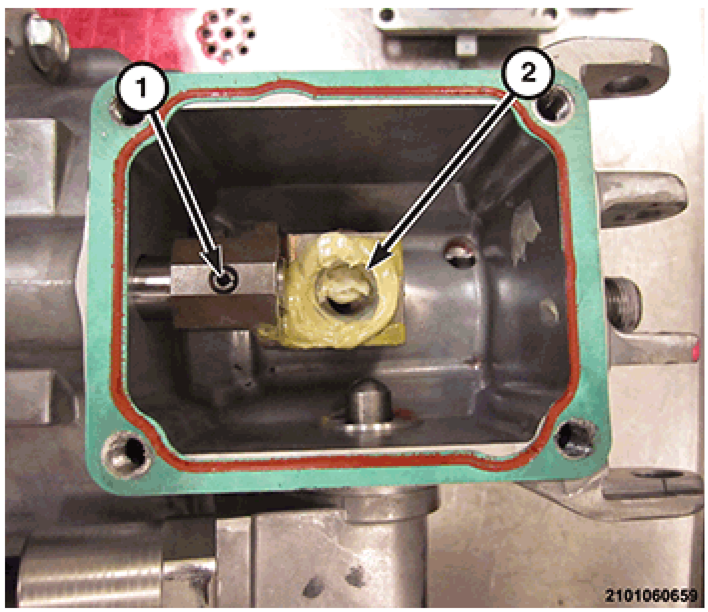

Fig. 210: Offset Lever & Roll Pin
Courtesy of CHRYSLER GROUP, LLC

50. Install the offset lever (2) and the offset lever roll pin (1) with a hammer and punch.

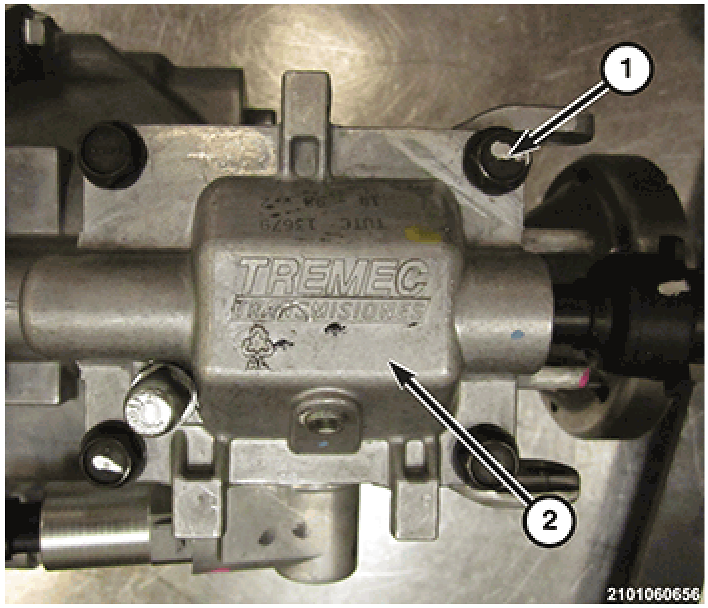

Fig. 211: Shift Cover & Bolts
Courtesy of CHRYSLER GROUP, LLC

51. For transmissions equipped with RTV use, Mopar Ā® ATF-RTV to the shift cover sealing surface.

    For transmissions equipped with a gasket, install a **NEW** gasket.

52. Install shift cover (2) bolts (1) and tighten to the proper **SPECIFICATIONS** .

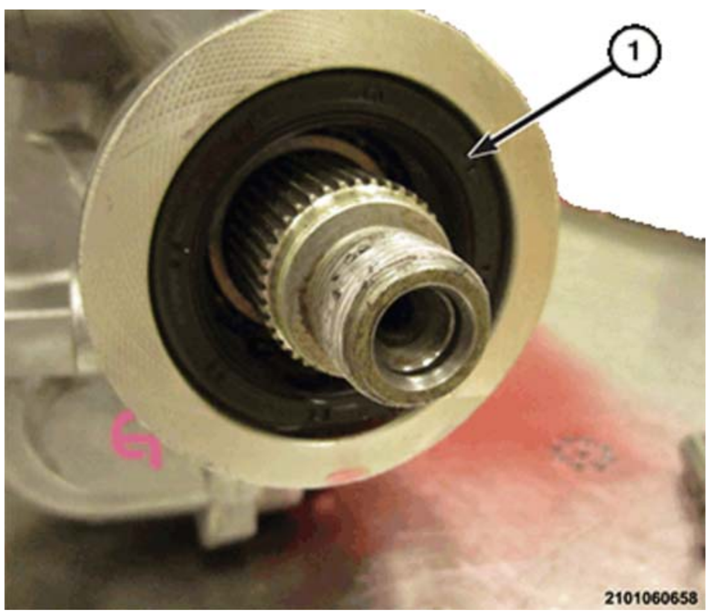

Fig. 212: Extension Housing Seal
Courtesy of CHRYSLER GROUP, LLC

53. Install the extension housing seal (1) in the extension housing with installer (special tool #7884, Installer, Seal) (2).

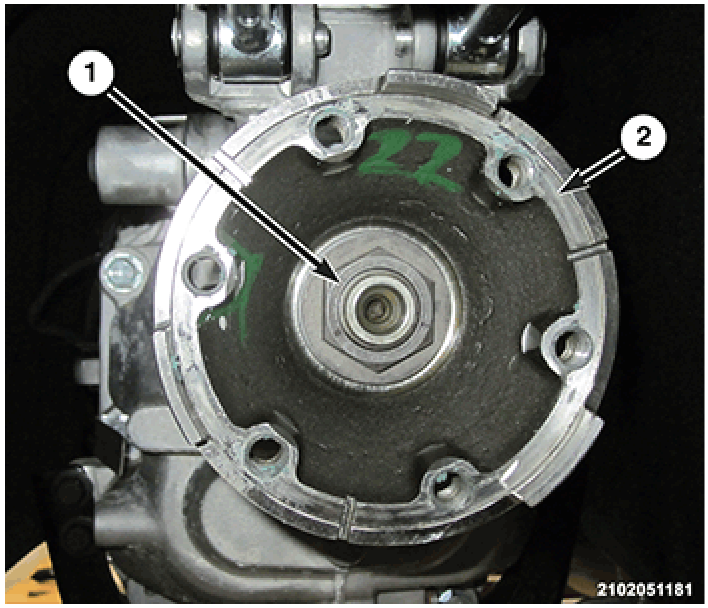

Fig. 213: Output Flange & Locknut
Courtesy of CHRYSLER GROUP, LLC

54. Install the output flange (2) to the transmission output shaft.
55. Hold the output flange (2) with Special Tool (special tool #C-3281, Holder, Flange) (2) Flange Wrench and tighten the output flange locknut (1) to the proper **SPECIFICATIONS** .

INSTALLATION

INSTALLATION

1. Position the transmission into the clutch and seat against the bell housing.

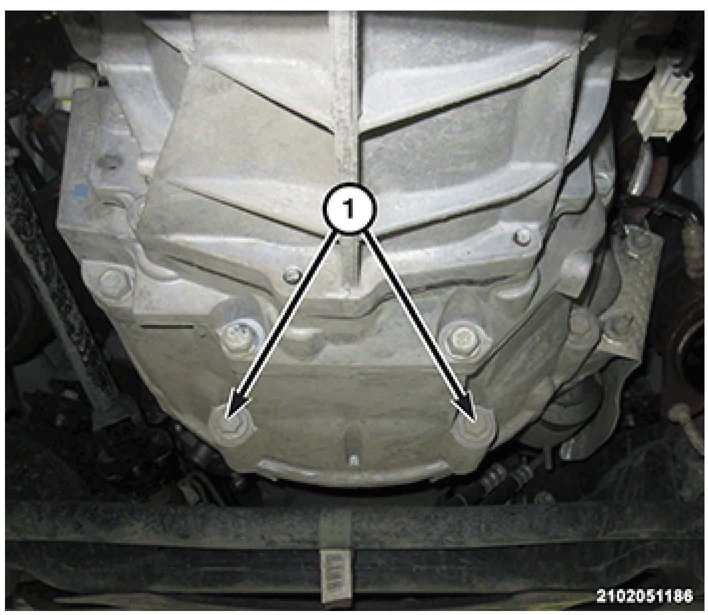

Fig. 214: Bottom Transmission To Oil Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Install the bottom transmission to oil pan bolts (1) and tighten to the proper **SPECIFICATIONS** .

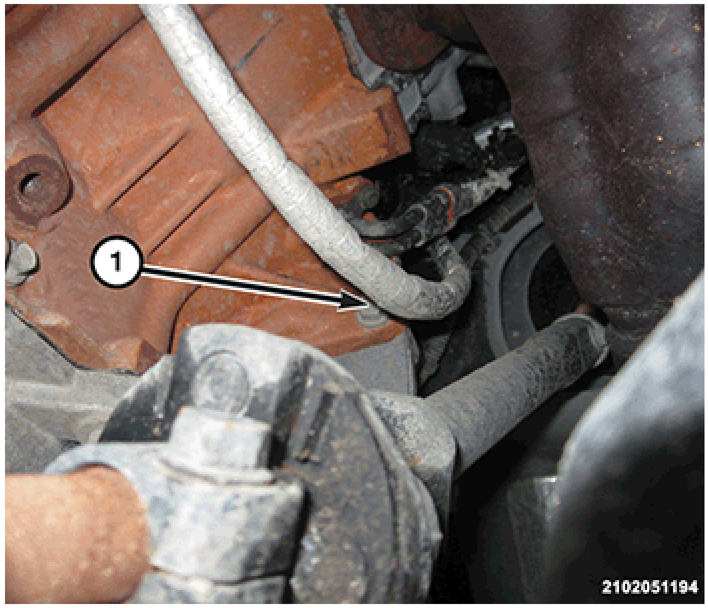

Fig. 215: Front Transmission To Engine Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Install the front transmission to engine bolt (1) and tighten to the proper **SPECIFICATIONS** .

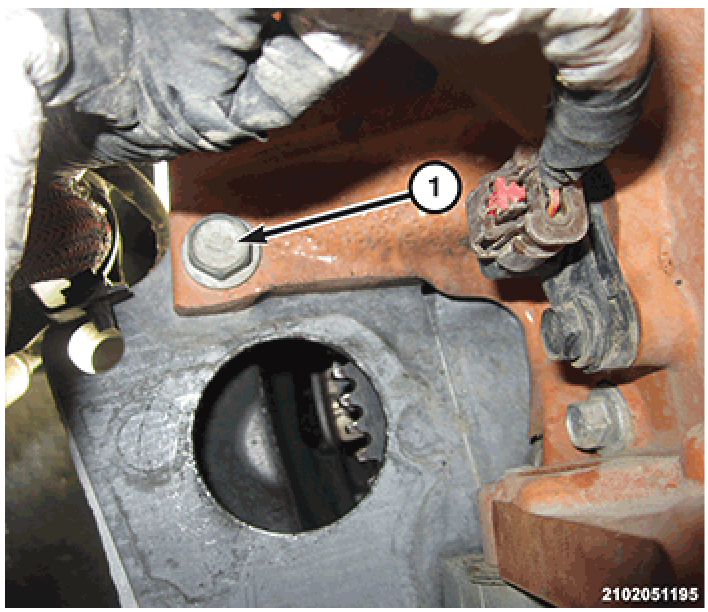

Fig. 216: Front Transmission To Engine Bolt
Courtesy of CHRYSLER GROUP, LLC

4. Install the front transmission to engine bolt and tighten to the proper **SPECIFICATIONS** .

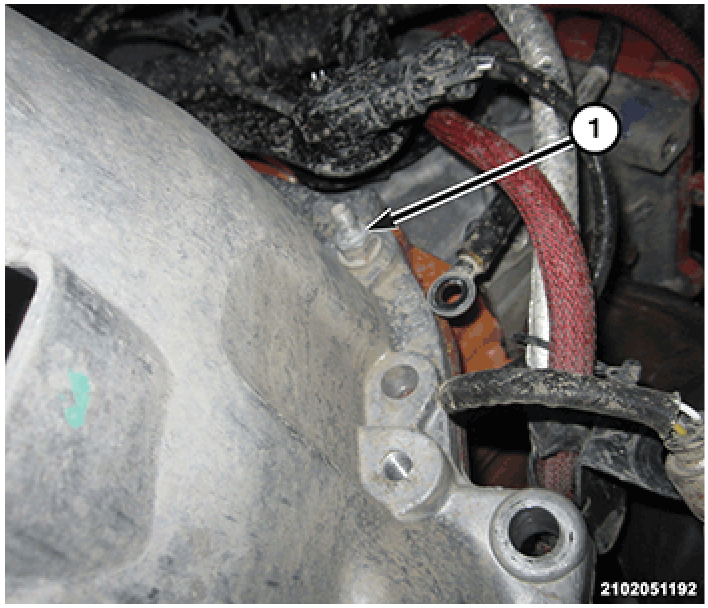

Fig. 217: Engine Stud Bolt
Courtesy of CHRYSLER GROUP, LLC

5. Install the transmission to engine stud (1) and tighten to the proper **SPECIFICATIONS** .

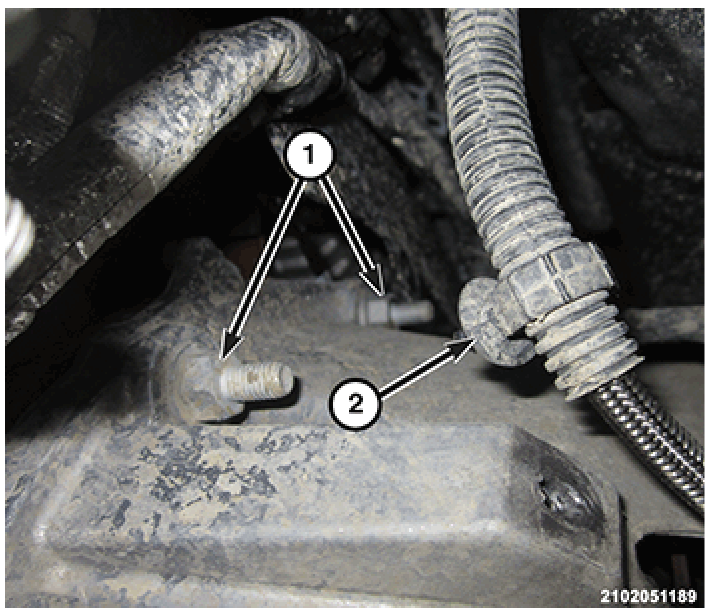

Fig. 218: Engine Stud Bolts & Harness Clip
Courtesy of CHRYSLER GROUP, LLC

6. Install the three (two shown) transmission to engine studs (1) and tighten to the proper **SPECIFICATIONS** .

Fig. 219: Rainbow Bracket Nut
Courtesy of CHRYSLER GROUP, LLC

7. Install the rainbow bracket nut (1) and tighten to the proper **SPECIFICATIONS** .

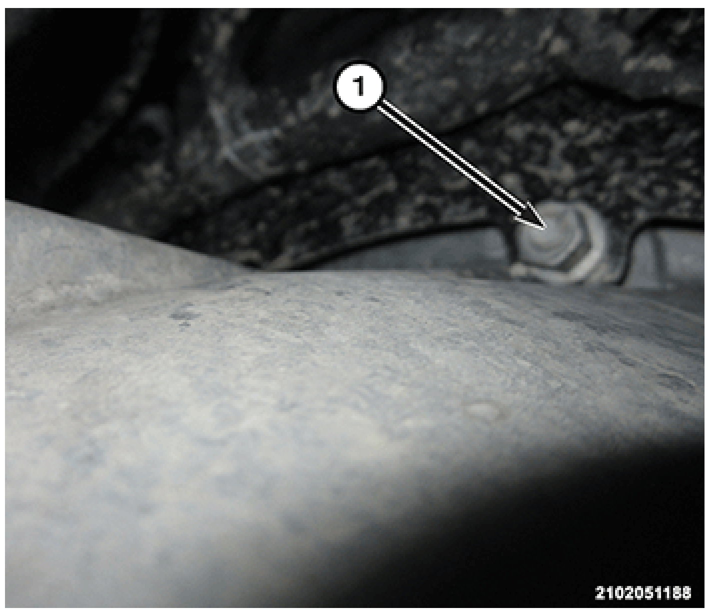

Fig. 220: Rainbow Bracket Nut
Courtesy of CHRYSLER GROUP, LLC

8. Install the rainbow bracket nut (1) and tighten to the proper **SPECIFICATIONS** .

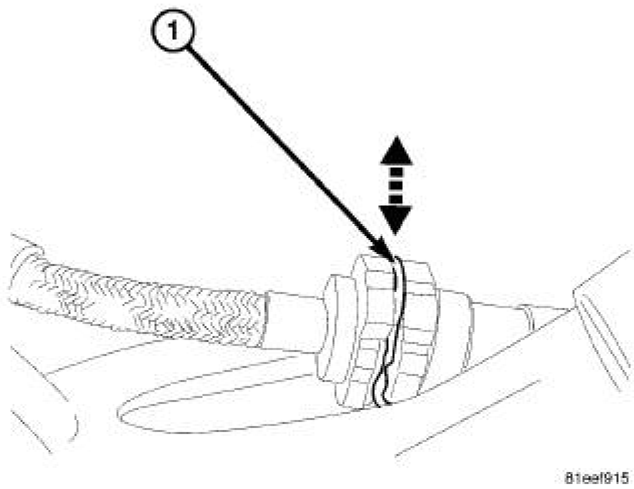

Fig. 221: Clutch Hose Removal
Courtesy of CHRYSLER GROUP, LLC

9. Push the clip (1) securing the clutch hydraulic hose to the throw out bearing assembly. Verify the clutch hydraulic hose is installed.

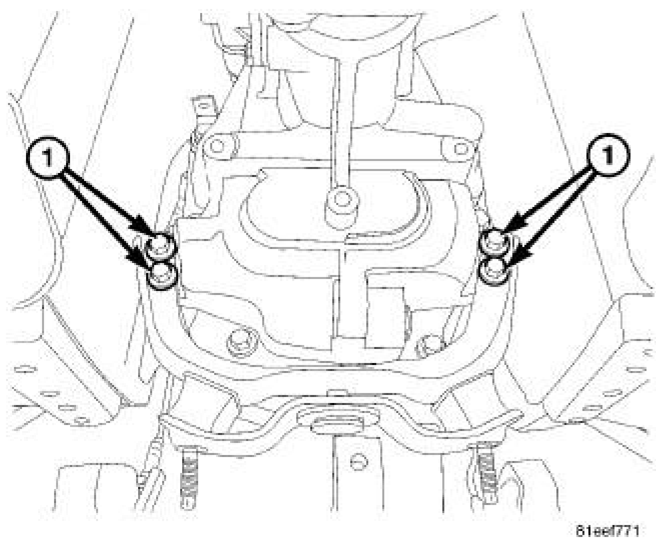

Fig. 222: Transmission Isolator Bracket Upper Bolts
Courtesy of CHRYSLER GROUP, LLC

10. Install the crossmember, isolator bracket and isolator on the transmission.
11. Install the isolator bracket bolts (1) and tighten to the proper **SPECIFICATIONS** .

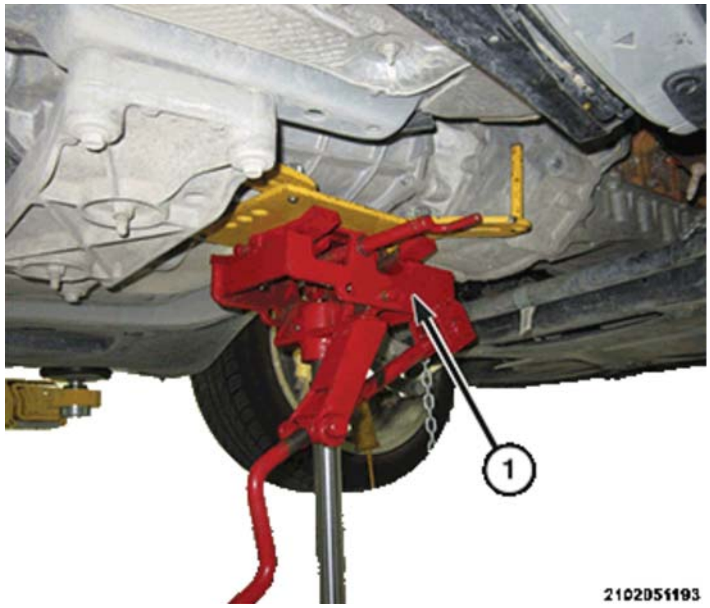

Fig. 223: Transmission Jack
Courtesy of CHRYSLER GROUP, LLC

12. Raise the transmission slightly with the transmission jack (1) to allow the crossmember to sit flush with the body.

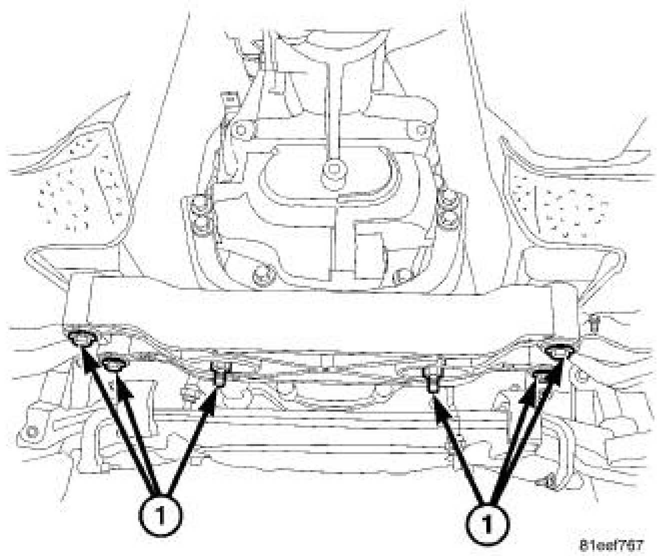

Fig. 224: Crossmember And Isolator Lower Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

13. Install the crossmember bolts (1) and tighten to the proper **SPECIFICATIONS** .

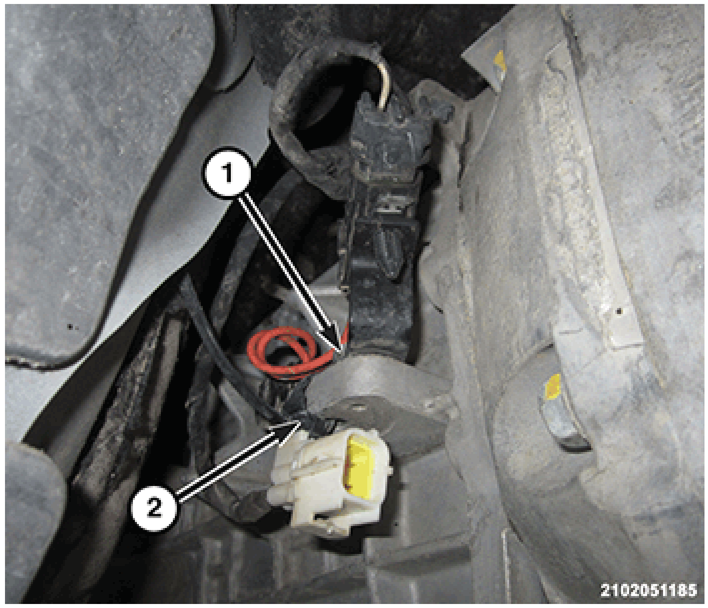

Fig. 225: Push Pin Wiring Connectors & Harness Clips
Courtesy of CHRYSLER GROUP, LLC

14. Install the push pin wiring connectors (1 and 2) on the transmission.

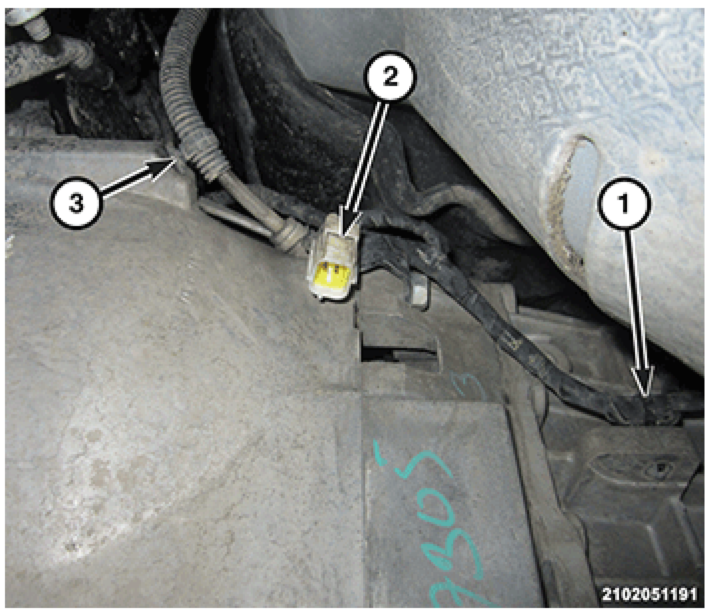

Fig. 226: Wire Harness Connector & Harness Clips
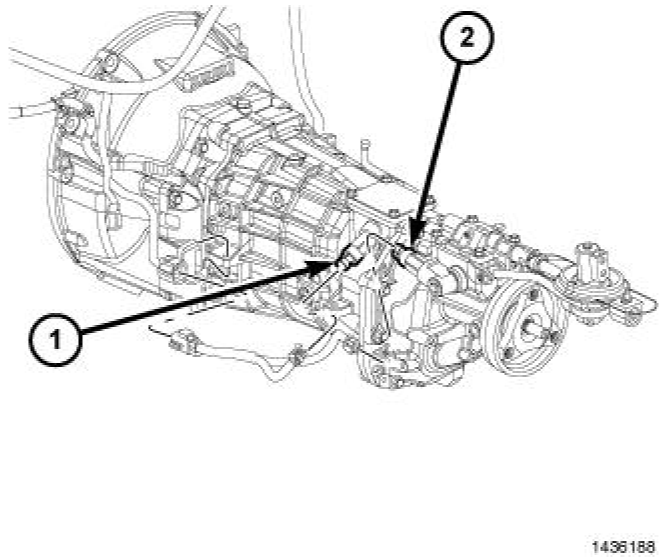
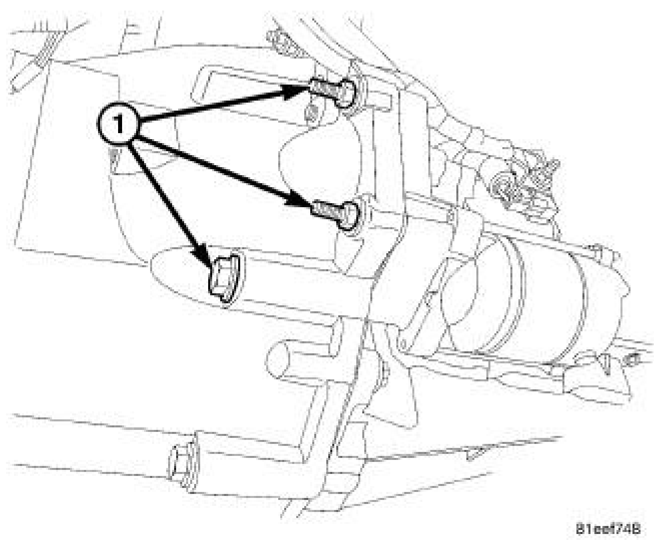
Courtesy of CHRYSLER GROUP, LLC

15. Install push pin wiring connectors (1 and 2) and the clutch hydraulic tube push pin (3) on the transmission.



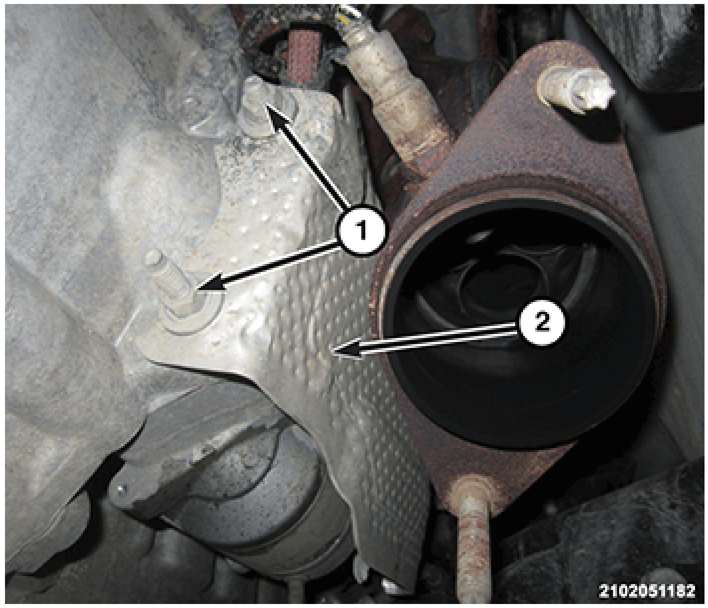
[Fig. 227: Skip Shift & Reverse Lockout Solenoids]
Courtesy of CHRYSLER GROUP, LLC

16. Connect the transmission skip shift solenoid wire harness connector (1) and the transmission reverse lockout solenoid wire harness connector (2).



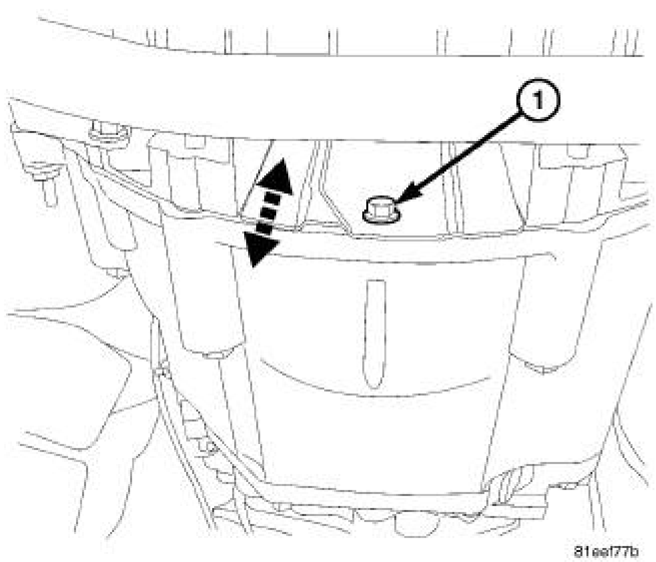
[Fig. 228: Starter Bolts]
Courtesy of CHRYSLER GROUP, LLC

17. Position the starter in place, install the starter bolts (1) and tighten to the proper **SPECIFICATIONS** .



[Fig. 229: Starter Heat Shield & Nuts]
Courtesy of CHRYSLER GROUP, LLC

18. Install the starter heat shield (2) and the starter heat shield nuts (1) and tighten to the proper **SPECIFICATIONS** .



[Fig. 230: Inspection Cover]
Courtesy of CHRYSLER GROUP, LLC

19. Install the inspection cover, the inspection cover bolt (1) and tighten to the proper **SPECIFICATIONS** .

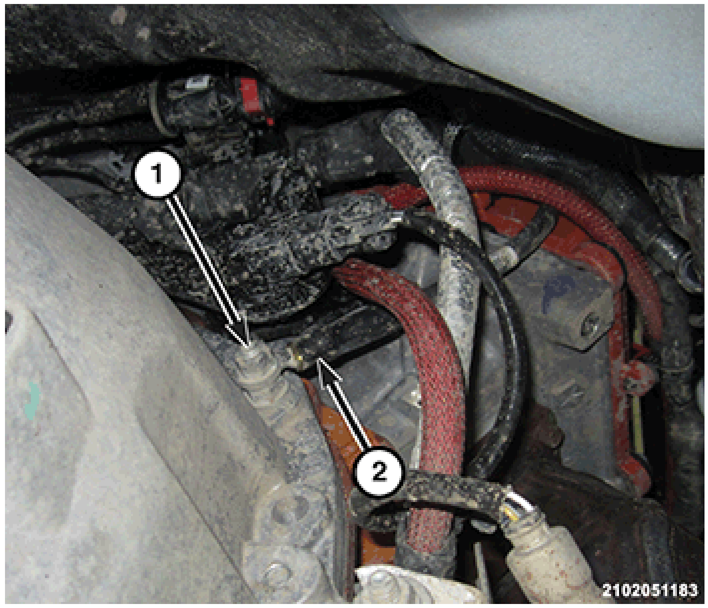


Fig. 231: Shift Linkage Bolt & Retaining Pins
Courtesy of CHRYSLER GROUP, LLC

20. Install the ground wire (2), the ground wire nut (1) and tighten to the proper SPECIFICATIONS .

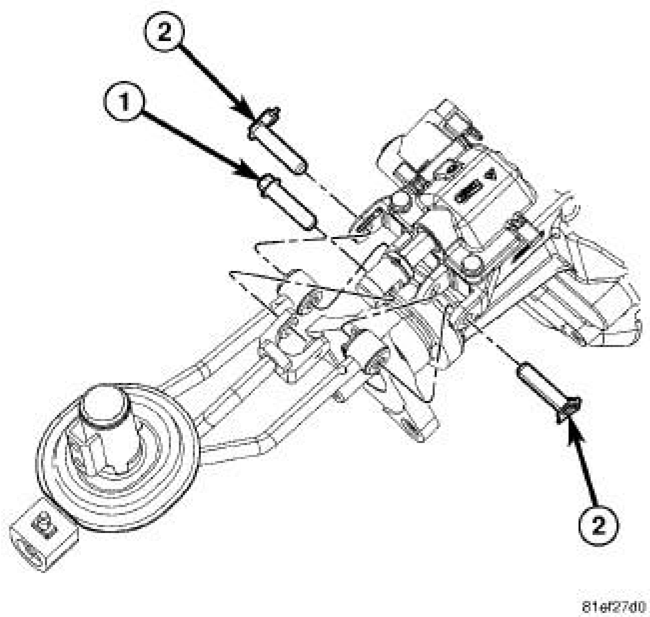

Fig. 232: Shift Linkage Bolt & Retaining Pins
Courtesy of CHRYSLER GROUP, LLC

21. If necessary install the shift linkage bolt (1) and the roll pins (2) and the shift linkage onto the transmission. Tighten the shift linkage bolt to the proper SPECIFICATIONS .
22. Install the drive shaft. Refer to INSTALLATION .
23. Install the exhaust. Refer to CONVERTER, CATALYTIC, INSTALLATION .
24. Lower the vehicle.

25. Connect the negative battery cable.
26. Road test the vehicle to verify proper operation.

INPUT SHAFT, TRANSMISSION

REMOVAL

REMOVAL

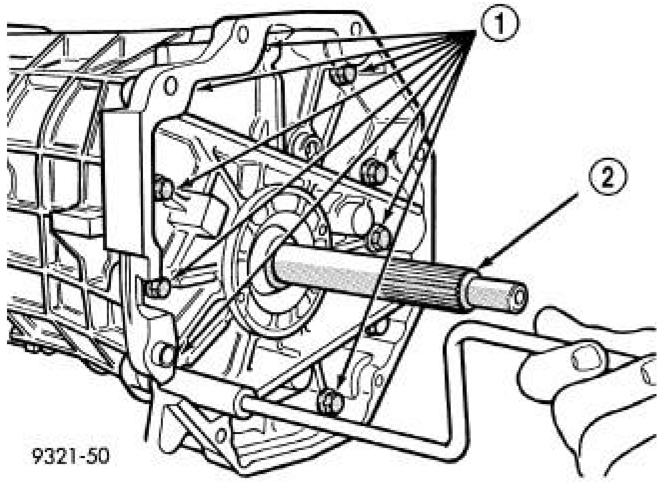

Fig. 233: Front Adapter Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: **If input shaft is damaged behind the seal, the transmission must be disassembled and inspected.**

1. Measure output shaft end play and record number.
2. Remove clutch slave cylinder from transmission adapter plate.
3. Remove front adapter plate bolts (1).

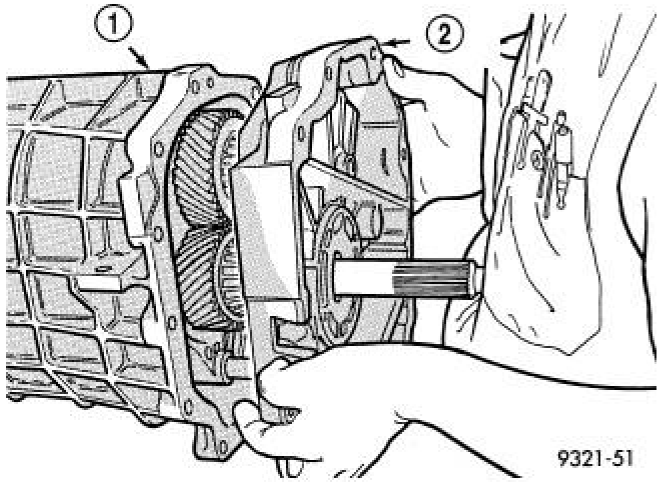

Fig. 234: Slide Off Adapter
Courtesy of CHRYSLER GROUP, LLC

4. Pry front cover adapter loose.
5. Hold input shaft while removing adapter (2).
6. Remove input shaft seal from adapter with a seal puller.
7. Clean and inspect all sealing surfaces for wear or damage.

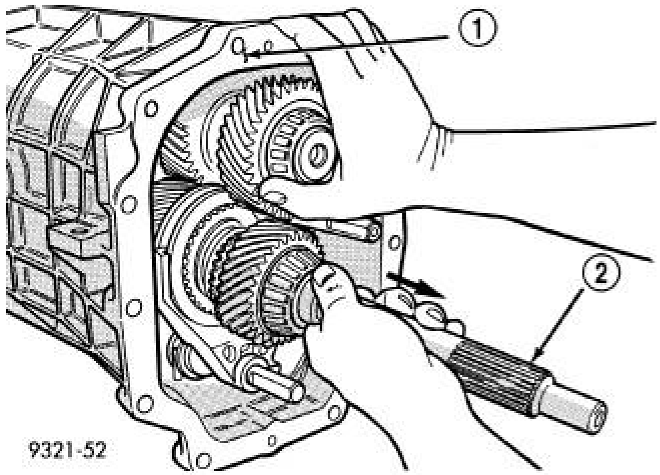

Fig. 235: Remove Input Shaft
Courtesy of CHRYSLER GROUP, LLC

8. Lift countershaft slightly and remove input shaft (2) from transmission (1).

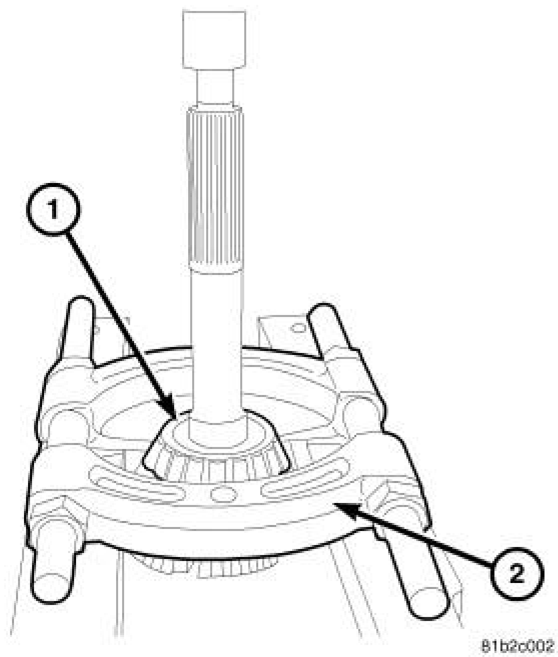

Fig. 236: Input Shaft Bearing
Courtesy of CHRYSLER GROUP, LLC

9. Remove input shaft bearing (1) with Splitter (special tool #1130, Splitter, Bearing/Gear) (2) and a press.

INSTALLATION

INSTALLATION

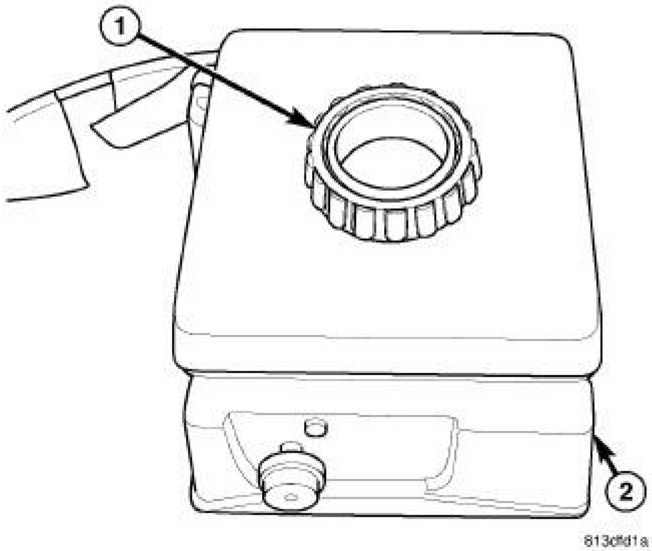

Fig. 237: Identifying Bearing Heater And Bearing
Courtesy of CHRYSLER GROUP, LLC

WARNING: Use tongs or welding gloves when handling heated components. Failure to follow these instructions will result in personal injury.

CAUTION: Bearings (1) are installed using a Bearing Heater (2). Use only a bearing heater/hot plate and follow manufacture's instructions. Heat components to 100 - 149 Celsius (212Â° Min. - 300Â° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for an extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.

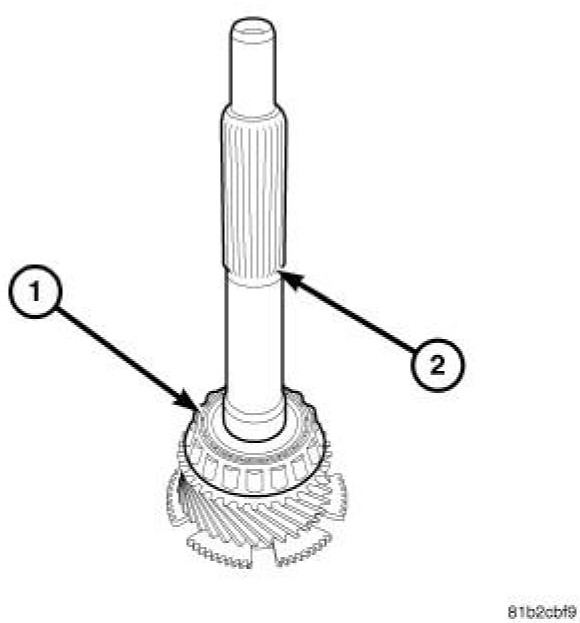

Fig. 238: Input Shaft Bearing

Courtesy of CHRYSLER GROUP, LLC

1. Heat input shaft bearing to 100 - 149 Celsius (212Â° Min. - 300Â° Max Fahrenheit). Install bearing (1) on input shaft (2) with tongs or welding gloves.
2. Install new bearing cup in front adapter with original shim behind cup.
3. Clean sealing surfaces of the transmission case and adapter plate.
4. Install input shaft and adapter plate.
5. Check output shaft end play and adjust shim to achieve the original reading.

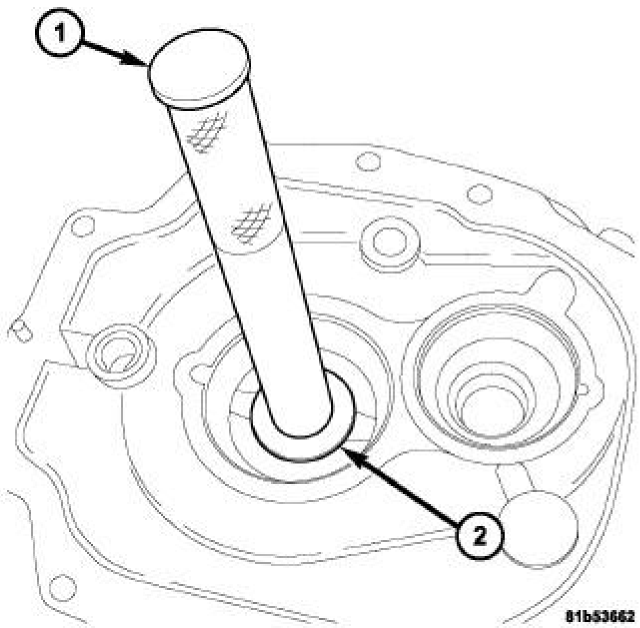

Fig. 239: Input Shaft Seal
Courtesy of CHRYSLER GROUP, LLC

6. Remove adapter plate and install a new input shaft seal with Handle (special tool #C-4171, Driver Handle, Universal) and Installer (special tool #9366, Installer, Seal).
7. Apply Mopar Â® ATF-RTV to the cleaned sealing surfaces.
8. Install adapter and tighten bolts to 34 N.m (25 ft. lbs.).

LEVER, SHIFT

REMOVAL

SHIFT LEVER

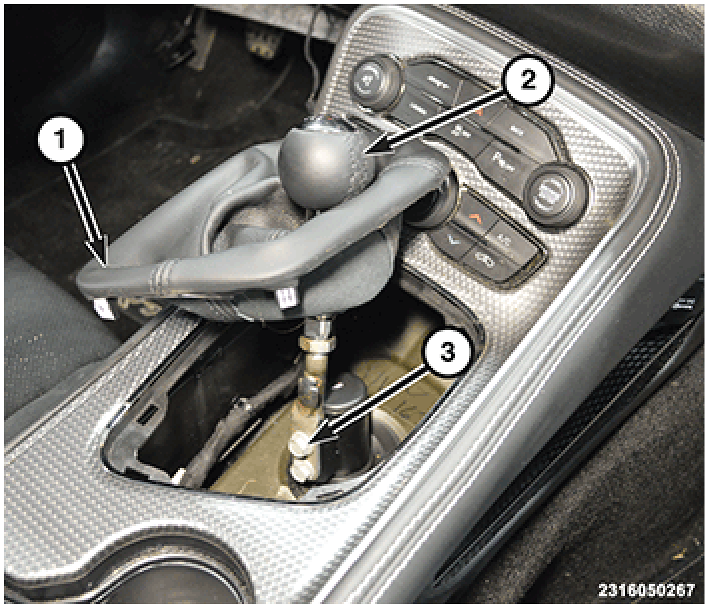

Fig. 240: Shifter Boot, Shift Lever & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent, separate the shift lever boot (1) from the floor console.
2. Remove the shift lever bolts (3) and the shift lever (2).

INSTALLATION

SHIFT LEVER

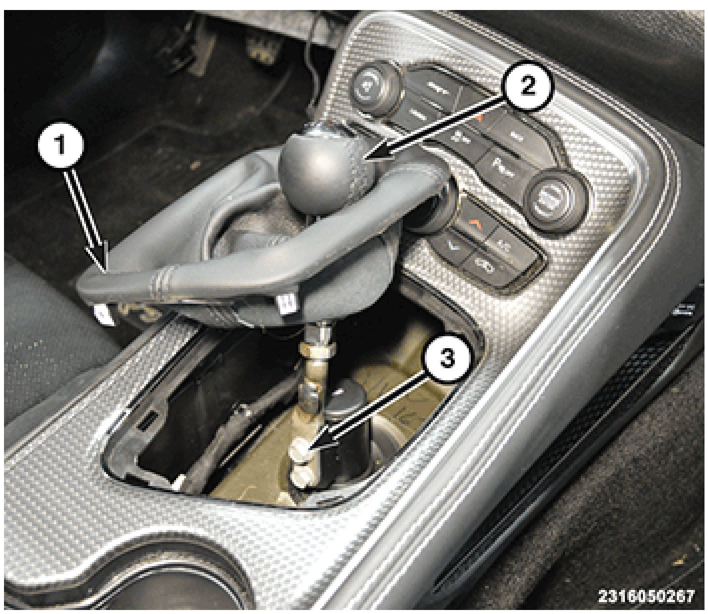

Fig. 241: Shifter Boot, Shift Lever & Bolts
Courtesy of CHRYSLER GROUP, LLC

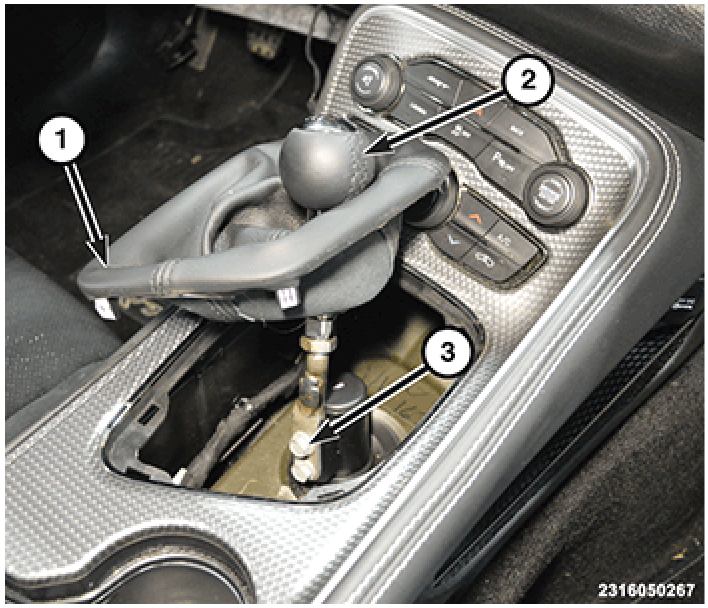
1. Install the shift lever (2) and the shift lever bolts (3) on the shifter assembly and tighten to the proper SPECIFICATIONS .
2. Install the shift lever boot (1).

MECHANISM, GEARSHIFT

REMOVAL

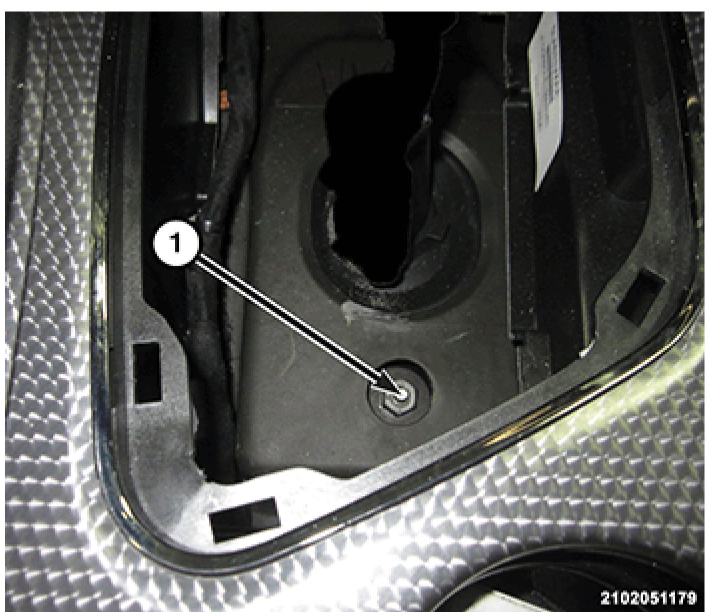
GEARSHIFT MECHANISM

1. Disconnect and isolate the negative battery cable.
2. Place transmission shifter in neutral.



[Fig. 242: Shifter Boot, Shift Lever & Bolts]
Courtesy of CHRYSLER GROUP, LLC

3. Using a trim stick (special tool #C-4755, Trim Stick) or equivalent, separate the shift lever boot (1) from the floor console.
4. Remove the shift lever bolts (3) and the shift lever (2).



[Fig. 243: Shift Linkage To Closure Panel Nut]

Courtesy of CHRYSLER GROUP, LLC

5. Remove the nut (1) holding the shift linkage to the closure panel.
6. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
7. Remove the exhaust system. Refer to **MUFFLER, EXHAUST, REMOVAL** .
8. Remove the drive shaft. Refer to **REMOVAL** .

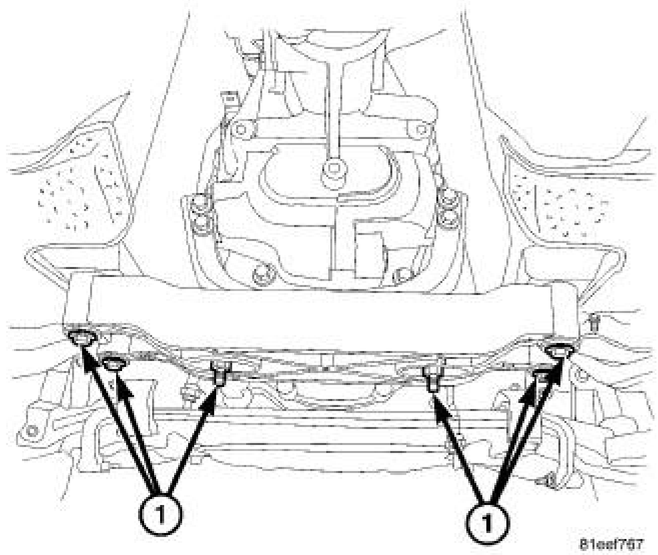


Fig. 244: Crossmember And Isolator Lower Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

9. Raise transmission slightly with suitable jack or high stand to relieve load on crossmember mount.
10. Remove the crossmember bolts (1) and remove the crossmember.
11. Lower the transmission enough to gain access to the shift linkage.

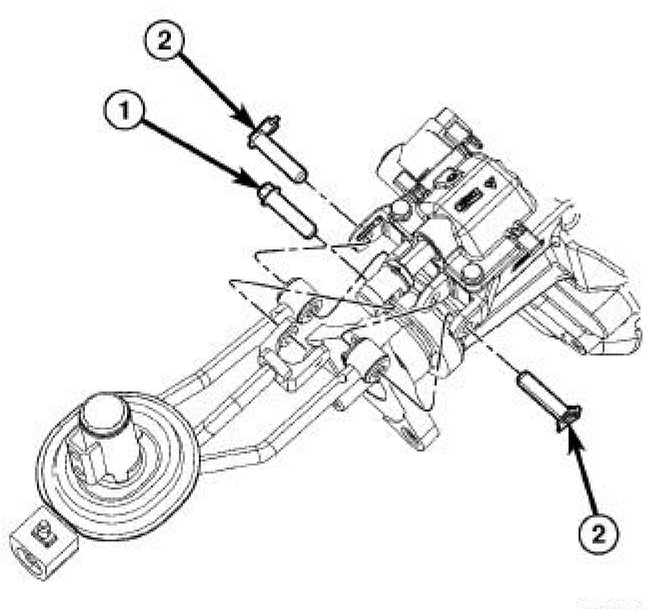

Fig. 245: Shift Linkage Bolt & Retaining Pins
Courtesy of CHRYSLER GROUP, LLC

12. Remove the bolt (1) holding the shift linkage to the transmission shift rail.

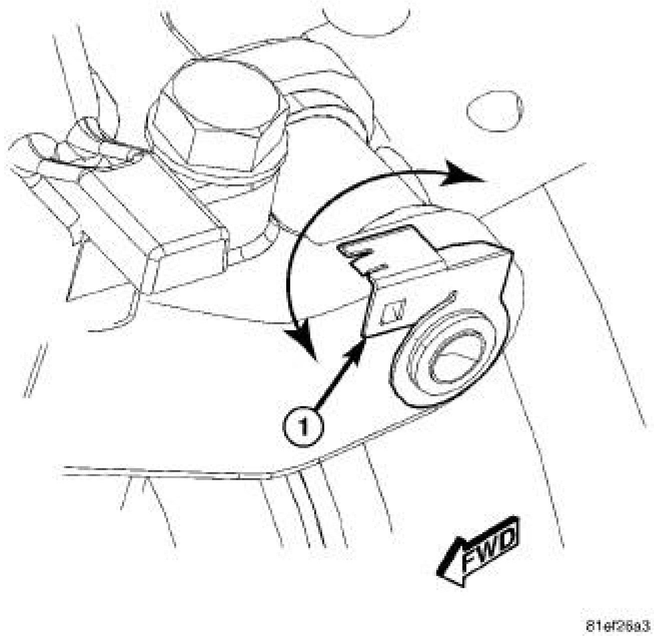

Fig. 246: Shifter Roll Pin Rotation
Courtesy of CHRYSLER GROUP, LLC

13. Rotate each of the locking tabs (1) to disengage them from the roll pins.

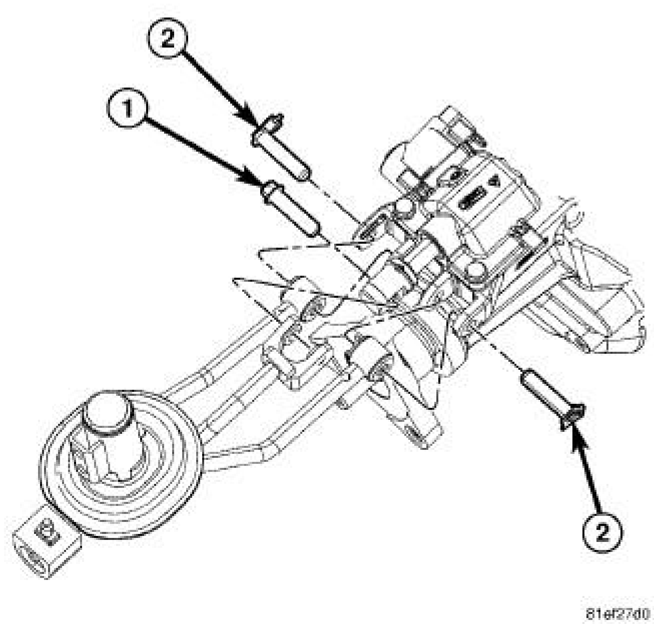

Fig. 247: Shift Linkage Bolt & Retaining Pins
Courtesy of CHRYSLER GROUP, LLC

14. Remove the roll pins (2) holding the shift linkage to the transmission.
15. Remove the shift linkage from the vehicle.

INSTALLATION

GEARSHIFT MECHANISM

1. Place the shift linkage in position on the vehicle.

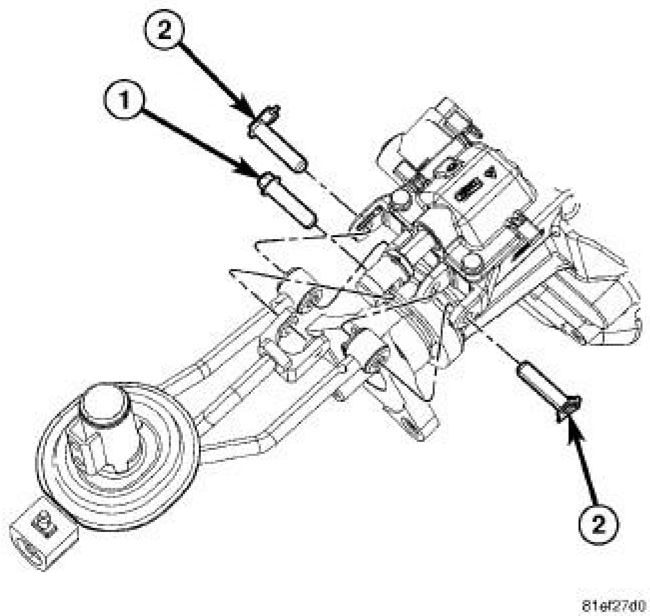

Fig. 248: Shift Linkage Bolt & Retaining Pins
Courtesy of CHRYSLER GROUP, LLC

2. Install the roll pins (2) to hold the shift linkage to the transmission.

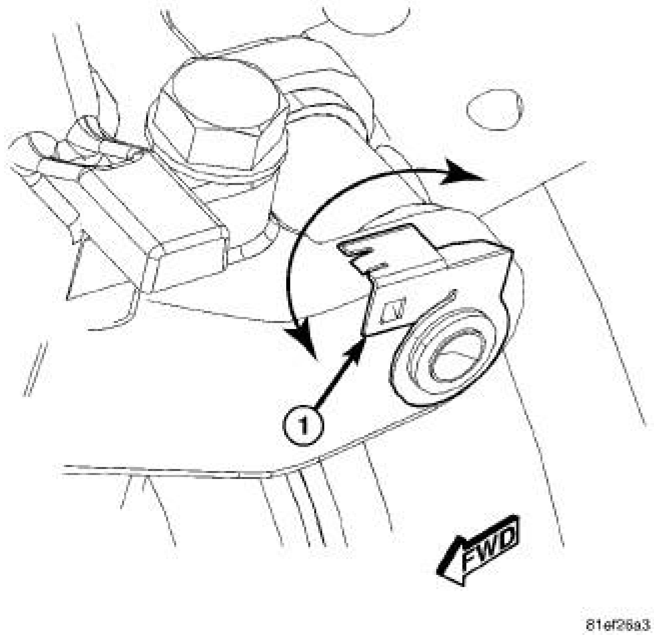

Fig. 249: Shifter Roll Pin Rotation
Courtesy of CHRYSLER GROUP, LLC

3. Install and rotate the locking tabs (1) to engage them onto the roll pins.

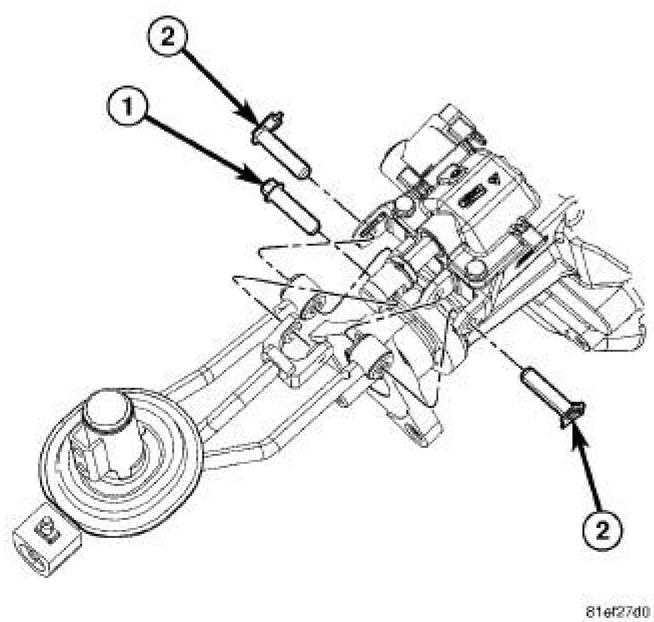

Fig. 250: Shift Linkage Bolt & Retaining Pins
Courtesy of CHRYSLER GROUP, LLC

4. Install the shift linkage bolt (1) and tighten to the proper **SPECIFICATIONS** .

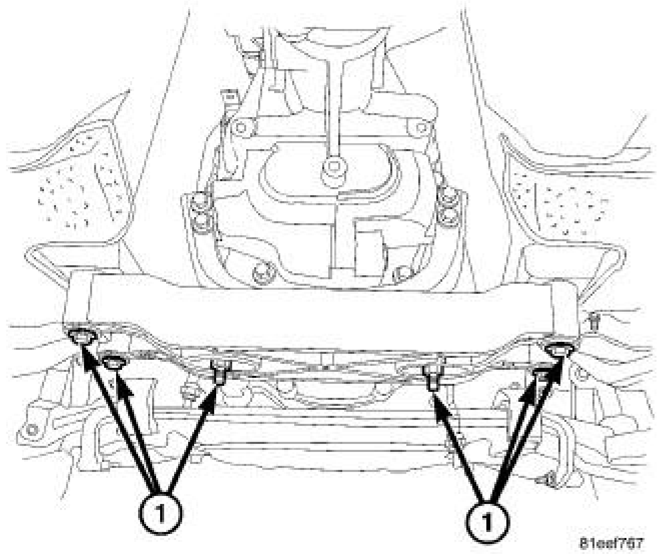

Fig. 251: Crossmember And Isolator Lower Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

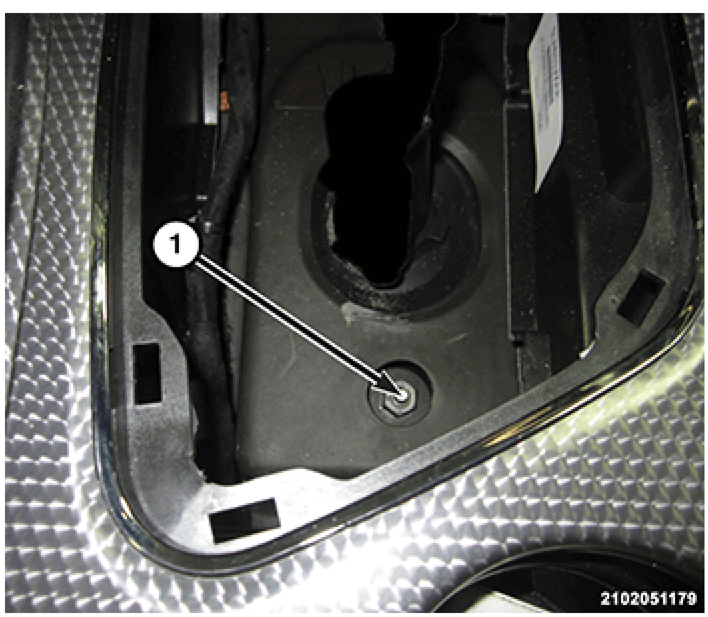
5. Lift the transmission enough to gain clearance for the crossmember.
6. Place the crossmember in position under the vehicle.
7. Install the crossmember, the crossmember bolts (1) and tighten to the proper **SPECIFICATIONS** .

   .

8. Install the drive shaft. Refer to **INSTALLATION** .

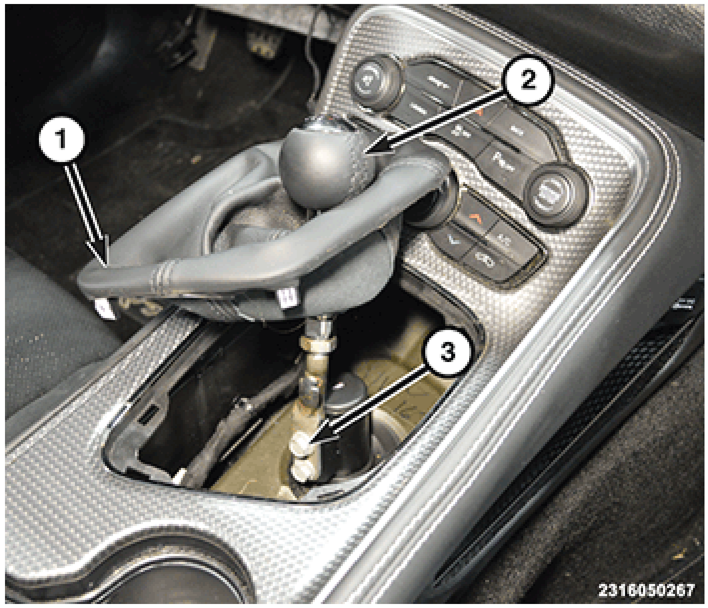
   .

9. Install the exhaust system. Refer to **MUFFLER, EXHAUST, INSTALLATION** .
10. Lower the vehicle.



[Fig. 252: Shift Linkage To Closure Panel Nut]
Courtesy of CHRYSLER GROUP, LLC

11. Install the nut (2) to holding the shift linkage to the closure panel.



[Fig. 253: Shifter Boot, Shift Lever & Bolts]
Courtesy of CHRYSLER GROUP, LLC

12. Install the shift lever (2) and the shift lever bolts (3) on the shifter assembly and tighten to the proper **SPECIFICATIONS** .
13. Install the shift lever boot (1).
14. Connect the negative battery cable.
15. Road test the vehicle to verify proper operation.

SEAL, EXTENSION HOUSING

REMOVAL

EXTENSION HOUSING SEAL

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the drive shaft. Refer to **REMOVAL** .

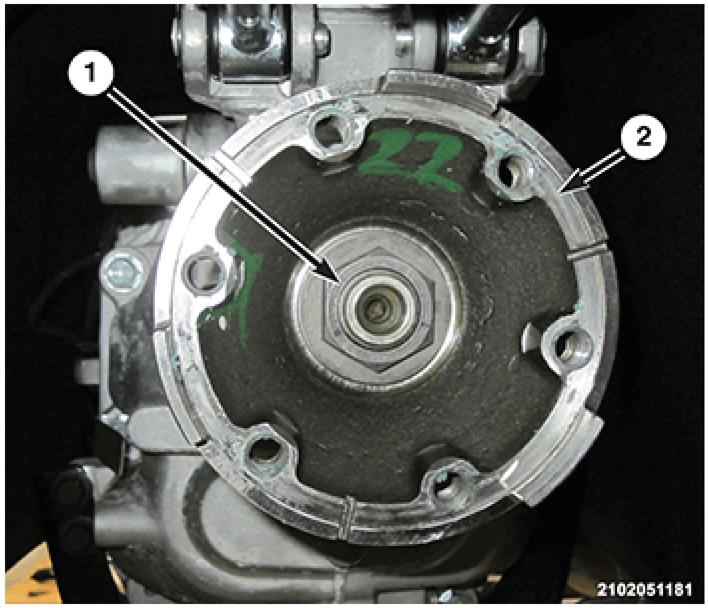


Fig. 254: Output Flange & Locknut
Courtesy of CHRYSLER GROUP, LLC

3. Hold the output flange (2) with Special Tool (special tool #C-3281, Holder, Flange) Flange Wrench while removing the output flange locknut (1).
4. Remove the output flange (2).
5. Remove the extension housing seal.
6. Clean and inspect extension housing seal location.

INSTALLATION

OUTPUT SHAFT SEAL

1. Install extension housing seal into extension housing (1) with Installer (special tool #7884, Installer, Seal) (2).
2. Install the extension housing seal in the extension housing (1) with Installer (special tool #7884, Installer, Seal) (2).

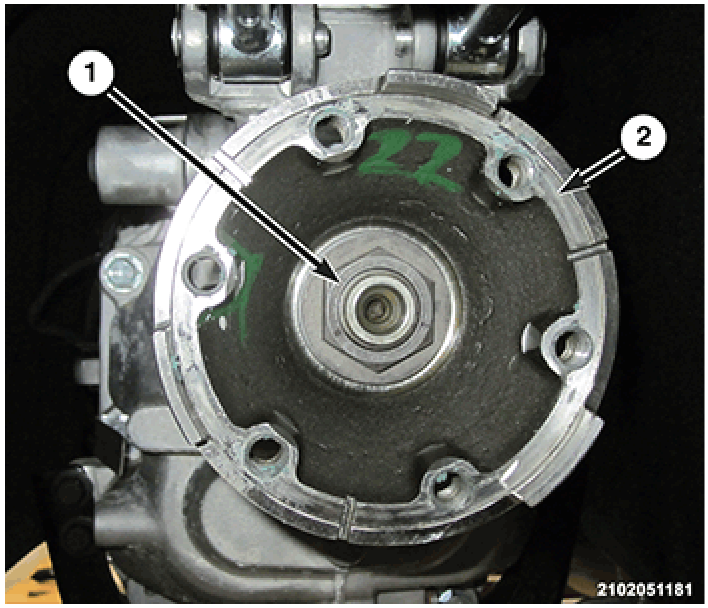

Fig. 255: Output Flange & Locknut
Courtesy of CHRYSLER GROUP, LLC

3. Install the output flange (2) to the transmission output shaft.
4. Hold the output flange (2) with Special Tool (special tool #C-3281, Holder, Flange) (2) Flange Wrench and tighten the output flange locknut (1) to the proper **SPECIFICATIONS** .
5. Install the drive shaft. Refer to **INSTALLATION** .
6. Check transmission fluid level and fill as necessary. Refer to **STANDARD PROCEDURE** .

SOLENOID, TRANSMISSION SKIP SHIFT

DESCRIPTION

DESCRIPTION

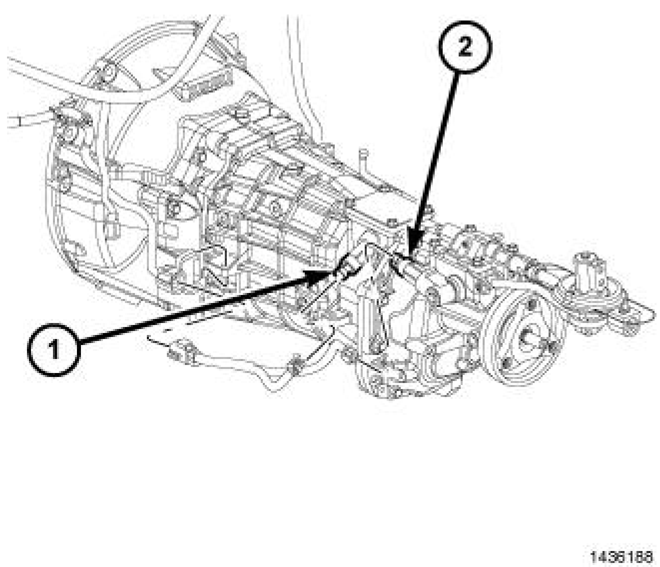

Fig. 256: Skip Shift & Reverse Lockout Solenoids
Courtesy of CHRYSLER GROUP, LLC

The skip shift solenoid (1) prevents the operator from shifting into second or third gear during part throttle operation. The solenoid is threaded into the left side of the transmission case.

OPERATION

OPERATION

The Powertrain Control Module (PCM) controls the skip shift solenoid, locking out second and third gear when all of the following conditions are met:

- Engine coolant exceeds 41Â°C (106Â°F)
- Vehicle speed is between 19 and 20 MPH
- The PCM verified first gear speed/RPM
- Throttle Position Sensor (TPS) signal is less than 0.68 volt above closed throttle (23 percent throttle opening)

The solenoid resets when vehicle speed drops below 3 MPH.

SOLENOID, TRANSMISSION, REVERSE LOCKOUT

DESCRIPTION

DESCRIPTION

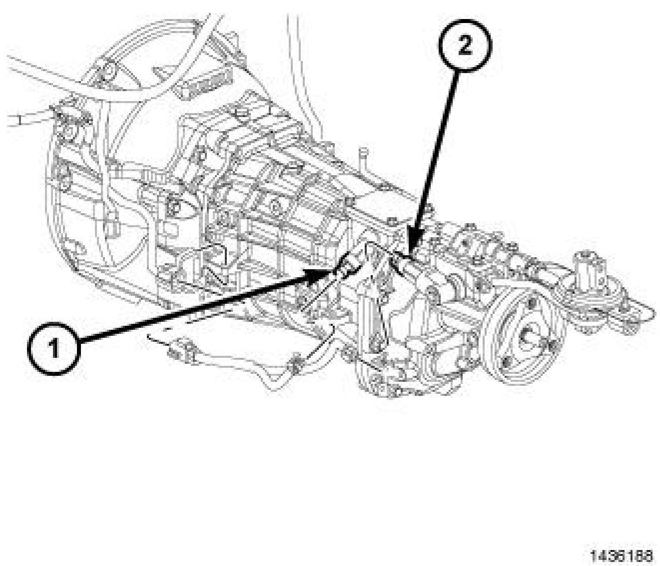

Fig. 257: Skip Shift & Reverse Lockout Solenoids
Courtesy of CHRYSLER GROUP, LLC

The reverse inhibitor solenoid (2) helps the operator to avoid shifting into reverse when the vehicle speed is greater than 3 mph. The solenoid is mounted to the left/rear side of the transmission with a bolt.

OPERATION

OPERATION

If the vehicle speed is less than 3 mph, the PCM sends a ground to energize the solenoid, which provides a low

spring load to the shift knob at the reverse gate and allows shifting the transmission into reverse. If the vehicle speed is greater than 3 mph, the solenoid is deactivated, which provides a high spring load to the shift knob at the reverse gate to help prevent shifting the transmission into reverse.

CENTER, ELECTRONIC VEHICLE INFORMATION

DESCRIPTION

DESCRIPTION

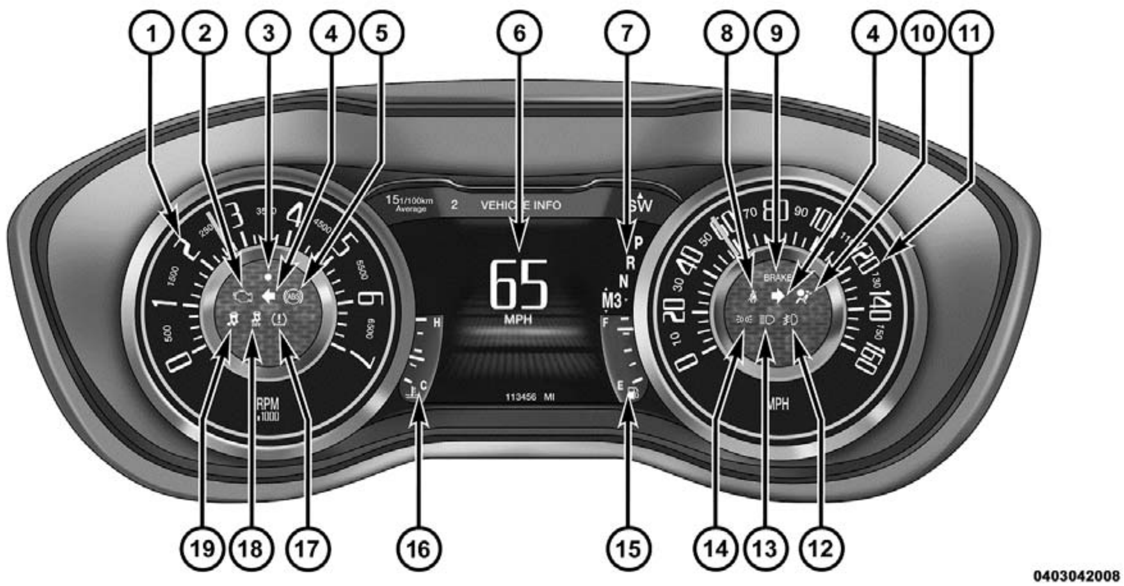

Fig. 1: Electronic Vehicle Information Center (EVIC)
Courtesy of CHRYSLER GROUP, LLC

The Electronic Vehicle Information Center (EVIC) system provides the vehicle operator with a convenient access to a wealth of useful information. This includes information that assists the operator in properly operating and maintaining the vehicle, cautions and warnings that improve the safety of the vehicle and its occupants, and information concerning environmental variables outside of the vehicle. The EVIC also provides an interface from which the vehicle operator can view and select from several programmable electronic feature options to customize those features to his or her particular preferences.

The EVIC system includes the following major components, which are described in further detail elsewhere in this service information:

- **EVIC Display** - A reconfigurable, multicolor, Thin Film Transistor (TFT) display unit is located between the speedometer and the tachometer and is integral to the Instrument Cluster (IC). Refer to DESCRIPTION .
- **EVIC Switches** - An EVIC switch pod containing momentary switch push buttons is located in the left horizontal spoke of the steering wheel.
- Controller Area Network (CAN) Data Bus

These EVIC components communicate with each other and with other systems and components throughout the vehicle using a combination of hard wired and the Controller Area Network (CAN) data bus. Refer to

COMMUNICATION, DESCRIPTION .

Hard wired circuitry connects the EVIC system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the EVIC system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

The Electronic Vehicle Information Center (EVIC) uses both non-switched and ignition switched sources of battery current so that some of its features remain operational at any time, while others may only operate with the ignition switch placed in the ON position.

Most EVIC messages automatically pop up and display when conditions warrant. The EVIC will display some message types until the condition that caused the message is corrected. Certain other message types will be automatically stored by the EVIC for later retrieval. When conditions warrant that multiple messages be displayed in the EVIC Thin Film Transistor (TFT) display at the same time, the EVIC uses arbiter programming to sort and prioritize the cycle sequence and duration of each message to be displayed.

Optional function and feature menus can be navigated, selected and displayed using the EVIC switch pod in the left horizontal spoke of the steering wheel. When the ignition switch is placed in the ON position, the EVIC display will return to the last main menu, sub menu or function being displayed before the ignition was placed in the OFF position.

Displays warnings and user interaction messages. Initial warnings will be displayed accompanied by a series of audible beeps. Critical text warnings will be displayed until the failure is corrected. Non-critical text warnings will be displayed for 60 seconds. The driver can scroll to view multiple messages by using the menu buttons.

When the appropriate conditions exist, the EVIC displays the following messages.

SYSTEM STATUS

- Autostick Unavailable Service Required
- Automatic Unavailable Use Autostick Service Req.
- Brake Fluid Low
- Battery Voltage Low
- Cruise Off
- Cruise Ready
- Cruise Set To XXX KM/H
- Cruise Set To XXX MPH
- Doors Open
- Driver Seatbelt Unbuckled

- Engage Park Brake to Prevent Rolling
- Engine Temperature Hot
- Front Seatbelts Unbuckled
- Fuel Low
- Gear Not Available
- Key in Ignition
- Key in Ignition Lights On
- Left Turn Signal Light Out
- Lights On
- Oil Change Due
- Oil Pressure Low
- Parking Brake Engaged
- Passenger Seatbelt Unbuckled
- Remote Start Aborted Door Open
- Remote Start Aborted Fuel Low
- Remote Start Aborted Hood Open
- Remote Start Active Key to Run
- Remote Start Aborted Trunk Open
- Remote Start Aborted Time Expired
- Remote Start Aborted Too Cold

- Remote Start Disabled Start to Reset
- Right Turn Signal Light Out
- Service Antilock Brake System
- Service Airbag System
- Service Airbag Warning Light
- Service Electronic Braking System
- Service Electronic Throttle Control
- Shift Not Allowed
- Service Power Steering
- Service Shifter
- Service Tire Pressure System
- Service Transmission
- Shift to Neutral then Drive or Reverse
- Tire Pressure Screen With Low Tire(s) "Inflate Tire to XX"
- Traction Control Off
- Transmission Cool Ready to Drive
- Transmission Getting Hot Press Brake

- Transmission Too cold Idle with Engine On
- Trans. Hot Stop Safely Shift to Park Wait to Cool
- Turn Signal On
- Vehicle Not in Park
- Washer Fluid Low

DISPLAY INFORMATION

Menu Items consists of the following:

- Speedometer
- Vehicle Info
- Performance - If Equipped
- Driver Assist - If Equipped
- Fuel Economy
- Trip
- Audio
- Messages
- Screen Setup
- Diagnostics - If Equipped

The system allows the driver to select information by pressing the steering wheel mounted buttons.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - ELECTRONIC VEHICLE INFORMATION CENTER

The Electronic Vehicle Information Center (EVIC) data is obtained from several components on the Controller Area Network (CAN) Data Bus circuit. The EVIC will not function properly if the bus messages from any of these components is not received. If no EVIC data is displayed, check the CAN Data Bus circuit communications, the Instrument Cluster (IC) functions and the Body Control Module (BCM).

The use of a scan tool and the proper diagnostic procedures information are recommended for further testing of the EVIC and the CAN Data Bus circuit. Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

STANDARD PROCEDURE

ENGINE OIL LIFE RESET

Vehicles Equipped With Keyless Enter-N-Go™

1. Without pressing the brake pedal, press the ENGINE START/STOP button and place the ignition to the ON/RUN position (do not start the engine.)
2. Fully depress the accelerator pedal, slowly, three times within 10 seconds.
3. Without pressing the brake pedal, press the ENGINE START/STOP button once to return the ignition to the OFF/LOCK position.

Secondary Method Of Navigating To The Oil Life Screen

Use the steering wheel controls for the following procedure(s):

1. Without pushing the brake pedal, cycle the ignition to the **ON/RUN** position (do not start the engine.)
2. Push and release the **DOWN** arrow button to scroll downward through the main menu to**" Vehicle Info** ".
3. Push and release the **RIGHT** arrow button to access the **"Oil Life"** screen.
4. Push and hold the **OK** button for one second to access the **" Oil Life Reset"** screen.
5. Push and release the **DOWN** arrow button to select**" Yes"** , then push and release the **OK** button to select reset of the Oil Life.
6. Push and release the **Up** arrow button to exit the screen.

MODULE, COMPASS

DESCRIPTION

DESCRIPTION

The compass module is an integrated part of the Combined Rear View Mirror module. Refer to MODULE, COMBINED REAR VIEW MIRROR, DESCRIPTION .

Refer to the Owners Manual for Compass Variance Adjustment and Manual Compass Calibration.

SENSOR, AMBIENT TEMPERATURE

DESCRIPTION

DESCRIPTION

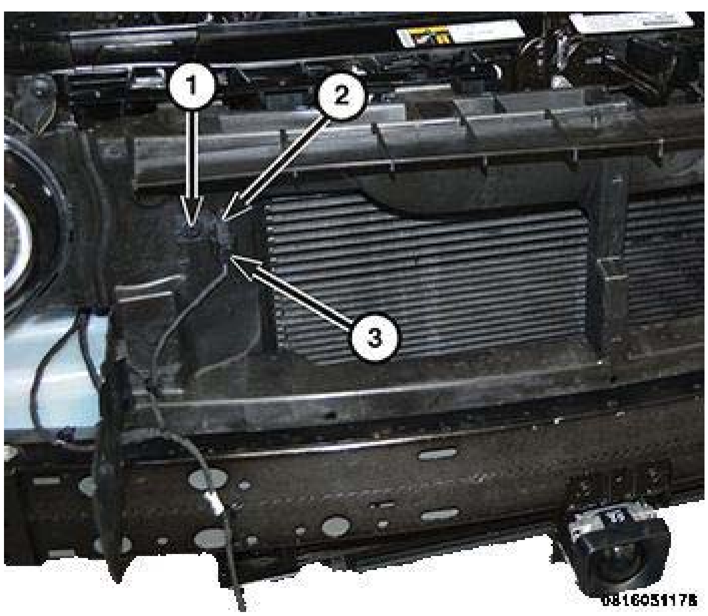

Fig. 2: Ambient Air Temperature Sensor, Wire Harness Connector & Retainer
Courtesy of CHRYSLER GROUP, LLC

The ambient air temperature sensor (2) is a variable resistor that monitors the air temperature outside of the

vehicle. The Automatic Temperature Control (ATC) heating and A/C system uses the ambient air temperature sensor data to help maintain optimum passenger compartment temperature levels. The ambient air temperature sensor is mounted behind the front fascia.

OPERATION

OPERATION

The ambient air temperature sensor is a variable resistor that operates on a 5 volt Direct Current (DC) reference signal sent by the Body Control Module (BCM). The ambient air temperature sensor is connected to the BCM through a two-wire lead and connector of the vehicle wire harness. The ambient air temperature sensor changes its internal resistance in response to changes in the outside air temperature, which either increases or decreases the reference signal voltage read by the BCM. The BCM converts and broadcasts the sensor data over the Controller Area Network (CAN) data bus, where it is read by the A/C-heater control, Powertrain Control Module (PCM) and other vehicle control modules.

NOTE: **To get the most accurate ambient temperature readings, the vehicle should be driven.**

The ambient air temperature sensor is diagnosed using a scan tool. Refer to **DIAGNOSIS AND TESTING** .

The ambient air temperature sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged. Refer to **SENSOR, AMBIENT TEMPERATURE, REMOVAL**.

REMOVAL

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the front fascia. Refer to **FASCIA, FRONT, REMOVAL** .

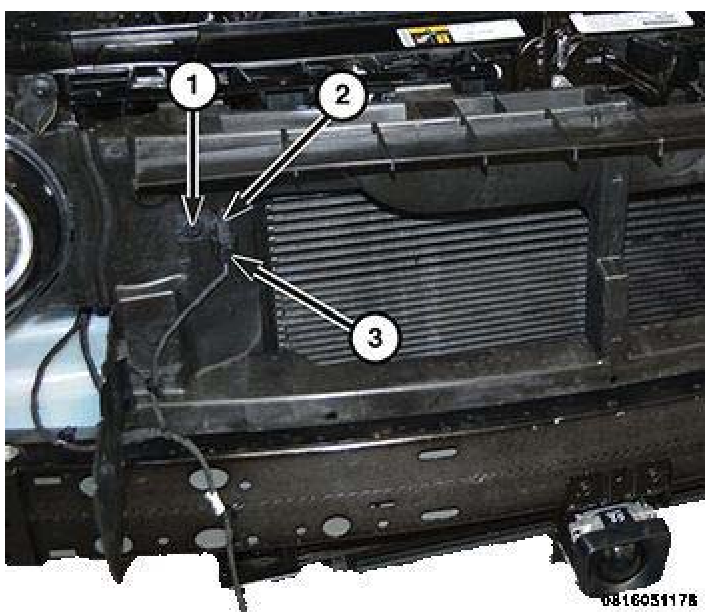

Fig. 3: Ambient Air Temperature Sensor, Wire Harness Connector & Retainer
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the wire harness connector (3) from the ambient temperature sensor (2).
4. Remove the push pin retainer (1) that secures the ambient temperature sensor.

INSTALLATION

INSTALLATION

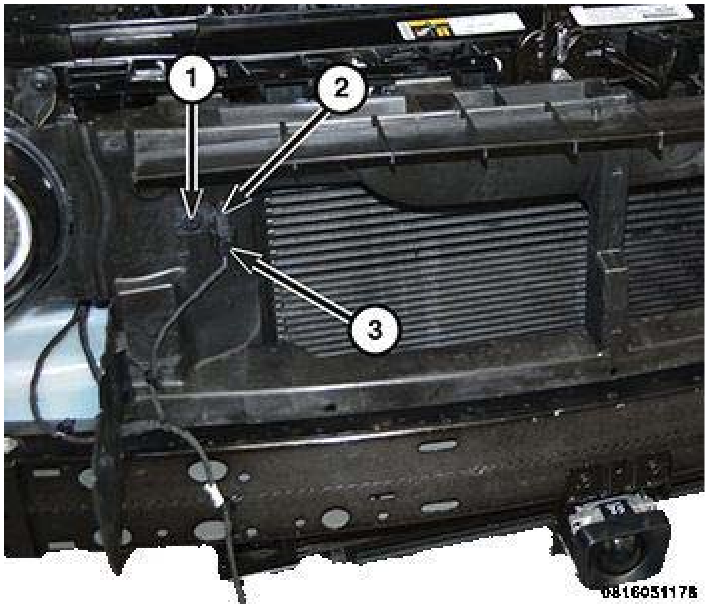

Fig. 4: Ambient Air Temperature Sensor, Wire Harness Connector & Retainer
Courtesy of CHRYSLER GROUP, LLC

1. Position the ambient temperature sensor (2) in the vehicle and install the push pin retainer (1).
2. Connect the wire harness connector (3) to the ambient temperature sensor (2).
3. Install the front fascia. Refer to **FASCIA, FRONT, INSTALLATION** .
4. Connect the battery negative cable.

SWITCH, EVIC CONTROL

DESCRIPTION

DESCRIPTION

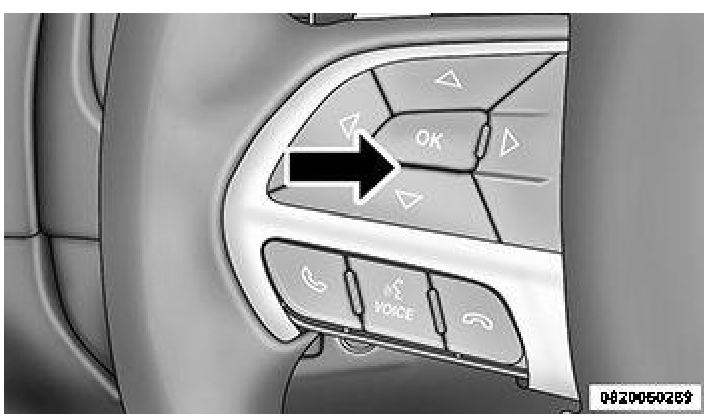

Fig. 5: EVIC Control Switch Pod

Courtesy of CHRYSLER GROUP, LLC

The Electronic Vehicle Information Center (EVIC) control switch pod is located in the left spoke of the steering wheel spoke bezel. This switch has up to eight push buttons. Five of the push buttons are used on all vehicles equipped with the EVIC. Three additional push buttons are found on vehicles equipped with the optional Uconnect™ Hands-Free Communication System. The only visible components of the switch pod are the switch push buttons and a decorative bezel around the push buttons, which stands slightly proud of the steering wheel spoke bezel. The remainder of the switch pod including its mounting provisions and its electrical connection are concealed beneath the spoke bezel.

The switch pod housing and push buttons are constructed of molded plastic. Each of the push buttons has white International Control and Display Symbol graphics or text applied to it, which clearly identify the function of each push button. The switch pod is secured through three integral mounting tabs to mounting bosses on the back of the spoke bezel by three screws. A connector receptacle integral to the inboard end of the switch pod housing connects the EVIC control switch pod to the vehicle electrical system through a dedicated take out and connector of the steering wheel wire harness.

The EVIC control switch pod cannot be adjusted or repaired. If any function of the switch is ineffective or damaged, the entire switch pod unit must be replaced.

OPERATION

OPERATION

The Electronic Vehicle Information Center (EVIC) control switch pod is Local Interface Network (LIN) unit that receives source current from and provides hard wired inputs to the LIN slave node circuitry of the LIN module. The LIN slave node circuitry communicates the switch states of the EVIC control switch pod, the remote radio switches, the horn switch and the heated steering wheel sensor (if equipped) over the LIN data bus to the LIN master node integral to the Steering Column Control Module (SCCM) microcontroller internal to the SCCM mounting housing located on the top of the steering column below the clockspring. The SCCM microcontroller is also a gateway to the Controller Area Network (CAN) data bus.

The EVIC control switch pod contains five push buttons whose functions are:

- **Down Arrow** - Pressing and releasing the Down Arrow push button allows the operator to scroll downward through the various EVIC main menus and sub menus.
- **Left Arrow** - Pressing and releasing the Left Arrow push button returns you to the previous sub menu or main menu.
- **OK** - Push the OK button to access/select the information screens or submenu screens of the Main Menu item. Push and hold the OK arrow button for one second to reset the displayed/selected features that can be reset.
- **Right Arrow** - Pressing and releasing the Right Arrow (Select) push button allows the operator to navigate, select and reset items or settings in the currently displayed EVIC main menu or sub menu. Pressing and holding the Right Arrow (Select) push button for two seconds provides a global reset of all of those EVIC features that can be reset, whether currently displayed or not.
- **Up Arrow** - Pressing and releasing the Up Arrow push button allows the operator to scroll upward through the various EVIC main menus and sub menus.

For vehicles equipped with the UconnectÂ® Hands-Free Communication System, the EVIC control switch pod

contains three additional switch push buttons whose functions are:

- **VR (Voice Recognition)** - This switch button activates the UconnectÂ® Voice Command system.
- **Phone Pick-Up** - This switch push button activates the UconnectÂ® Hands-Free Phone system.
- **Phone Hang-Up** - This switch push button disconnects the UconnectÂ® Hands-Free Phone system.

The LIN slave node circuitry of the LIN module or the cruise control switch pod provides current for all of the switches and sensors on the rotating steering wheel as well as for the Light Emitting Diode (LED) back lighting of both the cruise control and the EVIC control switch pods. The SCCM microcontroller continually monitors all of the hard wired speed control switch circuits as well as the LIN bus data. The SCCM will store a Signal Not Available (SNA) code for any LIN bus input errors. The SCCM also communicates with other electronic modules over the CAN data bus. Therefore, any SCCM DTC information can be retrieved using a diagnostic scan tool connected to the Data Link Connector (DLC).

The analog resistor multiplexed circuits of the EVIC control switch pod as well as the hard wired circuits between the switch pod and the speed control switch pod may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate Diagnostic & Testing article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the LIN slave or master nodes, the SCCM microcontroller or the electronic controls and communication between modules and other devices that provide some features of the EVIC system. The most reliable, efficient, and accurate means to diagnose the EVIC control switch pod, the LIN slave or master nodes, the SCCM microcontroller or the electronic controls and communication related to EVIC system operation requires the use of a diagnostic scan tool. Refer to the appropriate Diagnostic & Testing article.

REMOVAL

REMOVAL

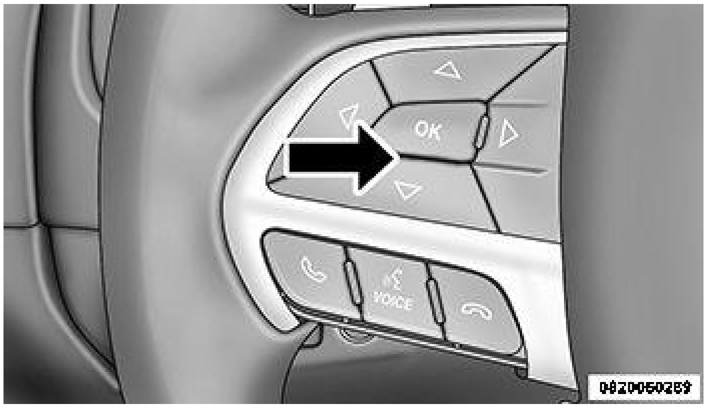

Fig. 6: EVIC Control Switch Pod
Courtesy of CHRYSLER GROUP, LLC

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative**

(ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.

Fig. 7: EVIC Switch Screw - Back Of Steering Wheel
Courtesy of CHRYSLER GROUP, LLC

2. Remove the remote radio switch, but leave the wire harness connected. Refer to **SWITCH, REMOTE RADIO, REMOVAL** .
3. From the back of the steering wheel, remove the screw (2) which secures the Electronic Vehicle Information Center (EVIC) switch to the steering wheel (1).

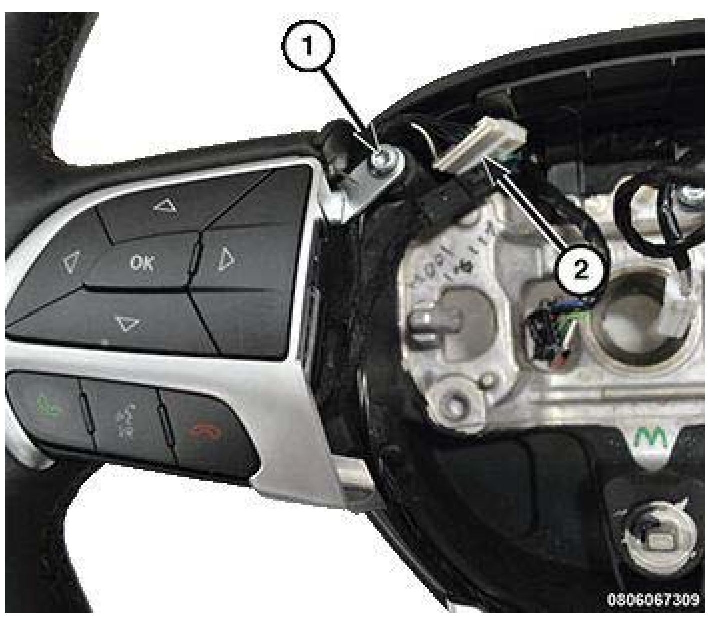

Fig. 8: EVIC Switch Screw & Connector
Courtesy of CHRYSLER GROUP, LLC

4. Remove the screw (1) from the front of the EVIC that secures it to the steering wheel.

NOTE: **Noting the position of the wire harnesses prior to removing the EVIC switch will help with assembly.**

5. Carefully pull the EVIC switch away from the steering wheel spoke. Disconnect the connector on the back of the switch from the steering wheel wire harness connector (2) and remove the switch.

INSTALLATION

INSTALLATION

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

Fig. 9: EVIC Switch Screw & Connector
Courtesy of CHRYSLER GROUP, LLC

1. Connect the EVIC wire harness to the steering wheel wire harness connector (2).
2. Position the Electronic Vehicle Information Center (EVIC) switch and wire harnesses to the front of the steering wheel.
3. Install and securely tighten the screw (1) that secures the switch to the steering wheel.

Fig. 10: EVIC Switch Screw - Back Of Steering Wheel
Courtesy of CHRYSLER GROUP, LLC

4. From the back of the steering wheel, install the screw (2) for the EVIC switch.
5. Install the remote radio switch. Refer to **SWITCH, REMOTE RADIO, INSTALLATION** .
6. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.

DTC TROUBLESHOOTING

B1295-12-PTS SENSOR 8-CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

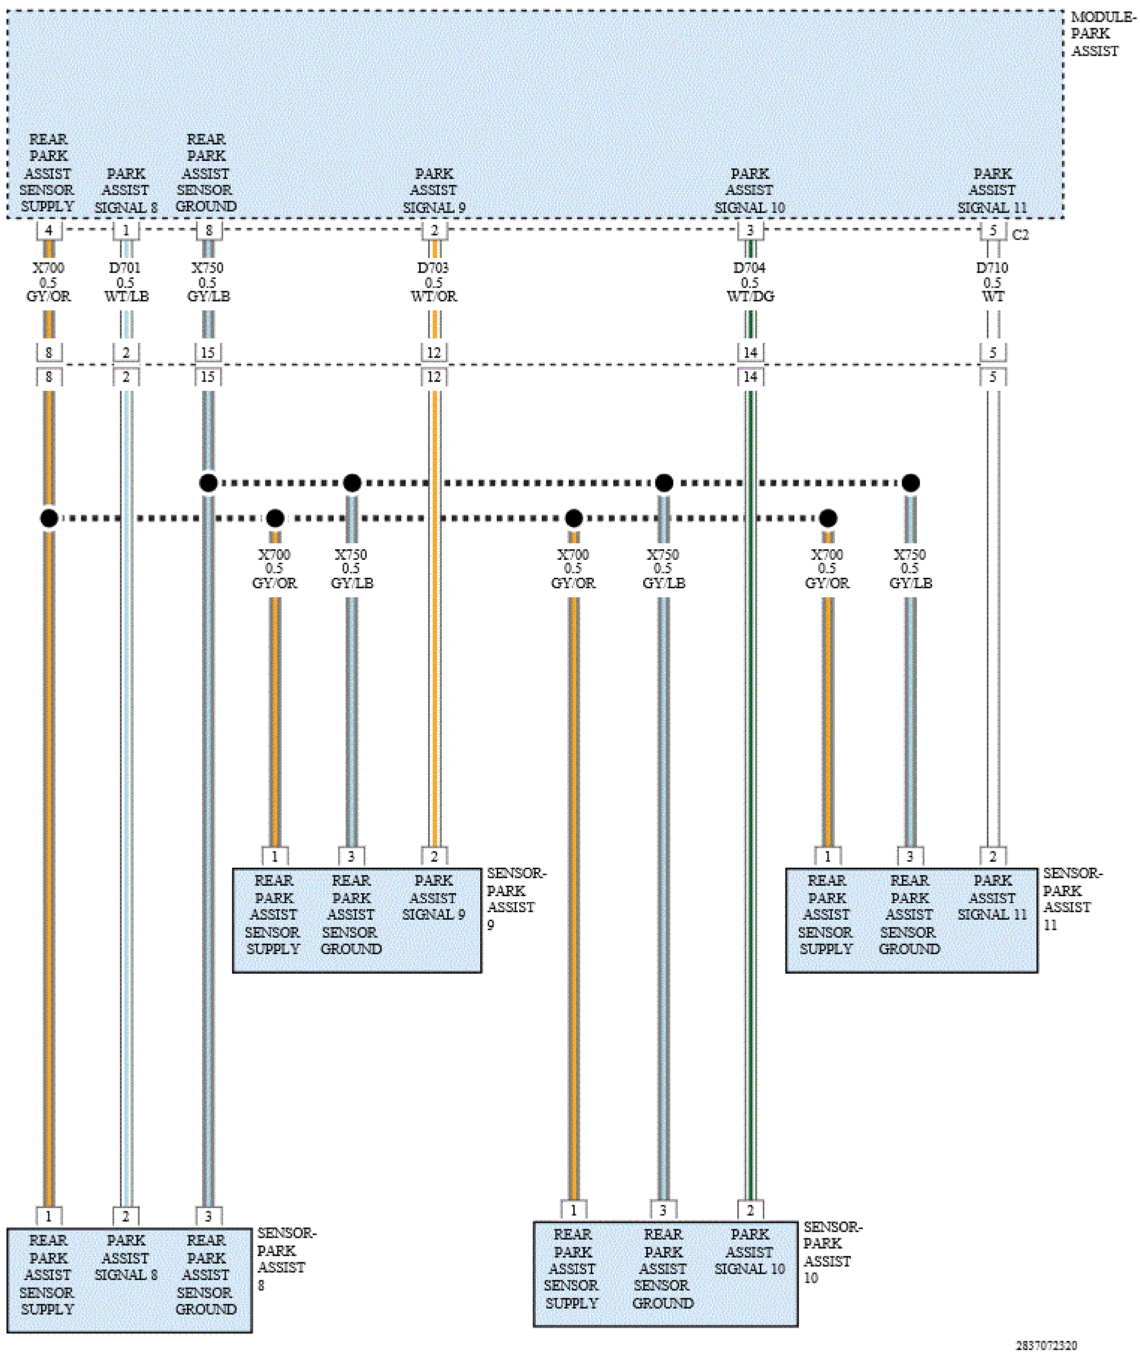

Fig. 1: PTS Sensor 8, 9, 10, 11 & Rear Sensors - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Vehicle in reverse.
- During the self-test while vehicle is in drive 11 km/h (7 mph) and 40 km/h (25 mph).

SET CONDITION

- Park Assist Module detects an open on the Park Assist Sensor Signal circuit.
- Park Assist Module detects a short to voltage on the Park Assist Sensor Signal circuit.

DEFAULT ACTION

- Park Assist is disabled.
- The Electronic Vehicle Information Center (EVIC) will display PARKING ASSISTANCE SVS REAR SENSORS

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR 8 SIGNAL CIRCUIT SHORTED TO VOLTAGE
PARK ASSIST SENSOR 8 SIGNAL CIRCUIT SHORTED TO THE PARK ASSIST SENSOR SUPPLY CIRCUIT
PARK ASSIST SENSOR GROUND CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

        NOTE: **A disconnected sensor will set this DTC.**

    2. With the scan tool, read PAM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.

4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
5. With the scan tool, read PAM DTCs.

   Did the DTC return?

   Yes

   - Go To 2

   No

   - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If no problems are found, test complete.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **(D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT SHORTED TO BATTERY**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C2 harness connector.
   3. Disconnect the Park Assist Sensor harness connector.
   4. Turn the ignition on.
   5. Measure the voltage between ground and the (D701) Park Assist Sensor 8 Signal circuit at the Park assist C2 harness connector.

      Is there any voltage present?

      Yes

      - Repair the (D701) Park Assist Sensor 8 Signal circuit for a short to voltage.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 3

3. **(D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT SHORTED TO THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Check for continuity between the (D701) Park Assist Sensor 8 Signal circuit and the (X700) Park Assist Sensor Supply circuit at the Park Assist Module C2 harness connector.

      Is there continuity between the (D701) Park Assist Sensor 8 Signal circuit and the (X700) Park Assist Sensor Supply circuit?

      Yes

      - Repair the (D701) Park Assist Sensor 8 Signal circuit for a short to the (X700) Park Assist

Sensor Supply circuit.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To4

4. **(X750) PARK ASSIST SENSOR GROUND CIRCUIT OPEN**
    1. Reconnect the Park Assist Module C2 harness connector.
    2. Measure the resistance between ground and the (X750) Park Assist Sensor Ground circuit.

    Is the resistance below 3.0 Ohms?

    Yes

    - Go To 5

    No

    - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
5. **(X750) PARK ASSIST SENSOR GROUND CIRCUIT OPEN BETWEEN PARK ASSIST MODULE AND SENSOR**
    1. Disconnect the Park Assist Module C2 harness connector.
    2. Measure the resistance of the (X750) Park Assist Sensor Ground circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor harness connector.

    Is the resistance below 3.0 Ohms?

    Yes

    - Repair the (X750) Park Assist Sensor Ground circuit for an open.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Replace the Park Assist Module in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1295-14-PTS-SENSOR-8-CIRCUIT-SHORT-TO-GROUND OR OPEN

PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

       NOTE: A disconnected sensor will set this DTC.

    2. With the scan tool, read PAM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read PAM DTCs.

       Did the DTC return?

       Yes

- Go To 2

No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If no problems are found, test complete.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE VOLTAGE OF THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage between ground and the (X700) Park Assist Sensor Supply circuit at the Park Assist Sensor harness connector.

   Is the voltage above 10.0 volts?

   Yes

   - Go To 4

   No

   - Go To 3
3. **CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C2 harness connector.
   3. Measure the resistance of the (X700) Park Assist Sensor Supply circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor harness connector.

   Is the resistance below 3.0 Ohms?

   Yes

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the (X700) Park Assist Sensor Supply circuit for an open or high resistance.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE CONNECTED**

NOTE: **Perform this step with the Park Assist Module connected.**

1. Check for continuity between ground and the (D701) Park Assist Sensor 8 Signal circuit at the Park Assist Module C2 harness connector.

   Is there continuity between ground and the (D701) Park Assist Sensor 8 Signal circuit?

   Yes

   - Go To 5

   No

   - Go To 7

5. **CHECK THE (D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**
   1. Disconnect the Park Assist Module C2 harness connector.
   2. Check for continuity between ground and the (D701) Park Assist Sensor 8 Signal circuit at the Park Assist Module C2 harness connector.

      Is there continuity between ground and the (D701) Park Assist Sensor 8 Signal circuit?

      Yes

      - Repair the (D701) Park Assist Sensor 8 Signal circuit for a short to ground.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6
6. **CHECK THE (D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT FOR A SHORT TO THE (X750) PARK ASSIST SENSOR GROUND CIRCUIT**
   1. Check for continuity between the (D701) Park Assist Sensor 8 Signal circuit and the (X750) Park Assist Sensor Ground circuit at the Park Assist Module C2 harness connector.

      Is there continuity between the (D701) Park Assist Sensor 8 Signal circuit and the (X750) Park Assist Sensor Ground circuit?

      Yes

      - Repair the (D701) Park Assist Sensor 8 Signal circuit and the (X750) Park Assist Sensor Ground circuit for a short together.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT FOR AN OPEN**
    1. Disconnect the Park Assist Module C2 harness connector.
    2. Measure the resistance of the (D701) Park Assist Sensor 8 Signal circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor harness connector.

    Is the resistance below 3.0 Ohms?

    Yes

    - Repair the (D701) Park Assist Sensor 8 Signal circuit for an open.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Go To 8
8. **PARK ASSIST SENSOR**
    1. Turn the ignition on.
    2. Reconnect the Park Assist Module C2 harness connector.
    3. Connect a jumper wire between the (X700) Park Assist Sensor Supply and (D701) Park Assist Sensor 8 Signal circuit at the Park Assist Sensor harness connector.
    4. Turn the ignition on.
    5. With the scan tool, read PAM DTCs.

    Does the scan tool display DTC: B1295-12-PTS SENSOR 8 - CIRCUIT SHORT TO BATTERY?

    Yes

    - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1295-25-PTS SENSOR 8-SIGNAL SHAPE / WAVEFORM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Vehicle in reverse.
- During the self-test while vehicle is in drive between 7 mph (11 km/h) and 25 mph (40 km/h).

SET CONDITION

- The Park Assist Module detects an internal Sensor error.

DEFAULT ACTION

- Park Assist is disabled.
- The Electronic Vehicle Information Center (EVIC) will display PARKING ASSISTANCE WIPE REAR SENSORS

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING FASCIA)
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: **Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.**

   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Is the DTC active?

      Yes

      - Go To 2

No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If no problems are found, test complete.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **PARK ASSIST SENSOR**
    1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

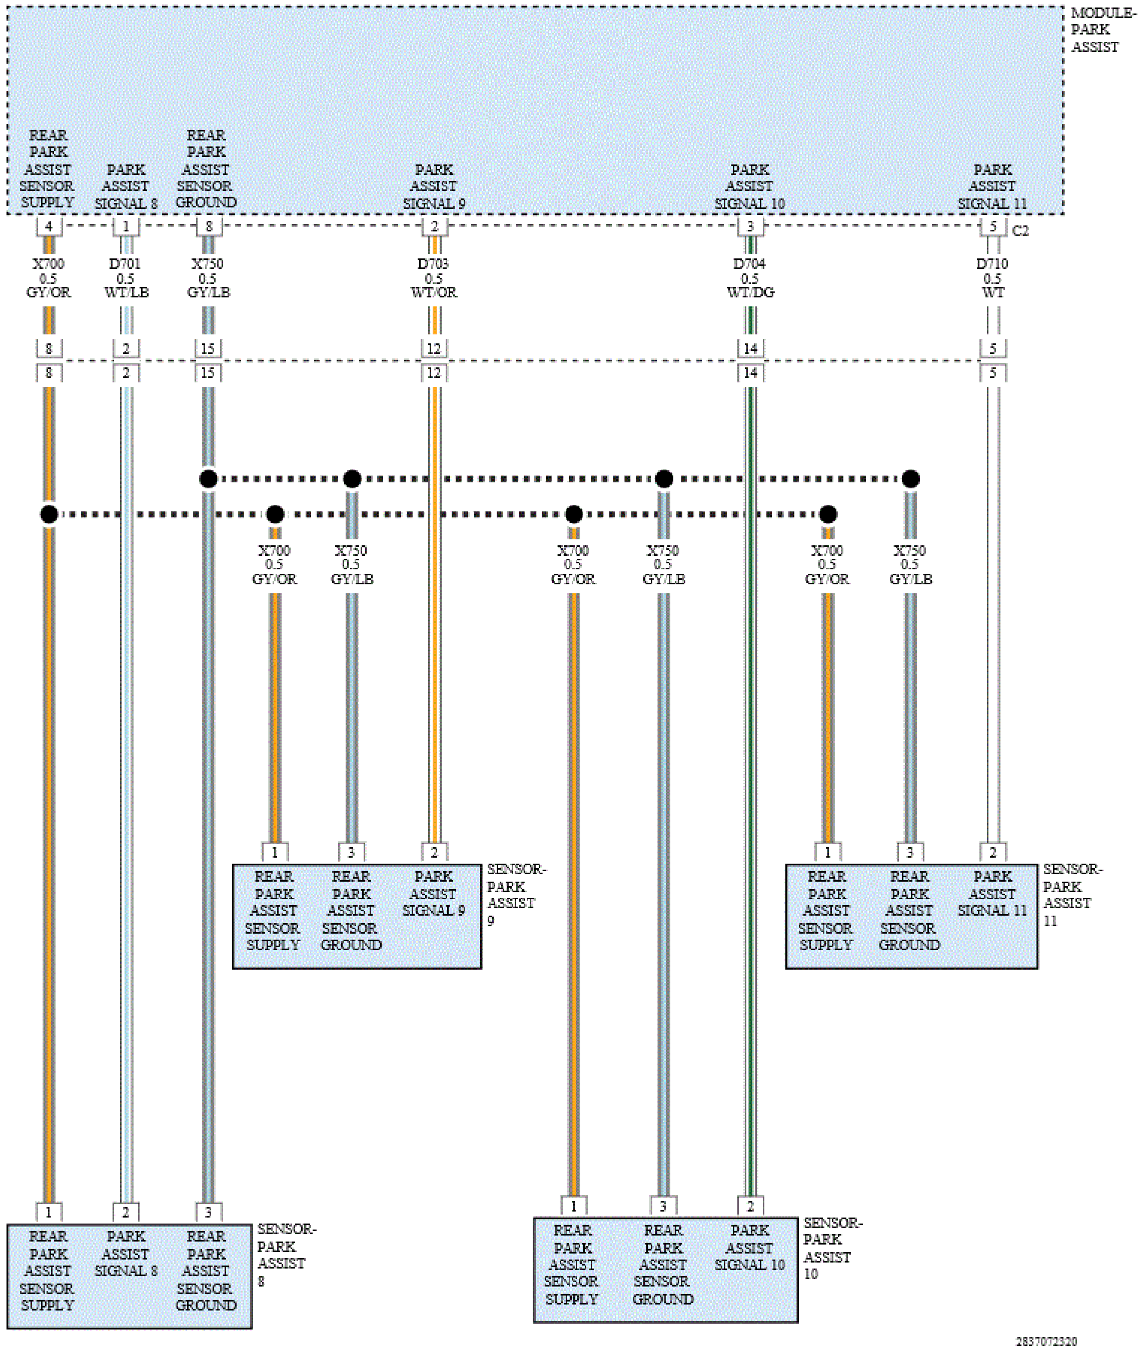
    If none of the possible causes mentioned above are present, view repair.

    Repair

    - Replace the Park Assist Sensor that caused this DTC to change from active to stored after disconnecting it in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1295-92-PTS SENSOR 8-PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .



[Fig. 3: PTS Sensor 8, 9, 10, 11 & Rear Sensors - Circuit Diagram]
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if**

equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Vehicle in reverse.
- During the self-test while vehicle is in drive between 11 km/h (7 mph) and 40 km/h (25 mph).

SET CONDITION

- When the system detects data corruption in the transmission in the internal communication line between the module and sensors, this code will set.

DEFAULT ACTION

- Park Assist is disabled.
- The Electronic Vehicle Information Center (EVIC) will display PARKING ASSISTANCE SVS REAR SENSORS

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR 8 SIGNAL CIRCUIT SHORTED TO GROUND
PARK ASSIST SENSOR 8 SIGNAL CIRCUIT SHORTED TO BATTER
PARK ASSIST SENSOR 8 SIGNAL CIRCUIT OPEN
PARK ASSIST SENSOR 8
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read PAM DTCs and record on the repair order.
    2. With the scan tool, erase DTCs.
    3. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    4. With the scan tool, read PAM DTCs.

    Did the DTC return?

    Yes

    - Go To 2

    No

    - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water

intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If no problems are found, test complete.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK PARK ASSIST SENSOR 8 FOR INTERNAL SHORT**
    1. Disconnect Park Assist Sensor 8.
    2. With the scan tool, read Park Assist Module DTCs.

    Is the DTC active?

    Yes

    - Go To 3

    No

    - Replace Park Assist Sensor 8 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the Park Assist Module C2 harness connector.
    3. Check for continuity between ground and the (D701) Park Assist Sensor 8 Signal circuit at the Park Assist Module C2 harness connector.

    Is there continuity between ground and the (D701) Park Assist Sensor 8 Signal circuit?

    Yes

    - Repair the (D701) Park Assist Sensor 8 Signal circuit for a short to ground.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Go To 4

4. **CHECK THE (D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition on.
    2. Measure the voltage between ground and the (D701) Park Assist Sensor 8 Signal circuit at the Park Assist Module C2 harness connector.

    Is there any voltage present?

    Yes

    - Repair the (D701) Park Assist Sensor 8 Signal circuit for a short to voltage.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CHECK THE (D701) PARK ASSIST SENSOR 8 SIGNAL CIRCUIT FOR AN OPEN**
    1. Measure the resistance of the (D701) Park Assist Sensor 8 Signal circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor 8 harness connector.

       Is the resistance below 3.0 Ohms?

       Yes

       - Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

       No

       - Repair the (D701) Park Assist Sensor 8 Signal circuit for an open.
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1296-12-PTS SENSOR 9-CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

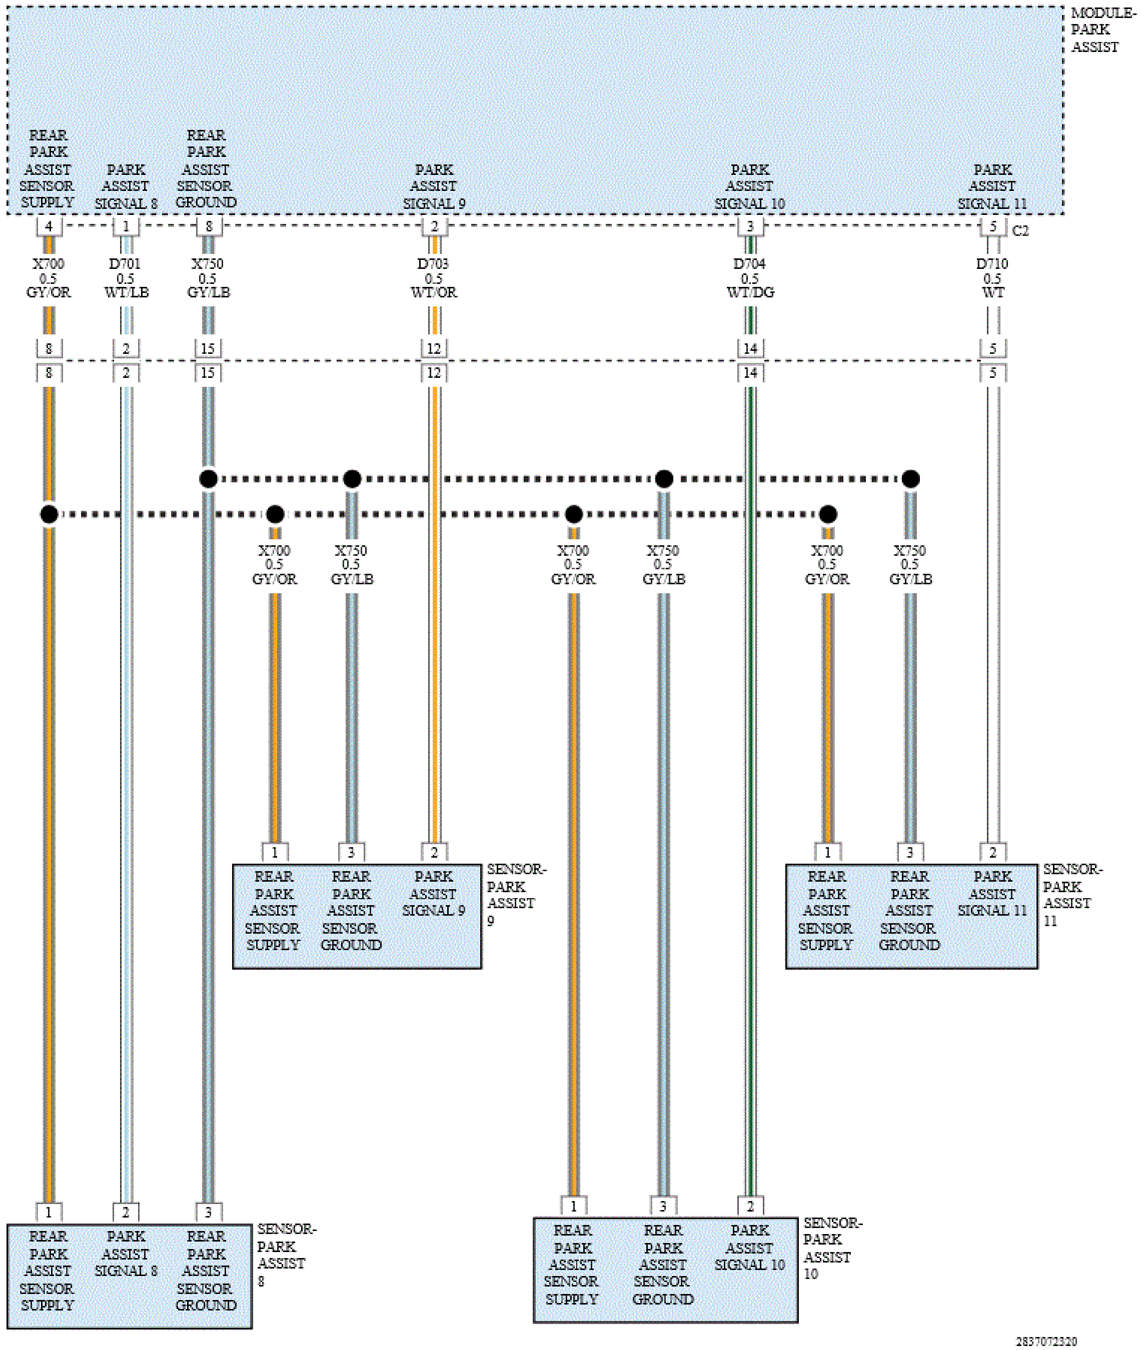


Fig. 4: PTS Sensor 8, 9, 10, 11 & Rear Sensors - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if**

equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Vehicle in reverse.
- During the self-test while vehicle is in drive between 11 km/h (7 mph) and 40 km/h (25 mph).

SET CONDITION

- The Park Assist Module detects an open or short to voltage on the Park Assist Sensor Signal circuit.

DEFAULT ACTION

- Park Assist is disabled.
- The Electronic Vehicle Information Center (EVIC) will display PARKING ASSISTANCE SVS REAR SENSORS

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR 9 SIGNAL CIRCUIT SHORTED TO VOLTAGE
PARK ASSIST SENSOR 9 SIGNAL CIRCUIT SHORTED TO THE PARK ASSIST SENSOR SUPPLY CIRCUIT
PARK ASSIST SENSOR GROUND CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

      NOTE: A disconnected sensor will set this DTC.

   2. With the scan tool, read PAM DTCs and record on the repair order.
   3. With the scan tool, erase DTCs.
   4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
   5. With the scan tool, read PAM DTCs.

      Did the DTC return?

      Yes

      - Go To 2

No

- Test complete, the condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **(D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT SHORTED TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the Park Assist Module C2 harness connector.
    3. Disconnect the Park Assist Sensor harness connector.
    4. Turn the ignition on.
    5. Measure the voltage between ground and the (D703) Park Assist Sensor 9 Signal circuit at the Park Assist Module C2 harness connector.

    Is there any voltage present?

    Yes

    - Repair the (D703) Park Assist Sensor 9 Signal circuit for a short to voltage.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Go To 3
3. **(D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT SHORTED TO THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT**
    1. Turn the ignition off.
    2. Measure the resistance between the (D703) Park Assist Sensor 9 Signal circuit and the (X700) Park Assist Sensor Supply circuit at the Park Assist Module C2 harness connector.

    Is the resistance below 3.0 Ohms?

    Yes

    - Repair the (D703) Park Assist Sensor 9 Signal circuit for a short to the (X700) Park Assist Sensor Supply circuit.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Go To 4
4. **(X750) PARK ASSIST SENSOR GROUND CIRCUIT OPEN**
    1. Reconnect the Park Assist Module C2 harness connector.
    2. Measure the resistance between ground and the (X750) Park Assist Sensor Ground circuit.

    Is the resistance below 3.0 Ohms?

Yes

- Go To 5

No

- Replace the Park Assist Sensor that caused this DTC to change from active to stored after disconnecting it in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **(X750) PARK ASSIST SENSOR GROUND CIRCUIT OPEN BETWEEN PARK ASSIST MODULE AND SENSOR**
   1. Disconnect the Park Assist Module C2 harness connector.
   2. Measure the resistance of the (X750) Park Assist Sensor Ground circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor harness connector.

   Is the resistance below 3.0 Ohms?

   Yes

   - Repair the (X750) Park Assist Sensor Ground circuit for an open.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1296-14-PTS SENSOR 9-CIRCUIT SHORT TO GROUND OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

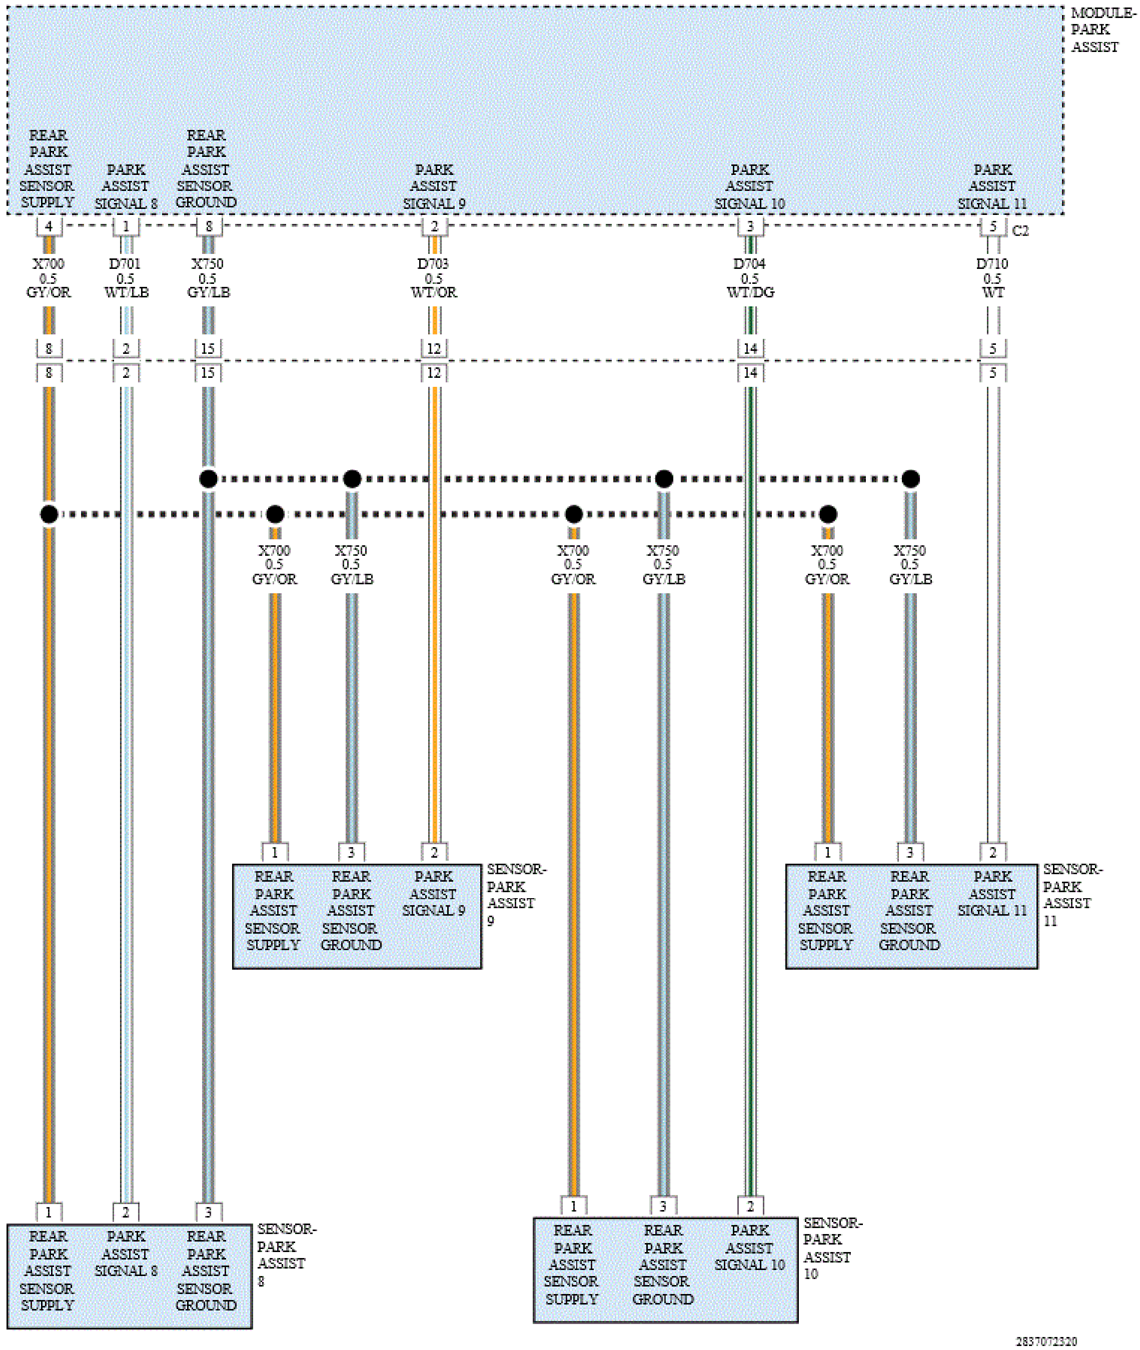

Fig. 5: PTS Sensor 8, 9, 10, 11 & Rear Sensors - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if**

equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Vehicle in reverse.
- During the self-test while vehicle is in drive between 11 km/h (7 mph) and 40 km/h (25 mph).

SET CONDITION

- The Park Assist Module detects a short to ground on the Park Assist Sensor Signal circuit.

DEFAULT ACTION

- Park Assist is disabled.
- The Electronic Vehicle Information Center (EVIC) will display PARKING ASSISTANCE SVS REAR SENSORS

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR DISCONNECTED
PARK ASSIST SENSOR 9 SIGNAL CIRCUIT SHORTED TO GROUND
PARK ASSIST SENSOR 9 SIGNAL CIRCUIT SHORTED TO THE PARK ASSIST SENSOR GROUND CIRCUIT
PARK ASSIST SENSOR 9 SIGNAL CIRCUIT OPEN
PARK ASSIST SENSOR SUPPLY CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

       NOTE: A disconnected sensor will set this DTC.

    2. With the scan tool, read PAM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read PAM DTCs.

       Did the DTC return?

       Yes

- Go To 2

No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If no problems are found, test complete.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE VOLTAGE OF THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT**
    1. Turn the ignition off.
    2. Disconnect the Park Assist Sensor.
    3. Turn the ignition on.
    4. Measure the voltage between ground and the (X700) Park Assist Sensor Supply circuit at the Park Assist Sensor harness connector.

    Is the voltage above 10.0 volts?

    Yes

    - Go To 4

    No

    - Go To 3
3. **CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
    1. Turn the ignition off.
    2. Disconnect the Park Assist Module C2 harness connector.
    3. Measure the resistance of the (X700) Park Assist Sensor Supply circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor harness connector.

    Is the resistance below 3.0 Ohms?

    Yes

    - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Repair the (X700) Park Assist Sensor Supply circuit for an open or high resistance.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE CONNECTED**

NOTE: **Perform this step with the Park Assist Module connected.**

1. Check for continuity between ground and the (D703) Park Assist Sensor 9 Signal circuit at the Park Assist Module C2 harness connector.

   Is the resistance below 3.0 Ohms?

   Yes

   - Go To 5

   No

   - Go To 7

5. **CHECK THE (D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**
   1. Disconnect the Park Assist Module C2 harness connector.
   2. Check for continuity between ground and the (D703) Park Assist Sensor 9 Signal circuit at the Park Assist Module C2 harness connector.

      Is the resistance below 3.0 Ohms?

      Yes

      - Repair the (D703) Park Assist Sensor 9 Signal circuit for a short to ground.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6

6. **CHECK THE (D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT FOR A SHORT TO THE (X750) PARK ASSIST SENSOR GROUND CIRCUIT**
   1. Check for continuity between the (D703) Park Assist Sensor 9 Signal circuit and the (X750) Park Assist Sensor Ground circuit at the Park Assist Module C2 harness connector.

      Is the resistance below 3.0 Ohms?

      Yes

      - Repair the (D703) Park Assist Sensor 9 Signal circuit and the (X750) Park Assist Sensor Ground circuit for a short together.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT FOR AN OPEN**
    1. Disconnect the Park Assist Module C2 harness connector.
    2. Measure the resistance of the (D703) Park Assist Sensor 9 Signal circuit.

    Is the resistance above 3.0 Ohms?

    Yes

    - Repair the open in the (D703) Park Assist Sensor 9 Signal circuit.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Go To 8
8. **PARK ASSIST SENSOR**
    1. Turn the ignition on.
    2. Reconnect the Park Assist Module C2 harness connector.
    3. Connect a jumper wire across the (X700) Park Assist Sensor Supply and (D703) Park Assist Sensor 9 Signal circuits.
    4. Turn the ignition on.
    5. With the scan tool, read DTCs.

    Does the scan tool display DTC: B1296-12-PTS SENSOR 9-CIRCUIT SHORT TO BATTERY as active?

    Yes

    - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1296-25-PTS SENSOR 9-SIGNAL SHAPE / WAVEFORM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve**

sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Vehicle in reverse.
- During the self-test while vehicle is in drive between 7 mph (11 km/h) and 25 mph (40 km/h).

SET CONDITION

- The Park Assist Module detects an internal Sensor error.

DEFAULT ACTION

- Park Assist is disabled.
- The Electronic Vehicle Information Center (EVIC) will display PARKING ASSISTANCE WIPE REAR SENSORS

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING FASCIA
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: **Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.**

   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

      Is the DTC active?

      Yes

      - Go To 2

No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If no problems are found, test complete.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **PARK ASSIST SENSOR**
   1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

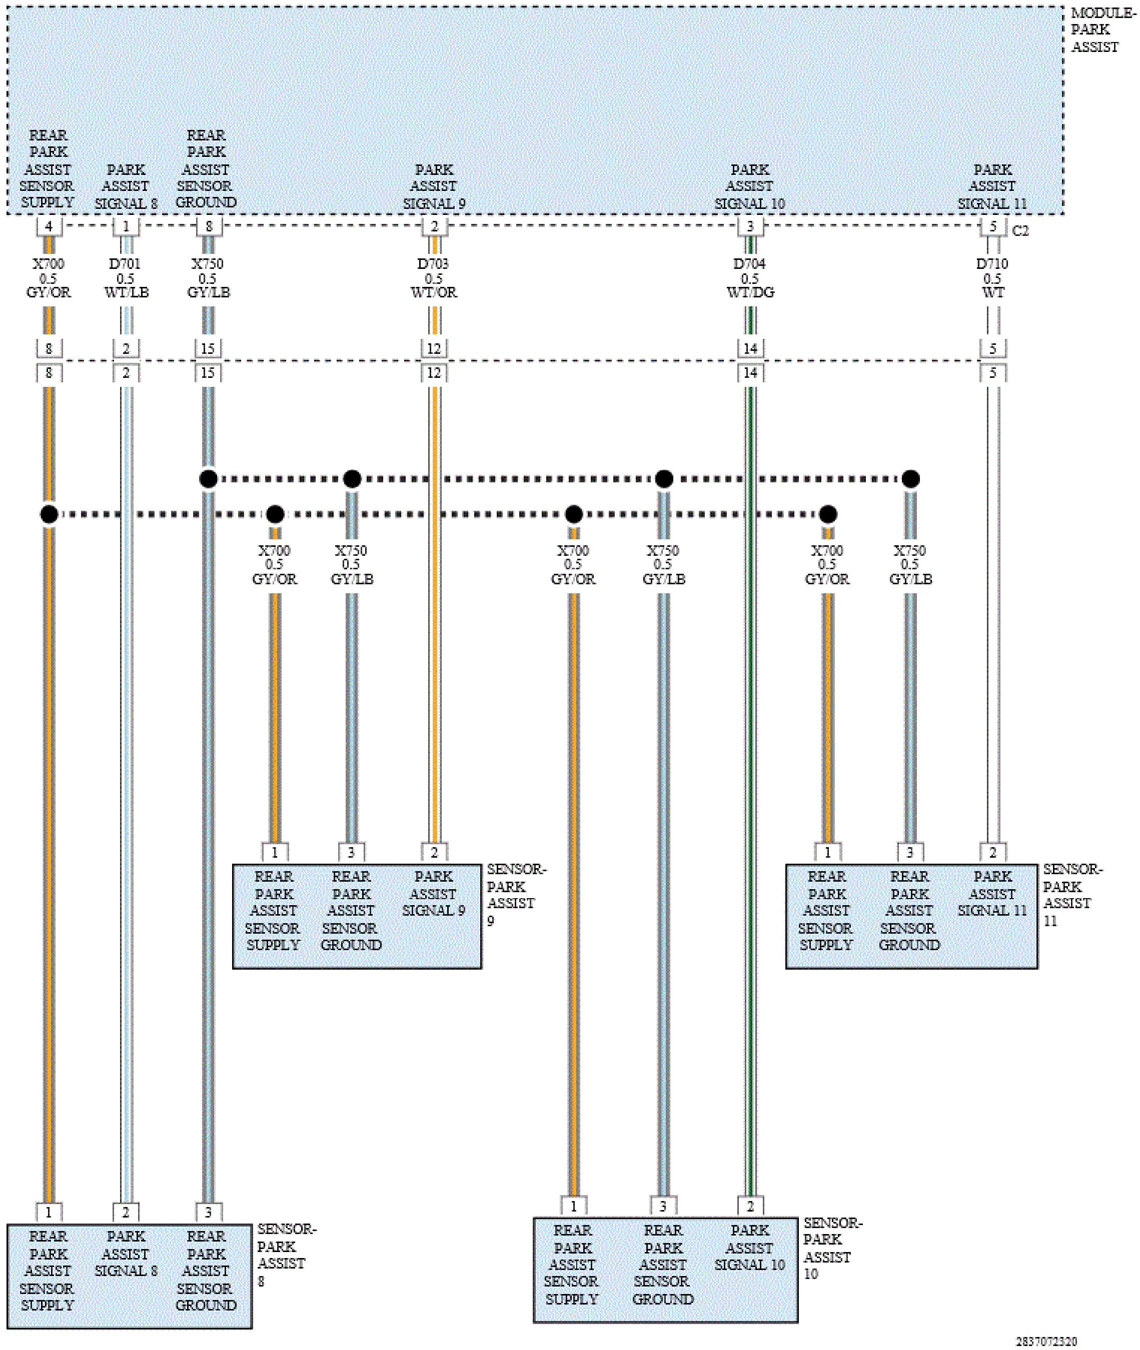
      If none of the possible causes mentioned above are present, view repair.

      Repair

      - Replace the Park Assist Sensor that caused this DTC to change from active to stored after disconnecting it in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1296-92-PTS SENSOR 9-PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .



[Fig. 6: PTS Sensor 8, 9, 10, 11 & Rear Sensors - Circuit Diagram]

This diagnostic runs continuously when the following conditions are met:

- Vehicle in reverse.
- During the self-test while vehicle is in drive between 11 km/h (7 mph) and 40 km/h (25 mph).

SET CONDITION

- If the system detects data corruption in the transmission in the internal communication line between the module and sensors, this code will set.

DEFAULT ACTION

- Park Assist is disabled.
- The Electronic Vehicle Information Center (EVIC) will display PARKING ASSISTANCE SVS REAR SENSORS

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR 9 SIGNAL CIRCUIT SHORTED TO GROUND
PARK ASSIST SENSOR 9 SIGNAL CIRCUIT SHORTED TO BATTERY
PARK ASSIST SENSOR 9 SIGNAL CIRCUIT OPEN
PARK ASSIST SENSOR 9
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

       NOTE: A disconnected sensor will set this DTC.

    2. With the scan tool, read PAM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read PAM DTCs.

       Did the DTC return?

       Yes

       - Go To 2

No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If no problems are found, test complete.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK PARK ASSIST SENSOR 9 FOR INTERNAL SHORT**
   1. Disconnect Park Assist Sensor 9.
   2. With the scan tool, read Park Assist Module DTCs.

   Is the DTC active?

   Yes

   - Go To 3

   No

   - Replace Park Assist Sensor 9 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C2 harness connector.
   3. Check for continuity between ground and the (D703) Park Assist Sensor 9 Signal circuit at the Park Assist Module C2 harness connector.

   Is there continuity between ground and the (D703) Park Assist Sensor 9 Signal circuit?

   Yes

   - Repair the (D703) Park Assist Sensor 9 Signal circuit for a short to ground.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Go To 4
4. **CHECK THE (D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
   1. Turn the ignition on.
   2. Measure the voltage between ground and the (D703) Park Assist Sensor 9 Signal circuit at the Park Assist Module C2 harness connector.

   Is there any voltage present?

Yes

- Repair the (D703) Park Assist Sensor 9 Signal circuit for a short to voltage

  Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CHECK THE (D703) PARK ASSIST SENSOR 9 SIGNAL CIRCUIT FOR AN OPEN**
   1. Measure the resistance of the (D703) Park Assist Sensor 9 Signal circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor 9 harness connector.

      Is the resistance below 3.0 Ohms?

      Yes

      - Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the (D703) Park Assist Sensor 9 Signal circuit for an open.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1297-12-PTS SENSOR 10-CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if**

equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Vehicle in reverse.
- During the self-test while vehicle is in drive between 11 km/h (7 mph) and 40 km/h (25 mph).

SET CONDITION

- The Park Assist Module detects an open or short to voltage on the Park Assist Sensor Signal circuit.

DEFAULT ACTION

- Park Assist is disabled.
- The Electronic Vehicle Information Center (EVIC) will display PARKING ASSISTANCE SVS REAR SENSORS

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR 10 SIGNAL CIRCUIT SHORTED TO VOLTAGE
PARK ASSIST SENSOR 10 SIGNAL CIRCUIT SHORTED TO THE PARK ASSIST SENSOR SUPPLY CIRCUIT
PARK ASSIST SENSOR GROUND CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

      NOTE: A disconnected sensor will set this DTC.

   2. With the scan tool, read PAM DTCs and record on the repair order.
   3. With the scan tool, erase DTCs.
   4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
   5. With the scan tool, read PAM DTCs.

      Did the DTC return?

      Yes

      - Go To 2

No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If no problems are found, test complete.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **(D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT SHORTED TO VOLTAGE**
    1. Turn the ignition off.
    2. Disconnect the Park Assist Module C2 harness connector.
    3. Disconnect the Park Assist Sensor harness connector.
    4. Turn the ignition on.
    5. Measure the voltage between ground and the (D704) Park Assist Sensor 10 Signal circuit at the Park Assist Module C2 harness connector.

    Is there any voltage present?

    Yes

    - Repair the (D704) Park Assist Sensor 10 Signal circuit for a short to voltage.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Go To 3
3. **(D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT SHORTED TO THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT**
    1. Turn the ignition off.
    2. Check for continuity between the (D704) Park Assist Sensor 10 Signal circuit and the (X700) Park Assist Sensor Supply circuit at the Park Assist Module C2 harness connector.

    Is there continuity between the (D704) Park Assist Sensor 10 Signal circuit and the (X700) Park Assist Sensor Supply circuit?

    Yes

    - Repair the (D704) Park Assist Sensor 10 Signal circuit for a short to the (X700) Park Assist Sensor Supply circuit.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Go To 4
4. **(X750) PARK ASSIST SENSOR GROUND CIRCUIT OPEN**
    1. Reconnect the Park Assist Module C2 harness connector.
    2. Measure the resistance between ground and the (X750) Park Assist Sensor Ground circuit at the

Park Assist Module C2 harness connector.

Is the resistance above 3.0 Ohms?

Yes

- Go To 5

No

- Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **(X750) PARK ASSIST SENSOR GROUND CIRCUIT OPEN BETWEEN PARK ASSIST MODULE AND SENSOR**
    1. Disconnect the Park Assist Module C2 harness connector.
    2. Measure the resistance of the (X750) Park Assist Sensor Ground circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor harness connector.

    Is the resistance below 3.0 Ohms?

    Yes

    - Repair the (X750) Park Assist Sensor Ground circuit for an open.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Replace the Park Assist Module in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1297-14-PTS SENSOR 10-CIRCUIT SHORT TO GROUND OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

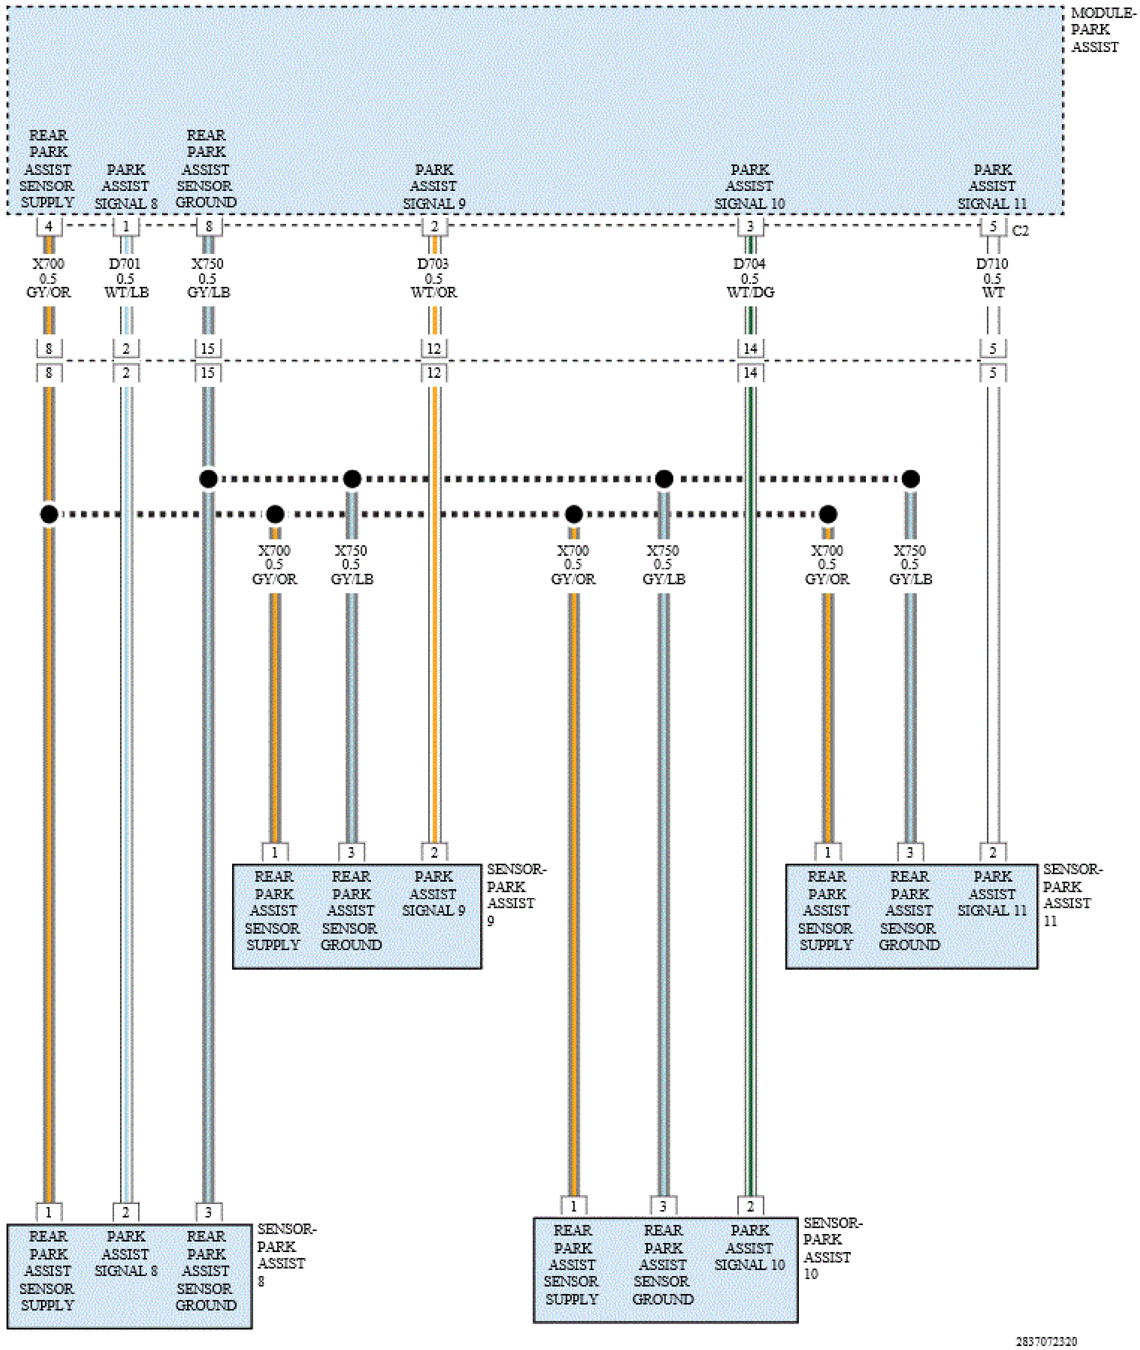

Fig. 8: PTS Sensor 8, 9, 10, 11 & Rear Sensors - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE:	**The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if**

equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Vehicle in reverse.
- During the self-test while vehicle is in drive between 11 km/h (7 mph) and 40 km/h (25 mph).

SET CONDITION

- The Park Assist Module detects a short to ground on the Park Assist Sensor Signal circuit.

DEFAULT ACTION

- Park Assist is disabled.
- The Electronic Vehicle Information Center (EVIC) will display PARKING ASSISTANCE SVS REAR SENSORS

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR DISCONNECTED
PARK ASSIST SENSOR 10 SIGNAL CIRCUIT SHORTED TO GROUND
PARK ASSIST SENSOR 10 SIGNAL CIRCUIT SHORTED TO THE PARK ASSIST SENSOR GROUND CIRCUIT
PARK ASSIST SENSOR 10 SIGNAL CIRCUIT OPEN
PARK ASSIST SENSOR SUPPLY CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

       NOTE: **A disconnected sensor will set this DTC.**

    2. With the scan tool, read PAM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read PAM DTCs.

       Did the DTC return?

       Yes

- Go To 2

No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If no problems are found, test complete.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE VOLTAGE OF THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Sensor harness connector.
   3. Turn the ignition on.
   4. Measure the voltage between ground and the (X700) Park Assist Sensor Supply circuit at the Park Assist Sensor harness connector.

      Is the voltage above 10.0 volts?

      Yes

      - Go To 4

      No

      - Go To 3

3. **CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C2 harness connector.
   3. Measure the resistance of the (X700) Park Assist Sensor Supply circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor harness connector.

      Is the resistance below 3.0 Ohms?

      Yes

      - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the (X700) Park Assist Sensor Supply circuit for an open or high resistance.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

4. **CHECK THE (D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE CONNECTED**

NOTE: **Perform this step with the Park Assist Module connected.**

1. Measure the resistance between ground and the (D704) Park Assist Sensor 10 Signal circuit at the Park Assist Module C2 harness connector.

   Is the resistance below 3.0 Ohms?

   Yes

   - Go To 5

   No

   - Go To 7

5. **CHECK THE (D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**
   1. Disconnect the Park Assist Module C2 harness connector.
   2. Measure the resistance between ground and the (D704) Park Assist Sensor 10 Signal circuit at the Park Assist Module C2 harness connector.

      Is the resistance below 3.0 Ohms?

      Yes

      - Repair the (D704) Park Assist Sensor 10 Signal circuit for a short to ground.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6

6. **CHECK THE (D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT FOR A SHORT TO THE (X750) PARK ASSIST SENSOR GROUND CIRCUIT**
   1. Measure the resistance between the (D704) Park Assist Sensor 10 Signal circuit and the (X750) Park Assist Sensor Ground circuit at the Park Assist Module C2 harness connector.

      Is the resistance below 3.0 Ohms?

      Yes

      - Repair the (D704) Park Assist Sensor 10 Signal circuit and the (X750) Park Assist Sensor Ground circuit for a short together.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT FOR AN OPEN**
    1. Disconnect the Park Assist Module C2 harness connector.
    2. Measure the resistance of the (D704) Park Assist Sensor 10 Signal circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor harness connector.

       Is the resistance below 3.0 Ohms?

       Yes

        - Repair the (D704) Park Assist Sensor 10 Signal circuit for an open.
        - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

       No

        - Go To 8
8. **PARK ASSIST SENSOR**
    1. Turn the ignition on.
    2. Reconnect the Park Assist Module C2 harness connector.
    3. Connect a jumper wire between the (X700) Park Assist Sensor Supply and (D704) Park Assist Sensor 10 Signal circuits at the Park Assist Sensor harness connector.
    4. Turn the ignition on.
    5. With the scan tool, read DTCs.

       Does the scan tool display DTC: B1297-12-PTS SENSOR 10 - CIRCUIT SHORT TO BATTERY?

       Yes

        - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
        - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

       No

        - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
        - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1297-25-PTS SENSOR 10-SIGNAL SHAPE / WAVEFORM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve**

sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Vehicle in reverse.
- During the self-test while vehicle is in drive between 7 mph (11 km/h) and 25 mph (40 km/h).

SET CONDITION

- The Park Assist Module detects an internal Sensor error.

DEFAULT ACTION

- Park Assist is disabled.
- The Electronic Vehicle Information Center (EVIC) will display PARKING ASSISTANCE WIPE REAR SENSORS

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING FASCIA)
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

NOTE: **Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.**

1. Turn the ignition on.
2. With the scan tool, read Park Assist Module DTCs.

Is the DTC active?

Yes

- Go To 2

No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If no problems are found, test complete.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **PARK ASSIST SENSOR**
    1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

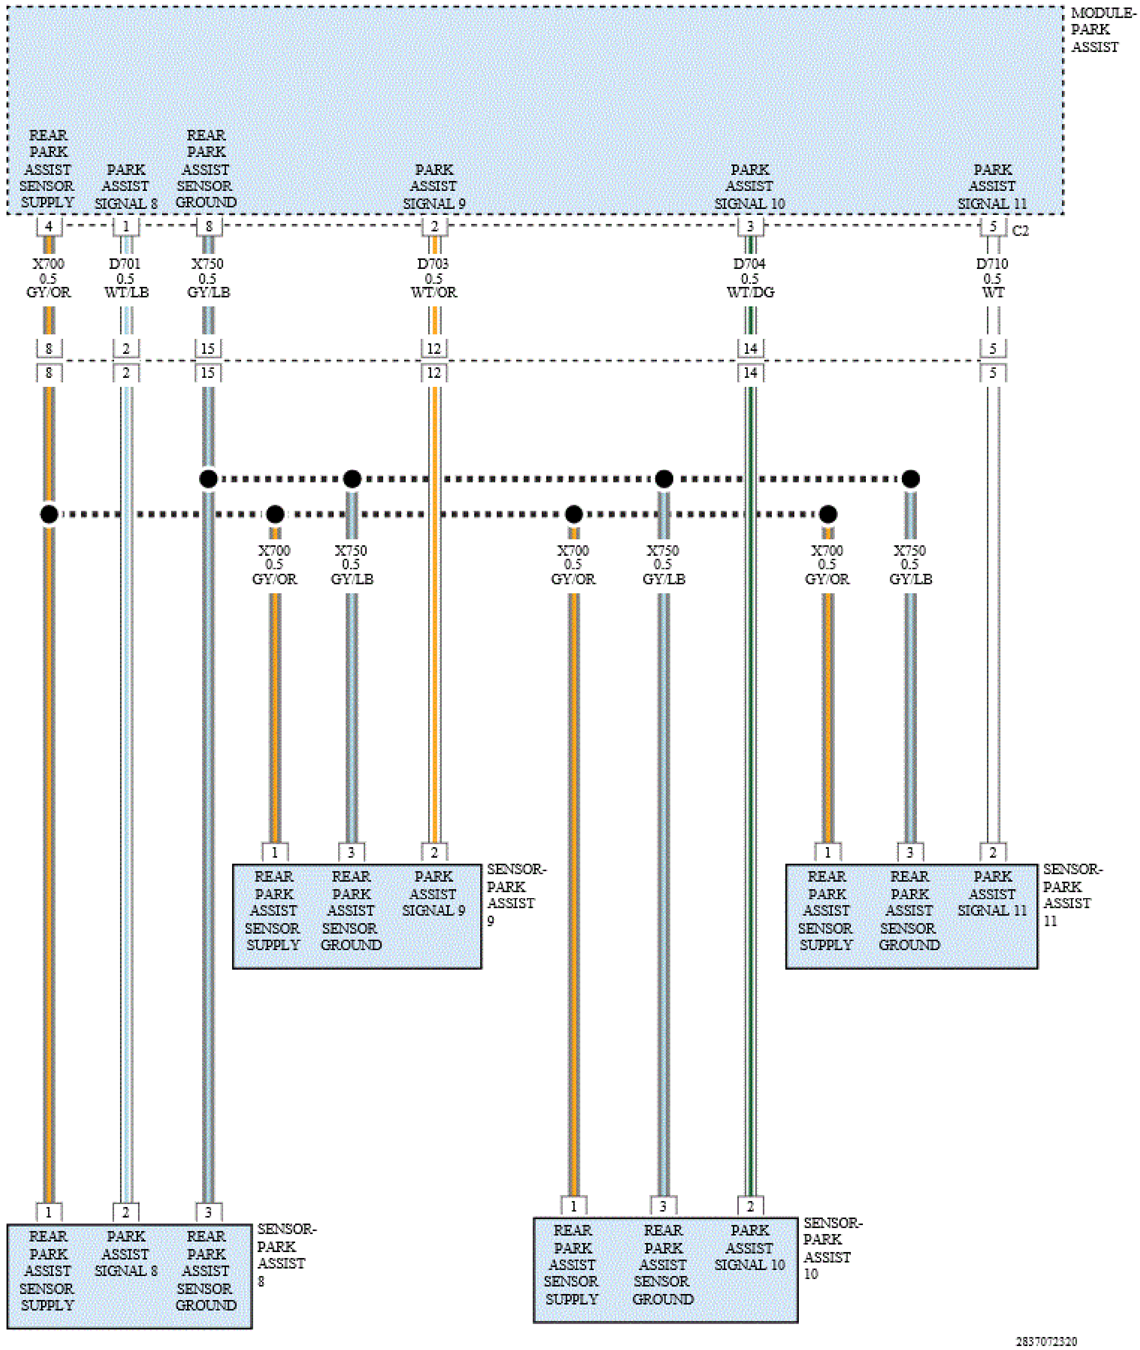
    If none of the possible causes mentioned above are present, view repair.

    Repair

    - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1297-92-PTS SENSOR 10-PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .



[Fig. 9: PTS Sensor 8, 9, 10, 11 & Rear Sensors - Circuit Diagram]

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if**

equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Vehicle in reverse.
- During the self-test while vehicle is in drive between 11 km/h (7 mph) and 40 km/h (25 mph).

SET CONDITION

- When the system detects data corruption in the transmission in the internal communication line between the module and sensors, this code will set.

DEFAULT ACTION

- Park Assist is disabled.
- The Electronic Vehicle Information Center (EVIC) will display PARKING ASSISTANCE SVS REAR SENSORS

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR 10 SIGNAL CIRCUIT SHORTED TO GROUND
PARK ASSIST SENSOR 10 SIGNAL CIRCUIT SHORTED TO BATTERY
PARK ASSIST SENSOR 10 SIGNAL CIRCUIT OPEN
PARK ASSIST SENSOR 10
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

       NOTE: A disconnected sensor will set this DTC.

    2. With the scan tool, read PAM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read PAM DTCs.

       Did the DTC return?

       Yes

       - Go To 2

No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If no problems are found, test complete.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK PARK ASSIST SENSOR 10 FOR INTERNAL SHORT**
    1. Disconnect Park Assist Sensor 10.
    2. With the scan tool, read Park Assist Module DTCs.

    Is the DTC active?

    Yes

    - Go To 3

    No

    - Replace Park Assist Sensor 10 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **CHECK THE (D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the Park Assist Module C2 harness connector.
    3. Check for continuity between ground and the (D704) Park Assist Sensor 10 Signal circuit at the Park Assist Module C2 harness connector.

    Is there continuity between ground and the (D704) Park Assist Sensor 10 Signal circuit?

    Yes

    - Repair the (D704) Park Assist Sensor 10 Signal circuit for a short to ground.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Go To 4

4. **CHECK THE (D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition on.
    2. Measure the voltage between ground and the (D704) Park Assist Sensor 10 Signal circuit at the Park Assist Module C2 harness connector.

    Is there any voltage present?

Yes

- Repair the (D704) Park Assist Sensor 10 Signal circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CHECK THE (D704) PARK ASSIST SENSOR 10 SIGNAL CIRCUIT FOR AN OPEN**
   1. Turn the ignition off.
   2. Measure the resistance of the (D704) Park Assist Sensor 10 Signal circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor 10 harness connector.

      Is the resistance below 3.0 Ohms?

      Yes

      - Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Repair the (D704) Park Assist Sensor 10 Signal circuit for an open.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1298-12-PTS SENSOR 11-CIRCUIT SHORT TO BATTERY

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Possible Causes
PARK ASSIST SENSOR 11 SIGNAL CIRCUIT SHORTED TO VOLTAGE
PARK ASSIST SENSOR 11 SIGNAL CIRCUIT SHORTED TO THE PARK ASSIST SENSOR SUPPLY CIRCUIT
PARK ASSIST SENSOR GROUND CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

       NOTE: **A disconnected sensor will set this DTC.**

    2. With the scan tool, read PAM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read PAM DTCs.

       Did the DTC return?

       Yes

       - Go To 2

No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If no problems are found, test complete.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **(D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT SHORTED TO VOLTAGE**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C2 harness connector.
   3. Disconnect the Park Assist Sensor 11 harness connector.
   4. Turn the ignition on.
   5. Measure the voltage between ground and the (D710) Park Assist Sensor 11 Signal circuit at the Park Assist Module C2 harness connector.

      Is there any voltage present?

      Yes

      - Repair the (D710) Park Assist Sensor 11 Signal circuit for a short to voltage.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 3
3. **(D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT SHORTED TO THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Check for continuity between the (D710) Park Assist Sensor 11 Signal circuit and the (X700) Park Assist Sensor Supply circuit at the Park Assist Module C2 harness connector.

      Is there continuity between the (D710) Park Assist Sensor 11 Signal circuit and the (X700) Park Assist Sensor Supply circuit ?

      Yes

      - Repair the (D710) Park Assist Sensor 11 Signal circuit for a short to the (X700) Park Assist Sensor Supply circuit.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 4
4. **(X750) PARK ASSIST SENSOR GROUND CIRCUIT OPEN**
   1. Reconnect the Park Assist Module C2 harness connector.
   2. Measure the resistance between ground and the (X750) Park Assist Sensor Ground circuit at the

Park Assist Module C2 harness connector.

Is the resistance below 3.0 Ohms?

Yes

- Go To 5

No

- Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

5. **(X750) PARK ASSIST SENSOR GROUND CIRCUIT OPEN BETWEEN PARK ASSIST MODULE AND SENSOR**
   1. Disconnect the Park Assist Module C2 harness connector.
   2. Measure the resistance of the (X750) Park Assist Sensor Ground circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor harness connector.

      Is the resistance above 3.0 Ohms?

      Yes

      - Repair the (X750) Park Assist Sensor Ground circuit for an open.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Park Assist Module in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1298-14-PTS SENSOR 11-CIRCUIT SHORT TO GROUND OR OPEN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

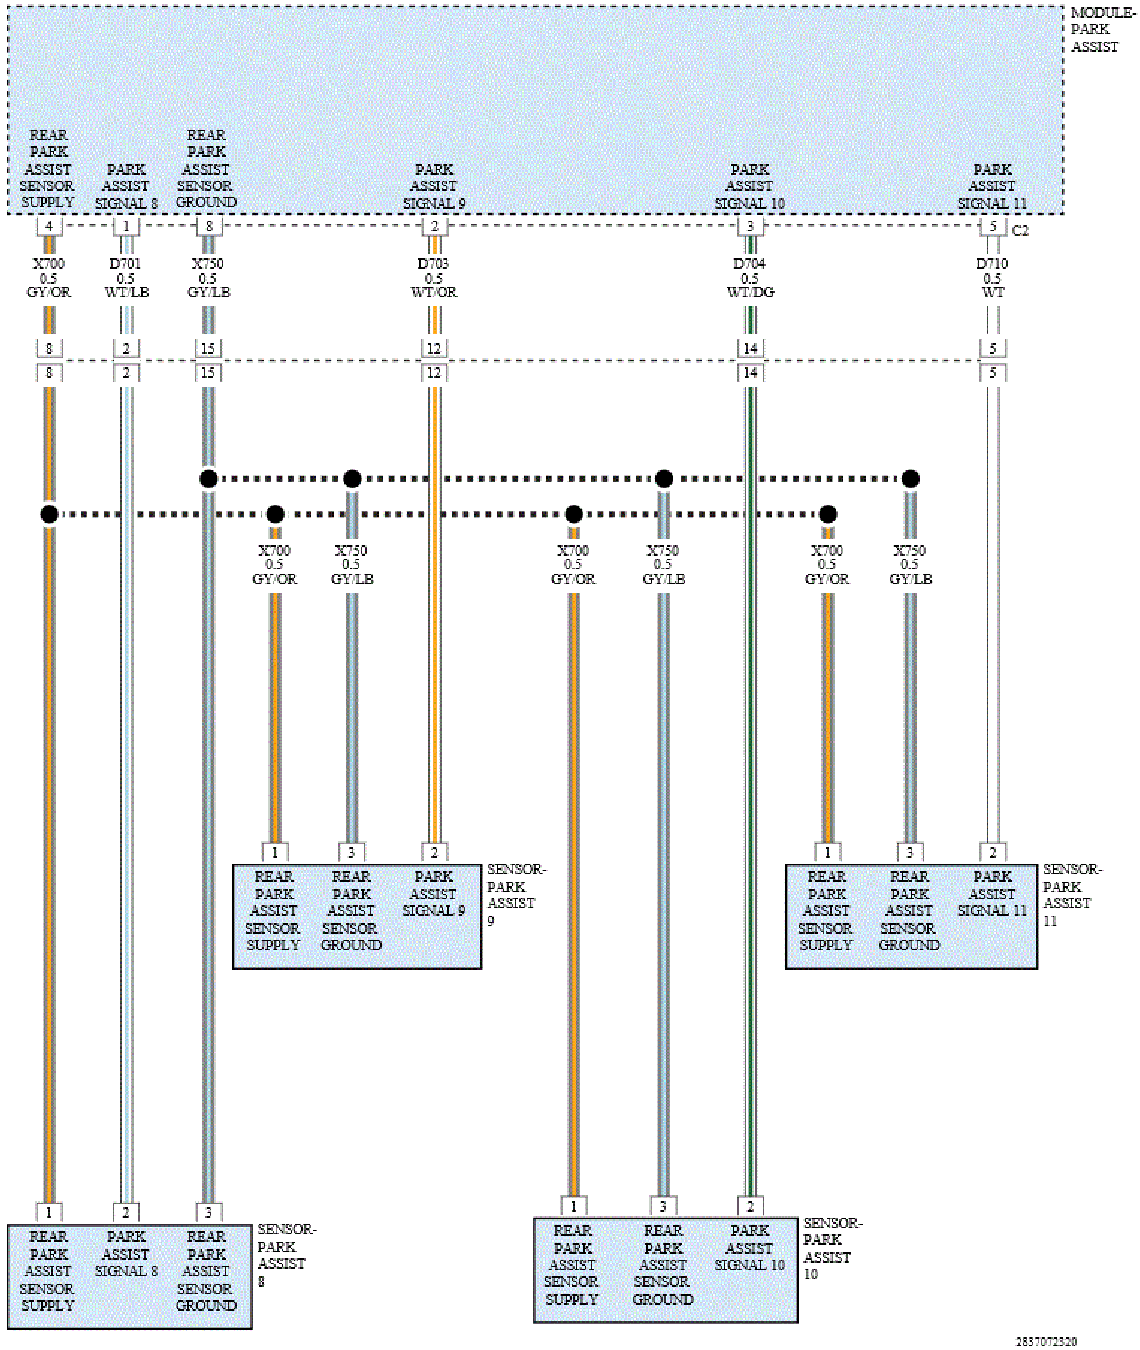

Fig. 11: PTS Sensor 8, 9, 10, 11 & Rear Sensors - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if**

equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Vehicle in reverse.
- During the self-test while vehicle is in drive between 11 km/h (7 mph) and 40 km/h (25 mph).

SET CONDITION

- The Park Assist Module detects a short to ground on the Park Assist Sensor Signal circuit.
-

DEFAULT ACTION

- Park Assist is disabled.
- The Electronic Vehicle Information Center (EVIC) will display PARKING ASSISTANCE SVS REAR SENSORS

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR DISCONNECTED
PARK ASSIST SENSOR 11 SIGNAL CIRCUIT SHORTED TO GROUND
PARK ASSIST SENSOR 11 SIGNAL CIRCUIT SHORTED TO THE PARK ASSIST SENSOR GROUND CIRCUIT
PARK ASSIST SENSOR 11 SIGNAL CIRCUIT OPEN
PARK ASSIST SENSOR SUPPLY CIRCUIT OPEN
PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
   1. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

      NOTE: A disconnected sensor will set this DTC.

   2. With the scan tool, read PAM DTCs and record on the repair order.
   3. With the scan tool, erase DTCs.
   4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
   5. With the scan tool, read PAM DTCs.

      Did the DTC return?

Yes

- Go To 2

No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If no problems are found, test complete.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE VOLTAGE OF THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Sensor 11 harness connector.
   3. Turn the ignition on.
   4. Measure the voltage between ground and the (X700) Park Assist Sensor Supply circuit at the Park Assist Sensor harness connector.

   Is the voltage above 10.0 volts?

   Yes

   - Go To 4

   No

   - Go To 3
3. **CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**
   1. Turn the ignition off.
   2. Disconnect the Park Assist Module C2 harness connector.
   3. Measure the resistance of the (X700) Park Assist Sensor Supply circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor harness connector.

   Is the resistance below 3.0 Ohms?

   Yes

   - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

   No

   - Repair the (X700) Park Assist Sensor Supply circuit for an open or high resistance.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE (D711) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR A SHORT TO**

GROUND WITH THE PARK ASSIST MODULE CONNECTED

NOTE: Perform this step with the Park Assist Module connected.

1. Check for continuity between ground and the (D711) Park Assist Sensor 11 Signal circuit at the Park Assist Module C2 harness connector.

   Is there continuity between ground and the (D711) Park Assist Sensor 11 Signal circuit?

   Yes

   - Go To 5

   No

   - Go To 7

5. **CHECK THE (D711) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR A SHORT TO GROUND WITH THE PARK ASSIST MODULE DISCONNECTED**
   1. Disconnect the Park Assist Module C2 harness connector.
   2. Check for continuity between ground and the (D711) Park Assist Sensor 11 Signal circuit at the Park Assist Module C2 harness connector.

      Is there continuity between ground and the (D711) Park Assist Sensor 11 Signal circuit?

      Yes

      - Repair the (D711) Park Assist Sensor 11 Signal circuit for a short to ground.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 6

6. **CHECK THE (D711) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR A SHORT TO THE (X750) PARK ASSIST SENSOR GROUND CIRCUIT**
   1. Measure the resistance between the (D711) Park Assist Sensor 11 Signal circuit and the (X750) Park Assist Sensor Ground circuit at the Park Assist Module C2 harness connector.

      Is the resistance below 3.0 Ohms?

      Yes

      - Repair the (D711) Park Assist Sensor 11 Signal circuit and the (X750) Park Assist Sensor Ground circuit for a short together.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

7. **CHECK THE (D711) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR AN OPEN**
    1. Disconnect the Park Assist Module C2 harness connector.
    2. Measure the resistance of the (D711) Park Assist Sensor 11 Signal circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor harness connector.

       Is the resistance below 3.0 Ohms?

       Yes

       - Repair the (D711) Park Assist Sensor 11 Signal circuit for an open.
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

       No

       - Go To 8
8. **PARK ASSIST SENSOR**
    1. Turn the ignition on.
    2. Reconnect the Park Assist Module C2 harness connector.
    3. Connect a jumper wire between the (X700) Park Assist Sensor Supply and (D711) Park Assist Sensor 11 Signal circuits at the Park Assist Sensor harness connector.
    4. Turn the ignition on.
    5. With the scan tool, read DTCs.

       Does the scan tool display DTC: B1298-12 PTS SENSOR 11-CIRCUIT SHORT TO BATTERY?

       Yes

       - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

       No

       - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1298-25PTS SENSOR 11-SIGNAL SHAPE / WAVEFORM FAILURE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.**

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Vehicle in reverse.
- During the self-test while vehicle is in drive between 7 mph (11 km/h) and 25 mph (40 km/h).

SET CONDITION

- The Park Assist Module detects an internal Sensor error.

DEFAULT ACTION

- Park Assist is disabled.
- The Electronic Vehicle Information Center (EVIC) will display PARKING ASSISTANCE WIPE REAR SENSORS

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR MEMBRANE OBSTRUCTION (ICE, SNOW, MUD, DIRT COVERING FASCIA)
PARK ASSIST SENSOR CONNECTOR OBSTRUCTION (ICE, SNOW, MUD, DIRT)
DECOUPLING RING MISSING/MOUNTED WRONG
OBJECTS - SUCH AS LICENSE PLATES - IN CLOSE RANGE TO THE SENSOR
PARK ASSIST SENSOR

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

   NOTE: **Before proceeding with this diagnostic procedure, remove any ice, snow, mud, dirt, or other obstructions from the front/rear fascia/bumper. Also remove any ice, snow, dirt, mud, or other obstructions from the underside of the Fascia/Bumper surrounding the sensors.**

   1. Turn the ignition on.
   2. With the scan tool, read Park Assist Module DTCs.

   Is the DTC active?

   Yes

   - Go To 2

No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If no problems are found, test complete.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **PARK ASSIST SENSOR**
    1. Verify that none of the possible causes mentioned above are present. Repair as necessary.

    If none of the possible causes mentioned above are present, view repair.

    Repair

    - Replace the Park Assist Sensor in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B1298-92PTS SENSOR 11-PERFORMANCE OR INCORRECT OPERATION

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

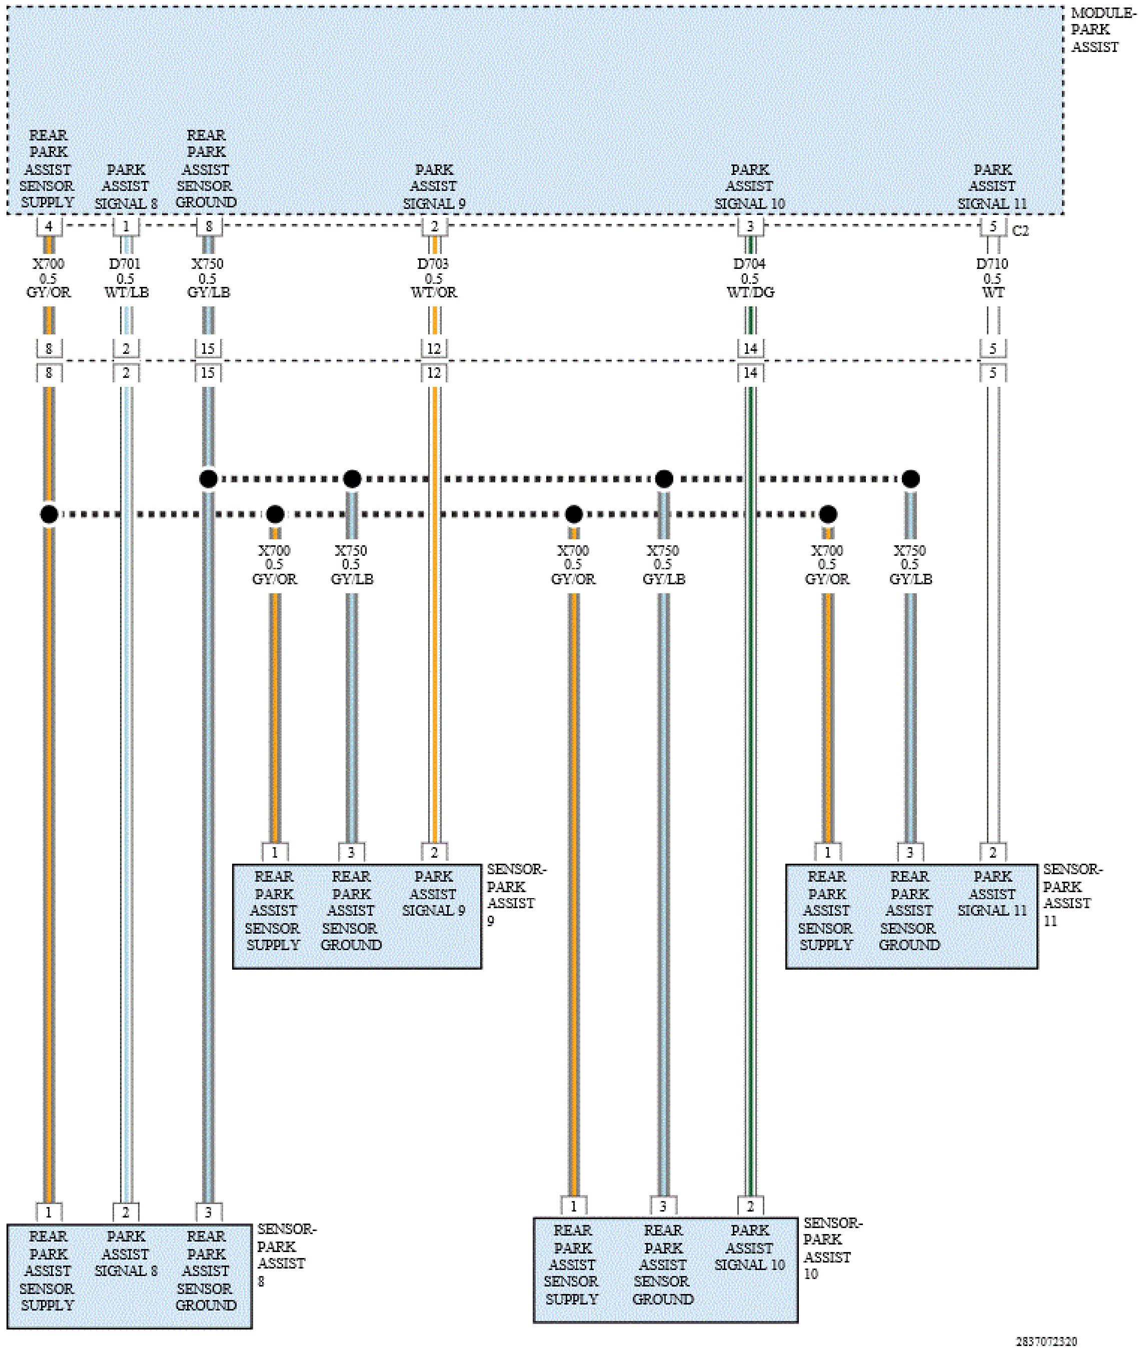

Fig. 12: PTS Sensor 8, 9, 10, 11 & Rear Sensors - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if**

equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Vehicle in reverse.
- During the self-test while vehicle is in drive between 11 km/h (7 mph) and 40 km/h (25 mph).

SET CONDITION

- When the system detects data corruption in the transmission in the internal communication line between the module and sensors, this code will set.

DEFAULT ACTION

- Park Assist is disabled.
- The Electronic Vehicle Information Center (EVIC) will display PARKING ASSISTANCE SVS REAR SENSORS

POSSIBLE CAUSES

Possible Causes
PARK ASSIST SENSOR 11 SIGNAL CIRCUIT SHORTED TO GROUND
PARK ASSIST SENSOR 11 SIGNAL CIRCUIT SHORTED TO BATTERY
PARK ASSIST SENSOR 11 SIGNAL CIRCUIT OPEN
PARK ASSIST SENSOR 11
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

       NOTE: A disconnected sensor will set this DTC.

    2. With the scan tool, read PAM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read PAM DTCs.

       Did the DTC return?

       Yes

       - Go To 2

No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If no problems are found, test complete.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK PARK ASSIST SENSOR 11 FOR INTERNAL SHORT**
    1. Disconnect Park Assist Sensor 11 harness connector.
    2. With the scan tool, read Park Assist Module DTCs.

    Is the DTC active?

    Yes

    - Go To 3

    No

    - Replace Park Assist Sensor 11 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **CHECK THE (D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the Park Assist Module C2 harness connector.
    3. Check for continuity between ground and the (D710) Park Assist Sensor 11 Signal circuit at the Park Assist Module C2 harness connector.

    Is there continuity between ground and the (D710) Park Assist Sensor 11 Signal circuit?

    Yes

    - Repair the (D710) Park Assist Sensor 11 Signal circuit for a short to ground.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Go To 4
4. **CHECK THE (D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**
    1. Turn the ignition on.
    2. Measure the voltage between ground and the (D710) Park Assist Sensor 11 Signal circuit at the Park Assist Module C2 harness connector.

    Is there any voltage present?

Yes

- Repair the (D710) Park Assist Sensor 11 Signal circuit for a short to voltage.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

No

- Go To 5

5. **CHECK THE (D710) PARK ASSIST SENSOR 11 SIGNAL CIRCUIT FOR AN OPEN**
    1. Measure the resistance of the (D710) Park Assist Sensor 11 Signal circuit between the Park Assist Module C2 harness connector and the Park Assist Sensor 11 harness connector.

    Is the resistance below 3.0 Ohms?

    Yes

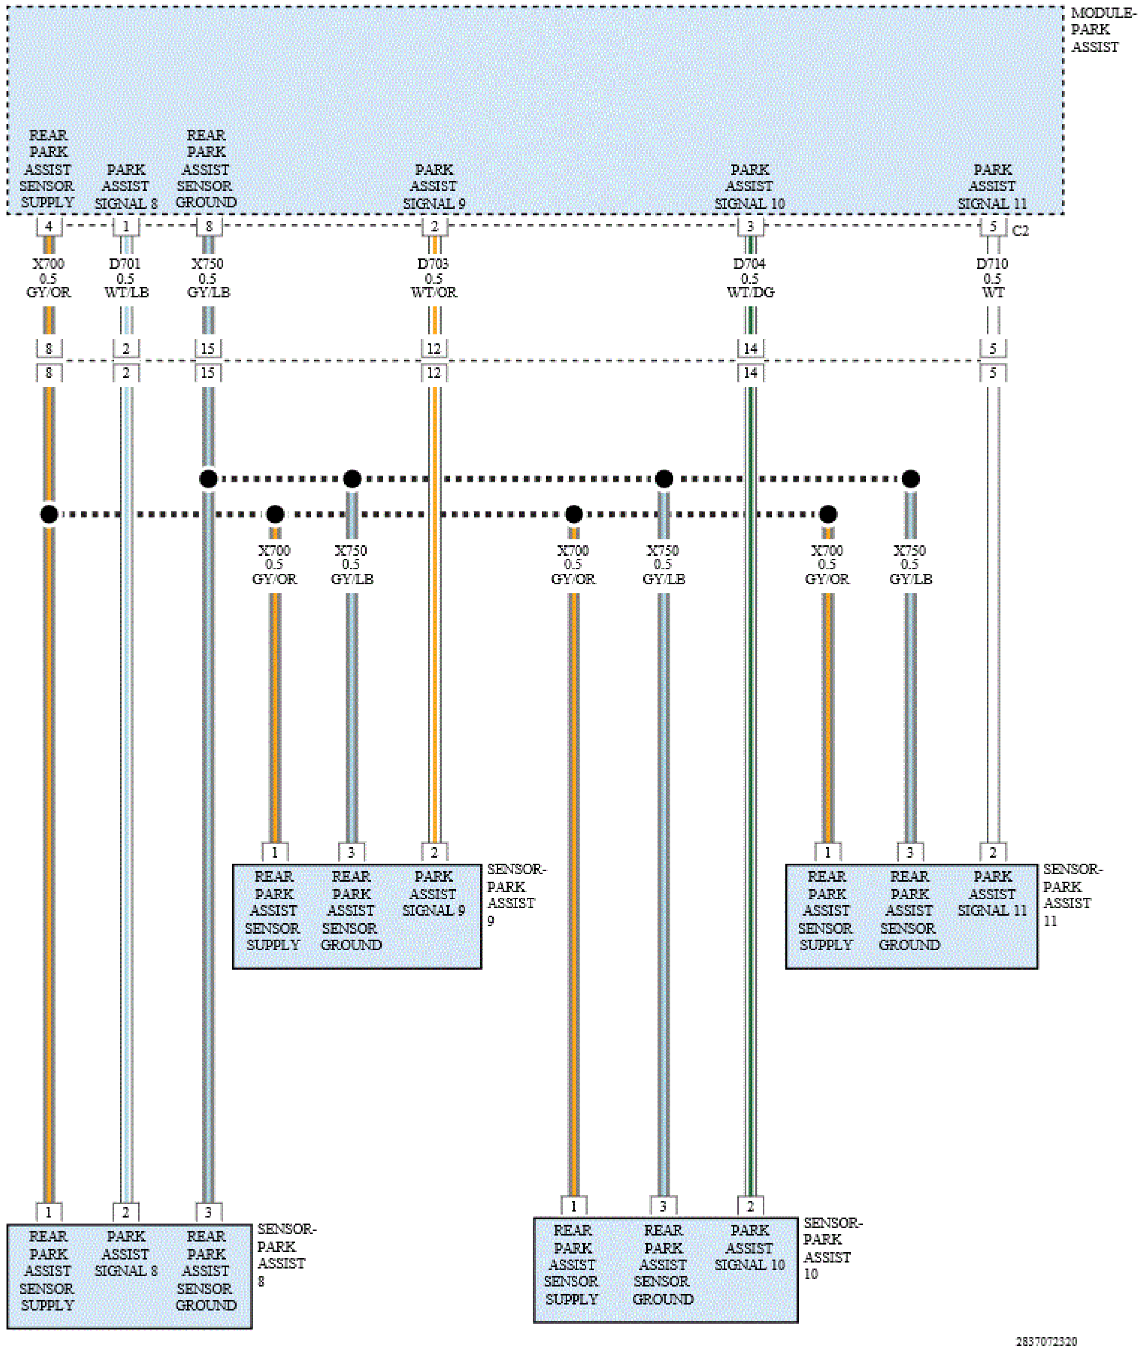
    - Replace the Park Assist Module in accordance with Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Repair the (D710) Park Assist Sensor 11 Signal circuit for an open.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B212B-11-REAR SENSORS POWER SUPPLY-CIRCUIT SHORT TO GROUND

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .



[Fig. 13: PTS Sensor 8, 9, 10, 11 & Rear Sensors - Circuit Diagram]

Courtesy of CHRYSLER GROUP, LLC

THEORY OF OPERATION

The Park Assist Sensors are ultrasonic transceivers that are controlled by the Park Assist Module. The sensors transmit and receive ultrasonic signals. Each sensor has a voltage, signal, and return circuit to the module. The sensors communicate with the Park Assist Module using a dedicated serial bus communication circuit.

NOTE: **The numbering system for the park assist sensors allows for up to twelve sensors on the vehicle, six front and six rear. The sensors are numbered in a clockwise manner starting at the left front bumper. The left front sensor (if**

equipped with front park assist) is the number 1 sensor. The numbering continues in a clockwise direction around the vehicle.

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Vehicle in reverse.
- During the self-test while vehicle is in drive between 11 km/h (7 mph) and 40 km/h (25 mph).

Default Actions:

DEFAULT ACTION

- Park Assist Module is disabled.
- The Electronic Vehicle Information Center (EVIC) will display PARKING ASSISTANCE SRVS REAR SENSORS message on the cluster.

POSSIBLE CAUSES

Possible Causes
REAR PARK ASSIST SENSOR SUPPLY CIRCUIT SHORTED TO GROUND
REAR PARK ASSIST SENSOR HARNESS SHORTED TO GROUND
REAR PARK ASSIST SENSOR
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read PAM DTCs and record on the repair order.
    2. With the scan tool, erase DTCs.
    3. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    4. With the scan tool, read PAM DTCs.

       Did the DTC return?

       Yes

       - Go To 2

       No

       - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If no problems are found, test complete.
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK THE REAR PARK ASSIST SENSOR WIRING HARNESS**
    1. Turn the ignition off.
    2. Disconnect the Park Assist Sensor wiring harness from the vehicle.
    3. With the scan tool, erase DTCs.
    4. Turn the ignition on.
    5. With the scan tool, read PAM DTCs.

    Did the DTC return?

    Yes

    - Go To 3

    No

    - Go To 4
3. **CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR A SHORT TO GROUND**
    1. Turn the ignition off.
    2. Disconnect the Park Assist Module C2 harness connector.
    3. Check for continuity between ground and the (X700) Park Assist Sensor Supply circuit at the Park Assist Module C2 harness connector.

    Is there continuity between ground and the (X700) Park Assist Sensor Supply circuit?

    Yes

    - Repair the (X700) Park Assist Sensor Supply circuit for a short to ground.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
4. **CHECK THE PARK ASSIST WIRING HARNESS FOR WIRE TO WIRE SHORTS**
    1. Disconnect all 4 Park Assist Sensors from the Park Assist harness connector.
    2. Check for continuity between the (X700) Park Assist Sensor Supply circuit and all other circuits at the Rear Park Assist harness connector.

    Is there continuity between the (X700) Park Assist Sensor Supply circuit and any other circuit?

    Yes

    - Repair the (X700) Park Assist Sensor Supply circuit for a short to another circuit.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

- Go To 5

5. **CHECK FOR AN INTERNALLY SHORTED OUT PARK ASSIST SENSOR**
    1. Reconnect the Park Assist Module C2 harness connector.
    2. Reconnect all Park Assist sensors except for Park Assist Sensor 8.
    3. Reconnect the Park Assist Sensor wiring harness.
    4. With the scan tool, erase DTCs.
    5. With the scan tool, read PAM DTCs.

    Did the DTC return?

    Yes

    - Go To 6

    No

    - Replace the Park Assist Sensor 8 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
6. **CHECK THE REMAINING PARK ASSIST SENSORS FOR AN INTERNALLY SHORTED OUT SENSOR**
    1. Disconnect Park Assist Sensor 9.
    2. With the Scan tool, erase DTCs.
    3. Turn the ignition on.
    4. With the scan tool, read PAM DTCs.

    Did the DTC return?

    Yes

    - Go To 7

    No

    - Replace the Park Assist Sensor 9 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
7. **CHECK THE REMAINING PARK ASSIST SENSORS FOR AN INTERNALLY SHORTED OUT SENSOR**
    1. Disconnect Park Assist Sensor 10.
    2. With the Scan tool, erase DTCs.
    3. Turn the ignition on.
    4. With the scan tool, read PAM DTCs.

    Did the DTC return?

Yes

- Go To 8

No

- Replace the Park Assist Sensor 10 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

8. **CHECK THE REMAINING PARK ASSIST SENSORS FOR AN INTERNALLY SHORTED OUT SENSOR**
    1. Disconnect Park Assist Sensor 11.
    2. With the Scan tool, erase DTCs.
    3. Turn the ignition on.
    4. With the scan tool, read PAM DTCs.

    Did the DTC return?

    Yes

    - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

    No

    - Replace the Park Assist Sensor 11 in accordance with the Service Information. Refer to **SENSOR, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2199-16-BATTERY VOLTAGE-CIRCUIT VOLTAGE BELOW THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

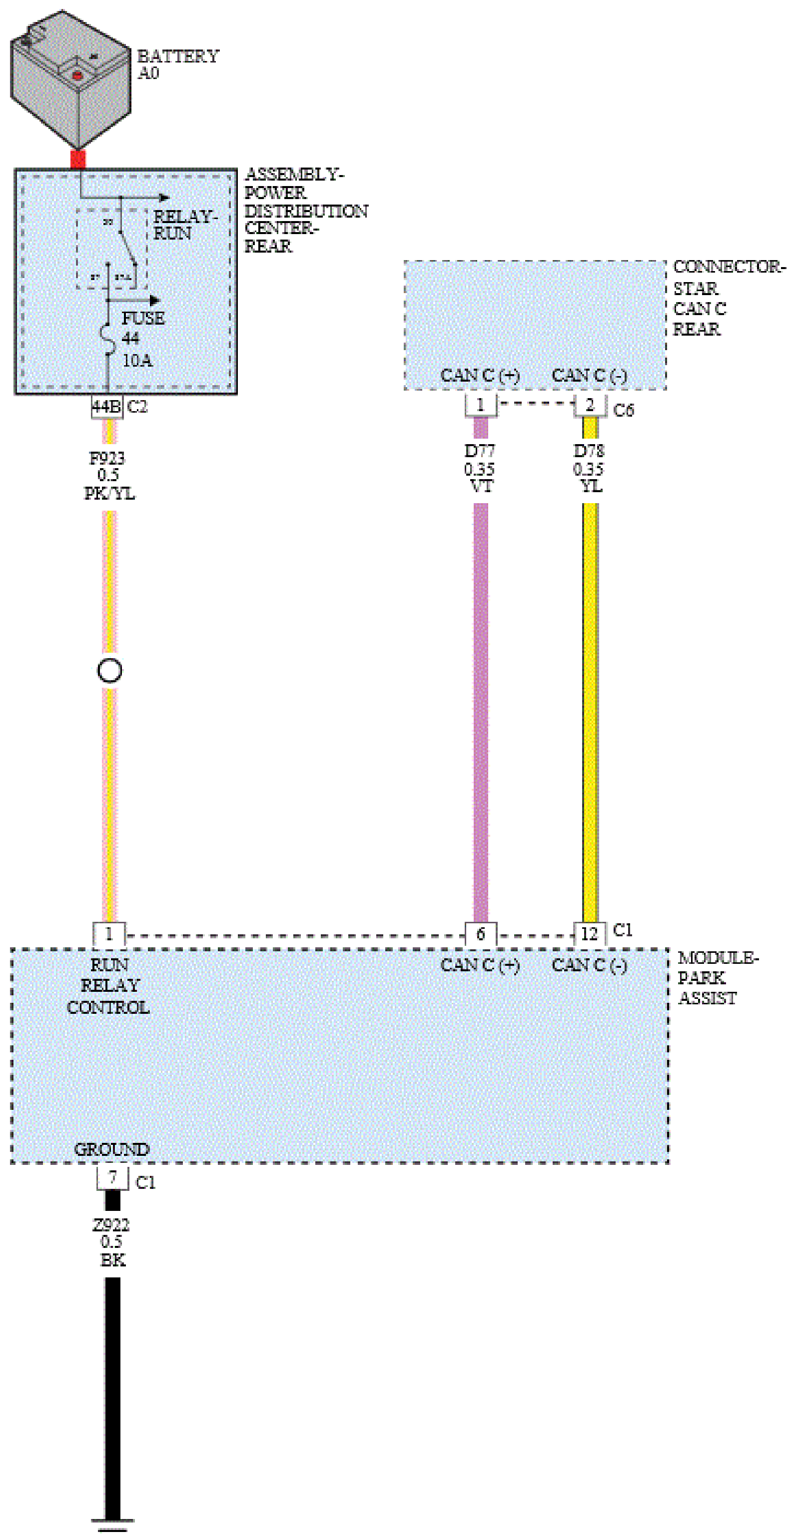


Fig. 14: Park Module Assist Module Battery Voltage - Circuit Diagram
Courtesy of CHRYSLER GROUP, LLC

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Vehicle in reverse.
- During the self-test while vehicle is in drive between 11 km/h (7 mph) and 40 km/h (25 mph).

SET CONDITION

- Park Assist Module supply voltage less than 6.5 volts.

DEFAULT ACTION

- Park Assist is disabled.
- The Electronic Vehicle Information Center (EVIC) will display PARKING ASSISTANCE DISABLED

POSSIBLE CAUSES

Possible Causes
VEHICLE CHARGING SYSTEM
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read PAM DTCs and record on the repair order.
    2. With the scan tool, erase DTCs.
    3. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    4. With the scan tool, read PAM DTCs.

    Did the DTC return?

    Yes

    - Go To 2

    No

    - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension and repair as necessary. If no problems are found, test complete.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY OPERATION OF THE VEHICLE CHARGING SYSTEM**

    NOTE: **Troubleshoot any PCM charging/cranking DTCs before proceeding.**

    NOTE: **Make sure the battery is fully charged.**

    Are any charging system DTCs present?

    Yes

- Refer to **DTC INDEX** and perform the appropriate diagnostic procedure.

No

- Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2199-17-BATTERY VOLTAGE-CIRCUIT VOLTAGE ABOVE THRESHOLD

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

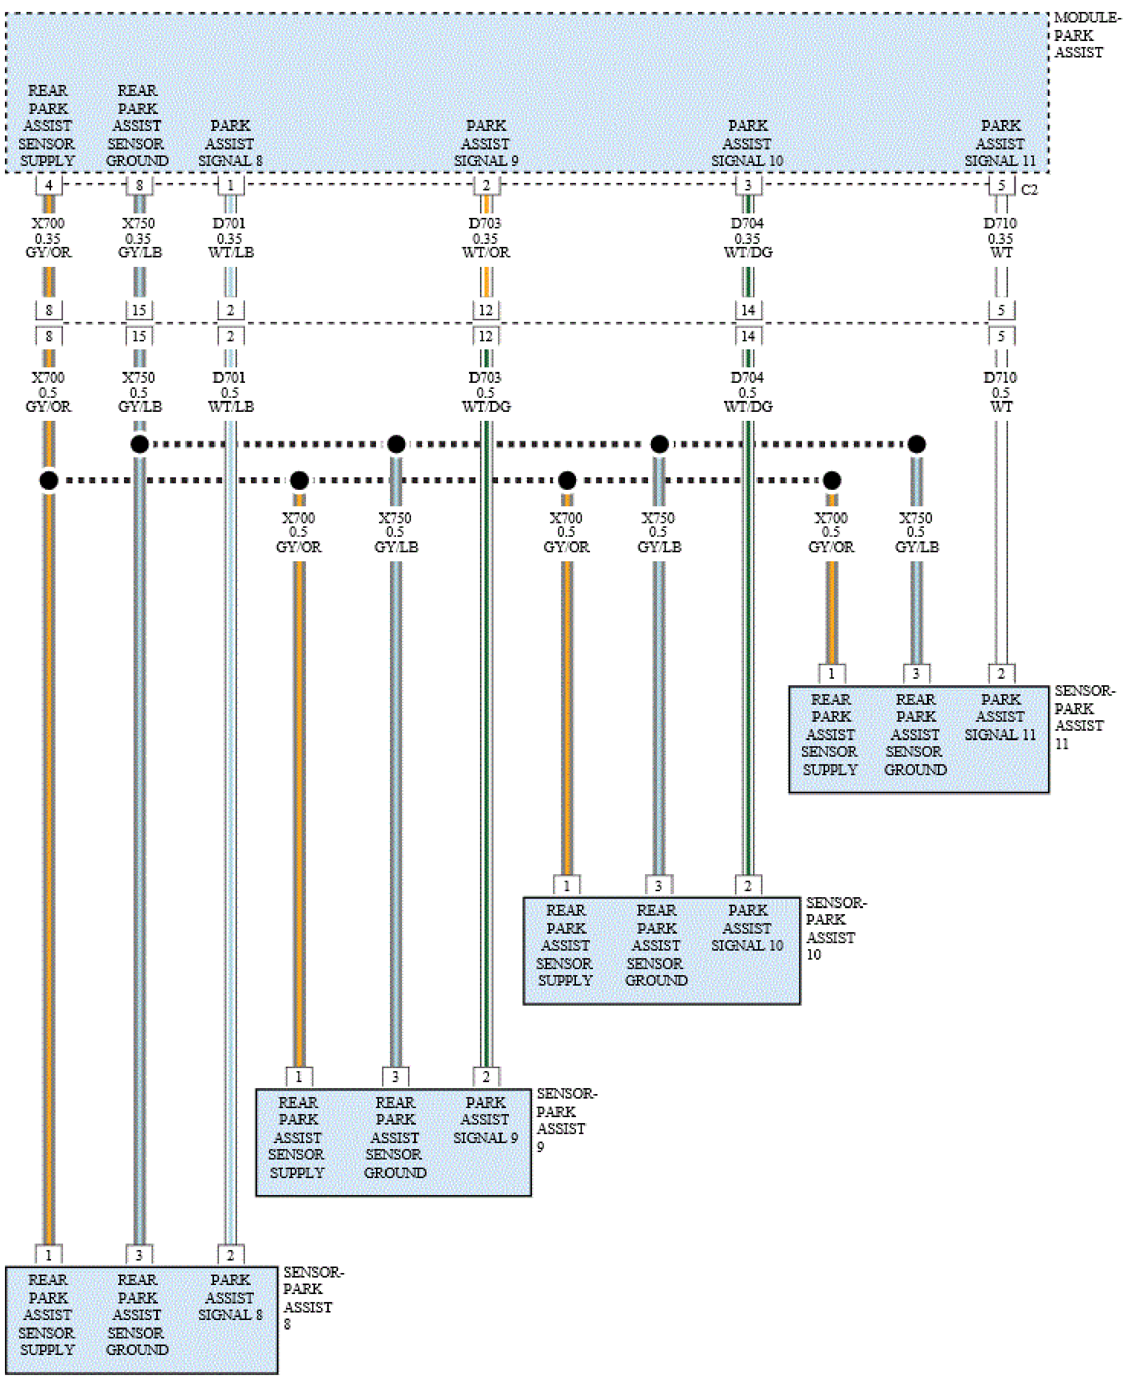

Fig. 15: Park Assist Battery Voltage - Circuit Diagram

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Vehicle in reverse.
- During the self-test while vehicle is in drive between 11 km/h (7 mph) and 40 km/h (25 mph).

SET CONDITION

- Park Assist Module supply voltage greater than 16.0 volts.

DEFAULT ACTION

- Park Assist is disabled.
- The Electronic Vehicle Information Center (EVIC) will display PARKING ASSISTANCE DISABLED

POSSIBLE CAUSES

Possible Causes
VEHICLE CHARGING SYSTEM
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. Verify the Park Assist Sensor is connected before proceeding with this diagnostic procedure.

       NOTE: A disconnected sensor will set this DTC.

    2. With the scan tool, read PAM DTCs and record on the repair order.
    3. With the scan tool, erase DTCs.
    4. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    5. With the scan tool, read PAM DTCs.

       Did the DTC return?

       Yes

       - Go To 2

       No

       - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If no problems are found, test complete.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY OPERATION OF THE VEHICLE CHARGING SYSTEM**

NOTE: **Troubleshoot any PCM charging/cranking DTCs before proceeding.**

NOTE: **Make sure the battery is fully charged.**

Are any charging system DTCs present?

Yes

- Refer to **DTC INDEX** and perform the appropriate diagnostic procedure.

No

- Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B222A-00-VEHICLE LINE MISMATCH

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following condition is met:

- Ignition on.

SET CONDITION

- If the Vehicle Line data transmitted on the CAN C Interior bus doesn't correspond with the data stored in the Park Assist Module.

DEFAULT ACTION

- Park Assist is disabled.
- The Electronic Vehicle Information Center (EVIC) will display PARKING ASSISTANCE DISABLED

POSSIBLE CAUSES

Possible Causes
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read PAM DTCs and record on the repair order.
    2. With the scan tool, erase DTCs.
    3. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    4. With the scan tool, read PAM DTCs.

Did the DTC return?

Yes

- Go To 2

No

- The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension. If no problems are found, test complete.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **CHECK VEHICLE LINE IN THE BCM**
    1. With the scan tool, compare the vehicle line that is programmed in to the BCM to the vehicle line of the vehicle.

       Does the vehicle line programmed into the BCM match the vehicle?

       Yes

       - Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

       No

       - Use the scan tool to read DTCs in all other modules. If any communication DTCs are present, perform the appropriate diagnostic procedure. Perform any Technical Service Bulletins that apply. If no problems are found, test is complete.
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

B2232-00-(PTS) PARKTRONICS INTERNAL

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

Possible Causes
PARK ASSIST MODULE

DIAGNOSTIC TEST

REPLACE THE PARK ASSIST MODULE

View Repair

Repair

- Replace the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0002-00-CAN C BUS OFF PERFORMANCE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

THEORY OF OPERATION

For an in-depth explanation of the CAN system operation, refer to **DESCRIPTION** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- Battery voltage above a calibrated value.

SET CONDITION

- CAN C bus has experienced a failure due to a circuit or processor fault.

POSSIBLE CAUSES

Possible Causes
OPEN OR SHORTED CAN C BUS CIRCUIT
CAN C RELATED MODULE
CAN C RELATED STAR CONNECTOR (IF EQUIPPED)

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**

NOTE: **If the scan tool will not communicate with CAN C, proceed to SCAN TOOL DOES NOT COMMUNICATE WITH CAN C. Refer to SCAN TOOL DOES NOT COMMUNICATE WITH CAN C .**

1. With the scan tool, run a Vehicle Scan Report and attached it to the repair order.
2. With the scan tool, erase DTCs.

3. Using the Vehicle Scan Report, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
4. With the scan tool, read DTCs.

   Did the DTC return?

   Yes

   - Proceed to SCAN TOOL DOES NOT COMMUNICATE WITH CAN C. Refer to **SCAN TOOL DOES NOT COMMUNICATE WITH CAN C** .

   No

   - Go To 2

2. **ATTEMPT TO LOCATE AN INTERMITTENT CIRCUIT FAULT**

   NOTE: The scan tool LOSS OF COMM TEST will force the modules on the CAN C bus to continuously ping each other.

   1. With the scan tool, initiate the LOSS OF COMM TEST.

      NOTE: A value above 0 under the NUMBER OF NO RESPONSES can help indicate the location of a circuit fault while wiggling the related CAN C bus circuits.

      NOTE: The scan tool lag time between pings is almost 1 full second. Keep this in mind while wiggling the wires and connectors.

   2. In a systematic manner, wiggle the applicable CAN C circuits at each related module, in-line connector, and Star Connector (if equipped) while monitoring the NUMBER OF NO RESPONSES on the scan tool.

      Did the above test help locate the fault?

      Yes

      - Repair as necessary.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

      No

      - Go To 3

3. **PERFORM VISUAL INSPECTION OF CONNECTORS, TERMINALS AND WIRES**
   1. Disconnect all CAN C related module harness connectors.
   2. Disconnect all related in-line harness connections.
   3. Inspect the harness connectors, component connectors, and all male and female terminals for the following conditions:
      - Proper connector installation.

- Damaged connector locks.
- Corrosion.
- Signs of water intrusion.
- Weather seal damage (if equipped).
- Bent terminals.
- Overheating due to a poor connection (terminal may be discolored due to excessive current draw).
- Terminals that have been pushed back into the connector cavity.
- Perform a terminal drag test on each connector terminal to verify proper terminal tension.

Repair any conditions that are found.

4. Reconnect all CAN C related module harness connectors. Be certain that all harness connectors are fully seated and the connector locks are fully engaged.
5. Reconnect all in-line harness connectors. Be certain that all connectors are fully seated and the connector locks are fully engaged.
6. With the scan tool, erase DTCs.
7. Using the Vehicle Scan Report, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
8. With the scan tool, read DTCs.

Did the DTC return?

Yes

- Proceed to SCAN TOOL DOES NOT COMMUNICATE WITH CAN C. Refer to **SCAN TOOL DOES NOT COMMUNICATE WITH CAN C** .

No

- The conditions that caused this DTC to set are no longer present. Test complete.

U0100-00-LOST COMMUNICATION WITH ECM/PCM

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0101-00-LOST COMMUNICATION WITH TCM

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0121-00-LOST COMMUNICATION WITH ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0140-00-LOST COMMUNICATION WITH BODY CONTROL MODULE

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to **STANDARD PROCEDURE** .

U0155-00-LOST COMMUNICATION WITH CLUSTER-CCN

Perform the COMMUNICATION PRE-DIAGNOSTIC PROCEDURE. Refer to STANDARD PROCEDURE .

U0401-00-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on.
- Vehicle in reverse.

SET CONDITION

- VIN data not received from Powertrain Control Module (PCM).

DEFAULT ACTION

- Park Assist is disabled.
- The Electronic Vehicle Information Center (EVIC) will display PARKING ASSISTANCE DISABLED

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH POWERTRAIN CONTROL MODULE (PCM)
DTCS STORED OR ACTIVE IN THE PCM
ACTIVE COMMUNICATION DTCS IN THE BCM
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read PAM DTCs and record on the repair order.
    2. With the scan tool, erase DTCs.
    3. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    4. With the scan tool, read PAM DTCs.

       Did the DTC return?

       Yes

       - Go To 2

       No

       - The condition or conditions that originally set this DTC are not present at this time. Using the

wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension and repair as necessary. If no problems are found, test complete.

- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY PCM IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, select ECU View.
    2. Verify that the PCM is active on the bus.

    Is the PCM active on the bus?

    Yes

    - Go To 3

    No

    - Perform the No Response from PCM diagnostic procedure. Refer to **NO RESPONSE FROM PCM (POWERTRAIN CONTROL MODULE) -- GAS** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **DTCS STORED OR ACTIVE IN THE PCM**
    1. With the scan tool, read PCM DTCs and record on the repair order.

    Are any DTCs active or stored in the PCM?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DTC INDEX** .

    No

    - Go To 4
4. **ACTIVE COMMUNICATION DTCS IN THE BCM**
    1. With the scan tool, select ECU View and select BCM.
    2. With the scan tool, read active DTCs.

    Are any Communication DTCs active in the BCM?

    Yes

    - Perform the appropriate diagnostic procedure. Refer to **DIAGNOSIS AND TESTING** .

    No

    - Replace and program the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0402-00-IMPLAUSIBLE DATA RECEIVED FROM TCM

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- With the ignition on for at least five seconds.
- Battery voltage between 10 and 16 volts.
- Body Control Module (BCM) is configured correctly.

SET CONDITION

- Whenever the communication data sent over the CAN BUS from the Transmission Control Module (TCM) is missing part of the message, the message is corrupted, or the message is an irrational value.

DEFAULT ACTION

- Park Assist is disabled.
- The Electronic Vehicle Information Center (EVIC) will display PARKING ASSISTANCE DISABLED

POSSIBLE CAUSES

Possible Causes
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
BCM NOT CONFIGURED CORRECTLY
TRANSMISSION CONTROL MODULE POWERS OR GROUNDS
TRANSMISSION CONTROL MODULE
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read PAM DTCs and record on the repair order.
    2. With the scan tool, erase DTCs.
    3. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    4. With the scan tool, read PAM DTCs.

    Did the DTC return?

    Yes

    - Go To 2

    No

    - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension and repair as

necessary. If no problems are found, test complete.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

2. **VERIFY TCM IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, select ECU View.
    2. Verify that the TCM is active on the bus.

    Is the TCM active on the bus?

    Yes

    - Go To 3

    No

    - Refer to **NO RESPONSE FROM TCM (TRANSMISSION CONTROL MODULE) 8--SPEED** and perform the No Response from TCM diagnostic procedure.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **DTCS STORED OR ACTIVE IN THE TCM**
    1. With the scan tool, read TCM DTCs.

    Are any DTCs active or stored in the TCM?

    Yes

    - Perform the appropriate diagnostic procedure.

    No

    - Go To 4
4. **ACTIVE COMMUNICATION DTCS IN THE BCM**
    1. With the scan tool, select ECU View and select BCM.
    2. With the scan tool, read active DTCs.

    Are any Communication DTCs active in the BCM?

    Yes

    - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

    No

    - Replace and program the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0415-00-IMPLAUSIBLE DATA RECEIVED FROM ABS

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Ignition on and the vehicle in reverse.

SET CONDITION

- Inaccurate or missing data from the Antilock Brake Module (ABS).

DEFAULT ACTION

- Park Assist is disabled.
- The Electronic Vehicle Information Center (EVIC) will display PARKING ASSISTANCE DISABLED

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH ANTILOCK BRAKE MODULE (ABS)
DTCS STORED OR ACTIVE IN THE ANTILOCK BRAKE MODULE (ABS)
ACTIVE COMMUNICATION DTCS IN THE BCM
INACCURATE OR SIGNAL NOT AVAILABLE (SNA) WHEEL SPEED SENSOR (WSS) MESSAGES RECEIVED FROM THE ABS MODULE
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read PAM DTCs and record on the repair order.
    2. With the scan tool, erase DTCs.
    3. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    4. With the scan tool, read PAM DTCs.

    Did the DTC return?

    Yes

    - Go To 2

    No

    - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension and repair as necessary. If no problems are found, test complete.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY ABS IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, select ECU View.

2. Verify that the ABS is active on the bus.

   Is the ABS active on the bus?

   Yes

   - Go To 3

   No

   - Refer to **NO RESPONSE FROM ABS (ANTI-LOCK BRAKE SYSTEM) MODULE** and perform the No Response from ABS diagnostic procedure.
   - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **DTCS STORED OR ACTIVE IN THE ANTILOCK BRAKE MODULE (ABS)**
   1. With the scan tool, read ABS DTCs.

      Are any DTCs active or stored in the ABS?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

      No

      - Go To 4
4. **ACTIVE COMMUNICATION DTCS IN THE BCM**
   1. With the scan tool, select ECU View and select BCM.
   2. With the scan tool, read active DTCs.

      Are any Communication DTCs active in the BCM?

      Yes

      - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

      No

      - With the scan tool, communicate with the ABS Module and check for any inaccurate or Signal Not Available (SNA) wheel Speed Sensor (WSS) data sensor values. Repair as necessary.
      - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0422-00-IMPLAUSIBLE DATA RECEIVED FROM BODY CONTROL MODULE

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- With the ignition on and the vehicle in reverse.

SET CONDITION

- Inaccurate or missing data received from the Body Control Module (BCM).

DEFAULT ACTION

- Park Assist is disabled.
- The Electronic Vehicle Information Center (EVIC) will display PARKING ASSISTANCE DISABLED

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH THE BODY CONTROL MODULE (BCM)
DTCS STORED OR ACTIVE IN THE BCM
INACCURATE OR SIGNAL NOT AVAILABLE (SNA) MESSAGES RECEIVED FROM THE BCM
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read PAM DTCs and record on the repair order.
    2. With the scan tool, erase DTCs.
    3. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    4. With the scan tool, read PAM DTCs.

       Did the DTC return?

       Yes

       - Go To 2

       No

       - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension and repair as necessary. If no problems are found, test complete.
       - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY BCM IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, select ECU View.
    2. Verify that the BCM is active on the bus.

       Is the BCM active on the bus?

       Yes

- Go To 3

No

- Refer to **NO RESPONSE FROM BCM (BODY CONTROL MODULE)** and perform the No Response from BCM diagnostic procedure.
- Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

3. **DTCS STORED OR ACTIVE IN THE BCM**
    1. With the scan tool, read BCM DTCs and record on the repair order.

    Are any DTCs active or stored in the BCM?

    Yes

    - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

    No

    - Replace and program the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

U0423-00-IMPLAUSIBLE DATA RECEIVED FROM CLUSTER/CCN

For a complete wiring diagram, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

WHEN MONITORED

This diagnostic runs continuously when the following conditions are met:

- Park Assist Module supply voltage between 9-16 volts.
- Ignition in Run/Start.

SET CONDITION

- Incorrect ignition status received from the Cluster.

DEFAULT ACTION

- Park Assist is disabled.
- The Electronic Vehicle Information Center (EVIC) will display PARKING ASSISTANCE DISABLED

POSSIBLE CAUSES

Possible Causes
NO COMMUNICATION WITH CLUSTER
DTCS STORED OR ACTIVE IN THE CLUSTER
ACTIVE COMMUNICATION DTCS IN THE BODY CONTROL MODULE (BCM)
PARK ASSIST MODULE

DIAGNOSTIC TEST

1. **CHECK FOR AN ACTIVE DTC**
    1. With the scan tool, read PAM DTCs and record on the repair order.
    2. With the scan tool, erase DTCs.
    3. Using the recorded Environmental Data, along with the When Monitored and Set Conditions above, operate the vehicle in the conditions that set the DTC.
    4. With the scan tool, read PAM DTCs.

    Did the DTC return?

    Yes

    - Go To 2

    No

    - The condition or conditions that originally set this DTC are not present at this time. Using the wiring diagrams as a guide, check all related splices and connectors for signs of water intrusion, corrosion, pushed out or bent terminals, and correct pin tension and repair as necessary. If no problems are found, test complete.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
2. **VERIFY CLUSTER IS ACTIVE ON THE CAN BUS**
    1. With the scan tool, select ECU View.
    2. Verify that the Cluster is active on the bus.

    Is the Cluster active on the bus?

    Yes

    - Go To 3

    No

    - Refer to **NO RESPONSE FROM IPC (INSTRUMENT PANEL CLUSTER)** and perform the No Response from Cluster/CCN diagnostic procedure.
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .
3. **DTCS STORED OR ACTIVE IN THE CLUSTER**
    1. Check for DTCs in the Cluster.

    Are any DTCs active or stored in the Cluster?

    Yes

    - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

    No

- Go To 4

4. **ACTIVE COMMUNICATION DTCS IN THE BCM**
    1. With the scan tool, select ECU View and select BCM.
    2. With the scan tool, read active DTCs.

    Are any Communication DTCs active in the BCM?

    Yes

    - Refer to **DIAGNOSIS AND TESTING** and perform the appropriate diagnostic procedure.

    No

    - Replace and program the Park Assist Module in accordance with the Service Information. Refer to **MODULE, PARK ASSIST, REMOVAL** .
    - Perform the BODY VERIFICATION TEST. Refer to **STANDARD PROCEDURE** .

.

Article GUID: A00735892

2015-16 ELECTRICAL

Power Distribution - Challenger

DESCRIPTION

DESCRIPTION

The power distribution system for this vehicle consists of the following components:

- Front Power Distribution Center (PDC) - located in the engine compartment
- Rear PDC - located in trunk
- Power Outlets - One outlet is located on the right side wall of the center console and the second outlet is located internal to the center bin storage compartment.
- Two Universal Serial Bus (USB) charging ports are located on the back of the center console.

For complete circuit schematics, **refer to appropriate SYSTEM WIRING DIAGRAMS article** .

The power distribution system also incorporates various types of circuit control and protection features, including:

- Automatic resetting circuit breakers
- Blade-type fuses
- Cartridge fuses
- Relays
- Mini fuses

CENTER, POWER DISTRIBUTION (PDC)

DESCRIPTION

DESCRIPTION

The majority of electrical system fuses and relays are housed in the two Power Distribution Centers (PDC). Both of the PDC assemblies are replaced only as part of the body wiring harness.

For fuse description and layout, refer to **FUSE - RELAY LOCATIONS AND TYPES, SPECIFICATIONS** .

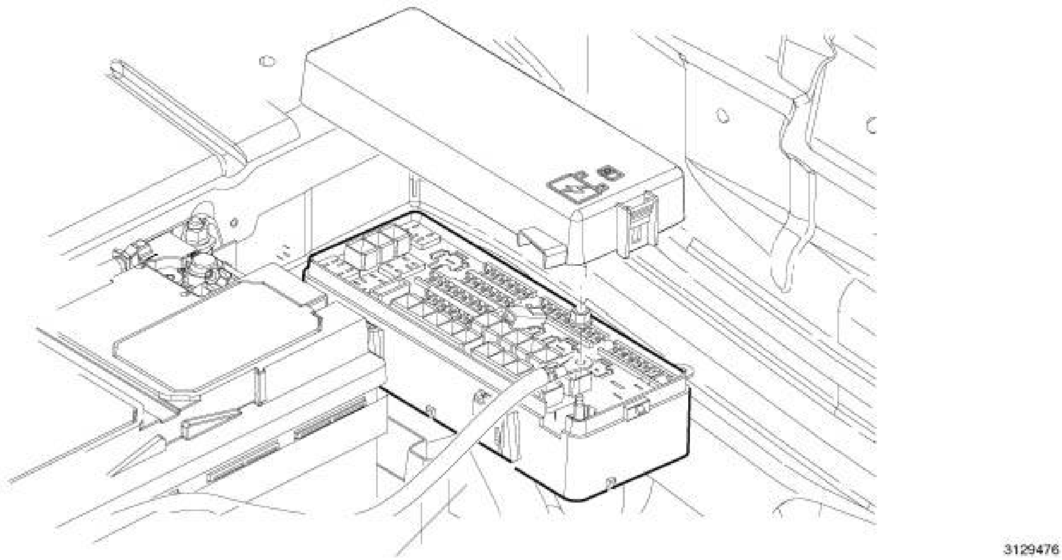

Fig. 1: Identifying Rear PDC
Courtesy of CHRYSLER GROUP, LLC

Rear PDC located in the truck next to the battery.

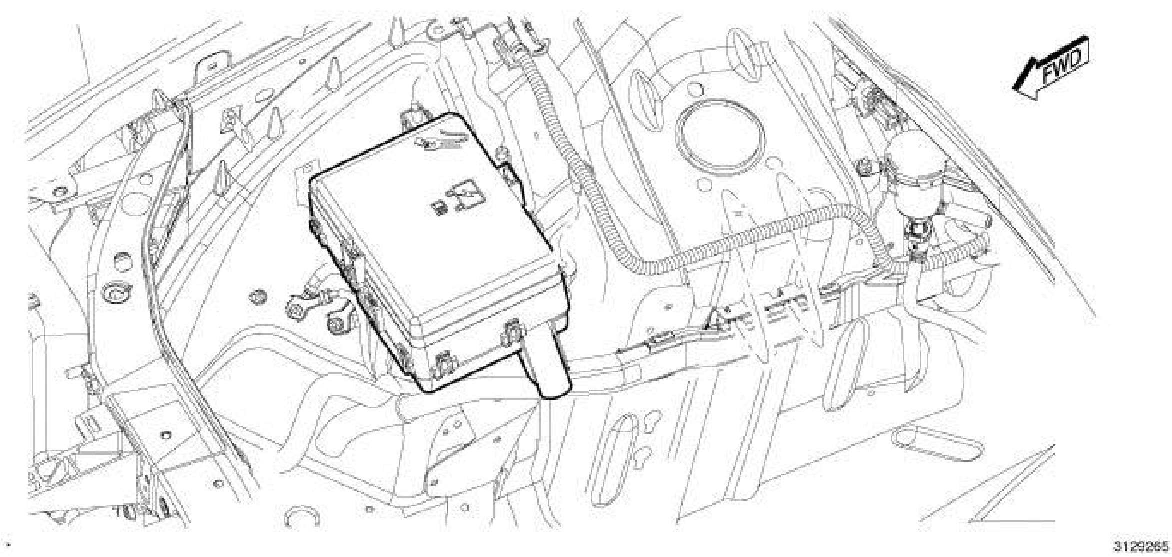

Fig. 2: Identifying Front PDC
Courtesy of CHRYSLER GROUP, LLC

Front PDC located in the engine compartment on the passenger side fender.

OUTLET, POWER, 12 V

REMOVAL

REMOVAL

1. Disconnect and isolate the battery negative cable.

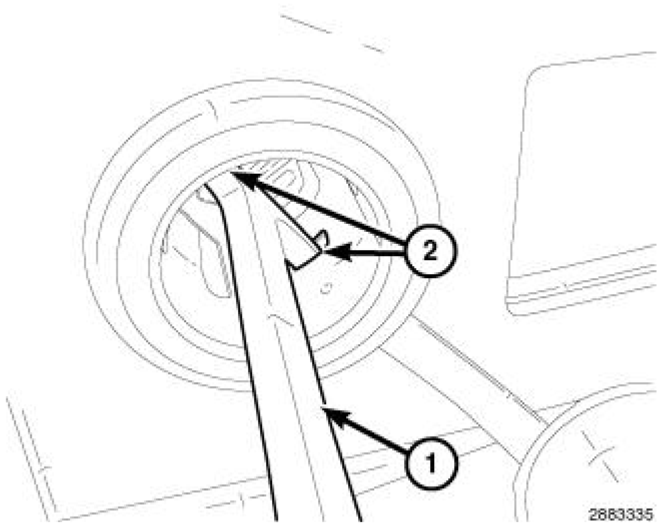

Fig. 3: Inserting Power Outlet Remover Special Tool
Courtesy of CHRYSLER GROUP, LLC

2. Look inside and note position of the retaining bosses (2).
3. Insert Remover, Power Outlet (special tool #10246, Remover, Power Outlet) (1) into the retaining bosses (2) of the power outlet.
4. Pull out the base through the mounting ring by gently rocking the tool.

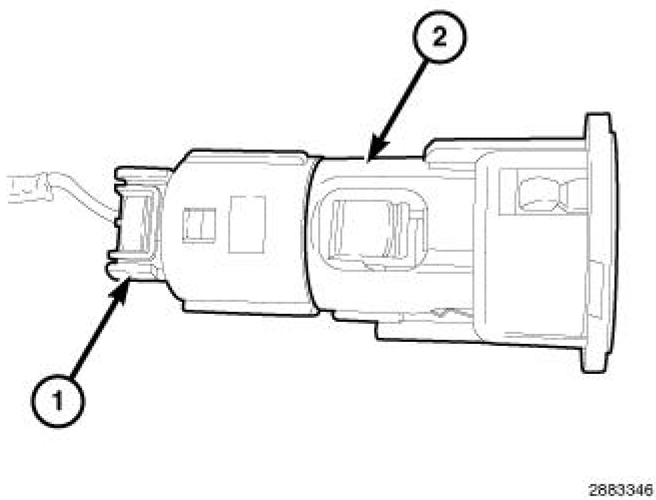

Fig. 4: Power Outlet & Connector
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the harness connector (1) from the power outlet (2).
6. Set the base aside and remove the base mount ring.

INSTALLATION

INSTALLATION

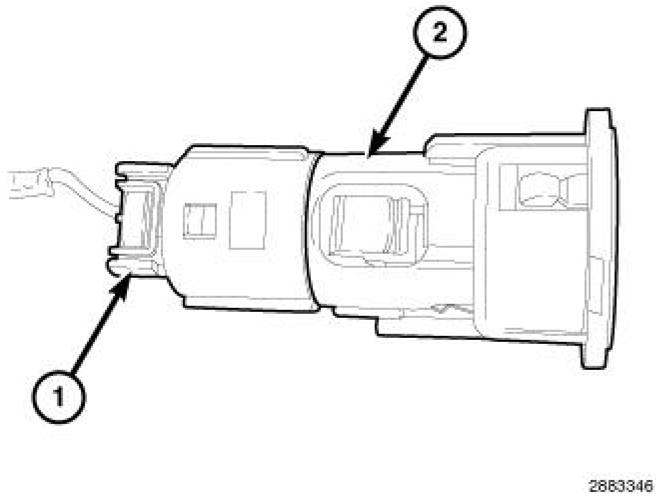

Fig. 5: Power Outlet & Connector
Courtesy of CHRYSLER GROUP, LLC

1. Connect the harness connector (1) to the power outlet receptacle (2).
2. Install the power outlet mount ring into the panel.
3. Align the splines on the outside of the power outlet receptacle base connector receptacle with the grooves on the inside of the mount ring.
4. Press firmly on the power outlet receptacle base until the retaining bosses of the mount ring are fully engaged in their receptacles.
5. Connect the battery negative cable.

Article GUID: A00735977

2015-16 ACCESSORIES AND EQUIPMENT

Power Locks - Service Information - Challenger

DESCRIPTION

DESCRIPTION

A power operated door and decklid lock system is standard factory-installed equipment on this vehicle. The power lock system allows all of the doors and the trunk to be locked or unlocked electrically. Locking or unlocking the vehicle using the power lock system can be accomplished by up to three different methods:

- **Power Lock System** - Operating a power lock system switch on either front door inside trim panel will lock or unlock the latches of all doors. Operating a trunk release switch on the instrument panel will unlatch the deck lid.
- **Remote Keyless Entry System** - Depressing the **Lock** or **Unlock** button of the standard equipment Remote Keyless Entry (RKE) system transmitter (also known as the FOB with Integrated Key/FOBIK) can also be used to lock or unlock the latches of the doors. Depressing the **Trunk Release** button of the RKE transmitter will unlatch the deck lid. The specific locks operated and the number of FOBIK button presses required varies depending upon the Customer Programmable settings chosen by the vehicle operator.
- **Passive Entry System** - Contacting the capacitive **Unlock** switch on the inside of either exterior front door Smart handle pull or depressing the tactile **Lock** button of either front door Smart handle while a valid FOBIK is identified in that same zone can be used to lock or unlock the doors. Also depressing the tactile **Unlock** button on the lens of the deck lid Center High Mounted Stop Lamp (CHMSL) while a valid FOBIK is identified in that same zone can be used to unlatch the deck lid. The specific locks operated varies depending upon the Customer Programmable settings chosen by the vehicle operator.

Additional details of each of these subsystems and their components can be found in the subheadings and paragraphs that follow.

PASSIVE ENTRY SYSTEM

An optional Passive Entry (PE) system is available factory-installed equipment for this vehicle. The PE system allows the vehicle to be unlocked without the use of a key, as long as an authorized FOB with Integrated Key (FOBIK) is in the possession of, or in close proximity to the individual and the aperture of the vehicle that is to be unlocked. All other features and Customer Programmable feature settings of the power lock system and the Remote Keyless Entry (RKE) system function the same as they would on vehicles without the PE system option.

The PE system includes the following major components, which are described in further detail elsewhere in this service information:

- **Deck Lid Latch Release Switch** - A tactile deck lid latch release switch is located on the right side of the lens of the Center High Mounted Stop Lamp (CHMSL) in the center of the vertical rear deck lid surface. Only the resilient black switch push button membrane is visible on the outside of the CHMSL lens.
- **Door Handle Switches** - Each PE door outside handle (also known as a Smart handle) is equipped with three switches and an Integrated Circuit (IC). A tactile Lock switch is located on the outer horizontal

surface of each door handle pull, a capacitive Unlock switch membrane is located on the inner vertical surface of the handle pull, while a Hall effect switch and an IC are concealed within the handle pull unit.

- **Low Frequency Antennas** - The PE system includes five Low Frequency (LF) antennas, one mounted on the underside of the center floor console, one on inside each lower quarter trim panel, one at the forward edge of the spare tire well within the trunk compartment and one on the rear fascia bracket above the license plate tub and to the right of the license plate lamp concealed behind the rear fascia at the rear of the vehicle.
- **Radio Frequency Hub** - The Radio Frequency Hub (also known as the RF Hub) is the Passive Entry Keyless Go (PEKG) system control module and RF receiver located on the shelf support behind the rear seat and is concealed beneath the package tray interior trim. Refer to **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION** .

Hard wired circuitry connects many of the PE system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the PE system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

POWER LOCK SYSTEM

The power lock system includes the following major components, which are described in further detail elsewhere in this service information:

- **Body Control Module** - The Body Control Module (BCM) is located beneath the instrument panel on the passenger side of the vehicle. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Deck Lid Release Switch** - A switch on the instrument panel to the left of the steering column will unlatch the deck lid only when the automatic transmission gear selector is in the PARK position, or when the manual transmission vehicle speed is below 8 kilometers-per-hour (5 miles-per-hour).
- **Door Modules** - The Driver Door Module (DDM) and Passenger Door Module (PDM) are located on their respective driver and passenger door hardware module carriers and are concealed behind the door inside trim panels. Refer to **MODULE, DOOR, DESCRIPTION** .
- **Electronic Vehicle Information Center** - The Electronic Vehicle Information Center (EVIC) includes the EVIC switches and the U-Connect Touch™ screen module in the Integrated Center Stack (ICS) located in the center stack area of the instrument panel.
- **Power Lock Motors** - A reversible electric power lock motor is integral to the latch of door and the deck lid.
- **Power Lock Switches** - A power lock switch is integral to the switch module located on the forward end of the arm rest of each door inside trim panel.

These components and their controls are combined to provide the following power lock system central locking and unlocking features:

- **Automatic Door Locking** - Automatic door locking (also known as rolling door locks) automatically locks any unlocked door when the vehicle speed exceeds about 25.7 kilometers per hour (15 miles per

hour). This is a Customer Programmable feature.

- **Automatic Door Unlocking** - Automatic door unlocking (also known as automatic unlock doors on exit) automatically unlocks the doors after they were automatically locked when the vehicle speed exceeded about 25.7 kilometers per hour (15 miles per hour), the vehicle speed has returned to zero, the transmission shift lever is in the **Neutral** or **Park** positions and the driver side front door is opened. This is a Customer Programmable feature.
- **Customer Programmable Features** - The vehicle operator interfaces with the BCM, which is the power lock system controller, using the EVIC. EVIC switches allow the vehicle operator to set or change the power lock system Customer Programmable Features through the U-Connect Touch™ screen module EVIC display.
- **Door Lock Inhibit** - Prevents locking the doors using a power door lock switch or the **Lock** button of the Remote Keyless Entry (RKE) system transmitter (also known as the FOB with Integrated Key/FOBIK) if the key is in the ignition and the driver side front door is open.
- **Enhanced Accident Response System** - In the event of a vehicle impact that causes airbag deployment but leaves vehicle electrical power intact, the Enhanced Accident Response System (EARS) automatically turns OFF the supply of fuel to the engine, turns ON the interior courtesy lamps, turns ON the hazard warning flashers and unlocks the doors after the vehicle speed has returned to zero. This helps emergency responders in their efforts to render the appropriate assistance. The courtesy lamps and hazard flashers remain ON as long as the battery has power or until the ignition is cycled to OFF.
- **Illuminated Entry** - Automatic illumination of the interior courtesy lamps when the vehicle is unlocked using the power lock system.

Hard wired circuitry connects the power lock system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the power lock system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

REMOTE KEYLESS ENTRY SYSTEM

The Remote Keyless Entry (RKE) system is standard factory-installed equipment on this vehicle. The RKE system includes the following major components, which are described in further detail elsewhere in this service information:

- **Electronic Vehicle Information Center** - The Electronic Vehicle Information Center (EVIC) is a digital display integral to the Integrated Center Stack (ICS). The EVIC includes the EVIC switches and the U-Connect Touch™ screen module located in the center stack area of the instrument panel. Refer to CENTER, ELECTRONIC VEHICLE INFORMATION, DESCRIPTION .
- **Radio Frequency Hub Module (RFHM)** - The RFHM is the RKE system control module and RF receiver located on the shelf support behind the rear seat and is concealed beneath the package tray interior trim. Refer to MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION .
- **Remote Keyless Entry System Transmitter** - The FOBIK is the battery powered, wireless and portable Radio Frequency (RF) user controller for all of the features of the RKE system.

These components and their controls are combined to provide the following RKE system features:

- **Customer Programmable Features** - The vehicle operator interfaces with the RFHM, which is the RKE system controller, using the EVIC. EVIC switches allow the vehicle operator to set or change the RKE system Customer Programmable Features through the U-Connect Touch™ screen module EVIC display.
- **Flash Lights With Lock And Unlock** - This is a Customer Programmable feature of the RKE system. The first option has the park lamps flash as an optical verification that the RKE system has received a valid **Lock** or **Unlock** request from the FOBIK. The second option disables the optical verification feature.
- **Panic Feature** - In certain markets the FOBIK may also be equipped with a red **Panic** button. Depressing the **Panic** button of the FOBIK while within transmitter range will sound the vehicle signal horn and flash the exterior lighting of the vehicle for about three minutes or until the **Panic** button is depressed a second time, whichever occurs first. Attaining a vehicle speed of about 25.7 kilometers per hour (15 miles per hour) will also cancel the panic event.
- **Programming Additional Transmitters** - Two RKE transmitters are shipped with the vehicle from the factory, but the RKE system can retain the vehicle access codes of up to a total of eight transmitters. The transmitter codes are retained in the RKE system controller memory, even if the battery is disconnected. If a FOBIK is ineffective, lost or an additional FOBIK is desired, new transmitter vehicle access codes can be programmed into the system using a diagnostic scan tool.
- **Remote Deck Lid Unlatching** - Depressing the **Trunk Release** button of the FOBIK twice within 5 seconds while within transmitter range will unlatch the deck lid of the vehicle.
- **Remote Engine Start** - On vehicles equipped with the optional Remote Starting System, depressing the **Remote Start** button of the FOBIK twice while within transmitter range will start the engine of the vehicle.
- **Remote Locking** - Depressing the **Lock** button of the FOBIK while within transmitter range will lock all of the vehicle doors.
- **Remote Unlocking** - Depressing the **Unlock** button of the FOBIK while within transmitter range will unlock the vehicle and activate the Illuminated Entry System. The specific locks operated and the number of FOBIK button presses required varies depending upon the Customer Programmable settings chosen by the vehicle operator.
- **Remote Unlock Sequence** - This is a Customer Programmable feature of the RKE system. There are two options available. The first option allows only the driver side front door to unlock when the FOBIK **Unlock** button is depressed one time, and the remaining doors unlock when the button is depressed a second time within 5 seconds of the first press. The second option allows all doors to unlock upon a single press of the FOBIK **Unlock** button.
- **Sound Horn On Lock** - This is a Customer Programmable feature of the RKE system. There are two options available. The first option has the signal horn of the vehicle sound a short chirp as an audible verification that the RKE system received a valid **Lock** request from the FOBIK. The second option disables the audible verification feature.
- **Vehicle Theft Security System Arming** - If the vehicle is equipped with the optional Vehicle Theft Security System (VTSS), depressing the **Lock** button of the FOBIK while within transmitter range will arm the VTSS in addition to activating the remote locking feature.
- **Vehicle Theft Security System Disarming** - If the vehicle is equipped with the optional Vehicle Theft Security System (VTSS), depressing the **Unlock** button of the FOBIK while within transmitter range will disarm the VTSS in addition to activating the remote unlocking feature.

Hard wired circuitry connects many of the RKE system components to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the RKE system components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

POWER LOCK SYSTEM

The power lock system uses non-switched battery current received through a fused B(+) fuse in the Body Control Module (BCM) so that the system remains operational regardless of the ignition switch position. The BCM is the primary power lock system controller. The power lock switches are hard wired to their respective Driver Door Module (DDM) or Passenger Door Module (PDM). The BCM, the DDM and the PDM all communicate with each other and with other electronic modules in the vehicle over the Controller Area Network (CAN) data bus.

When a door module receives an input from a power lock switch, it sends the appropriate electronic **Lock Request** or **Unlock Request** message to the BCM over the CAN data bus. The BCM responds to these request messages by providing the appropriate outputs to each of the power lock motors to lock or unlock each of the door latches. The BCM also monitors a hard wired input from the deck lid release switch and electronic message inputs indicating automatic transmission gear selector position and vehicle speed. The BCM uses all of these inputs and internal programming to determine whether or not to provide the output necessary to operate the deck lid latch release motor.

The BCM also stores the power lock system Customer Programmable feature settings received over the CAN data bus from the Electronic Vehicle Information Center (EVIC). The BCM uses these settings and internal programming along with hard wired and electronic message inputs to determine the proper outputs needed to produce each of the appropriate power lock system features.

The power lock system circuits are continually monitored and controlled by the microcontroller and software contained within the BCM, the DDM and the PDM. When one of these modules monitors a problem in any of the power lock system circuits or components, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit. The hard wired circuits between components related to the power lock system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the power lock system or the electronic controls or communication between other modules and devices that provide features of the power lock system. The most reliable, efficient, and accurate means to diagnose the power lock system or the electronic controls and communication related to power lock system operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOTE KEYLESS ENTRY SYSTEM

The Remote Keyless Entry (RKE) system uses non-switched battery current received through a fused B(+) fuse in the Body Control Module (BCM) so that the system remains operational regardless of the ignition switch position. The Radio Frequency Hub Module (RFHM) is the primary RKE system controller as well as the Radio Frequency (RF) RKE receiver. The RFHM validates the vehicle access code of each RKE transmitter (also known as FOB with Integrated Key/FOBIK) from which it receives RF signal inputs. It ignores requests from any transmitter for which it has no stored vehicle access code.

The RFHM communicates and shares resources with the BCM and many other electronic modules in the vehicle over the CAN data bus. The RFHM also stores the RKE system Customer Programmable feature settings received over the CAN data bus from the Electronic Vehicle Information Center (EVIC). When the RFHM receives an input from a valid transmitter source, it uses these settings and internal programming to send the appropriate electronic request messages to the BCM and other electronic modules over the CAN data bus to invoke the proper RKE system features and responses.

The RKE system circuits and transmitter inputs are continually monitored by the microcontroller and software contained within the RFHM. When the RFHM monitors a problem in any of the RKE system circuits or transmitters, it stores a Diagnostic Trouble Code (DTC) in its memory circuit. The hard wired circuits between components related to the RKE system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the RKE system or the electronic controls or communication between other modules and devices that provide features of the RKE system. The most reliable, efficient, and accurate means to diagnose the RKE system or the electronic controls and communication related to RKE system operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

PASSIVE ENTRY SYSTEM

In the Passive Entry (PE) system the doors are unlocked passively; however, they must still be locked actively after exiting the vehicle using the tactile **Lock** button on either front door handle. When the system senses a hand approaching the capacitive switch in the door handle pull or detects a button press of the deck lid release switch, it sends out challenge messages through the Low Frequency (LF) antennas to authenticate the presence and location of a valid FOB with Integrated Key (FOBIK).

The FOBIK responds by sending a Ultra High Frequency (UHF) message back to the receiver within the Radio Frequency Hub Module (RFHM). If the RFHM determines the FOBIK is valid and that it is located outside the vehicle in the same zone or vicinity as the door handle or deck lid switch being activated, it sends an electronic **Unlock Request** message over the Controller Area Network (CAN) data bus to the Body Control Module (BCM) to automatically unlock and allow entry to that aperture.

The PE system circuits and FOBIK inputs are continually monitored by the microcontroller and software contained within the RFHM. When the RFHM monitors a problem in any of the PE system circuits or FOBIK inputs, it stores a Diagnostic Trouble Code (DTC) in its memory circuit. The hard wired circuits between components related to the PE system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and

connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the PE system or the electronic controls or communication between other modules and devices that provide features of the PE system. The most reliable, efficient, and accurate means to diagnose the PE system or the electronic controls and communication related to PE system operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER LOCKS AND REMOTE KEYLESS ENTRY SYSTEM

POWER LOCK SYSTEM

The following are tests that may help to diagnose the hard wired components and circuits of the power lock system. However, these tests may not prove conclusive in the diagnosis of this system. In order to obtain conclusive testing of the power lock system, the Controller Area Network (CAN) data bus and all of the electronic modules that provide inputs to, or receive outputs from the power lock system components must also be tested.

The most reliable, efficient, and accurate means to diagnose the power lock system requires the use of a diagnostic scan tool and the appropriate diagnostic information. The diagnostic scan tool can provide confirmation that the CAN data bus is functional, that all of the proper electronic modules are sending and receiving the proper electronic messages over the CAN data bus, and that the power lock motors are receiving the proper hard wired outputs from the Body Control Module (BCM) for them to perform their power lock system functions.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

PRELIMINARY DIAGNOSIS

As a preliminary diagnosis for the power lock system, note the system operation while actuating both the Lock and Unlock functions with the power lock switches and with the Remote Keyless Entry (RKE) transmitter (also known as the FOB with Integrated Key/FOBIK). Then, proceed as follows:

1. If the entire power lock system fails to function with either the power lock switches or the FOBIK, check the fused B(+) fuse for the power lock system.
2. If the power lock system functions with both power lock switches, but not with the FOBIK, proceed to diagnosis of the RKE system.
3. If the power lock system functions with the FOBIK, but not with one or both power lock switches, proceed to diagnosis of the door lock switches.
4. If only one power lock motor fails to operate with both power lock switches and the RKE transmitter, proceed to diagnosis of the power lock motor.

REMOTE KEYLESS ENTRY SYSTEM

Following are tests that may help to diagnose the Remote Keyless Entry (RKE) system. However, these tests

may not prove conclusive in the diagnosis of this system. In order to obtain conclusive testing of the RKE system, the Controller Area Network (CAN) data bus network and all of the electronic modules that provide inputs to, or receive outputs from the RKE system components must also be tested.

The most reliable, efficient, and accurate means to diagnose the RKE system requires the use of a diagnostic scan tool and the appropriate diagnostic information. The diagnostic scan tool can provide confirmation that the CAN data bus is functional, that all of the proper electronic modules are sending and receiving the proper electronic messages over the CAN data bus, and that the Radio Frequency Hub (also known as the RF Hub) is being sent the proper Radio Frequency (RF) signals by the RKE transmitters (also known as FOB with Integrated Key/FOBIK) to perform its RKE system functions.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

PRELIMINARY DIAGNOSIS

As a preliminary diagnosis for the RKE system, first confirm that the power lock system operates satisfactorily. If the power lock system fails to operate correctly, repair that problem before attempting to diagnose the RKE system. If the problem being diagnosed involves only one or more Customer Programmable features, check using the Electronic Vehicle Information Center (EVIC) or with a diagnostic scan tool to be certain that these programmable features are enabled. If the features are enabled and still fail to operate, the RF Hub and the CAN data bus must be tested. Next, note the RKE system operation while you perform both the Lock and Unlock functions with the FOBIK. Then, proceed as follows:

1. If the power lock system functions with both power lock switches, but not with the FOBIK, proceed to diagnosis of the FOBIK.
2. If the FOBIK checks okay, proceed to diagnosis of the RF Hub or the CAN data bus. The use of a diagnostic scan tool and the appropriate diagnostic information are required.

PASSIVE ENTRY SYSTEM

As a preliminary diagnosis for the Passive Entry (PE) system, first check using the Electronic Vehicle Information Center (EVIC). U-Connect™ menu options or with a diagnostic scan tool to be certain that this Customer Programmable feature is enabled. Next, confirm that the power lock system and the RKE system operate satisfactorily. If the power lock system or the RKE system fails to operate correctly, repair that problem before attempting to diagnose the PE system.

The most reliable, efficient, and accurate means to diagnose the PE system requires the use of a diagnostic scan tool and the appropriate diagnostic information. The diagnostic scan tool can provide confirmation that the CAN data bus is functional, that all of the proper electronic modules are sending and receiving the proper electronic messages over the CAN data bus, and that the Radio Frequency Hub Module (RFHM) is sending the proper Radio Frequency (RF) signals to and receiving the proper RF signals from the RKE transmitters (also known as FOB with Integrated Key/FOBIK) to perform its PE system functions.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

ANTENNA, PASSIVE ENTRY

DESCRIPTION

DESCRIPTION

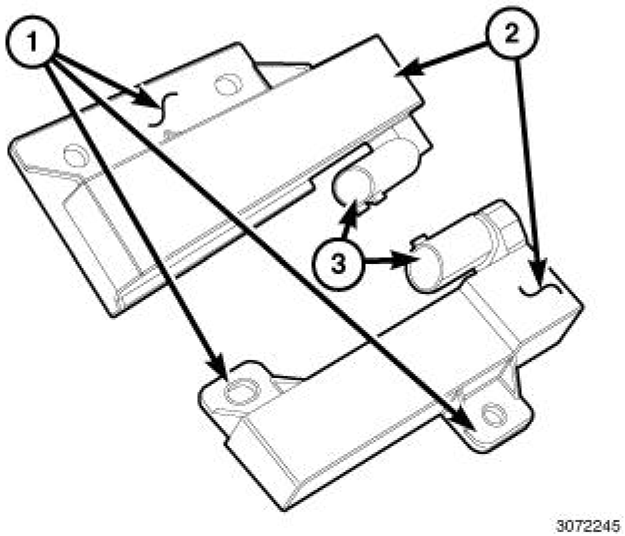

Fig. 1: Integral Connector Receptacle, Ferrite Antenna Units & Flanges
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the Passive Entry (PE) and Keyless Go (KG) systems have several Low Frequency (LF), ferrite antenna units (2) located within the vehicle. Each ferrite PE antenna unit is contained within a molded black plastic housing with an integral connector receptacle (3) molded into one end. The connector receptacle contains terminal pins that connect the antenna to the vehicle electrical system through a twisted pair of conductors and a connector that are part of the adjacent wire harness.

Each antenna housing also includes two integral mounting flange or flanges (1) which can be used to mount the unit with screws. However, in some applications the antenna mounting flanges are snapped into a spring steel adapter or retainer, which allows the antenna unit to be securely clipped in place over a body flange rather than being secured with screws. This vehicle platform uses five PE antenna units. One is secured to the underside of the center floor console, one is secured to each rear quarter concealed behind the inside quarter trim panels, one is secured to the forward flange of the spare tire well within the trunk area and one is concealed behind the rear fascia to the right of the license plate lamp.

The antennas are each connected to the Radio Frequency Hub (also known as the RF Hub) on dedicated and sequentially numbered circuits. The left rear quarter antenna is connected through the antenna 1 circuits, the right rear quarter antenna is connected through the antenna 2 circuits, the trunk antenna is connected through the antenna 3 circuits, the center floor console is connected through the antenna 4 circuits and the rear fascia bracket antenna is connected through the antenna 5 circuits.

LOW FREQUENCY ANTENNA AND CIRCUIT NUMBERING	
Location	**Antenna And Circuit Number**
Left Rear Quarter Panel	1
Right Rear Quarter Panel	2
Trunk	3

LOW FREQUENCY ANTENNA AND CIRCUIT NUMBERING	
Location	**Antenna And Circuit Number**
Center Floor Console	4
Rear Fascia Bracket	5

An LF antenna unit cannot be adjusted or repaired. If ineffective or damaged, it must be replaced with a new unit. For applications where it is used, the antenna unit adapter or retainer may be serviced only as a unit with the LF antenna.

OPERATION

OPERATION

The Passive Entry (PE) antenna units allow the transmitter within the Radio Frequency Hub (also known as the RF Hub) to communicate via Low Frequency (LF) radio transmission with a FOB with Integrated Key (FOBIK) that is located inside the vehicle or, at most, about 2 meters (6.5 feet) horizontally in all directions around the outside of the vehicle. The RF Hub uses communication through the antenna units to wake up and challenge a FOBIK that is within range in order to authenticate whether that FOBIK is valid (programmed) to the vehicle. The RF Hub communication with the FOBIK is on 20 kilohertz using Frequency-Shift Keying (FSK) modulation.

Each antenna unit has two dedicated connections to the RF Hub. One connection is the LF antenna output circuit, while the other connection Is the LF antenna return circuit. These circuits to each antenna unit are a twisted pair to help reduce the potential for induced electrical interference. The RF Hub microcontroller continuously monitors all of the antenna units and will store a Diagnostic Trouble Code (DTC) for any fault that it detects.

The hard wired inputs and outputs of the antenna units may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, the most reliable, efficient, and accurate means to diagnose the antenna units requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

CENTER FLOOR CONSOLE

1. Disconnect and isolate the battery negative cable.
2. Remove the center floor console from the vehicle. Refer to **CONSOLE, FLOOR, REMOVAL** .

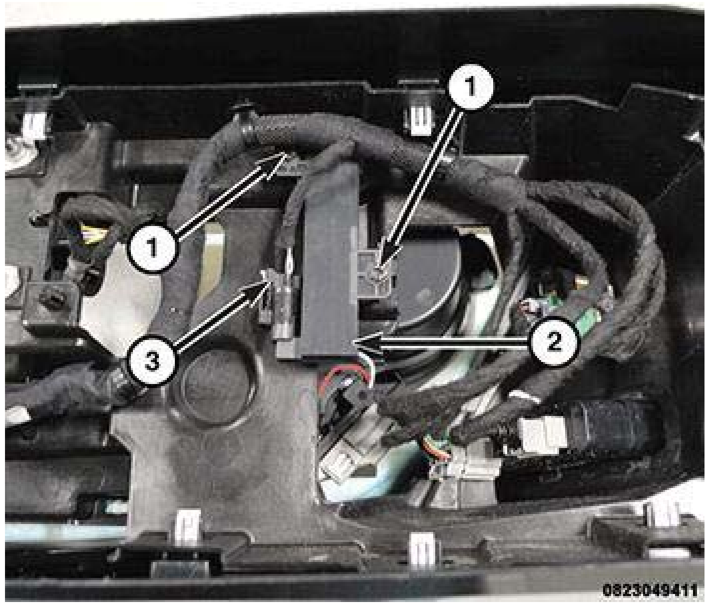

Fig. 2: Antenna, Connector Receptacle & Screws
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the wire harness connector from the connector receptacle (3) for the Low Frequency (LF) antenna (2) on the underside of the console.
4. Remove the two screws (1) that secure the antenna to the underside of the console.
5. Remove the antenna from the console.

INTERIOR REAR QUARTER

1. Disconnect and isolate the negative battery cable.
2. Remove the C-pillar trim panel. Refer to **PANEL, C-PILLAR TRIM, REMOVAL** .

Fig. 3: Quarter Trim Panel Screws
Courtesy of CHRYSLER GROUP, LLC

3. Remove the screw covers and remove the screws (1) and (2).
4. Remove the quarter trim lower panel. Refer to PANEL, QUARTER TRIM, REMOVAL .

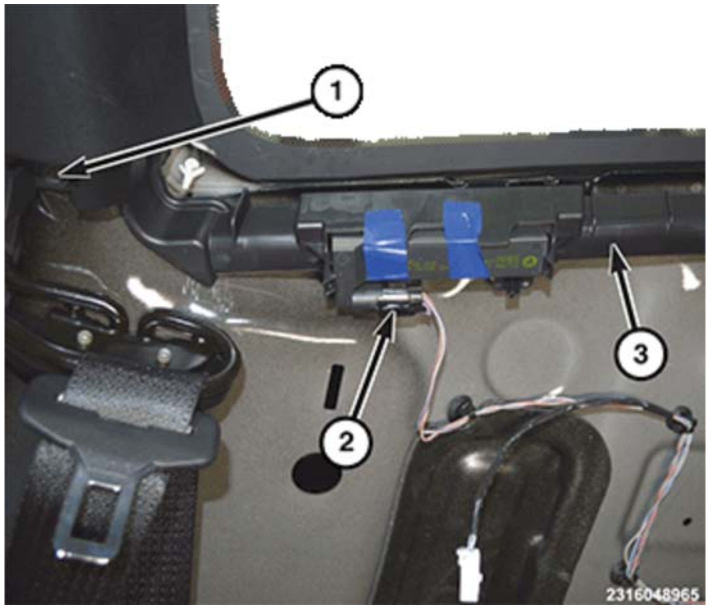

Fig. 4: Screw, Wire Harness Connector & Quarter Trim Upper Panel
Courtesy of CHRYSLER GROUP, LLC

5. Disconnect the wire harness connector (2).
6. Remove the LF antenna by sliding it off of the bracket attached to the body panel.

REAR FASCIA BRACKET

1. Disconnect and isolate the battery negative cable.
2. Remove the rear fascia from the vehicle. Refer to FASCIA, REAR, REMOVAL or FASCIA, REAR, LOWER, REMOVAL .

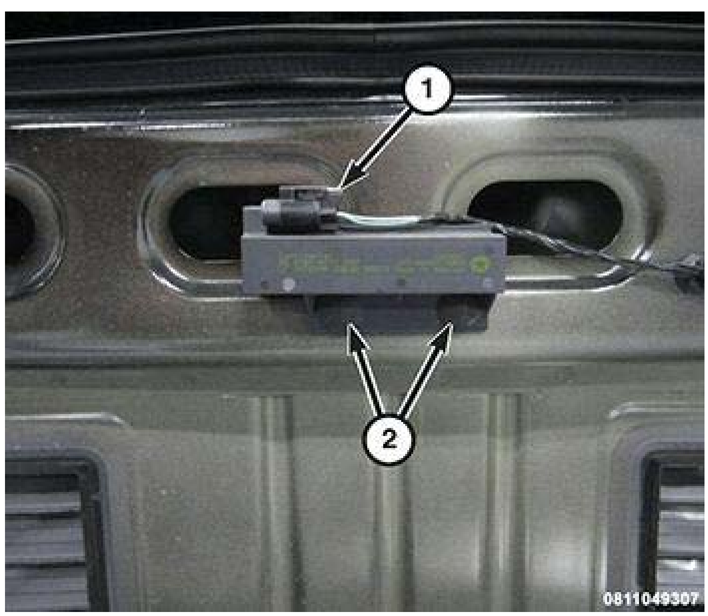

Fig. 5: Connector & Retainers

Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the wire harness connector (1) from the connector receptacle for the Low Frequency (LF) antenna.
4. Unsnap and lift the LF antenna from the retainer and remove from the vehicle.

TRUNK

1. Disconnect and isolate the battery negative cable.
2. Fold up and move the spare tire cover and trunk carpet aside far enough to access the trunk floor where it meets the forward edge of the spare tire well. Refer to CARPET, REMOVAL .

Fig. 6: Antenna & Connector
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the body wire harness connector (2) from the Low Frequency (LF) antenna (1) connector receptacle.
4. Pull the antenna and retainer unit rearward off of the flange at the front of the spare tire well.
5. Remove the antenna and retainer from the trunk as a unit.

INSTALLATION

CENTER FLOOR CONSOLE

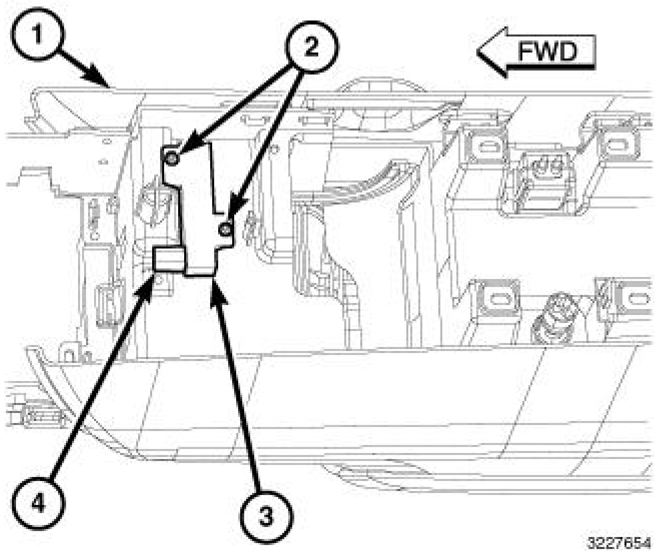

Fig. 7: Center Floor Console, Connector Receptacle & Low Frequency Antenna
Courtesy of CHRYSLER GROUP, LLC

1. Position the Low Frequency (LF) antenna (3) to the underside of the center floor console (1).
2. Install and tighten the two screws (2) that secure the antenna to the console. Tighten the screws securely.
3. Reconnect the wire harness connector to the antenna connector receptacle (4).
4. Reinstall the console into the vehicle. Refer to **CONSOLE, FLOOR, INSTALLATION** .
5. Reconnect the battery negative cable.

INTERIOR REAR QUARTER

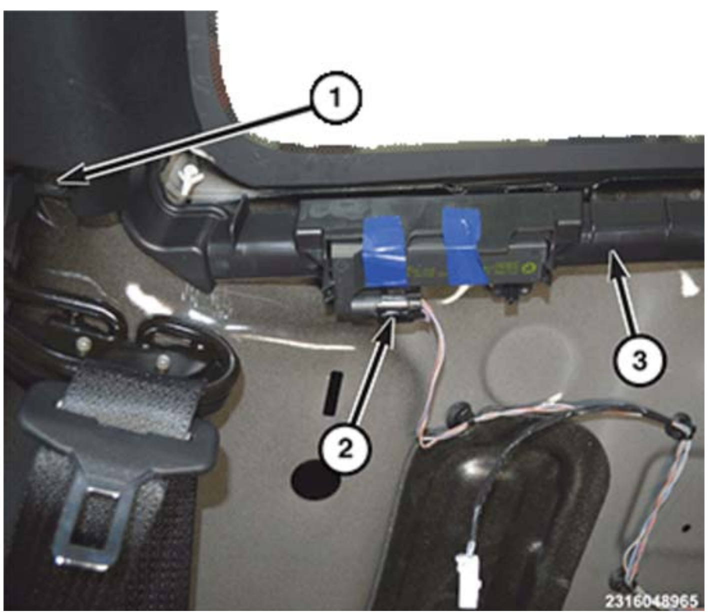

Fig. 8: Screw, Wire Harness Connector & Quarter Trim Upper Panel
Courtesy of CHRYSLER GROUP, LLC

1. Install the LF antenna to the interior rear quarter clip / bracket.
2. Connect the wire harness connector (2).

Fig. 9: Quarter Trim Panel Screws
Courtesy of CHRYSLER GROUP, LLC

3. Install the screws (1) and (2) and tighten securely, then install the screw covers.
4. Install the quarter trim lower panel. Refer to **PANEL, QUARTER TRIM, INSTALLATION** .
5. Install the C-pillar trim panel. Refer to **PANEL, C-PILLAR TRIM, INSTALLATION** .
6. Connect the negative battery cable.

REAR FASCIA BRACKET

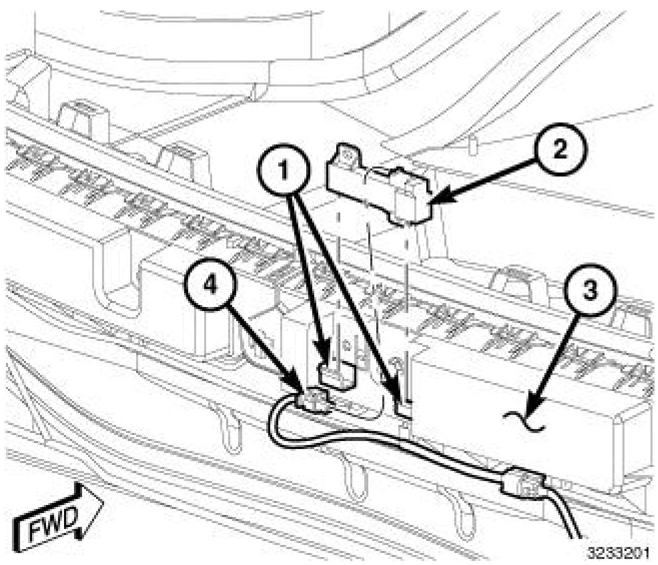

Fig. 10: Wire Harness Connector, Antenna & Rear Fascia Bracket
Courtesy of CHRYSLER GROUP, LLC

1. Position the Low Frequency (LF) antenna (2) to the pocket near the center of the rear fascia bracket (3).
2. Reconnect the wire harness connector (4) to the connector receptacle for the antenna.
3. Align the antenna with the retainers (1) integral to the rear fascia bracket, then slide it downward until it snaps into place.

4. Reinstall the rear fascia onto the vehicle. Refer to **FASCIA, REAR, INSTALLATION** or **FASCIA, REAR, LOWER, INSTALLATION** .
5. Reconnect the battery negative cable.

TRUNK

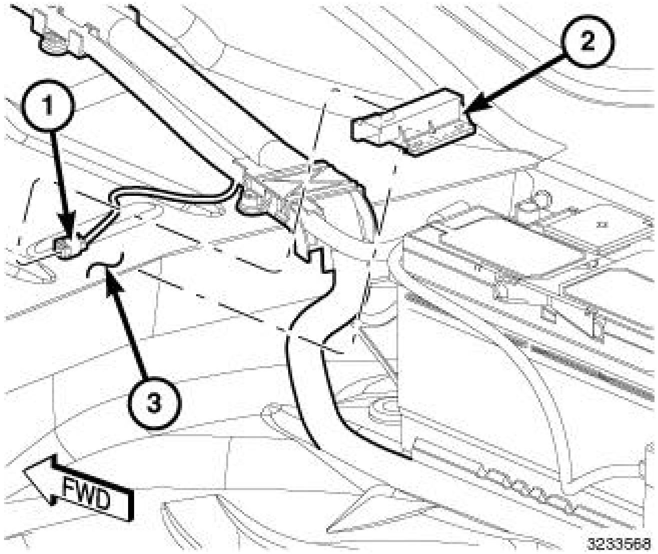

Fig. 11: Wire Harness Connector, Antenna & Trunk Floor
Courtesy of CHRYSLER GROUP, LLC

1. Position the Low Frequency (LF) antenna and receiver (2) into the trunk as a unit.
2. Align the clip on the underside of the antenna retainer with the flange where the trunk floor (3) meets the forward edge of the spare tire well.
3. Push the antenna and retainer unit forward until the clip is fully seated on the flange.
4. Reconnect the body wire harness connector (1) to the antenna connector receptacle.
5. Reinstall the spare tire cover and trunk carpet over the trunk floor and the spare tire well. Refer to **CARPET, INSTALLATION** .
6. Reconnect the battery negative cable.

MOTOR, DOOR LOCK

DESCRIPTION

DESCRIPTION

Power operated door locking and deck lid latching mechanisms are standard equipment in this vehicle. The lock mechanisms of each door and the deck lid latch are actuated by a reversible electric motor integral to each latch unit. A connector receptacle integral to each latch connects the power lock motor and the integral door or deck lid ajar micro switch to the vehicle electrical system through a dedicated take out and connector of the door or body wire harness.

The power lock motors cannot be adjusted or repaired and, if ineffective or damaged, the entire door or deck lid latch unit must be replaced.

OPERATION

OPERATION

The power lock motors are controlled by outputs received from the Body Control Module (BCM). The BCM acts upon programming, hard wired inputs from the driver or passenger door lock switches as well as electronic **lock** or **unlock** command message inputs received over the Controller Area Network (CAN) data bus from the Radio Frequency Hub Module (RFHM) based upon inputs from the FOB with Integrated Key (FOBIK) transmitters.

A positive and negative battery connection to the two lock motor terminals will cause the motor to move in one direction, locking or unlocking the latch. Reversing the current will cause the motor to move in the opposite direction.

The power lock motors and the hard wired circuits between the motors and the BCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the power lock system or the electronic controls or communication between other modules and devices that provide some features of the power lock system. The most reliable, efficient, and accurate means to diagnose the power lock motors or the electronic controls and communication related to power lock motor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER LOCK MOTOR

Remember, the Body Control Module (BCM) (also known as the Common Body Controller/CBC) circuitry controls the outputs to the power lock motors. If both the power lock motors and the circuits between the motors and the BCM test okay, the use of a diagnostic scan tool is required for further power lock system diagnosis. Refer to the appropriate diagnostic information.

Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

1. Check the power lock motor for correct operation while moving a power lock switch to both the **Lock** and **Unlock** positions.
2. Disconnect the door or body wire harness connector from the inoperative power lock motor.
3. Apply 12 volts to the lock and unlock driver circuit cavities of the power lock motor connector to check its operation in one direction.
4. Reverse the connection polarity to check the motor operation in the opposite direction.
5. If motor operation is okay in both directions, check both the lock and unlock circuits between the lock motor and the BCM and repair if required. If motor operation is not okay in both directions, replace the latch unit containing the ineffective power lock motor.

SWITCH, DECK LID RELEASE

DESCRIPTION

DECK LID

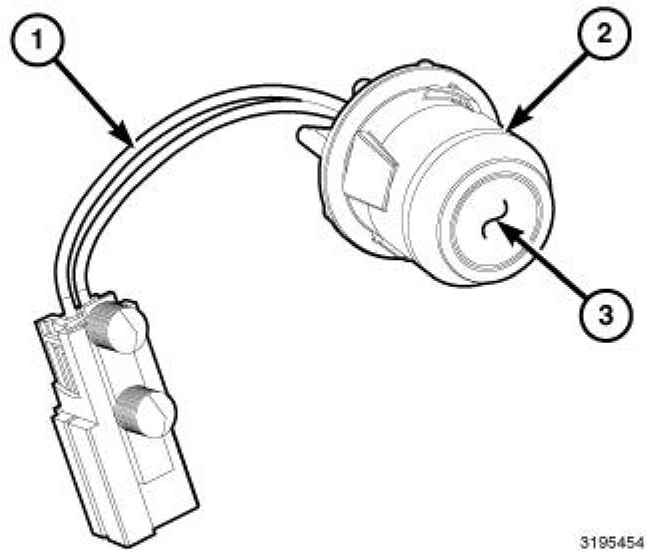

Fig. 12: Wire And Connector, Release Switch & Switch Button
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the Passive Entry (PE) system have a PE deck lid release switch (2) integral to the Center High Mounted Stop Lamp (CHMSL). This tactile switch is secured to the back of the right side of the CHMSL housing with a wedge type base connection. The switch button (3) extends through clearance holes in the lamp housing and lens so that it can be accessed on the right end of the CHMSL lens, which is visible on the upper rear vertical face of the deck lid.

The switch has a pigtail wire and connector (1) secured to the back of the CHMSL housing that connects the switch to the vehicle electrical system through a dedicated take out and connector of the body wire harness. An integral 3.0 kilohm diagnostic resistor is connected in series with the output side of the switch.

The PE deck lid release switch cannot be adjusted or repaired. If the switch is damaged or ineffective, the entire switch unit must be replaced.

INSTRUMENT PANEL

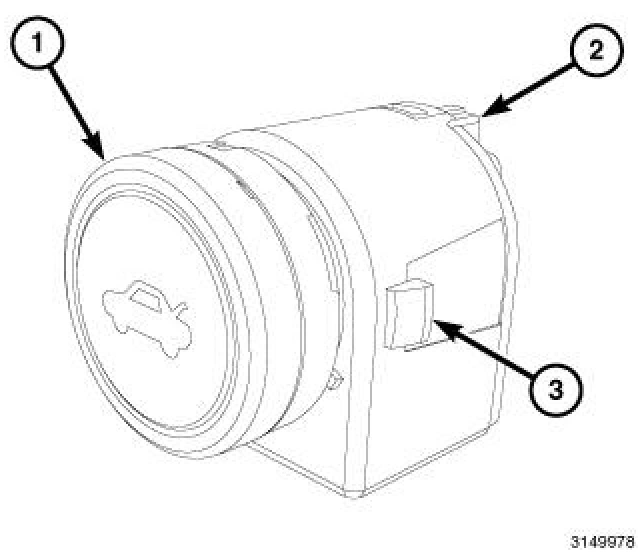

Fig. 13: Release Switch, Receptacle & Single Integral Latch
Courtesy of CHRYSLER GROUP, LLC

The instrument panel deck lid release switch (1) is mounted in the steering column opening cover to the left of the steering column on the instrument panel. Only the switch button is visible on the outer surface of the instrument panel. The black plastic switch button has a white International Control and Display Symbol icon applied to it, which clearly identifies its function.

The black, molded plastic switch housing encloses the switch button mechanism and the switch circuitry including the switch contacts. A connector receptacle (2) is integral to the back of the switch housing, while a single integral latch feature (3) on each side of the housing are used secure the switch by a yoke type retainer and two screws on the back side of the steering column opening cover. The deck lid release switch is connected to the vehicle electrical system through a dedicated take out and connector of the instrument panel wire harness.

The instrument panel deck lid release switch cannot be adjusted or repaired and, if ineffective or damaged, the unit must be replaced.

OPERATION

DECK LID

The Passive Entry (PE) deck lid release switch is a normally open switch that is connected to ground at all times. When the switch button is depressed, it provides a ground signal to the Body Control Module (BCM) through a deck lid release switch sense circuit. In response to that input, the BCM sends an electronic **unlock request** message to the Radio Frequency Hub Module (RFHM) over the Controller Area Network (CAN) data bus. The RFHM determines the PE system response based upon the inputs it receives through the authentication process with each detected FOB with Integrated Key (FOBIK).

The diagnostic resistor integral to the output side of the switch enables the BCM to monitor the condition of the deck lid release switch and switch sense circuit. The BCM will store a Diagnostic Trouble Code (DTC) for any fault that is detected in this circuit.

The hard wired circuits between the PE deck lid release switch and the BCM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the switch or the electronic controls and communication between other modules and devices that provide some features of the PE system. The most reliable, efficient, and accurate means to diagnose the PE system or the electronic controls and communication related to deck lid release switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

INSTRUMENT PANEL

The instrument panel deck lid release switch is a normally open switch that is connected to ground at all times. When the switch button is depressed, it provides a ground signal to the Body Control Module (BCM) (also known as the Common Body Controller/CBC) through a deck lid release switch sense circuit.

The BCM uses internal programming and inputs from other sources to determine the appropriate response to an instrument panel deck lid release switch input. If the vehicle has an automatic transmission, the BCM must confirm that the transmission gear selector lever is in the PARK position before activating the deck lid latch motor. If the vehicle is equipped with a manual transmission, the BCM must confirm that the vehicle speed input is less than 8 kilometers-per-hour (5 miles-per-hour) before activating the deck lid latch motor.

The hard wired circuits between the instrument panel deck lid release switch and the BCM may be diagnosed

using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the switch or the electronic controls and communication between other modules and devices that provide the deck lid release feature. The most reliable, efficient, and accurate means to diagnose the deck lid release feature or the electronic controls and communication related to instrument panel deck lid release switch operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

DECK LID

1. Disconnect and isolate the battery negative cable.

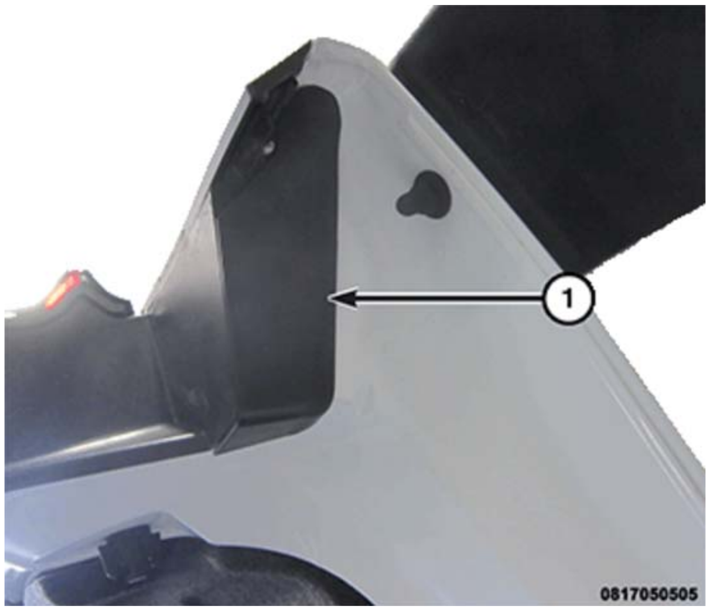

Fig. 14: Close Out Panel Cover
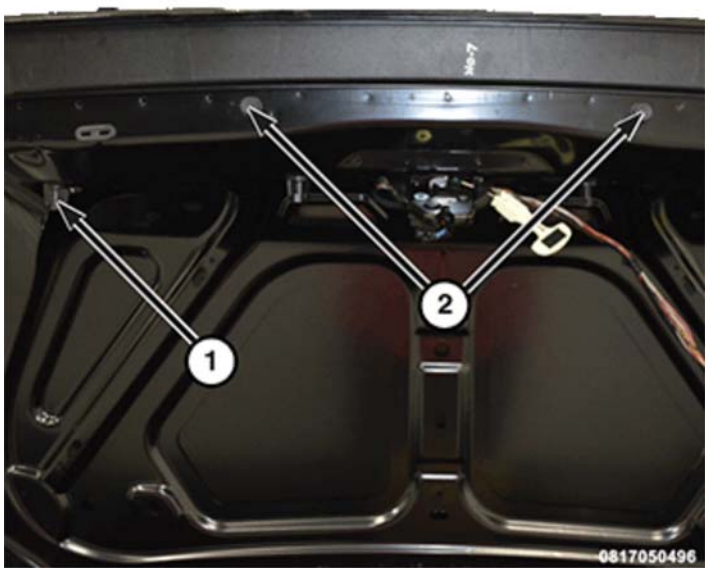
Courtesy of CHRYSLER GROUP, LLC

2. Open the deck lid to access and remove the close out panel cover (1) on both sides on each side of the deck lid.

[Fig. 15: Inboard Screw](#)
Courtesy of CHRYSLER GROUP, LLC

3. Remove the inboard screw (1) on each side of the deck lid.



[Fig. 16: Push Pins & Plastic Wing-Nuts](#)
Courtesy of CHRYSLER GROUP, LLC

4. Remove two push pins (2) and four plastic wing-nuts (1).
5. Pull the lamp applique out far enough to disconnect the wiring harness connection.
6. Remove the lamp applique from the vehicle.
7. Disconnect the passive entry switch from the wiring harness.
8. Remove the passive entry switch from the applique.

INSTRUMENT PANEL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS). Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

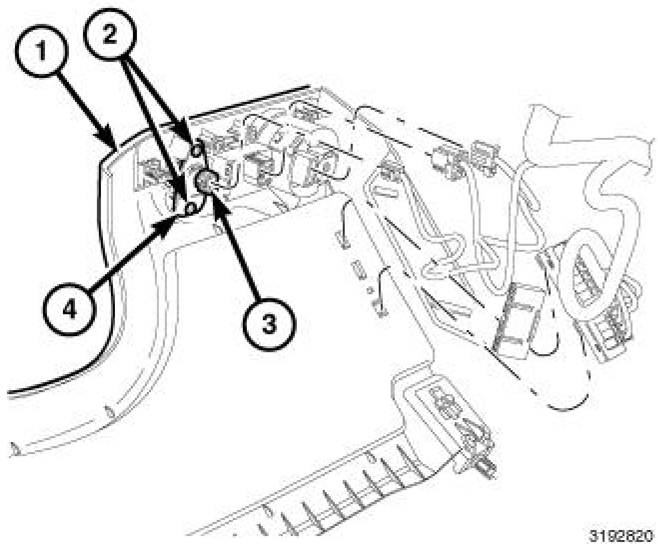


Fig. 17: Steering Column Opening Cover, Release Switch & Retainer Yoke
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the steering column opening cover (1) from the instrument panel. Refer to **COVER, STEERING COLUMN OPENING, REMOVAL** .
3. Working from the back of the steering column opening cover, remove the two screws that secure the deck lid release switch (3) retainer yoke (4) to the back of the cover.
4. Remove the switch and retainer from the back of the cover.
5. Remove the switch from the retainer.

INSTALLATION

DECK LID

1. Install the passive entry deck lid switch to the applique.
2. Position the applique to the vehicle close enough in order to the connect the wiring harness connector to the back of the assembly.

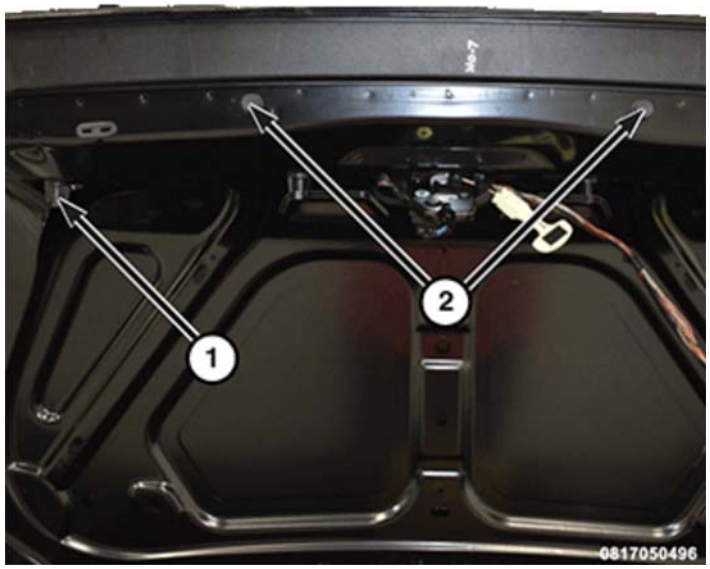

Fig. 18: Push Pins & Plastic Wing-Nuts
Courtesy of CHRYSLER GROUP, LLC

3. Install four wing-nut retainers (1) and two push pins (2) to secure the applique to the deck lid.

Fig. 19: Inboard Screw
Courtesy of CHRYSLER GROUP, LLC

4. Install the inboard screw (1) on each side of the deck lid.

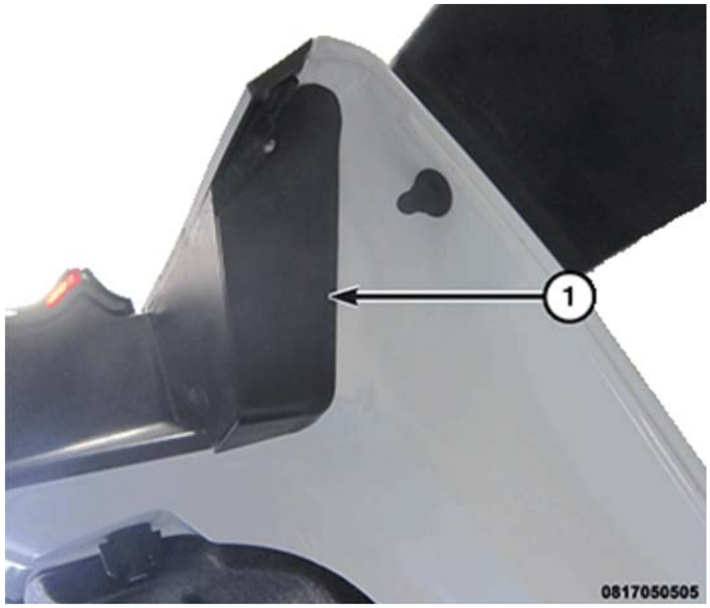

Fig. 20: Close Out Panel Cover
Courtesy of CHRYSLER GROUP, LLC

5. Install the close out panel cover on both sides of the deck lid.
6. Connect the negative battery cable.

INSTRUMENT PANEL

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS). Refer to RESTRAINTS - SERVICE INFORMATION before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

1. Position the back of the deck lid release switch (3) through the hole in the retainer yoke (4).
2. Position the switch and retainer to the back of the steering column opening cover (1).
3. Install and tighten the two screws (2) that secure the switch and retainer to the back of the cover. Tighten the screws securely.
4. Reinstall the steering column opening cover onto the instrument panel. Refer to **COVER, STEERING COLUMN OPENING, INSTALLATION** .
5. Reconnect the battery negative cable.

SWITCH, DOOR HANDLE

DESCRIPTION

DESCRIPTION

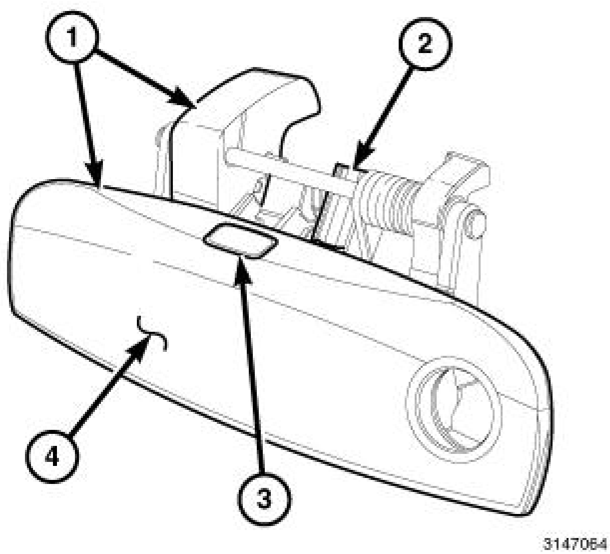

Fig. 22: Pull, Surface & Resistive Membrane Lock Switch
Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with the optional Passive Entry (PE) system have unique outside door handles that incorporate three switches and a logic circuit. These unique PE door handles are sometimes referred to as smart handles. The handle itself is very similar in appearance to those used in conventional non-PE applications, consisting primarily of a pull (4) and a base.

The PE door handles can be readily identified by a tactile, resistive membrane lock switch (3) located on the outward facing horizontal surface at the top of the pull, and by a capacitive sensor or switch membrane patch on the inside surface (2) of the pull. A third, Hall-effect type switch as well as an Integrated Circuit (IC) chip are concealed within the pull.

The mechanical functions and mounting provisions of the PE handle are identical to those of a conventional outside door handle. However, an integral connector receptacle (2) is located at the back of the handle base where it is concealed within the door interior. The PE handle is connected to the vehicle electrical system through a dedicated take out and connector of the PE door jumper wire harness.

The individual switches of the PE outside front door handles cannot be adjusted or repaired. If any one of the switches, the IC or any of the mechanical handle components is damaged or ineffective, the entire handle unit must be replaced. Refer to **HANDLE, EXTERIOR, REMOVAL** .

OPERATION

OPERATION

The three switches of each Passive Entry (PE) outside door handle are powered by and provide a direct input to the Integrated Circuit (IC) of that door handle. The IC of each PE outside front door handle receives power from the Radio Frequency Hub Module (RFHM) on a signal circuit, and a clean ground from the RFHM on a return circuit. The PE handle IC and the RFHM communicate with each other by modulating the current in the signal circuit.

Each PE outside front door handle has three switches. The inputs from those three switches and the handle logic circuit allow each handle to send the RFHM up to four different signals: Unlock Request, Hall, Lock Request and Error. The RFHM determines the system response based upon the inputs it receives from each handle as well as the inputs it receives through the authentication process with each detected FOB with Integrated Key (FOBIK).

The tactile, mechanical, resistive membrane lock switch allows the user to actively lock the vehicle. The capacitive switch senses a hand approaching the handle grip to passively unlock the vehicle. The Hall-effect switch senses handle grip movement. An adaptation algorithm in the logic circuit of each handle can modify the sensitivity of the capacitive switches as well as system responses to the Hall-effect switch inputs to compensate for sensed repeated or continuous actuations such as might be caused by the switch membrane being wetted, but restores normal sensitivity about one minute after the repeated or continuous actuation input ceases.

The hard wired inputs and outputs of the PE outside front door handle may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, the most reliable, efficient and accurate means to diagnose this component requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

SWITCH, LOCK

DESCRIPTION

DESCRIPTION

A window/lock switch located in each door trim panel. The driver's side window/lock switch includes the following:

- **Power Lock Switch** - A two-way, momentary, resistor multiplexed switch to control the power lock system.
- **Power Window Lockout Switch** - A two-way, latching, push-button switch allows the vehicle operator to lock out the power window switch on the passenger door so that the passenger door power window may be operated only from the master switches.
- **Power Window Switches** - A two-way, momentary power window switch for the driver side door also has a second detent in the Down direction and internal circuitry to provide an Auto-Down feature for the driver side door power window. In addition to the power window switch for its own door, the window/lock switch houses a master switch for the passenger door power window.

The passenger side window/lock switch includes the following:

- **Power Lock Switch** - A two-way, momentary, resistor multiplexed switch to control the power lock system.
- **Power Window Switch** - A two-way, momentary power window switch for the passenger side door.

OPERATION

OPERATION

The two-way, momentary, resistor multiplexed (MUX) power lock switches on the driver and passenger side doors are connected in series between the door lock switch return and the right or left door lock switch mux inputs to the Body Control Module (BCM) located in the passenger compartment. Each power lock switch rocker position (LOCK and UNLOCK) provides a unique input to the BCM through the resistor trees within the switches which allows the BCM to sense the switch position.

Based upon the power lock switch inputs, the BCM controls the battery and ground outputs to the power lock motors to lock or unlock all of the doors The Light-Emitting Diode (LED) in the rocker of the power lock switches is connected to battery current through a panel lamps dimmer circuit Pulse Width Modulated (PWM) output from the Electro Mechanical Instrument Cluster (EMIC); therefore, the switch will only be illuminated when the exterior lighting is turned ON and the illumination level will be synchronized with that of the other panel lamps dimmer controlled lamps in the vehicle.

The power lock switch as well as the hard wired inputs and outputs of the switch may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER WINDOW SWITCH

Any diagnosis of the Power Windows system should begin with the use of scan tool and the appropriate Diagnostic Service Information .

The hard wired inputs and outputs of the speed control system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the Local Interface Network (LIN) slave node integral and internal to the door control switch. The most reliable, efficient and accurate means to diagnose the LIN slave node operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

1. Disconnect and isolate the battery negative cable.

Fig. 23: Prying Bezel Of Front Door Switch Module
Courtesy of CHRYSLER GROUP, LLC

2. Using a trim stick or another suitable wide flat-bladed tool, pry the bezel of the front door switch module up and away from the front door trim panel arm rest far enough to disengage the four spring steel retainers of the switch from the arm rest opening.

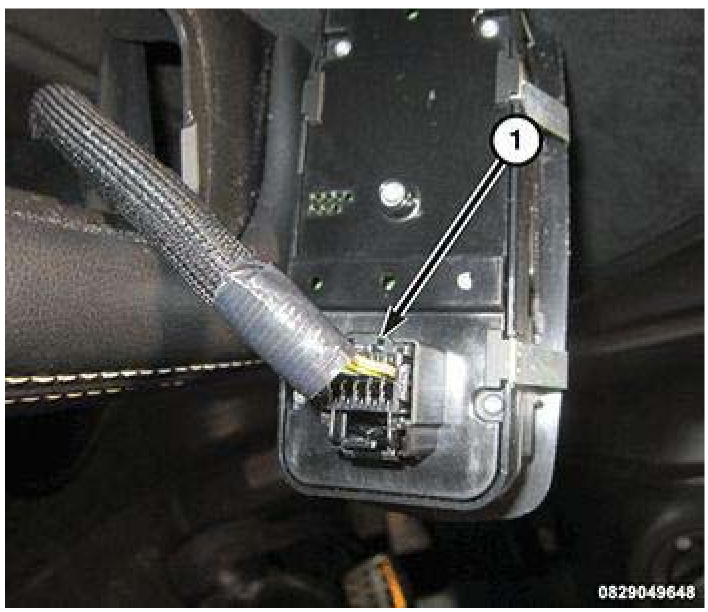

Fig. 24: Front Door Switch Module Connector
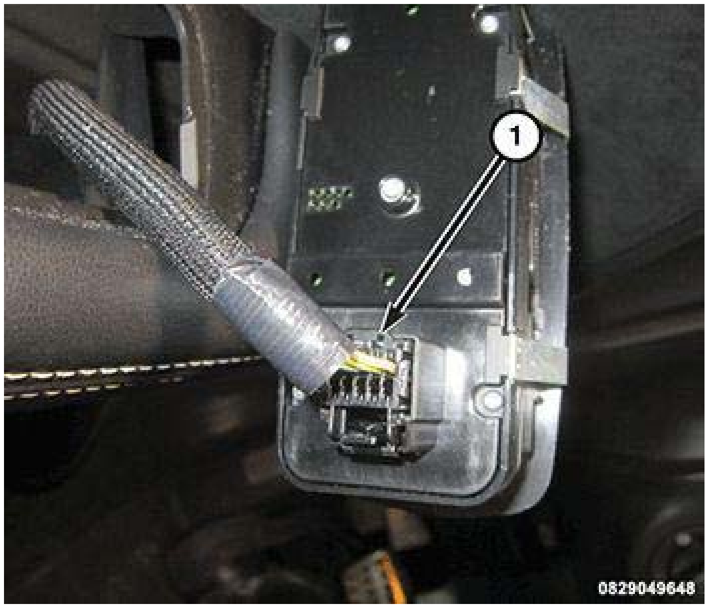
Courtesy of CHRYSLER GROUP, LLC

3. Pull the switch module away from the mounting hole of the arm rest far enough to access and disconnect the door wire harness connector (1) from the switch connector receptacle.
4. Remove the switch module from the vehicle.

INSTALLATION

INSTALLATION



[Fig. 25: Front Door Switch Module Connector](#)
Courtesy of CHRYSLER GROUP, LLC

1. Position the front door switch module close enough to the mounting hole in the arm rest of the front door trim panel to access and reconnect the front door wire harness connector (1) to the switch connector receptacle.
2. Align the switch module to the arm rest mounting hole.
3. Using hand pressure, press the switch module firmly and evenly into the mounting hole until the four spring steel retainers of the switch are fully engaged and the switch bezel is fully seated against the arm rest.
4. Connect the battery negative cable.

TRANSMITTER, INTEGRATED KEY FOB

DESCRIPTION

DESCRIPTION

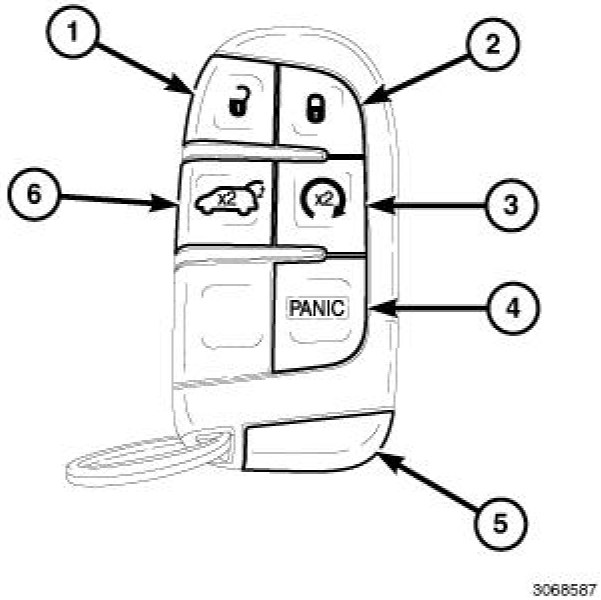


Fig. 26: Transponder Key
Courtesy of CHRYSLER GROUP, LLC

Vehicles are shipped from the factory with two FOB with Integrated Key (FOBIK) Remote Keyless Entry (RKE) transmitters programmed to the vehicle as standard equipment. The FOBIK circuitry is contained and protected within a molded black plastic case with a black soft rubber touch pad on the face divided into six sections. The rearward end of the FOBIK case houses a mechanical, metal, coded emergency key (5) that is released by sliding a latch button on the back of the FOBIK case.

Depending upon vehicle equipment, each FOBIK has at least three and no more than five functional resistive membrane switches located beneath the six touch pad sections. Each functional touch pad section is clearly identified by white icons or white text and icons identifying the specific function obtained by pushing that button. Domestic market vehicles also include a touch pad section on the FOBIK with the red text **PANIC** applied to it. Please note that when selecting stealth mode on the interceptor model vehicle, the panic alarm feature is disabled by design. Not counting the **PANIC** touch pad (4), the available switches include:

- **Unlock (1)**

  - Standard equipment.

- **Lock (2)** - Standard equipment.
- **Remote Start (3)** - Only for vehicles equipped with the factory-installed remote start system.
- **Trunk (6)** - Standard equipment.

The FOBIK RKE transmitter is the primary customer active interface for remotely operating the power lock system, the RKE system and the remote start system components and features. However, the FOBIK also has an important passive role in each of the following vehicle systems:

- **Keyless Go System** - Refer to STARTING - SERVICE INFORMATION . .
- **Passive Entry System** - Refer to DESCRIPTION.
- **Sentry KeyÂ® Theft Deterrent System** - Refer to VEHICLE THEFT SECURITY SYSTEM .

- **Vehicle Theft Security System (VTSS)** - Refer to **VEHICLE THEFT SECURITY SYSTEM** .

Other than battery replacement, the FOBIK cannot be adjusted or repaired. Once a FOBIK has been programmed to a vehicle, it cannot be reprogrammed for use on any other vehicle. If damaged or ineffective, the FOBIK must be replaced with a new unit. A new and unused FOBIK unit must be properly programmed in order to function properly with the systems of the vehicle. The mechanical emergency key of the new FOBIK must also be cut to match the coding of the lock cylinders in the vehicle.

SRT KEY FOBS

If the vehicle is equipped with the 6.2L supercharged engine, it will support an additional engine power level configuration as part of SRT Drive Modes. The vehicle comes with three key fobs (two red and one black) that allow for different engine power levels.

- Use of the RED key FOB unlocks the full potential of the engine's output, and allows the driver to select from two power levels within Drive Modes Set-Up.
- Use of the BLACK key FOB limits the driver to a reduced engine output. This information is also available within the SRT Drive Modes UconnectÂ® interface, and can be accessed by pressing the "KEY FOB" button on the touchscreen in the SRT Drive Modes menu.

NOTE: **Not all options listed in this service information are available on every vehicle. Refer to the chart below for all available Drive Mode vehicle configurations.**

Engine/Transmission	Red Key / 700+ HP	Black Key / 500 HP	Transmission	Paddle Shifters	Suspension	Steering	Traction
6.2L AUTO	X	X	X	X	X	N/A	X
6.2L MANUAL	X	X	N/A	N/A	X	N/A	X
6.4L AUTO	N/A	N/A	N/A	X	X	X	X
6.4L MANUAL	N/A	N/A	N/A	N/A	X	X	X

The SRT Drive Modes main screen displays the current drive mode and real-time status of the vehicle's performance configuration. The selectable Drive Modes buttons are Track, Sport, Custom, or Default and will be highlighted when displaying the current configuration. Information shown below each drive mode button will indicate the actual status of each system, along with a graphic that displays the status of the vehicle's components. The color red indicates "Track," orange "Sport," and yellow "Street." If the system status shown does not match the current drive mode set up, a message will be displayed indicating which values are not matching the current mode and why.

NOTE: **ESC Full-Off can be activated across all of the Drive Mode features by pushing and holding the ESC Off button on the instrument panel switch bank for five seconds.**

Listed below are the available Drive Modes:

- Track
- Sport

- Default
- Custom

OPERATION

OPERATION

The FOB with Integrated Key (FOBIK) incorporates many useful functions into a single, compact unit. The transducer on the internal circuit board of the FOBIK uses low frequency Radio Frequency (RF) communication to ensure vehicle security through an electronic validation or handshake process that is performed with the RF Hub each time the engine is started.

When any one of the Remote Keyless Entry (RKE), liftgate or remote start buttons of the FOBIK is depressed, the on-board transmitter of the FOBIK generates a high frequency RF request signal that is received and validated by the RF Hub. If the RF Hub determines the RF signal was generated by a FOBIK that is valid for the vehicle, the RF Hub relays electronic request messages to the appropriate electronic modules in the vehicle over the Controller Area Network (CAN) data bus to invoke the functions or features associated with the request.

The integrated mechanical emergency key of the FOBIK provides emergency access to the vehicle in case the battery in the vehicle or the transmitter becomes discharged. The emergency key can also be retained to keep any locked on-board vehicle storage compartments such as the glove box secured, for example: While the vehicle is being attended to by a parking valet.

Each vehicle owner is provided with a four-digit Personal Identification Number (PIN) by the dealer at the time of vehicle purchase. This number is required along with a diagnostic scan tool for the dealer to program an additional or replacement FOBIK into the electronics of the vehicle. The emergency key included with a new additional or replacement blank FOBIK must also be cut to match the coding of the lock cylinders in the vehicle.

Diagnosis of a FOBIK transmitter requires the use of a Radio Frequency Detector such as (special tool #9001, Rf Detector). Refer to the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - RKE TRANSMITTER

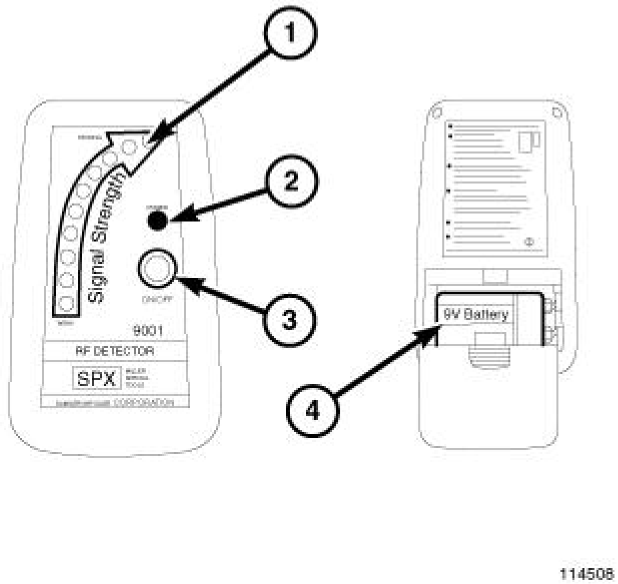

Fig. 27: Radio Frequency Detector #9001
Courtesy of CHRYSLER GROUP, LLC

Use a Radio Frequency Detector such as (special tool #9001, Rf Detector) to confirm that the Remote Keyless Entry (RKE) transmitter is functioning. Typical testing distance is 2.5 centimeters (1 inch) for the transmitters of vehicles manufactured for Asian markets, and 30.5 centimeters (12 inches) for all others.

NOTE: **The panic alarm is not designed to function when stealth mode is enabled on Interceptor package vehicles.**

1. Position the transmitter the appropriate distance from the special tool.
2. Depress any transmitter button, then test each button individually. The special tool will issue an audible beep tone if a satisfactory radio signal strength that lights five or more LED units is detected.
3. Repeat Step 2 three times. If the transmitter fails any of the signal strength tests, use a diagnostic scan tool and the appropriate diagnostic information to complete further diagnosis.

STANDARD PROCEDURE

BATTERY REPLACEMENT

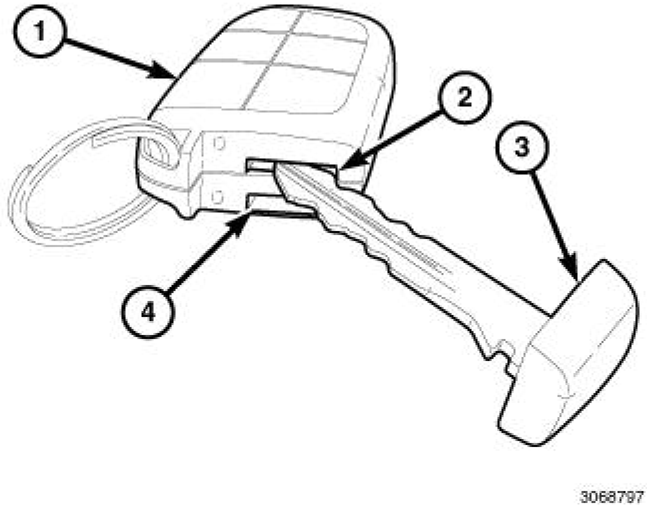

Fig. 28: Emergency Key, Storage Slot & Integrated Key (FOBIK) Case
Courtesy of CHRYSLER GROUP, LLC

CAUTION: **Do not touch or disturb the metal contacts for the battery. Avoid touching the new battery. Battery contamination from oils on your skin may result in shortened battery life. If the battery or contacts are contaminated, clean them thoroughly with rubbing alcohol.**

1. Unlatch and remove the emergency key (3) from the storage slot (4) of the FOB with Integrated Key (FOBIK) case (1).
2. With the front of the FOBIK case facing upward, insert the tip of the emergency key into the notch (2) between the case halves and twist the key to unsnap and separate the front case half from the back case half.

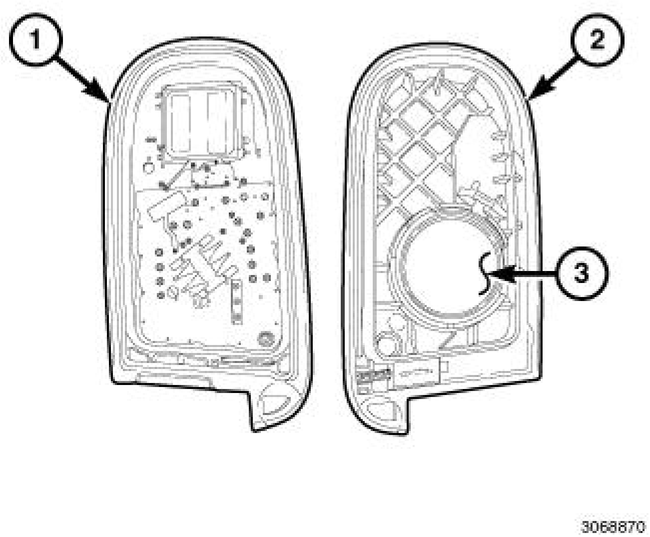

Fig. 29: FOBIK Case & Battery
Courtesy of CHRYSLER GROUP, LLC

3. Lift the battery (3) out of the receptacle in the back half of the FOBIK case (2).
4. Replace the battery with a recommended replacement battery. Refer to **TRANSMITTER,**

   INTEGRATED KEY FOB, SPECIFICATIONS.

5. Install the new battery into the receptacle in the back half of the FOBIK case with the negative terminal facing upward.
6. Align the front half of the FOBIK case (1) with the back half.
7. Using hand pressure, squeeze the two FOBIK case halves around their perimeters until they snap back together.
8. Reinsert the emergency key into the storage slot of the FOBIK case.
9. Test the FOBIK operation.

FOBIK PROGRAMMING

FOB with Integrated Key (FOBIK) programming may require the use of the Personal Identification Number PIN) for the vehicle, a diagnostic scan tool and the appropriate diagnostic information. Also be certain that the FOBIK and any replaced electronic modules are programmed in the proper sequence. Refer to **STANDARD PROCEDURE** .

SPECIFICATIONS

SPECIFICATIONS

BATTERY

The FOB with Integrated Key (FOBIK) transmitter is powered by a single 3-volt lithium and manganese dioxide button cell battery, which can be removed and replaced without special tools. Refer to **TRANSMITTER, INTEGRATED KEY FOB, STANDARD PROCEDURE**. The international standard battery type designation is: **CR2032** . This battery type is available at many local retail stores. Typical battery life is approximately three years.

CAUTION: Do not handle the batteries any more than necessary. Hands must be clean and dry.

RANGE

Normal Remote Keyless Entry (RKE) transmitter operation range for vehicles manufactured for domestic markets is up to 20 meters (66 feet) away from the vehicle. On vehicles manufactured for export markets, normal RKE transmitter range is up to 10 meters (33 feet) away from the vehicle. If a domestic market vehicle is equipped with the optional factory-installed Remote Start System, the normal transmitter range is increased to up to 91 meters (300 feet). Please note that the actual RKE transmitter range values may be better or worse than specified above, depending upon many possible variables in the environment at the specific time and location that any RKE transmission is attempted.

2015-16 ACCESSORIES AND EQUIPMENT

Power Mirrors - Service Information - Challenger

DESCRIPTION

DESCRIPTION

Driver and passenger power operated outside rear view mirrors are standard factory-installed equipment. In addition, automatic dimming rear view mirrors, both inside and a driver side outside are available as optional equipment. The power mirror system for this vehicle includes the following major components, which are described in further detail elsewhere in this service information:

- **Automatic Dimming Rear View Mirrors** - The optional automatic dimming inside rear view mirror is secured to a mounting button on the inside of the windshield glass near the upper windshield opening header. This is the same mounting button that is used for mounting the standard prismatic inside rear view mirror. The optional automatic dimming outside rear view mirror is only available for the driver side door. The automatic dimming outside rear view mirror is secured to the same mounting flag on the front door panel and in the same manner that is used to mount the standard equipment outside rear view mirrors.
- **Front Door Control Modules** - Vehicles that use the low current front door power switch configuration also have a front door control module for each front door. The front door control modules are concealed behind the door trim panels on the front door hardware module carrier. Refer to **MODULE, DOOR, DESCRIPTION** .
- **Front Door Power Switch Modules** - Front door power switch modules are used in both primary system configurations: high current and low current. The outputs of the switches will identify the configuration type being used. In the high current configuration the switch outputs are hard wired directly to the power mirror, power window and power lock motors. In the low current configuration the switch outputs are hard wired to the driver or passenger front door control modules, which then control the high current outputs to the power mirror, power window and power lock motors. Refer to **SWITCH, POWER WINDOW, DESCRIPTION** .
- **Power Mirror Switches** - The power mirror system includes two selector switches and an adjuster switch that are located on the driver front door trim panel and are only serviced as an integral part of their respective driver front door power switch module. Refer to **SWITCH, POWER WINDOW, DESCRIPTION** .
- **Power Outside Rear View Mirrors** - Power outside rear view mirror units are mounted to the mirror flag at the front belt line of each front door window opening. Many variations of both the driver and passenger mirror are available, depending upon both trim and other optional equipment in the vehicle.

In the low current switch configuration, the front door power switch modules and the front door control modules each contain a microcontroller and programming that allow them to communicate with each other using a Local Interface Network (LIN) data bus. The front door control modules and the automatic dimming inside rear view mirror each contain a microcontroller and programming that allow them to communicate with each other, with other electronic modules in the vehicle and with a diagnostic scan tool connected to the 16-way Data Link Connector (DLC) using the Controller Area Network (CAN) Interior High Speed (IHS) data bus. Refer to **COMMUNICATION, DESCRIPTION** .

Hard wired circuitry connects the power mirror system components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the power mirror system components through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

POWER OPERATED OUTSIDE REAR VIEW MIRROR SYSTEM

The power operated outside rear view mirror system is available factory-installed equipment on this vehicle. This system allows the driver to adjust both the driver and passenger side outside rear view mirrors electrically from the driver seat by operating switches on the arm rest of the driver side front door inside trim panel. These switches allow the vehicle operator a convenient means of adjusting the mirrors to optimize peripheral vision to include the areas at the sides and rear corners of the vehicle, those blind spot areas that are generally blocked from the view of the vehicle operator by the vehicle structure.

The power operated outside rear view mirror system includes the following major components, which are described in further detail elsewhere in this service information:

- **Power Mirror** - Vehicles equipped with the power operated outside rear mirror system have a power operated mirror secured to the mirror flag area at the front of each front door glass opening. Refer to **MIRROR, OUTSIDE REARVIEW, DESCRIPTION**.
- **Power Mirror Switch** - Vehicles equipped with the power operated outside rear view mirror system have a power mirror selector switch, a power mirror control switch, and a power folding mirror switch integral to the power switch module located near the front of the arm rest on the driver side front door interior trim panel. Refer to **SWITCH, LOCK, DESCRIPTION** .

Certain functions and features of the power operated outside rear view mirror system may rely upon resources shared by other electronic modules in the vehicle over a Local Interface Network (LIN) data bus as well as over the Controller Area Network (CAN) data bus. Other electronic modules in the vehicle that may affect power operated outside rear view mirror operation are:

- **Blind Spot Sensors** - Vehicles equipped with the BSM system have both a Left Blind Spot Sensor (LBSS) and a Right Blind Spot Sensor (RBSS). The LBSS and the RBSS each include a RAdio Detection And Ranging (RADAR) sensor and an integral electronic control unit. Each of the two control units is independent, communicates on the Controller Area Network (CAN) data bus and is hard wired to its respective right or left blind spot display. The LBSS and the RBSS are concealed behind their respective right and left outboard ends of the rear bumper fascia, just behind the rear wheel openings.
- **Body Control Module** - The BCM controls many of the body electrical system components. The BCM is both a LIN master node and a gateway to the CAN data bus. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Radio Frequency Hub Module** - The Radio Frequency Hub Module (RFHM) (also known as the RF

Hub) is the RKE system control module and RF receiver. Refer to **MODULE, RADIO FREQUENCY (RF HUB), DESCRIPTION** .

These components and their controls are combined to provide the following power operated outside rear view mirror system features:

- **Blind Spot Monitor Display** - In vehicles also equipped with the optional Blind Spot Monitor (BSM) system, an amber Light Emitting Diode (LED) unit behind a small, triangular translucent icon in each outside rear view mirror glass is illuminated each time the right or left blind spot sensor detects an object of interest in one of the monitored vehicle blind spots. Refer to **DISPLAY, BLIND SPOT, DESCRIPTION** .
- **Heated Mirrors** - The heated mirror option includes an electric heating grid behind the mirror glass in each outside rear view mirror, which can clear the mirror glass of ice, snow, or fog. Refer to **DESCRIPTION** .

AUTOMATIC DIMMING INSIDE REAR VIEW MIRROR SYSTEM

The automatic dimming inside rear view mirror is available factory-installed equipment on this vehicle. This mirror is also known as the ElectroChromic Mirror Module (ECMM). This mirror system uses an ElectroChromic (EC) material and will automatically adjust the reflectance of the mirror glass to reduce glare from the headlamps of following vehicles during dark or night time driving conditions. Reducing glare will improve driver comfort and vision under these driving conditions. The components of the automatic dimming inside rear view mirror system are completely self-contained within the inside rear view mirror. Refer to **MIRROR, AUTOMATIC DAY AND NIGHT, DESCRIPTION**.

Certain functions and features of the EC mirror system may rely upon resources shared by other electronic modules in the vehicle over a Local Interface Network (LIN) data bus as well as over the Controller Area Network (CAN) data bus. Other electronic modules in the vehicle that may affect EC mirror operation are:

- **Body Control Module** - The Body Control Module (BCM) is located beneath the instrument panel on the driver side of the vehicle. The BCM controls many of the body electrical system components. The BCM is both a LIN master node and a gateway to the CAN data bus. Refer to **MODULE, BODY CONTROL, DESCRIPTION** .
- **Powertrain Control Module** - The Powertrain Control Module (PCM) is located beneath the hood in the engine compartment of the vehicle. The PCM controls many of the powertrain electrical system components. The PCM communicates on the CAN data bus. Refer to **MODULE, POWERTRAIN CONTROL, DESCRIPTION** .
- **Transmission Control Module** - On vehicles with an automatic transmission, the Transmission Control Module (TCM) controls many of the automatic transmission electrical system components. The TCM communicates on the CAN data bus. Refer to **MODULE, TRANSMISSION CONTROL, OPERATION** .

These components and their controls are combined to provide the following EC mirror system feature:

- **Dimming Disabled In Reverse** - The automatic dimming feature of the EC mirrors is disabled anytime the Reverse position of the transmission is selected.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER MIRRORS

The hard wired inputs and outputs of the speed control system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the Local Interface Network (LIN) slave node integral and internal to the drivers door master control switch. The most reliable, efficient and accurate means to diagnose the LIN slave node operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

MIRROR, AUTOMATIC DAY AND NIGHT

DESCRIPTION

DESCRIPTION

An automatic dimming (day and night) inside rear view mirror is an available factory-installed option for this vehicle. Vehicles equipped with the automatic dimming inside rear view mirror are also available with an optional factory-installed automatic dimming outside rear view mirror for the driver side of the vehicle. In vehicles so equipped, this system will automatically change the reflectance of the inside and driver side outside rear view mirrors to protect the driver from the unwanted headlight glare of trailing vehicles while driving at night. Following are general descriptions of this optional equipment.

INSIDE MIRROR

Fig. 1: Automatic Dimming Mirror
Courtesy of CHRYSLER GROUP, LLC

An automatic dimming inside rear view mirror is an available factory-installed option on this vehicle. This mirror features a thin layer of ElectroChromic (EC) material sandwiched between two pieces of conductive glass to make up the face of the mirror. The EC material explains how this mirror also became known as the ElectroChromic Mirror Module (ECMM). The ECMM will automatically change the reflectance of the inside rear view mirror glass to reduce the glare of headlamps approaching the vehicle from the rear while driving during dark or night time conditions. The Automatic Dimming Mirror feature can be turned on or off using the UconnectÂ® System. The Automatic Dimming Mirror feature is disabled when the vehicle is in reverse gear to improve rear view viewing.

The ECMM is a completely self-contained unit that replaces the standard equipment prismatic inside rear view mirror. Besides the mirror glass, the ECMM includes a power switch, a Light Emitting Diode (LED) power indicator, two photocell sensors, the electronic mirror control circuitry and the hardware necessary to communicate as a Local Interface Network (LIN) slave node on the LIN data bus.

The ECMM may also integrate these other optional features:

- **Imager Camera** - For vehicles equipped with the SmartBeamÂ® Automatic Headlamp High Beam System, a digital imaging camera is integral to the ECMM mounting bracket and shares the LIN data bus communication features of the ECMM.
- **Microphones** - Stereo microphones are integral to the inside rear view mirror in vehicles equipped with the hands-free phone system. These microphones are located on the top surface of the mirror housing, one to each side of center.
- **Assist** - Pressing the **ASSIST** button will present the customer with three choices. Uconnect™ Care, Vehicle Care or Roadside Assistance. These selection options are presented as soft keys in the RRM display. Selecting any one of these choices will place a call to the selected group. If there are questions about Uconnect™ Services, Uconnect™ Care can be contacted; if there are questions related to vehicle functionality, Vehicle Care can be contacted; or, if Roadside Assistance is needed, a direct call can be made.
- **9-1-1** - Pressing the **9-1-1** button will initiate an emergency call to a Public Safety Answering Point (PSAP). The Global Positioning System (GPS) coordinates of the vehicle are made available to the emergency operator in the event help needs to be sent. In addition it opens a two way voice channel with the emergency operator allowing communication between the vehicle occupant and the emergency operator.

Hard wired circuitry connects the ECMM to the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system and to the ECMM through the use of a combination of soldered splices, splice block connectors and many different types of wire harness terminal connectors and insulators. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention as well as pin-out and location views for the various wire harness connectors, splices and grounds.

The ECMM cannot be repaired or adjusted. If any component of this unit is ineffective or damaged, the entire ECMM unit must be replaced.

OUTSIDE

The automatic dimming driver side outside rear view mirror is able to automatically change its reflectance. The automatic dimming outside rear view mirror replaces the standard equipment outside rear view mirror. The two layers of conductive mirror glass with a thin layer of electrochromic material between them is contained within the outside rear view mirror glass case. However, this mirror relies upon the photocells and mirror control circuitry of the automatic dimming inside rear view mirror to control its reflectance.

The automatic dimming outside rear view mirror is secured to the same mounting flag on the front door panel and in the same manner that is used to mount the standard equipment outside rear view mirrors. The mirror is connected to the vehicle electrical system through a dedicated take out and connector of the front door wire harness. The automatic dimming circuitry of the outside rear view mirror receives current through auto

day/night mirror feed (+) and return (-) circuits from the inside rear view mirror, and will only operate when the ignition switch is in the ON or START positions.

The automatic dimming outside rear view mirror sensitivity cannot be repaired or adjusted. If any component of this unit is ineffective or damaged, the entire outside rear view mirror unit must be replaced. For service procedures, refer to **MIRROR, OUTSIDE REARVIEW, REMOVAL** and **MIRROR, OUTSIDE REARVIEW, INSTALLATION** .

OPERATION

OPERATION

Both the inside and outside automatic dimming mirrors receive battery current through a fused ignition switch output (run/start) circuit and fuse in the Power Distribution Center (PDC), and will only operate when the ignition switch is in the ON or START positions.

INSIDE

The soft switch located in the U-Connect™ touch screen provides the vehicle operator with a manual control of whether the automatic dimming feature is operational. If the dimming is turned to the off position, the mirror will always turn back ON by default at the onset of a new ignition ON cycle. The automatic dimming mirror circuitry also senses the backup lamp circuit, and will automatically disable its self-dimming feature whenever the transmission gear selector is in the REVERSE position.

The ambient photocell sensor of the mirror faces forward, to detect the outside light levels through the windshield glass. A second headlamp photocell sensor is located in the upper right quadrant of the mirror face, to detect the light level received at the rear window side of the mirror. When the mirror control circuitry detects that the difference between the two sensed light levels has become too great (the light level received at the rear of the mirror is much higher than that at the front of the mirror) the mirror begins to darken. A thin layer of electrochromic material between two pieces of conductive glass make up the face of the mirror.

On vehicles equipped with an optional driver side automatic dimming outside rear view mirror, the signal to control the dimming of that mirror is generated by the automatic dimming inside rear view mirror circuitry. That signal is then delivered to the driver side outside rear view mirror on two hard wired circuits.

For vehicles equipped with the **ASSIST Call** and **911 Call** options. Refer to **OPERATION** .

The BCM determines the ignition status and the gear status. Once determined, the BCM sends an enable/disable signal over the LIN bus to the electrochromic mirror. The electrochromic mirror reads the internal message for the sensor value and determines the ratio between forward/backward light intensity, along with the enable signal coming from the BCM, to determine the reflecting mode to be used.

OUTSIDE

The driver side automatic dimming outside mirror is operated by the same controls and circuitry as the automatic inside rear view mirror. When the automatic inside rear view mirror is switched ON or OFF, the automatic dimming outside mirror is likewise switched ON or OFF. Just as in the automatic inside rear view mirror, a thin layer of electrochromic material between two pieces of conductive glass make up the face of the automatic dimming outside mirror. However, the signal to control the dimming of the outside mirror is generated by the automatic dimming inside rear view mirror control circuitry based upon the inputs from the two photocell sensors integral to the inside mirror. That signal is then delivered to the driver side outside rear

view mirror on two hard wired circuits.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - AUTOMATIC DIMMING MIRRORS

For complete circuit diagrams, **refer to appropriate SYSTEM WIRING DIAGRAMS article** . The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

1. Check the fused ignition switch output (run/start) fuse in the Power Distribution Center (PDC). If OK, go to step 2. If not OK, repair the shorted circuit or component as required and replace the ineffective fuse.
2. Turn the ignition switch to the ON position. Check for battery voltage at the fused ignition switch output (run/start) fuse in the PDC. If OK, go to step 3. If not OK, repair the open fused ignition switch output (run/start) circuit to the run-start relay in the PDC as required.
3. Disconnect the overhead wire harness connector from the automatic dimming inside rear view mirror. Check for battery voltage at the fused ignition switch output (run-start) circuit cavity of the overhead wire harness connector for the mirror. If OK, go to step 4. If not OK, repair the open fused ignition switch output (run/start) circuit to the fuse in the PDC as required.
4. Turn the ignition switch to the OFF position. Check for continuity between the ground circuit cavity of the overhead wire harness connector for the automatic dimming inside rear view mirror and a good ground. There should be continuity. If OK, go to step 5. If not OK, repair the open circuit to ground as required.
5. Turn the ignition switch to the ON position. Set the parking brake. Place the transmission gear selector lever in the REVERSE position. Check for battery voltage at the backup lamp switch output circuit cavity of the overhead wire harness connector for the automatic dimming inside rear view mirror. If OK, reconnect the overhead wire harness connector to the mirror and go to step 6. If not OK, repair the open backup lamp switch output circuit as required.
6. Place the transmission gear selector lever in the NEUTRAL position. Place the automatic dimming inside rear view mirror switch in the ON (green LED indicator illuminated) position. Cover the forward facing ambient photocell light sensor to keep out any ambient light.

NOTE: **The ambient photocell sensor must be covered completely, so that no light reaches the sensor. Use a finger pressed tightly against the sensor, or cover the sensor completely with electrical tape.**

7. Shine a light into the rearward facing headlamp photocell light sensor. The automatic dimming mirror glass should darken within 2 minutes if testing for the first time. For an immediate response, turn the mirror switch to the OFF position and back to the ON position with the forward-facing ambient light sensor still covered. This defeats the daylight detection logic of the mirror. If OK, go to step 8. If not OK, replace the ineffective mirror unit.
8. With the mirror darkened, place the transmission gear selector lever in the REVERSE position. The automatic dimming mirror glass should return to its normal reflectance. If not OK, replace the ineffective mirror unit.

MIRROR, OUTSIDE REARVIEW

DESCRIPTION

DESCRIPTION

The power operated outside rear view mirrors allow the driver to adjust both mirrors electrically from the driver seat position by operating switches integral to the power switch module on the driver side front door trim panel. The power outside mirrors operate on non-switched battery current received through a fuse in the Power Distribution Center (PDC) so that the mirrors remain operational, regardless of the ignition switch position.

Each power mirror housing contains two electric motors, two drive mechanisms, the mirror glass case and the mirror glass (2). One motor and drive controls mirror up-and-down (vertical) movement, and the other controls right-and-left (horizontal) movement. Vehicles manufactured for certain export markets also have a power folding mirror option. These mirrors include a third motor and drive mechanism that allow the mirror to be folded inward and outward from the driver seat position for additional clearance through narrow passages or in tight parking spaces.

A memory system that automatically positions the driver power mirror for two different drivers is an available option. With the memory system, the driver side mirror head also contains two position potentiometers. One position potentiometer monitors the vertical mirror motor, and the other monitors the horizontal mirror motor. Refer to **DESCRIPTION** .

The standard equipment mechanically folding or the optional power folding, power operated outside rear view mirrors are also electrically heated. The mirror heater only operates when the ignition switch is in the ON position and the rear window defogger switch is turned ON. When the rear window defogger switch is in the ON position, electric heater grids on the rear window glass and behind both outside rear view mirror glasses are energized. These electric heater grids produce heat to help clear the rear window glass and outside rear view mirrors of ice, snow, or fog. Refer to **DESCRIPTION** .

On vehicles equipped with the optional automatic dimming inside rear view mirror, an optional driver side automatic dimming outside rear view mirror that darkens the mirror to reduce the glare of bright lights approaching the vehicle from behind is available. This mirror is controlled an output of the automatic dimming inside rear view mirror. Like the automatic dimming inside rear view mirror, a thin layer of electrochromic material between two pieces of conductive glass make up the face of the mirror glass. Refer to **MIRROR, AUTOMATIC DAY AND NIGHT, DESCRIPTION**.

On vehicles equipped with the optional Blind Spot Monitor (BSM) system, a Light Emitting Diode (LED) display unit is concealed behind the outside rear view mirror glass. This unit illuminates an amber triangle icon through the lower edge of the mirror glass to give the vehicle operator an indication that an object has been detected by the BSM system. Refer to **DESCRIPTION** .

The power outside rear view mirror unit cannot be repaired. If any other component of the power mirror unit is ineffective or damaged, the entire power mirror unit must be replaced.

OPERATION

OPERATION

The power operated outside rear view mirrors are connected to battery current at all times. Each mirror head contains two electric motors, two drive mechanisms, an electric heating element and the mirror glass. If the vehicle is equipped with the high current door power switch module configuration, hard-wired ground and

battery current outputs to each power mirror motor determine whether the horizontal or the vertical motor will be operated and the polarity of those outputs control the direction in which the motor will move the drive unit and mirror glass.

Power mirror and mirror switch functionality is the same with the low current configuration; however, the driver door power switch module sends power mirror switch status messages over the Local Interface Network (LIN) data bus to the driver front door control module. The driver front door control module then controls the high current outputs to the driver door mirror motors or sends electronic request messages over the Controller Area Network (CAN) Interior High Speed (IHS) data bus to the passenger front door control module to control high current outputs to the passenger door mirror motors.

The standard equipment power outside rear view mirrors are electrically heated. In the high current door power switch module configuration, the heater grid behind each mirror glass is energized whenever the rear window defogger relay is energized by the Power Distribution Center (PDC) in response to electronic defogger switch status messages received over the CAN data bus from the A/C-heater control. In the low current door power switch configuration each front door control module responds to the electronic defogger switch status messages received over the CAN data bus from the A/C-heater control to control the high current output to the heater grid of the mirror on the same door as appropriate.

On vehicles equipped with the optional driver side automatic dimming outside rear view mirror, the mirror reflectance is controlled by the driver front door control module based upon hard-wired inputs received from the automatic dimming inside rear view mirror.

If the vehicle is equipped with the optional Blind Spot Monitor (BSM) system, an LED display unit behind the lower edge of each mirror glass illuminates an amber triangle to indicate to the vehicle operator that an object has been detected by the BSM system. The BSM LED display is controlled by the front door control modules based upon electronic messages received from the BSM control module over the CAN data bus.

SWITCH, MIRROR

DESCRIPTION

DESCRIPTION

The power mirror system includes two selector switches and an adjuster switch that are located on the driver front door trim panel and are only serviced as an integral part of the driver front door power switch module. For the appropriate service information, refer to **SWITCH, POWER WINDOW, REMOVAL** and **SWITCH, POWER WINDOW, INSTALLATION** .

OPERATION

OPERATION

The power mirror switch circuitry within the driver side front door power switch module is connected to battery current through a non-switched fused B(+) circuit in the underhood Power Distribution Center (PDC). The power mirror switch circuitry also has a path to ground at all times through a take out and eyelet terminal of the body wire harness that is secured to the body sheet metal. These connections allow the power mirror switch to remain operational regardless of the status of the ignition switch.

A latching push button power mirror selector switch has three positions, **L** (left), **R** (right) and **N** (neutral).

..

After the right or left mirror is selected, one of the four directional arrows on the momentary power mirror control switch disc is depressed to move the selected mirror up, down, right or left. The power mirror control switch directs the appropriate battery current and ground feeds to the proper horizontal or vertical motor within the mirror articulating mechanism of the selected power mirror.

The power mirror switches as well as the hard wired input and output circuits of the switches may be diagnosed using conventional diagnostic tools and procedures.

2015-16 ACCESSORIES AND EQUIPMENT

Power Seats - Service Information - Challenger

DESCRIPTION

DESCRIPTION

The power seat system allows the driver to electrically adjust the seating position using the power seat switch located on the outboard seat cushion side shield.

The available driver side six-way power seat includes a six-way adjustable seat cushion track and a manual recline and fold flat feature. The seat can be electrically adjusted forward, rearward, up, down and seat front only, up and down.

The driver power seat includes a four-way power lumbar support. The lumbar support can be electrically adjusted in, out, up and down.

The power seat contains reversible motors that are connected to worm-drive gearboxes that move the seat through a combination of screw-type drive units. Each motor contains a self-resetting circuit breaker to protect it from overload. Consecutive or frequent resetting of the circuit breakers may damaged the motors.

The power seating system is also available with heated seat and vented seat options. Refer to **DESCRIPTION** and **DESCRIPTION** .

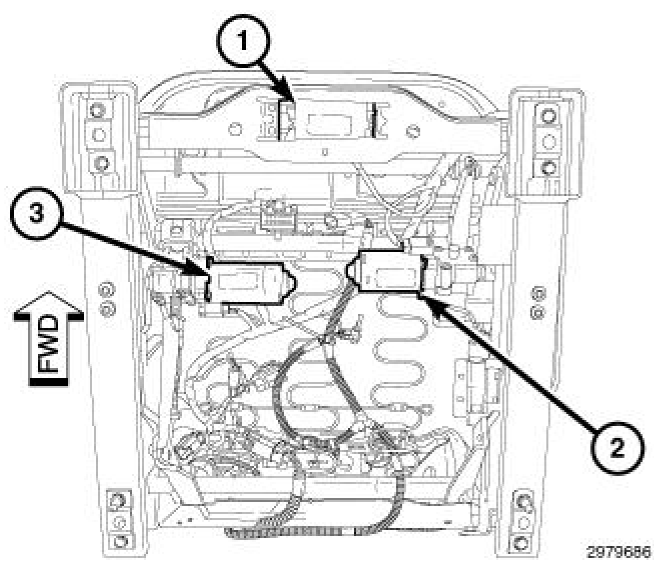

Fig. 1: Fore/Aft Motor, Front Tilt Motor & Rear Tilt Motor
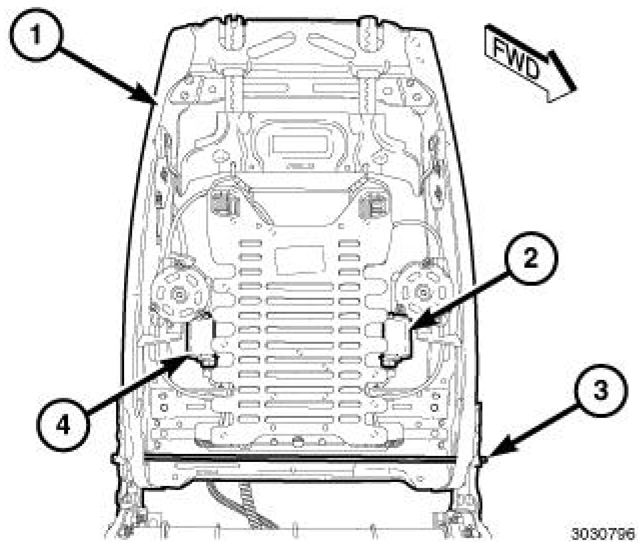
Courtesy of CHRYSLER GROUP, LLC

The power seat track for this vehicle includes the following:

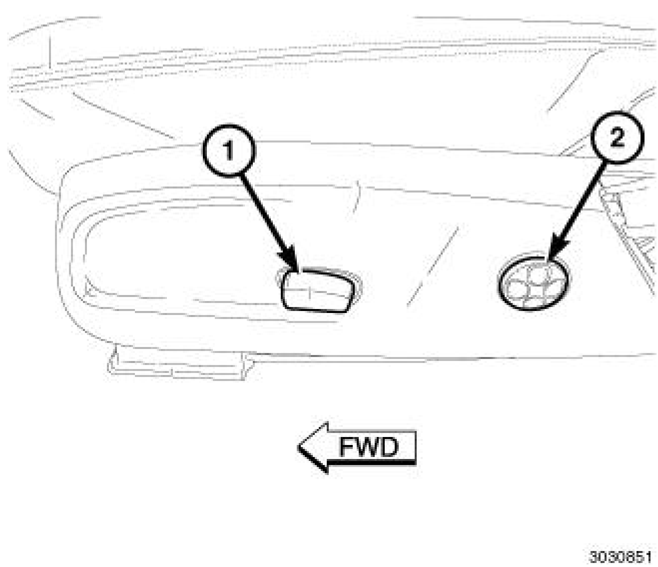
- **Fore/Aft Motor** (1) - located at the front of the seat track.
- **Front Tilt Motor** (2) - located on the left side of the seat track.
- **Rear Tilt Motor** (3) - located on the right side of the seat track.



[Fig. 2: Seat Back, Power Lumbar Motors & Manual Seat Back Recliner]
Courtesy of CHRYSLER GROUP, LLC

The seat back (1) for this vehicle includes the two following major components:

- **Power Lumbar Motors** (2 and 4) - two motors located on the power lumbar mechanism, in seat back frame.
- **Manual Seat Back Recliner** (3) - located on the outboard side of the seat back frame. Controls the up and down movement of the seat back.



[Fig. 3: Seat Position Switch & Lumbar Switch]
Courtesy of CHRYSLER GROUP, LLC

The power seat for this vehicle can include the following switches:

- **Seat Position Switch** (1) - located at the center of the outboard seat cushion trim panel. The power seat switch is a six-way paddle-type lever. Movement of the seat bottom mimics the action of the switch.
- **Lumbar Switch** (2) - located at the rear of the outboard seat cushion trim panel. The power lumbar switch is a four-way rocker type switch. Lumbar support can be increased and decreased, and the support

area can be lowered or raised for added driver comfort.

OPERATION

POWER SEAT SYSTEM

- Only the driver's seat can be equipped with an electrically adjustable lumbar support device.
- Lumbar adjustment allows the backrest support to be altered to improve comfort. It is operated by a special electric motor and controlled by a switch on the seat.
- The circuit is protected by a special fuse and controlled by a relay switch in the luggage compartment.
- Lumbar adjustment is only allowed with ignition-operated exclusion (INT/A).

NOTE: **The front seats are also equipped with backrest angle adjustment, lengthwise adjustment and cushion height adjustment. In this configuration these adjustments are always mechanical, not controlled by electric motors.**

When a power seat switch is actuated, a battery feed and a ground path are applied through the power seat switch contacts to the Memory Seat Motor (MSM). The MSM then applies power and ground to the appropriate motor or motors. The motor and drive unit operate to move the seat adjuster, seat back or lumbar support (when equipped) in the selected direction until the switch is released, or until the travel limit of the drive unit is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor is reversed through the switch contacts. This causes the motor to run in the opposite direction. Power seats remain operational, regardless of the ignition switch position.

The motors, gearboxes and linkage for the power seat adjuster, power reclining seat back and power lumbar support cannot be adjusted or serviced separately. If a motor, gearbox or linkage for the power seat adjuster, power recliner or power lumbar becomes inoperative or damaged, the entire power seat adjuster and pan assembly, or the seat back frame assembly must be replaced.

Lumbar adjustment is only allowed with ignition-operated exclusion (INT/A).

DIAGNOSIS AND TESTING

POWER SEAT SYSTEM

NOTE: **For complete circuit diagrams, refer to appropriate SYSTEM WIRING DIAGRAMS article . Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.**

Operate the power seat switches and power lumbar support switch. Move the seat, seat back and power lumbar support in all directions. The seat and lumbar support should move in each of the selected directions. If any of the power seat and/or lumbar support motors fail to operate in more than one direction, proceed as follows:

1. Inspect the power seat motors, power lumbar motors and Memory Seat Module (MSM) to ensure the electrical connectors are fully connected to the motors. If OK, go to Step 2. If not OK, reconnect the electrical connector(s).
2. Check the power seat fuse in the Power Distribution Center (PDC). If OK, go to Step 3. If not OK,

replace the fuse.

3. Remove the power seat switch and/or power lumbar switch from the seat cushion side panel. Check for battery voltage at the fused B(+) circuit cavity of the switch wire harness connector. If OK, go to Step 4. If not OK, repair the open circuit as required.
4. Check for continuity between the ground circuit cavity of the power seat switch and/or power lumbar switch wire harness connector and a good ground. There should be continuity. If OK, go to Step 5. If not OK, repair the open circuit to ground as required.
5. Test the power seat switch and/or power lumbar switch. Refer to **SWITCH, SEAT, DIAGNOSIS AND TESTING** and **SWITCH, LUMBAR CONTROL, DIAGNOSIS AND TESTING**. If the switch tests OK, check the wire harness between the switch and the MSM and then the MSM and the motor(s) (See appropriate Wiring information). If the circuits check OK, replace the inoperative power seat track and pan assembly or the seat back assembly. If the circuits are not OK, repair the wire harness as required.

SWITCH, LUMBAR CONTROL

DESCRIPTION

DESCRIPTION

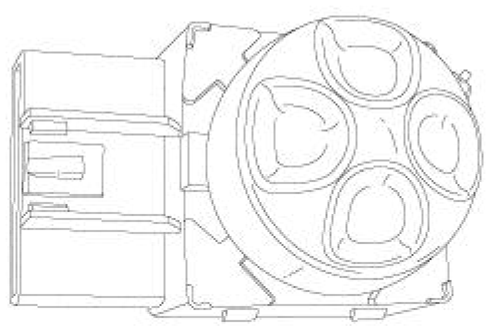


Fig. 4: Power Lumbar Switch
Courtesy of CHRYSLER GROUP, LLC

The driver power lumbar can be adjusted in four different ways using the power lumbar switch, located on the outboard seat cushion side shield, on models so equipped. The power lumbar support can be adjusted inward, outward, upward and downward for added driver comfort.

OPERATION

OPERATION

When the lumbar support switch is actuated, a battery feed and a ground path are applied through the switch contacts to the lumbar support adjuster. The selected lumbar support adjuster motor operates the lumbar support adjuster mechanism through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached. When the switch is moved in the opposite direction, the battery feed and ground

path to the motor are reversed through the switch contacts. This causes the selected lumbar support adjuster motor to run in the opposite direction.

The lumbar support switch should be held applied in any direction after the adjuster has reached its travel limit. The lumbar support adjuster motors each contain a self-resetting circuit breaker to protect them from overload. However, consecutive or frequent resetting of the circuit breaker may result in motor damage.

The lumbar switch cannot be adjusted or repaired and must be replaced if damaged or inoperative.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER LUMBAR SWITCH

NOTE: **For complete circuit diagrams, refer to appropriate SYSTEM WIRING DIAGRAMS article . Wiring Information includes wiring diagrams, connector pin-out and location views, details of wire harness routing and retention, splice and ground locations and proper wire and connector repair procedures.**

DRIVER SEAT

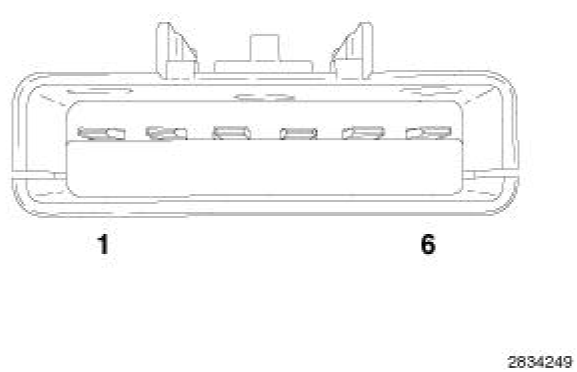

Fig. 5: Power Lumbar Switch Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the power lumbar support switch from the seat. Refer to **SWITCH, LUMBAR CONTROL, REMOVAL**.
3. Use an ohmmeter to test the continuity of the power lumbar support switch using the following table. If not OK, replace the inoperative power lumbar support switch. If switch tests OK, check for an open or short in the power lumbar support circuit wiring. If no open or short is found, replace the power lumbar support adjuster motor(s) as required.

DRIVER SEAT LUMBAR SWITCH CONTINUITY

SWITCH POSITION	CONTINUITY BETWEEN
OFF	1-2, 1-3, 1-4, 1-5, 2-3, 2-4, 2-5, 3-4, 3-5, 4-5

SWITCH POSITION	CONTINUITY BETWEEN
UP	1-2, 1-3, 1-4, 2-3, 2-4, 3-4, 5-6
DOWN	1-3, 1-4, 1-5, 2-3, 2-4, 2-5, 3-4, 3-5, 4-5
IN	1-2, 1-4, 1-5, 2-6, 3-4, 3-5, 4-5
OUT	2-4, 2-5, 3-6, 4-5

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any front seat diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury. Refer to WARNING .

NOTE: Driver seat shown in illustrations. Passenger seat similar.

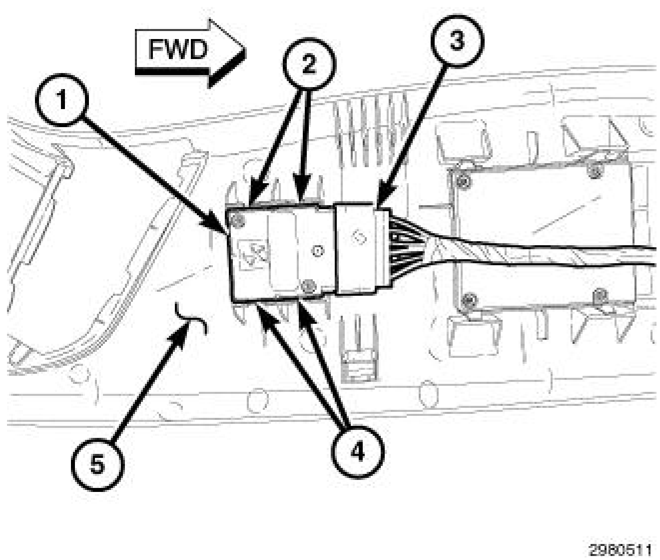

Fig. 6: Electrical Connector, Power Lumbar Control Switch, Seat Cushion Side Trim Panel & Four Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Position the seat being serviced all the way forward.
2. Disconnect and isolate the negative battery cable.

NOTE: It is not necessary to remove the seat belt anchor from the seat when servicing the power lumbar control switch.

3. Remove the outboard seat cushion side trim panel (5) from the seat. Refer to **REMOVAL** .
4. Using Trim Stick (special tool #C-4755, Trim Stick) or equivalent, carefully disengage the four tabs (2 and 4) that secure the lumbar control switch (1) to the seat cushion side trim panel.
5. Disconnect the electric connector (3) from the lumbar control switch and remove the switch.

INSTALLATION

INSTALLATION

NOTE: Driver seat shown in illustrations. Passenger seat similar.

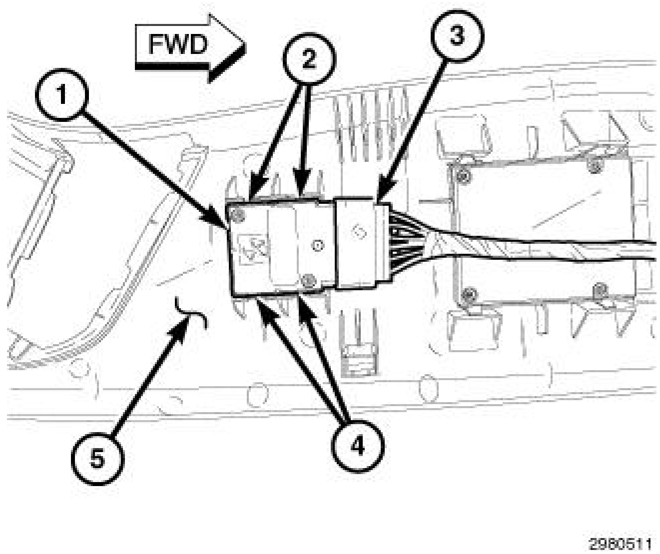

Fig. 7: Electrical Connector, Power Lumbar Control Switch, Seat Cushion Side Trim Panel & Four Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Connect the electrical connector (3) to the power lumbar control switch (1). Make sure the connector is fully engaged to the switch.
2. Position the lumbar control switch to the seat cushion side trim panel (5) and engage the four retaining tabs (2 and 4) that secure the switch to the trim panel. Make sure the retaining tabs are fully engaged.
3. Install the outboard seat cushion side trim panel. Refer to **INSTALLATION** .
4. Connect the negative battery cable.
5. Verify proper power lumbar support operation.

SWITCH, SEAT

DESCRIPTION

DESCRIPTION

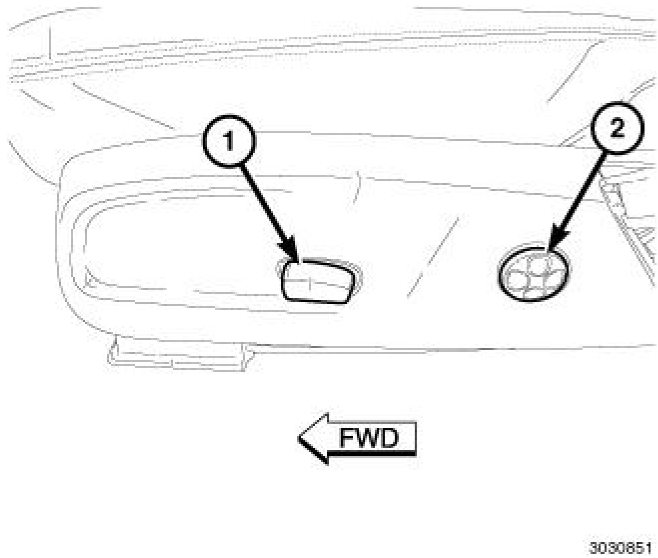

Fig. 8: Seat Position Switch & Lumbar Switch
Courtesy of CHRYSLER GROUP, LLC

The available driver side six-way power seat switch (1) includes a six-way adjustable seat cushion track and a manual recline and fold flat feature. The seat can be electrically adjusted forward, rearward, up, down and seat front only, up and down. The available driver power seat includes a four-way power lumbar support. The lumbar support can be electrically adjusted in, out, up and down by the lumbar seat switch (2).

OPERATION

OPERATION

When a power seat switch is actuated, a hardwired resistive multiplex signal is sent to the Memory Seat Module (MSM). The resistor value indicates which seat motor(s) to drive. The MSM then applies battery feed and ground to the appropriate power seat adjuster or recliner adjuster motor (s). The selected seat adjuster motor operates to move the seat or recliner through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached. When the switch is moved in the opposite direction, the battery feed and ground path from the MSM to the motor are reversed through the switch contacts. This causes the seat adjuster motor to run in the opposite direction.

No power seat switch should be held applied in any direction after the adjuster has reached its travel limit. The power seat adjuster motors each contain a self-resetting circuit breaker to protect them from overload. However, consecutive or frequent resetting of the circuit breaker may result in motor damage.

The individual switches in the power seat switch cannot be adjusted or repaired. If one switch is damaged or inoperative, the entire power seat switch must be replaced.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER SEAT SWITCH

6-WAY DRIVER SEAT

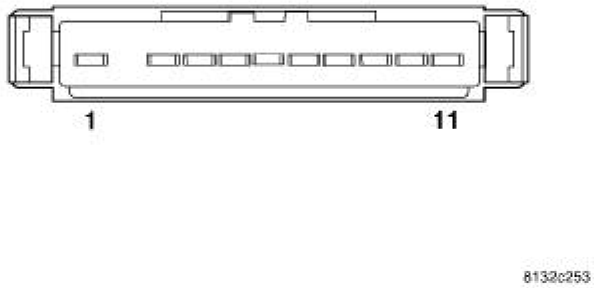

Fig. 9: Power Seat Switch Connector End View
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the power seat switch from the seat. Refer to SWITCH, SEAT, REMOVAL.
3. Use an ohmmeter to test the continuity of the power seat switch using the following table. If not OK, replace the inoperative power seat switch. If switch tests OK, check for an open or short in the power seat circuit wiring. If no open or short is found, replace the power seat track and pan assembly.

6-WAY DRIVER SEAT SWITCH CONTINUITY

SWITCH POSITION	CONTINUITY BETWEEN
OFF	7-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
HORIZONTAL FORWARD	6-8, 7-1, 7-3, 7-4, 7-5, 7-9, 7-10, 7-11
HORIZONTAL REARWARD	6-4, 7-1, 7-3, 7-5, 7-8, 7-9, 7-10, 7-11
FRONT TILT DOWN	6-5, 7-1, 7-3, 7-4, 7-8, 7-9, 7-10, 7-11
FRONT TILT UP	6-9, 7-1, 7-3, 7-4, 7-5, 7-8, 7-10, 7-11
REAR TILT DOWN	6-10, 7-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-11
REAR TILT UP	6-11, 7-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10

REMOVAL

REMOVAL

WARNING: Disable the airbag system before attempting any front seat diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury. Refer to WARNING .

NOTE: Driver seat shown in illustrations. Passenger seat similar.

1. Position the seat being serviced all the way forward.
2. Disconnect and isolate the negative battery cable.

NOTE: **It is not necessary to remove the seat belt anchor from the seat when servicing the power seat switch.**

3. Remove the seat back panel. Refer to **PANEL, SEAT BACK, FRONT, REMOVAL** .

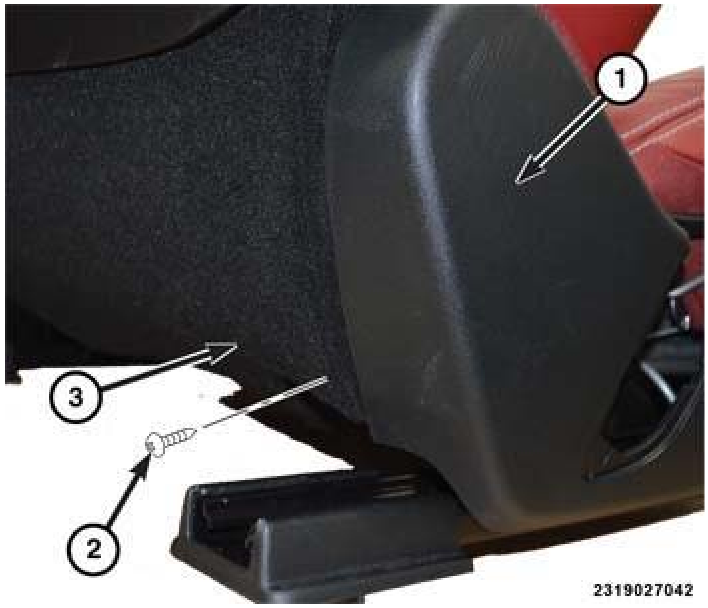

Fig. 10: Back Of Side Shield & Screw
Courtesy of CHRYSLER GROUP, LLC

4. Remove the screw (2) at the back of the side shield (1).
5. Unclip the side shield (1) and position aside to disconnect the wiring harness from the seat switches.

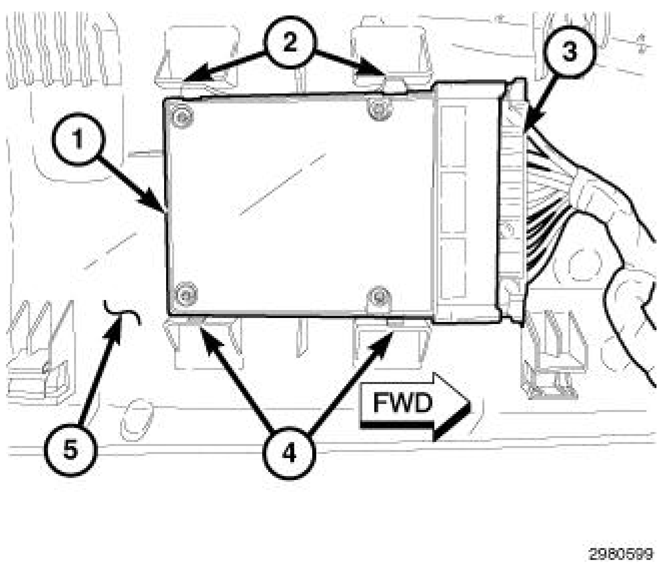

Fig. 11: Electrical Connector, Power Seat Switch, Seat Cushion Side Trim Panel & Four Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

6. Using Trim Stick (special tool #C-4755, Trim Stick) or equivalent, carefully disengage the four tabs (2 and 4) that secure the power seat switch (1) to the seat cushion side trim panel.

7. Disconnect the electric connector (3) from the power seat switch and remove the switch.

INSTALLATION

INSTALLATION

NOTE: **Driver seat shown in illustrations. Passenger seat similar.**

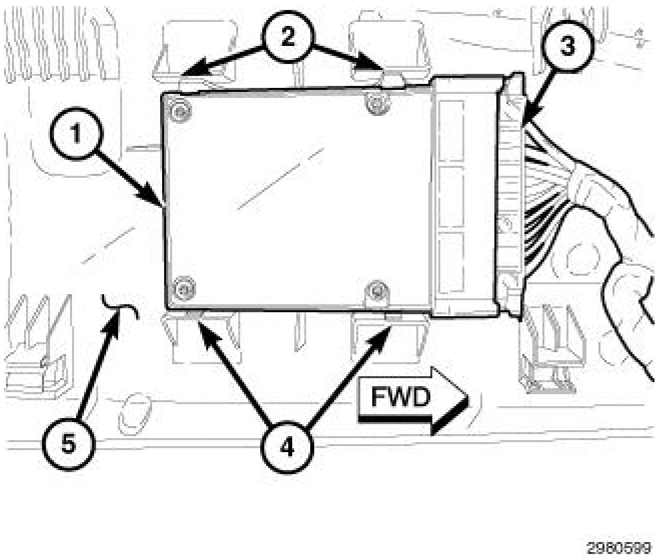

Fig. 12: Electrical Connector, Power Seat Switch, Seat Cushion Side Trim Panel & Four Retaining Tabs
Courtesy of CHRYSLER GROUP, LLC

1. Connect the electrical connector (3) to the power seat switch (1). Make sure the connector is fully engaged to the switch.
2. Position the power seat switch to the seat cushion side trim panel (5) and engage the four retaining tabs (2 and 4) that secure the switch to the trim panel. Make sure the retaining tabs are fully engaged.

Fig. 13: Back Of Side Shield & Screw
Courtesy of CHRYSLER GROUP, LLC

3. Position the side shield (1) close to the seat and connect the wiring connectors to the seat switches.
4. Clip the side shield onto the seat and install screw (2).
5. Install the seat back panel. Refer to **PANEL, SEAT BACK, FRONT, INSTALLATION** .
6. Connect the negative battery cable.
7. Verify proper power seat operation.

Article GUID: A00735976

2015-16 ACCESSORIES AND EQUIPMENT

Power Windows - Service Information - Challenger

DESCRIPTION

DESCRIPTION

The power window system allows each of the door windows to be raised and lowered electrically by actuating a switch on the trim panel of each respective door. A master switch on the driver side front door trim panel allows the driver to raise or lower each of the passenger door windows and to lock out the individual switches on the passenger door from operation. The power window system receives battery feed through a circuit breaker, only when the ignition switch is in the RUN or ACCESSORY position.

The power window system includes the power window switches on each door trim panel, the circuit breaker, and the power window motors inside each door. The power switches are all similar in design and function with exception of the drivers side power switch module however, they are all serviced in the same manner. The power motors are similar as well and can be serviced separately from the window regulators.

OPERATION

OPERATION

POWER WINDOW MOTOR

A permanent magnet reversible motor moves the window regulator through an integral gearbox mechanism. A positive and negative battery connection to the two motor terminals will cause the motor to rotate in one direction. Reversing the current through these same two connections will cause the motor to rotate in the opposite direction. Each individual motor is grounded through the master switch. In addition, each power window motor is equipped with an integral self-resetting circuit breaker to protect the motor from overloads. The power window motor and gearbox assembly cannot be adjusted or repaired. If damaged or ineffective, the entire unit must be replaced.

POWER WINDOW SWITCH

The power windows are controlled by a window/lock switch on the trim panel of each front door. Switches in the driver door window/lock switch allows the driver to control the passenger windows.

The power window switch for the driver side front door window has a second detent position beyond the normal Down position, that provides an automatic one-touch window down feature.

Some vehicles may be equipped with an express closing feature. During an express closing, anytime an obstacle is detected in the way of the glass, the motor will stop and reverses travel to avoid pinching an occupant fingers. Modules in the doors are programmed to compare the position of the glass to the amount of current being used to drive up the glass.

The system also includes various features to manage the perceived forces on the glass as it travels up. If the express closing calibration is lost, the system will self-calibrate itself after the windows are moved up and down two cycles.

The power window switches control the battery and ground feeds to the power window motors. All passenger door power window switches receive their battery and ground feeds through the circuitry of the window/lock switch. When the power window lockout switch is in the Lock position, the battery feed for the individual passenger door power window switches is interrupted.

EXPRESS DOWN WINDOW FEATURE

This feature allows the customer to remotely lower both front door windows at the same time. To use this feature, press and release the UNLOCK button on the RKE transmitter and then immediately press and hold the UNLOCK button until the windows lower to the desired level or until they lower completely.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER WINDOWS

For complete circuit diagrams, **refer to appropriate SYSTEM WIRING DIAGRAMS article.**

ALL WINDOWS INOPERATIVE

1. Check the circuit breaker. If OK, go to Step 2. If not OK, replace the inoperative circuit breaker.
2. Disconnect and isolate the battery negative cable. Remove the window/lock switch from the driver side front door trim panel. Unplug the wire harness connector.
3. Check for continuity between the ground circuit cavity of the door module wire harness connector and a good ground. If OK, go to Step 4. If not OK, repair the circuit to ground as required.
4. Connect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run) circuit cavity of the window/lock switch wire harness connector. If OK, refer to **SWITCH, LOCK, DIAGNOSIS AND TESTING** . If not OK, repair the circuit as required.

ONE WINDOW INOPERATIVE

The window glass must be free to slide up and down for the power window motor to function properly. If the glass is not free to move up and down, the motor will overload and trip the integral circuit breaker. To determine if the glass is free, disconnect the regulator from the glass. Then slide the window up and down by hand.

There is an alternate method to check if the glass is free. Position the glass between the up and down stops. Then, shake the glass in the door. Check that the glass can be moved slightly from side to side, front to rear, and up and down. Then check that the glass is not bound tight in the tracks. If the glass is free, proceed with the diagnosis that follows. If the glass is not free, determine the cause of the condition.

If the only inoperative window is in the driver or passenger side front door and the preceding checks have not identified a problem, refer to **MOTOR, WINDOW REGULATOR, DIAGNOSIS AND TESTING**. If the problem being diagnosed involves only the Auto-down feature for the driver side front door window, but all of the power windows are operational, replace the driver's side window/lock switch. For diagnosis of the window/lock switch, refer to **SWITCH, LOCK, DIAGNOSIS AND TESTING** . For a rear power window problem proceed with the following:

1. Disconnect and isolate the battery negative cable. Unplug the wire harness connector from the power window switch unit on the door with the inoperative power window. Check for continuity between the

ground circuit cavity of the power window switch wire harness connector and a good ground. There should be continuity. If OK, go to Step 2. If not OK, repair the open circuit to the power window and door lock master switch as required.

2. Connect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run) circuit cavity in the body half of the power window switch unit wire harness connector. If OK, go to Step 3. If not OK, repair the open circuit to the power window and door lock master switch as required.
3. Test the power window switch continuity. Refer to **SWITCH, POWER WINDOW, DIAGNOSIS AND TESTING**. If OK, go to Step 4. If not OK, replace the power window switch.
4. Check the continuity in each circuit between the inoperative power window switch wire harness connector cavities and the corresponding power window motor wire harness connector cavities. If OK, refer to **MOTOR, WINDOW REGULATOR, DIAGNOSIS AND TESTING**. If not OK, repair the open circuit(s) as required.

NOTE: **All passenger door power window switches receive their battery and ground feed for operating the passenger door power window motors through the driver side power window and lock master switch and wire harness connector.**

STANDARD PROCEDURE

DOOR MODULE LEARN PROCEDURES

NOTE:

- **This procedure must be performed anytime the power window system has been serviced in either front door or when there is a possible concern with a door module calibration.**
- **The battery must be fully charged or the vehicle running before proceeding with the learn procedure.**
- **All doors must be completely closed before proceeding.**
- **It is suggested to sit inside the vehicle in the drivers seat and close the door.**

Express-up / Express-down possible concerns.

- Glass will not lower all the way down flush to the belt-line.
- Glass will not raise fully; wind noise / water leak.
- Glass will not raise automatically (Expess-up) after lifting the switch to the second detent and releasing.

To relearn the door module memory after module replacement, perform the following procedure:

1. Check and repair any door module Diagnostic Trouble Code (DTC) (s) unrelated to missing calibration before proceeding.
2. Using the window switch, lower the door glass to the full-down position by pushing down (depress) the window switch to its second detent and hold the switch until the door glass is fully open. Continue to hold the window switch down for two seconds after the door glass is fully open.
3. Raise the door glass to the full-up position by pulling up on the window switch and hold the switch until

the door glass is fully closed. Continue to hold the window switch up for two seconds after the door glass is full closed.

4. Code should now be stored. Clear code and test window operations.

To relearn the door module memory after window/regulator replacement, perform the following procedure:

1. Using the scan tool, go to the network topology screen.
2. Click on the Diagnostic Procedures tab at the lower portion of the screen.
3. Run ECU Reset for DDM/PDM.
4. DDM/PDM calibration missing DTC will now set.
5. Using the window switch, lower the door glass to the full-down position by pushing down (depress) the window switch to its second detent and hold the switch until the door glass is fully open. Continue to hold the window switch down for two seconds after the door glass is fully open.
6. Raise the door glass to the full-up position by pulling up on the window switch and hold the switch until the door glass is fully closed. Continue to hold the window switch up for two seconds after the door glass is full closed.
7. DTC will now be stored. Clear code and test window operations.

MOTOR, WINDOW REGULATOR

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - WINDOW MOTOR

NOTE: **Even though the motor has a circuit breaker a fused jumper should be used to avoid any damage to the circuits.**

1. Remove door trim panel. Refer to PANEL, DOOR TRIM, REMOVAL .
2. Connect positive (+) lead from a test battery to either of the two motor terminals.
3. Connect negative (-) lead from test battery to remaining motor terminal.
4. The motor should now rotate in one direction to either move window up or down.
   a. If window happens to already be in full UP position and motor is connected so as to move it in UP direction no movement will be observed.
   b. Likewise, motor connected to move window in DOWN direction no movement will be observed if window is already in full DOWN position.
   c. Reverse battery leads in Step 2 and Step 3 and window should now move. If window does not move, replace motor.
5. If window moved completely up or down, the test leads should be reversed one more time to complete a full window travel inspection.
6. If window does not move, check to make sure that it is free.
7. It is necessary that the window be free to slide up and down in the glass channels. If the window is not free to move up and down, the window lift motor will not be able to move the glass.
8. To determine if the glass is free, disconnect the regulator from the glass lift plate. Remove the two

attaching screws, and slide the window up and down by hand.

REMOVAL

REMOVAL

Refer to **REGULATOR, WINDOW, REMOVAL** .

INSTALLATION

INSTALLATION

SWITCH, POWER WINDOW

DESCRIPTION

DESCRIPTION

0829051259

Fig. 1: Power Window Switch
Courtesy of CHRYSLER GROUP, LLC

A front door power switch module and bezel unit is located near the forward end of the arm rest of each front door trim panel. Two different modules are used: a driver side module, and a passenger side module. Each switch button in both modules is identified with either an International Control and Display Symbol icon or text that clearly identifies the switch function, and each switch button has a Light Emitting Diode (LED) unit soldered to the switch circuit board that provides back lighting of the icon or text for night visibility.

Each switch module housing is secured within the trim panel armrest by four spring clip retainers, two on each side of the switch module housing. The passenger side switch module includes a small cubby bin. A connector receptacle integral to the switch module housing connect the switches to the vehicle electrical system through dedicated take outs and connectors of the door wire harness.

The front door power switch modules include the following switches:

- **Power Lock Switch** - A momentary switch button to control the **Lock** function of the power lock system.
- **Power Unlock Switch** - A momentary switch button to control the **Unlock** function of the power lock system.
- **Power Mirror Selector Switch (Driver Side Switch Only)** - Three mirror selector switch buttons choose the power mirror to be adjusted, **R** (right) or **L** (left).
- **Power Mirror Direction Control Switch (Driver Side Switch Only)** - After a power mirror is selected, pressing down on one of the arrows on the momentary mirror direction switch will move the selected mirror in that direction for as long as it is held down until the limit of the mirror travel is reached.
- **Power Window Switches** - A single two-way, momentary power window switch with a push-to-open and a lift-to-close tab is provide for the passenger door window while the driver side switch module contains two of these power window switches, one switch dedicated to each door window. The switch tab for the driver side front door power window has a second detent in the down direction which is used to activate the **Auto-Down** (also known as express down or one-touch down) feature. A second detent in the up direction on both front door power window switches activates the **Express-Up** feature.

The front door power switch modules cannot be adjusted or repaired. If damaged or ineffective, the entire driver side or passenger side front door switch module must be replaced as a unit.

OPERATION

OPERATION

The driver side front door power switch assembly combines the following switches into a single unit:

- power lock
- power window (for each window including auto-down and express up for both front door windows)
- power mirror selector
- power mirror adjustment in a single unit

The passenger side power door switch module contains a passenger side front door power window switch with the auto-down and express up features.

The driver side front door power switch module provides resistor multiplexed outputs to the driver door module indicating the power lock switch selection. The power window switch selections are hard wired analog outputs indicating the power mirror selector switch, adjustment switch selections, and electronic message outputs over a Local Interface Network (LIN) data bus connection.

The passenger side front door power switch module provides resistor multiplexed outputs to the passenger door module indicating the power window switch selections.

The hard-wired circuits between the driver side front door power switch module and the driver side door module may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic controls and communication between the switch module and the door module or in the diagnosis of the electronic controls and communication between other modules and the door module that provide some features of the power lock, power mirror or power window systems. The most reliable, efficient, and accurate means to diagnose the driver side power switch module or the electronic controls and communication related to power lock, power mirror or power window system operation requires the use of a diagnostic scan tool. Refer to

the appropriate diagnostic information.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - POWER WINDOW SWITCH

Any diagnosis of the Power Windows system should begin with the use of scan tool and the appropriate Diagnostic Service Information.

The hard wired inputs and outputs of the speed control system may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the Local Interface Network (LIN) slave node integral and internal to the door control switch. The most reliable, efficient and accurate means to diagnose the LIN slave node operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

1. Disconnect and isolate the battery negative cable.

Fig. 2: Prying Bezel Of Front Door Switch Module
Courtesy of CHRYSLER GROUP, LLC

2. Insert the (special tool #C-4755, Trim Stick) as shown in illustration and lift to partially release switch from the door panel.

Fig. 3: Lifting Switch From Door Panel
Courtesy of CHRYSLER GROUP, LLC

3. Insert the trim stick as shown in illustration and lift the switch from the door panel.

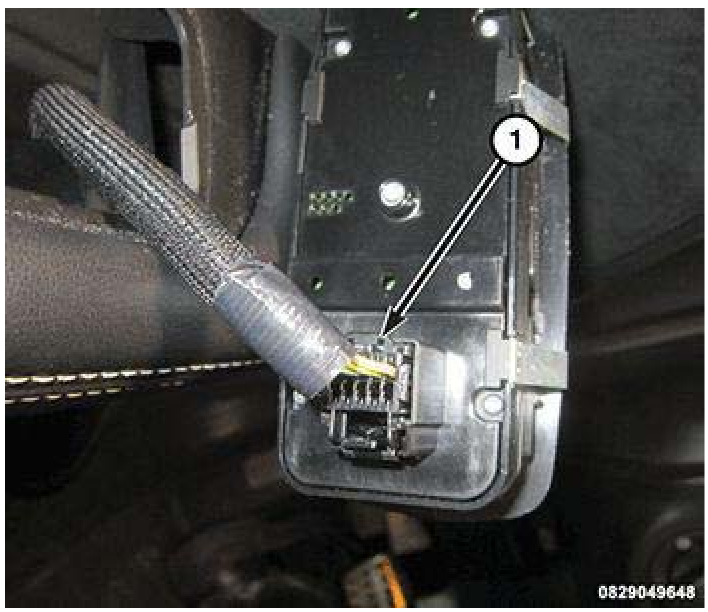

Fig. 4: Front Door Switch Module Connector
Courtesy of CHRYSLER GROUP, LLC

4. Pull the switch module away from the mounting hole far enough to access and disconnect the door wire harness connector (1) from the switch connector receptacle.
5. Remove the switch module from the vehicle.

INSTALLATION

INSTALLATION

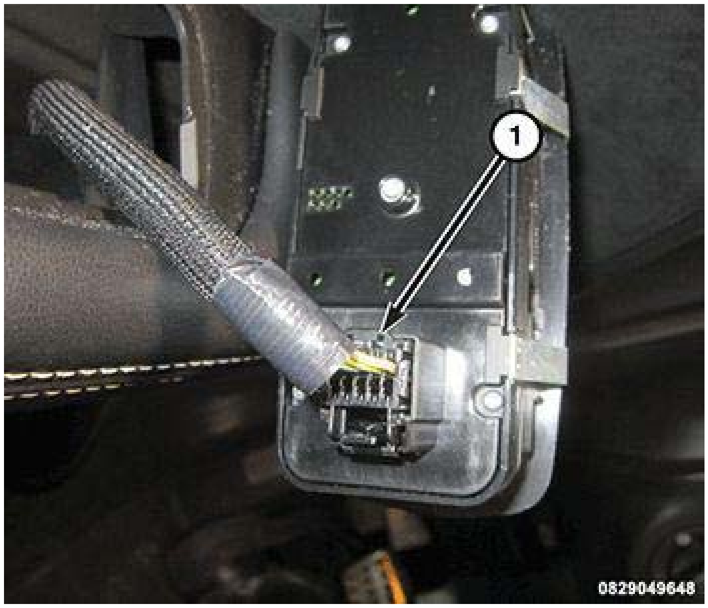

Fig. 5: Front Door Switch Module Connector
Courtesy of CHRYSLER GROUP, LLC

1. Position the front door switch module (1) close enough to the mounting hole in the arm rest of the front door trim panel to access and connect the front door wire harness connector (1) to the switch connector receptacle.
2. Align the switch module to the arm rest mounting hole.
3. Using hand pressure, press the switch module firmly and evenly into the mounting hole until the four spring steel retainers of the switch are fully engaged and the switch bezel is fully seated against the arm rest.
4. Connect the negative battery cable.

.

Article GUID: A00735968

2015-16 DRIVELINE/AXLES

Propeller Shaft - Challenger

DESCRIPTION

DESCRIPTION

NOTE: **The drive shaft components are not serviceable, the drive shaft must be replaced as an assembly.**

Rear wheel drive utilizes a "two-piece" rear drive shaft design to transmit torque to the rear axle assembly. This two-piece design consists of:

- Front and rear shaft segments
- Center support bearing/bracket assembly
- Plunging Cross Grove (CG) Constant Velocity (CV) joint aft of the center bearing
- Plunging CG CV joint at the transmission flange
- Fixed Rzeppa CV joint at the rear axle flange

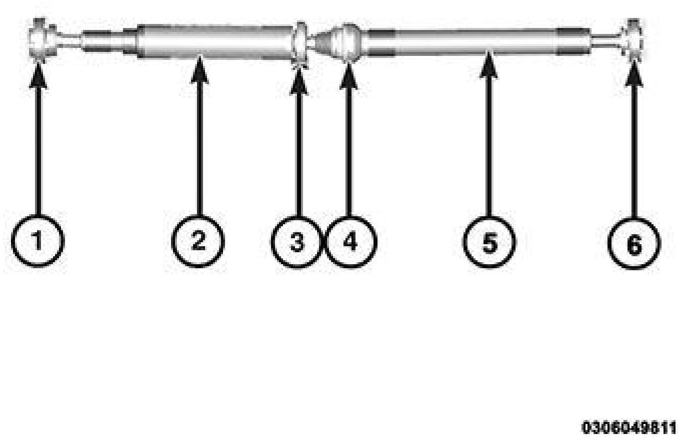

Fig. 1: Driveshaft Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - FRONT PLUNGING CG CV JOINT (TRANSMISSION FLANGE)
2 - FRONT SHAFT SEGMENT
3 - CENTER SUPPORT BEARING/BRACKET ASSEMBLY
4 - PLUNGING CG CV JOINT
5 - REAR SHAFT SEGMENT
6 - FIXED RZEPPA CV JOINT (AXLE FLANGE)

***NEW FASTENER:** Do not reuse these fasteners. If removed, a new fastener must be installed and tightened to specifications. If **NEW** bolts/nuts are not available clean the old bolts/nuts and apply MoparÂ® Lock and Seal Adhesive or equivalent.				

REMOVAL

DRIVE SHAFT

CAUTION: **Drive shaft removal is a two-person operation. Never allow the drive shaft to hang from the center bearing, or while only connected to the transmission or rear axle flanges. An assistant is required. If a drive shaft section is hung unsupported, damage may occur to the shaft, joint and/or center bearing from over-angulation. This may result in driveline vibrations and/or component failure."**

NOTE: **During drive shaft removal or installation avoid any contact with the front and rear joint grease caps. Any damage to the grease cap caused by improper handling during installation or removal could cause a grease leak and subsequent damage to the CV joint. Do not pull on the shaft in order to remove the front joint from the transmission/transfer case flange, this could dent or dislodge the boot and cause a grease leak and subsequent joint failure.**

NOTE: **The use of soft blunt tools is recommended for removal of the joints from companion flanges. Use of sharp pry tools, such as a screwdriver, will damage the joint housing and could result in driveline imbalance.**

1. Raise and support the vehicle. Refer to HOISTING, STANDARD PROCEDURE .

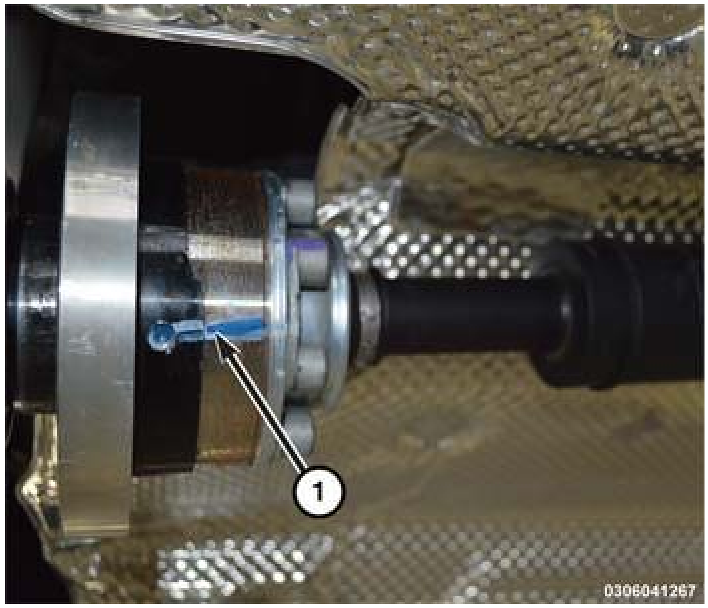

Fig. 2: Alignment Index Marks
Courtesy of CHRYSLER GROUP, LLC

2. Apply alignment index marks (1) on the transmission and axle flanges.
3. Remove the rear exhaust system. Refer to **MUFFLER, EXHAUST, REMOVAL** .

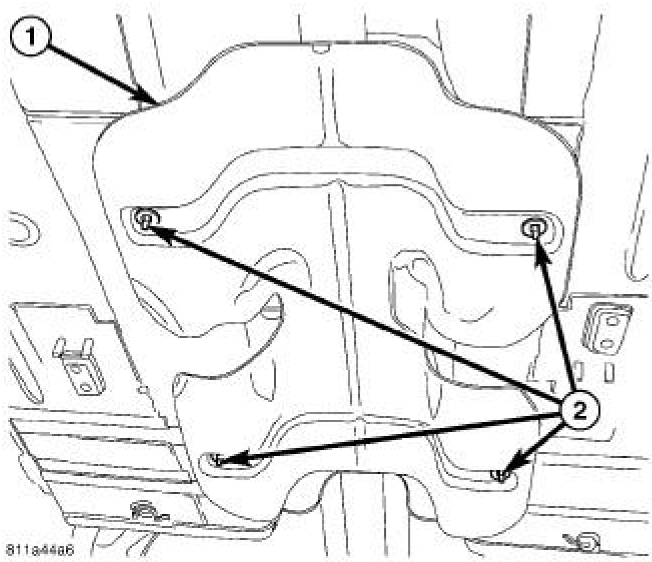

Fig. 3: Heat Shield
Courtesy of CHRYSLER GROUP, LLC

4. Remove the heat shield nuts (2) and the heat shield (1).

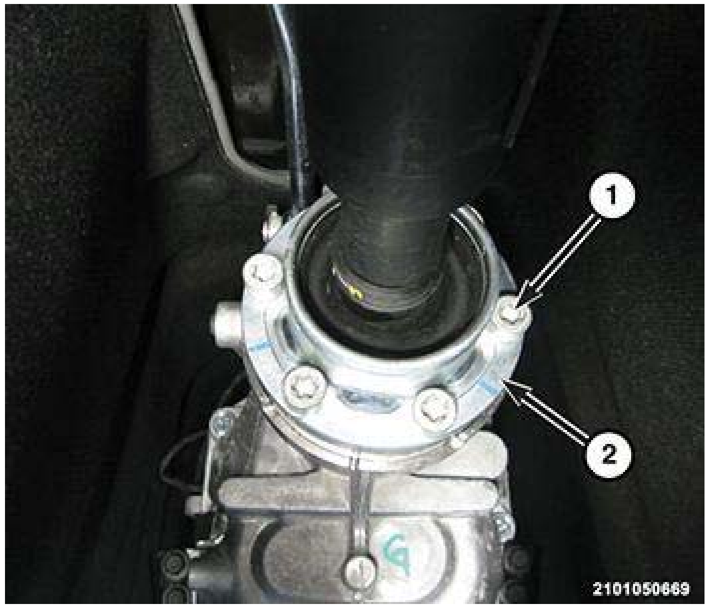

Fig. 4: Bolts And Washers & Transmission Flange
Courtesy of CHRYSLER GROUP, LLC

5. Remove and discard the drive shaft to transmission flange (1) bolts and washers (2).

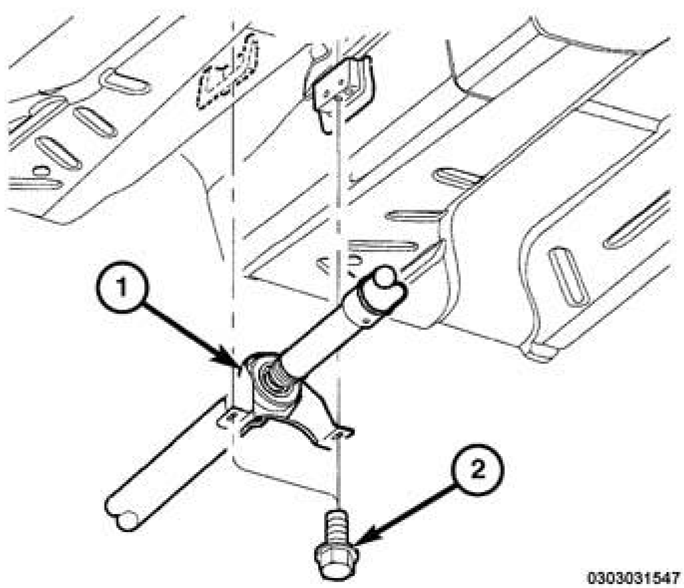

Fig. 5: Center Bearing & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Remove the center bearing bracket (1) bolts (2).

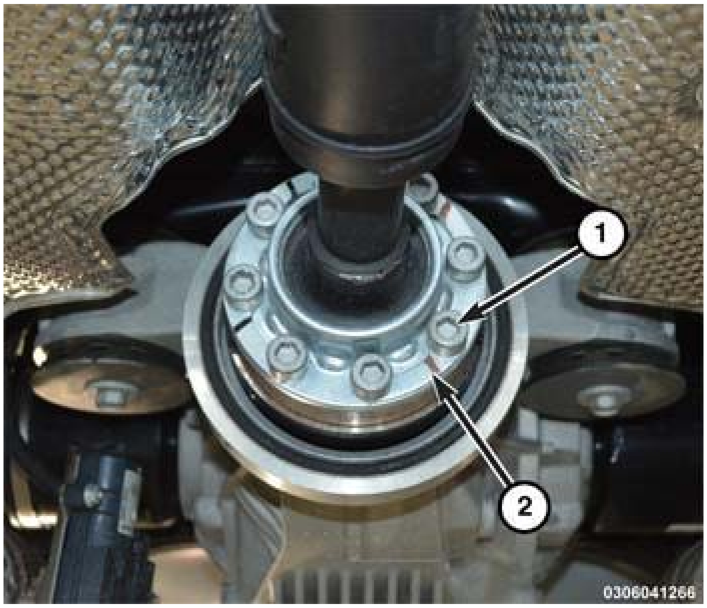

Fig. 6: Drive Shaft To Axle Flange Bolts & Washers

7. Remove and discard the drive shaft to axle flange bolts (1) and washers (2).
8. With the aid of an assistant, remove the drive shaft assembly.

INSTALLATION

DRIVE SHAFT

CAUTION: **Drive shaft removal is a two-person operation. Never allow the drive shaft to hang from the center bearing, or while only connected to the transmission or rear axle flanges. An assistant is required. If a drive shaft section is hung unsupported, damage may occur to the shaft, joint and/or center bearing from over-angulation. This may result in driveline vibrations and/or component failure."**

NOTE: **During drive shaft removal or installation avoid any contact with the front and rear joint grease caps. Any damage to the grease cap caused by improper handling during installation or removal could cause a grease leak and subsequent damage to the CV joint. Do not pull on the shaft in order to remove the front joint from the transmission/transfer case flange, this could dent or dislodge the boot and cause a grease leak and subsequent joint failure.**

NOTE: **Drive shaft bolts must be replaced with NEW . If NEW bolts are not available clean the old bolts and apply MoparÃ® Lock and Seal Adhesive or equivalent.**

NOTE: **To avoid driveline vibration or damage, it is critical that all components are reinstalled in their original orientations.**

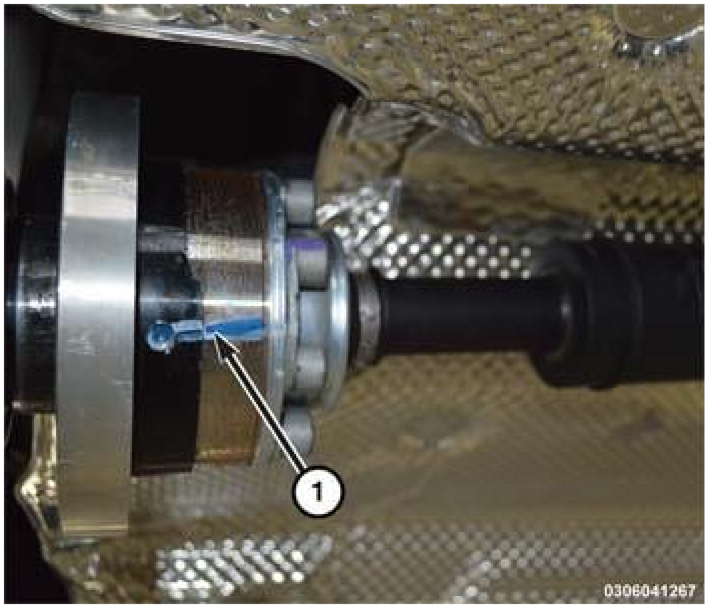

Fig. 7: Alignment Index Marks
Courtesy of CHRYSLER GROUP, LLC

1. With the aid of an assistant, install the drive shaft into position at the axle flange and align the index marks (1) made upon removal.

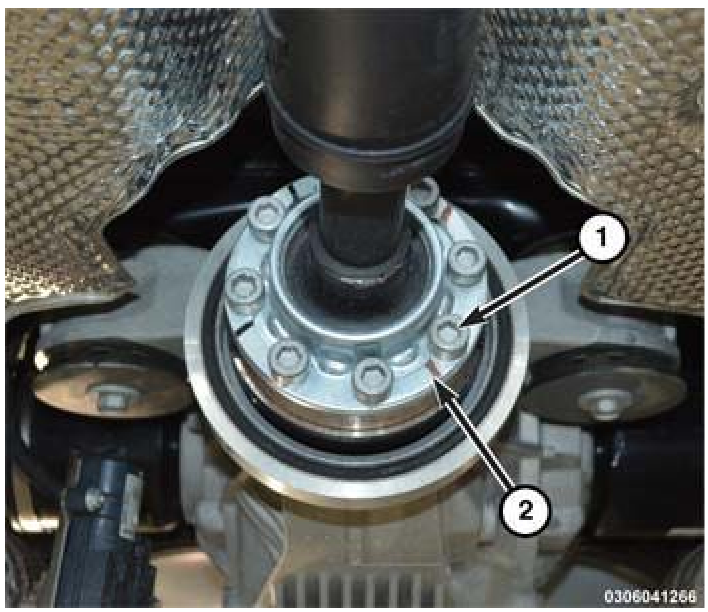

Fig. 8: Drive Shaft To Axle Flange Bolts & Washers
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Drive shaft bolts must be replaced with NEW . If NEW bolts are not available clean the old bolts and apply MoparÃ® Lock and Seal Adhesive or equivalent.**

2. Install the **NEW** drive shaft to axle flange washers (2) and bolts (1) by hand. Do not tighten at this time.

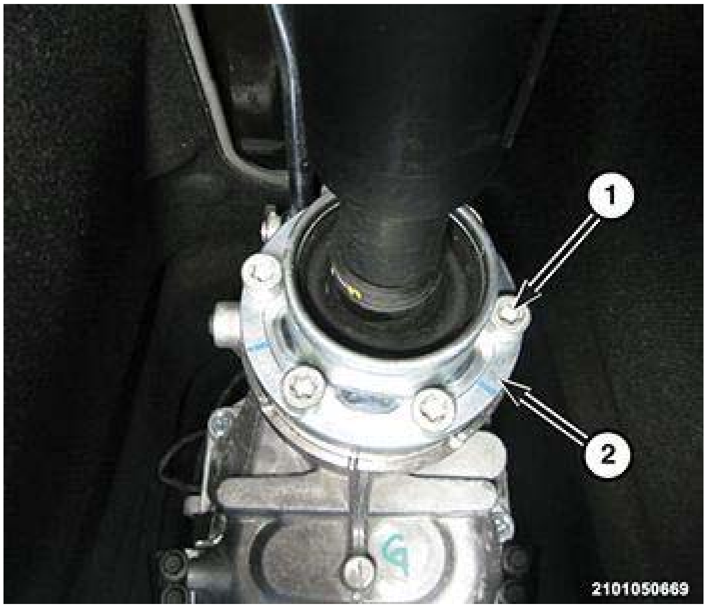

Fig. 9: Bolts And Washers & Transmission Flange
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Drive shaft bolts must be replaced with NEW . If NEW bolts are not available clean the old bolts and apply MoparÂ® Lock and Seal Adhesive or equivalent.**

3. Install drive shaft into position at the transmission flange. Align index marks made upon removal. Install the **NEW** drive shaft to transmission flange washers (2) and drive shaft bolts (1) by hand. Do not tighten at this time.

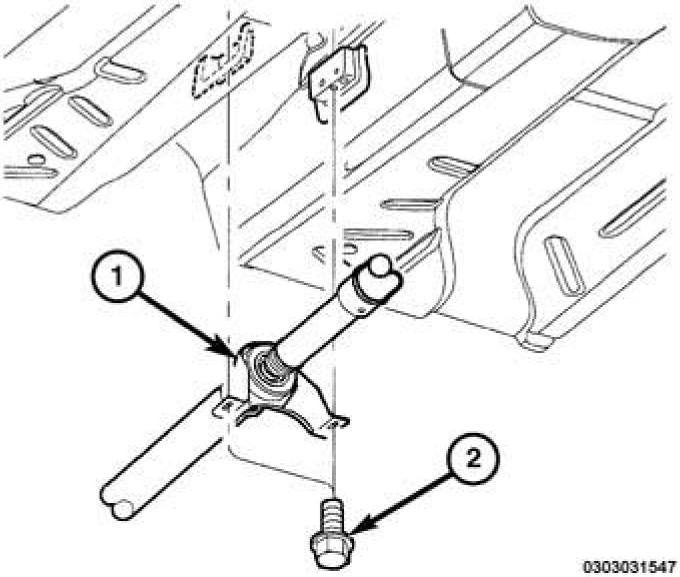

Fig. 10: Center Bearing & Mounting Bolts
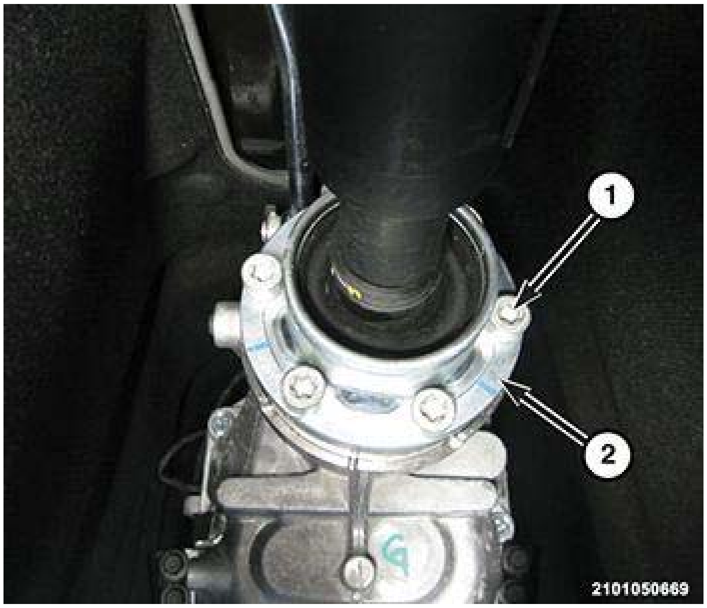
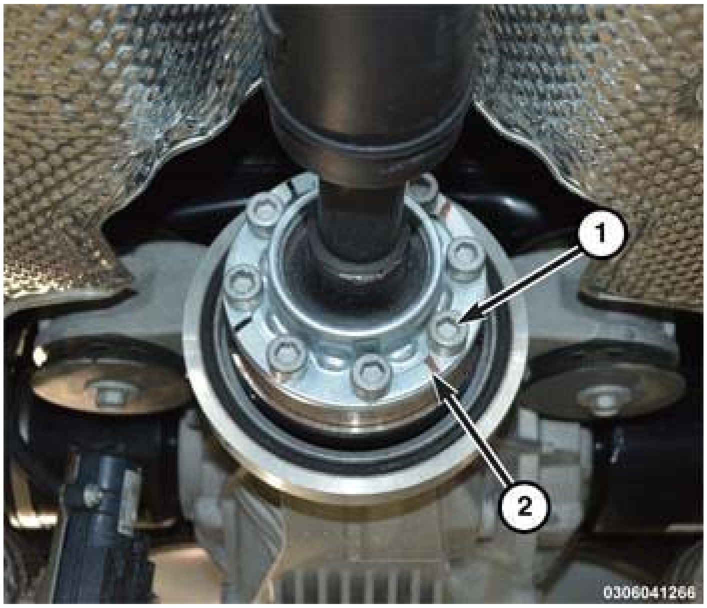
Courtesy of CHRYSLER GROUP, LLC

4. Position the center bearing (1) in place and loosely install the center bearing to body bolts (2) by hand. Do not tighten at this time.



[Fig. 11: Bolts And Washers & Transmission Flange](#)
Courtesy of CHRYSLER GROUP, LLC

5. Tighten the drive shaft to transmission flange bolts (1) in a star pattern to 66 Nm (49 ft.-lbs.).



[Fig. 12: Drive Shaft To Axle Flange Bolts & Washers](#)

DESCRIPTION

DESCRIPTION

The 195 MM RIA (Rear-Independent-Aluminum) axle is an independent assembly with an aluminum housing and differential.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - AXLE

DIAGNOSTIC CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
WHEEL NOISE	1. Wheel loose.	1. Tighten loose lug nuts.
	2. Faulty, brinelled wheel bearing.	2. Replace wheel bearing.
LOSS OF LUBRICANT	1. Lubricant level too high.	1. Drain lubricant to the correct level.
	2. Worn axle seals.	2. Replace axle seals.
	3. Worn pinion seal.	3. Replace pinion seal.
	4. Worn/scored pinion flange journal.	4. Replace axle assembly.
	5. Axle cover not properly sealed.	5. Replace axle assembly.
	6. Vent hose/gore vent position is not vertical	6. Replace gore vent/hose assembly, install in 12 O'Clock orientation.
AXLE OVERHEATING	1. Lubricant level low.	1. Fill differential to correct level.
	2. Improper grade of lubricant.	2. Fill differential with the correct fluid type and quantity.
	3. Bearing preload too high.	3. Replace axle assembly.
	4. Insufficient ring gear backlash.	4. Replace axle assembly.
GEAR TEETH BROKE	1. Overloading.	1. Replace axle assembly.
	2. Improper adjustments.	2. Replace axle assembly.
AXLE NOISE	1. Insufficient lubricant.	1. Fill axle with the correct fluid type and quantity.
	2. Improper ring gear and pinion adjustment.	2. Replace axle assembly.
	3. Unmatched ring gear and pinion.	3. Replace axle assembly.

CONDITION	POSSIBLE CAUSE	CORRECTION
	4. Worn teeth on ring gear and/or pinion.	4. Replace axle assembly.
	5. Loose pinion bearings.	5. Replace axle assembly.
	6. Loose differential bearings.	6. Replace axle assembly.
	7. Misaligned or sprung ring gear.	7. Replace axle assembly.
	8. Housing not machined properly.	8. Replace axle assembly.

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, incorrect pinion depth, tooth contact, worn/damaged gears, or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly:

- Check for insufficient lubricant.

Differential side gears and pinions can be checked by turning the vehicle. They usually do not cause noise during straight-ahead driving when the gears are unloaded. The side gears are loaded during vehicle turns. A worn pinion shaft can also cause a snapping or a knocking noise.

BEARING NOISE

The differential and pinion bearings can produce noise when worn or damaged. Bearing noise can be either a whining, or a growling sound.

Pinion bearings have a constant-pitch noise. This noise changes only with vehicle speed. Pinion bearing noise will be higher pitched because it rotates at a faster rate.

Worn or damaged differential bearings usually produce a low pitch noise. Differential bearing noise is similar to pinion bearing noise. The pitch of differential bearing noise is also constant and varies only with vehicle speed.

Wheel hub bearings produce noise and vibration when worn or damaged. The noise generally changes when the bearings are loaded. Road test the vehicle. Turn the vehicle sharply to the left and to the right. This will load the bearings and change the noise level. Where axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 mph.

LOW SPEED KNOCK

Low speed knock is generally caused by a worn joint or by worn side-gear thrust washers. A worn pinion shaft bore will also cause low speed knock.

VIBRATION

Vibration at the rear of the vehicle is usually caused by a:

- Damaged propeller shaft.
- Missing propeller shaft balance weight(s).
- Worn or out-of-balance wheels.
- Loose wheel lug nuts.
- Worn Constant Velocity (CV) joints.
- Loose/broken springs.
- Loose pinion gear nut.
- Excessive pinion CV flange run out.
- Bent halfshaft(s).

Check for loose or damaged front-end components or engine/transmission mounts. These components can contribute to what appears to be a rear end vibration. Do not overlook engine accessories, brackets and drive belts.

All driveline components should be examined before starting any repair.

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear, can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn Constant Velocity (CV) joints.
- Worn or broken axle mount isolators.
- Loose pinion gear nut and CV flange.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

The source of a snap or a clunk noise can be determined with the assistance of a helper. Raise the vehicle on a hoist with the wheels free to rotate. Instruct the helper to shift the transmission into gear. Listen for the noise, a mechanics stethoscope is helpful in isolating the source of a noise.

STANDARD PROCEDURE

STANDARD PROCEDURE - FLUID DRAIN AND FILL

1. Drive the vehicle until the differential lubricant is at the normal operating temperature.

   NOTE: The vehicle must be LEVEL .

2. Raise and support the vehicle and hold vehicle at curb position. Refer to **HOISTING, STANDARD PROCEDURE** .

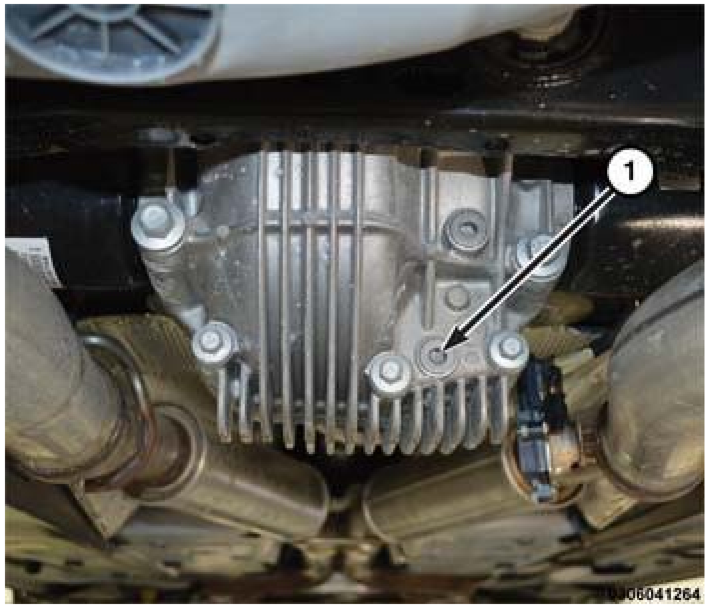

Fig. 1: Rear Axle Drain Plug
Courtesy of CHRYSLER GROUP, LLC

3. Remove the rear axle drain plug (1) and drain the lubricant completely from the axle.
4. Install the rear axle drain plug (1) and tighten to the proper specification. Refer to **SPECIFICATIONS** .

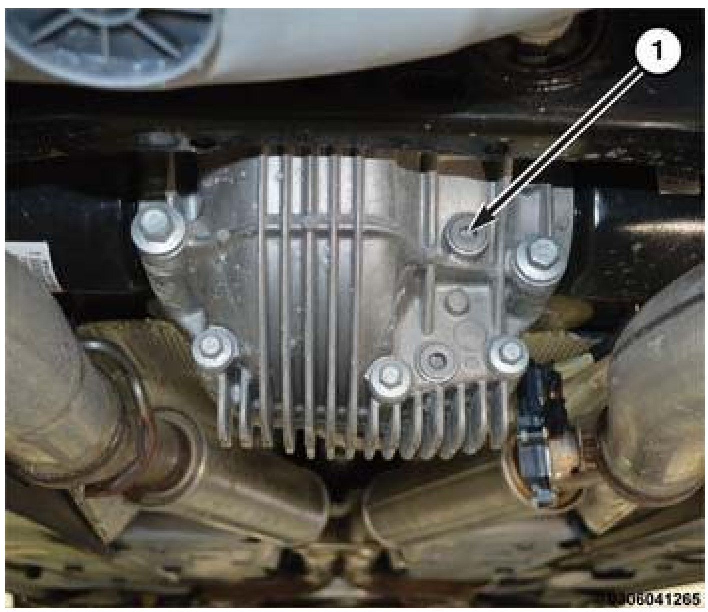

Fig. 2: Rear Axle Fill Plug
Courtesy of CHRYSLER GROUP, LLC

5. Fill the rear axle to the correct level. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
6. Install the rear axle fill plug (1) and tighten to the proper specification. Refer to **SPECIFICATIONS** .

***NEW FASTENER:** Do not reuse these fasteners. If removed, a new fastener must be installed and tightened to specifications.				

REMOVAL

REAR AXLE

NOTE: **This procedure requires the compression of the rear suspension to ride height. A drive-on hoist should be used. If a drive-on hoist is not used, screw-style under-hoist jack stands are required to compress the rear suspension, facilitating rear halfshaft removal.**

CAUTION: **Never grasp halfshaft assembly by the inner or outer boots. Doing so may cause the boot to pucker or crease, reducing the service life of the boot and joint. Avoid over angulating or stroking the C/V joints when handling the halfshaft.**

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the rear exhaust system. Refer to **MUFFLER, EXHAUST, REMOVAL** .

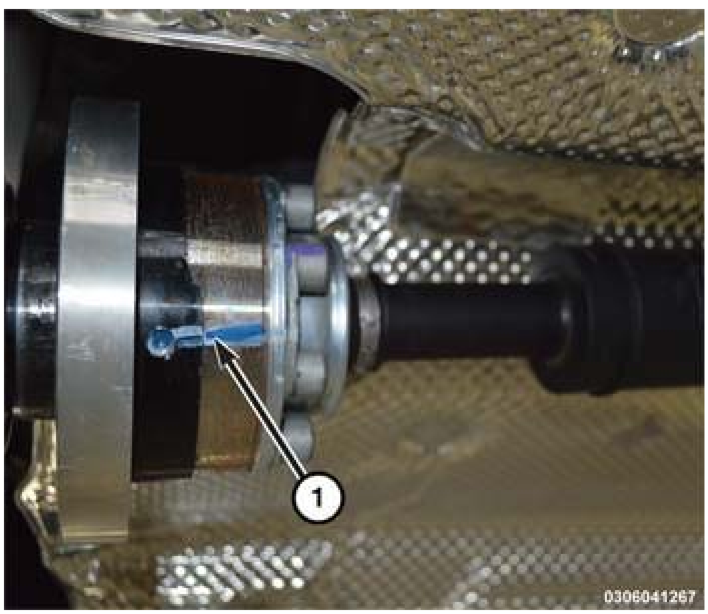

Fig. 3: Alignment Index Marks
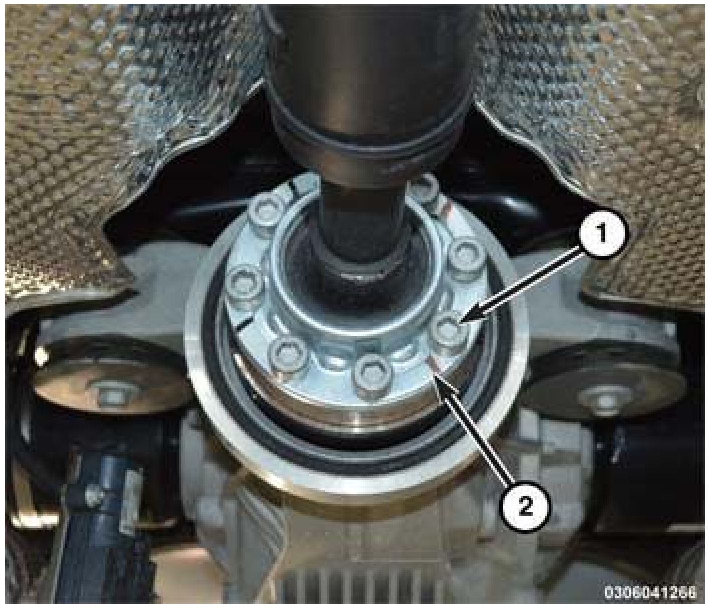
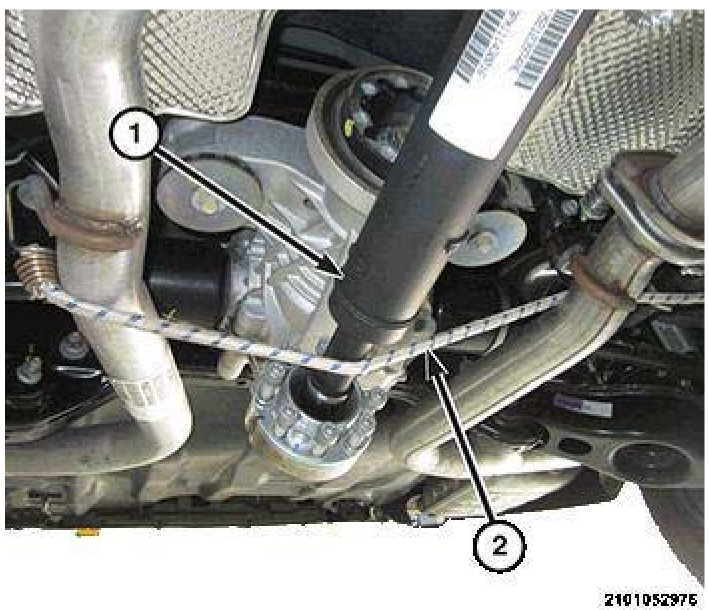
Courtesy of CHRYSLER GROUP, LLC

3. Apply alignment index marks (1) to the drive shaft and the axle flange.



[Fig. 4: Drive Shaft To Axle Flange Bolts & Washers](#)
Courtesy of CHRYSLER GROUP, LLC

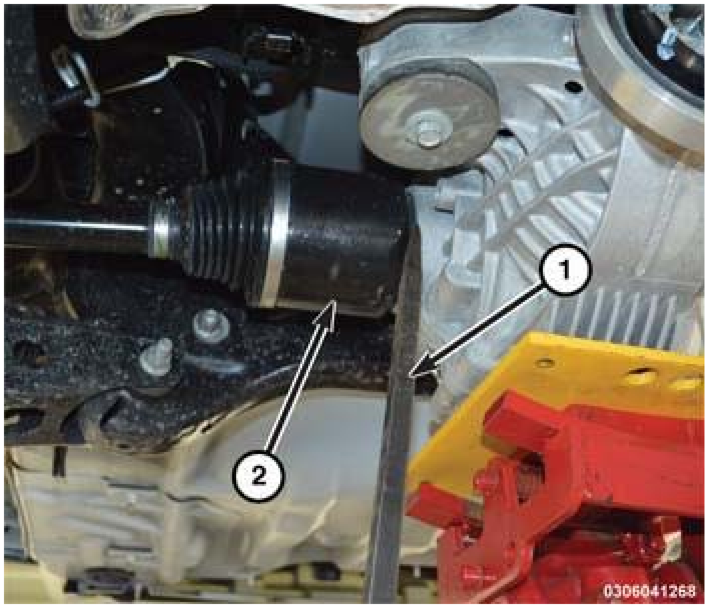
4. Remove and discard the drive shaft to axle flange bolts (1) and washers (2).



[Fig. 5: Supporting Drive Shaft With Strap](#)
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Do not let the drive shaft hang on the center support bearing.**

5. Support the drive shaft (1) with a strap (2) or equivalent.



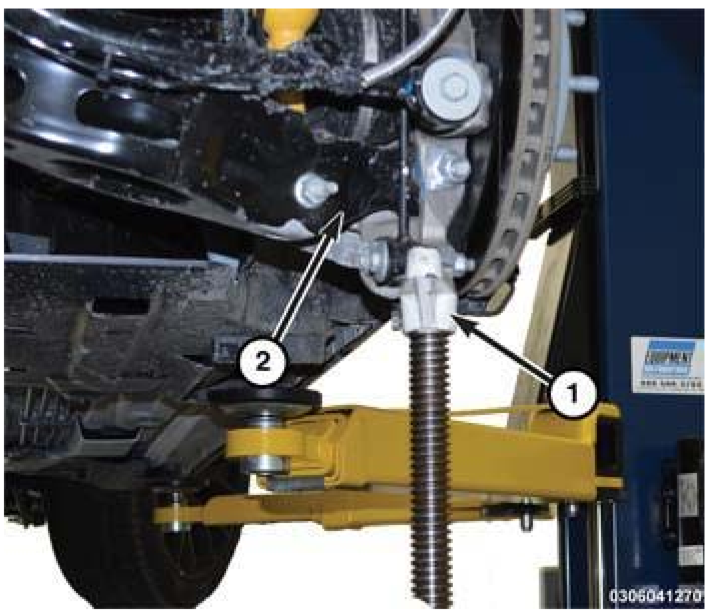
[Fig. 6: Removing Halfshaft]

Courtesy of CHRYSLER GROUP, LLC

NOTE: **Do not damage the axle seal, axle seal dust cover, and halfshaft boot.**

NOTE: **Left Hand (LH) side shown in illustration, Right Hand (RH) side similar.**

6. Using a suitable screwdriver (1), partially disengage the halfshafts (2) from the axle assembly.



[Fig. 7: Screw-Style Under-Hoist Jack Stand & Rear Suspension]

Courtesy of CHRYSLER GROUP, LLC

7. If a drive-on hoist is not used, compress the rear suspension (2) using a screw-style under-hoist jack stand (1), and position a transmission jack under the rear axle assembly.

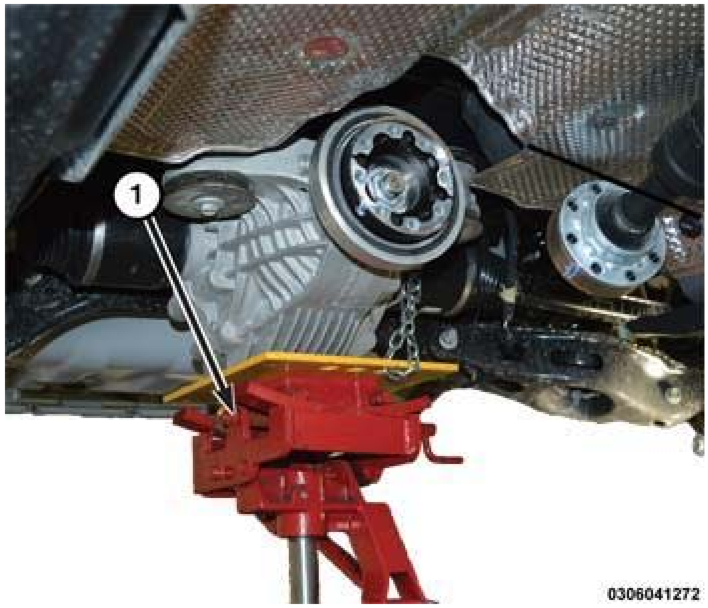


Fig. 8: Transmission Jack
Courtesy of CHRYSLER GROUP, LLC

8. Position the transmission jack (1) under the rear axle assembly.

10. Remove the two rear axle to crossmember bolts (1) from the rear axle.

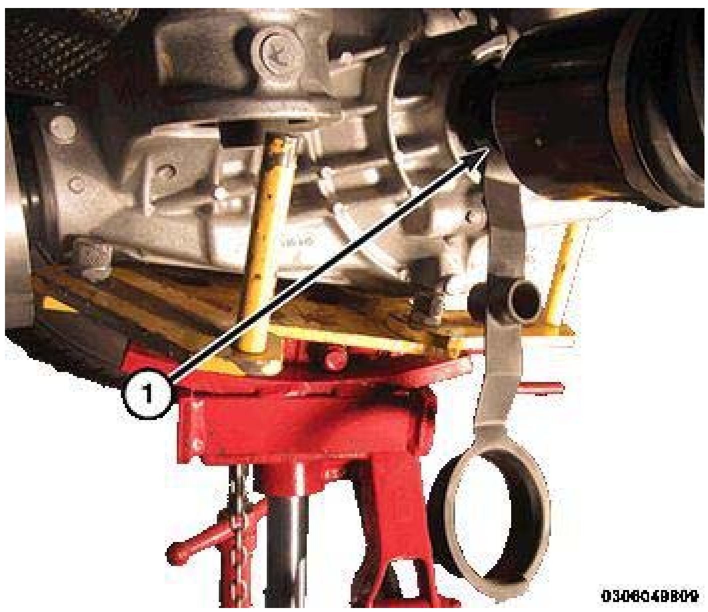

Fig. 11: Half Shaft Protector
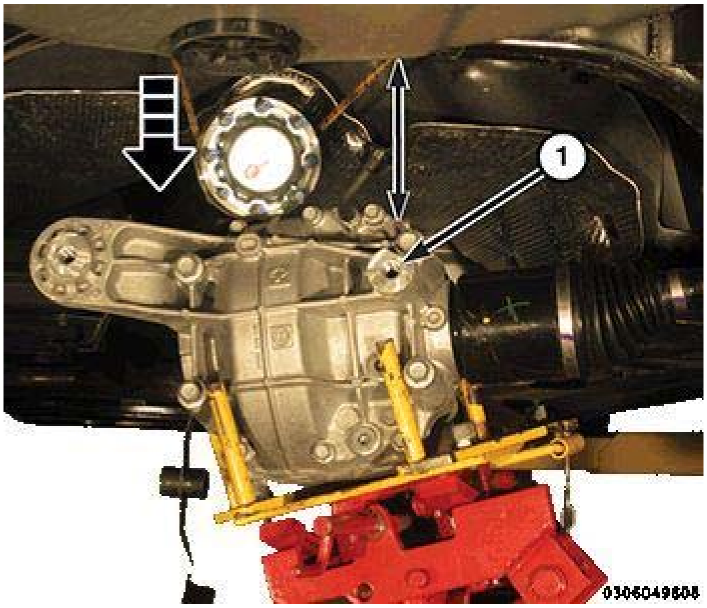
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Left Hand (LH) side shown in illustration, Right Hand (RH) side similar.**

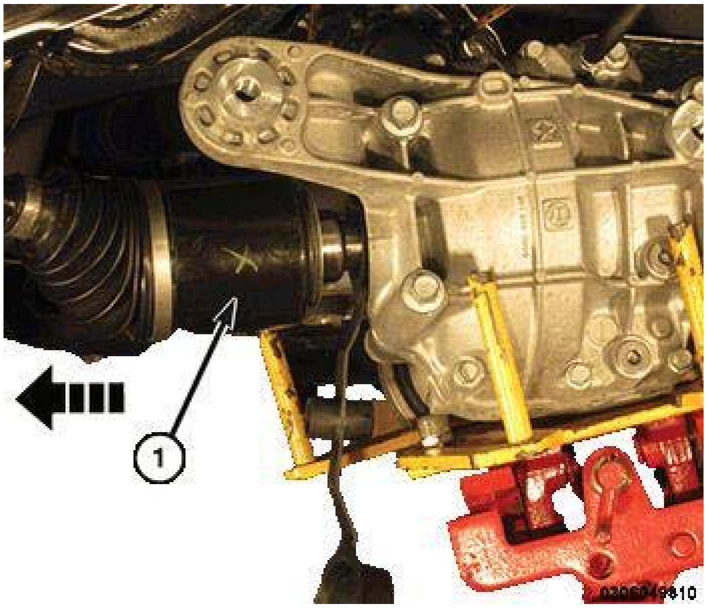
11. Install the Protector, Half Shaft, Drive (special tool #10270, Protector, Half Shaft, Drive) (1).



[Fig. 12: Lowering Rear Axle]
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Left Hand (LH) side shown in illustration, Right Hand (RH) side similar.**

12. Lower the rear axle (1) approximately six inches and push the rear axle assembly towards the front of the vehicle.



[Fig. 13: Removing Halfshaft]
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Do not allow the halfshaft splines to come in contact with the halfshaft seal.**

13. With the aid of an assistant, shift the rear axle assembly in one direction and compress one halfshaft inner joint as far as possible while removing the other halfshaft (1).

14. Remove the rear axle assembly from vehicle.

INSTALLATION

REAR AXLE

1. Install new circlip (s), on the halfshaft (s).

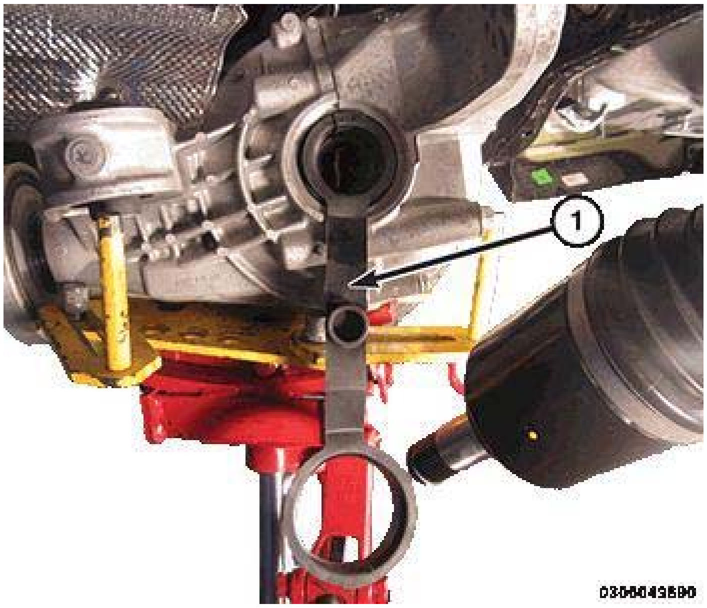


Fig. 14: Protector Installed In Rear Axle
Courtesy of CHRYSLER GROUP, LLC

2. Install the Protector, Half Shaft, Drive (special tool #10270, Protector, Half Shaft, Drive) (1) in the rear axle.

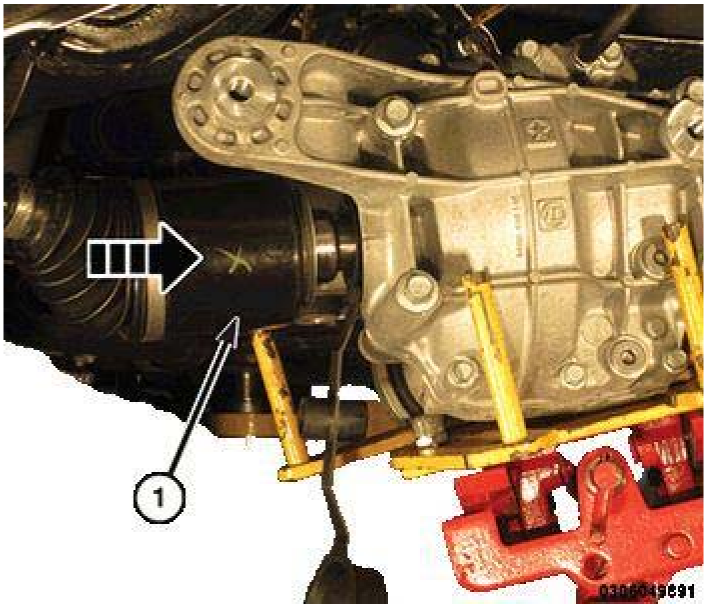

Fig. 15: Installing Halfshaft
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Use care when installing halfshaft to axle assembly. The halfshaft installation angle should be minimized to avoid damage to seal upon installation.**

NOTE: **Use care not to damage the axle seal or the seal dust cover.**

3. With the Protector, Half Shaft, Drive (special tool #10270, Protector, Half Shaft, Drive) (1) installed and the aid of an assistant, shift the rear axle assembly in one direction and compress one halfshaft inner joint as far as possible while installing the other halfshaft (1).

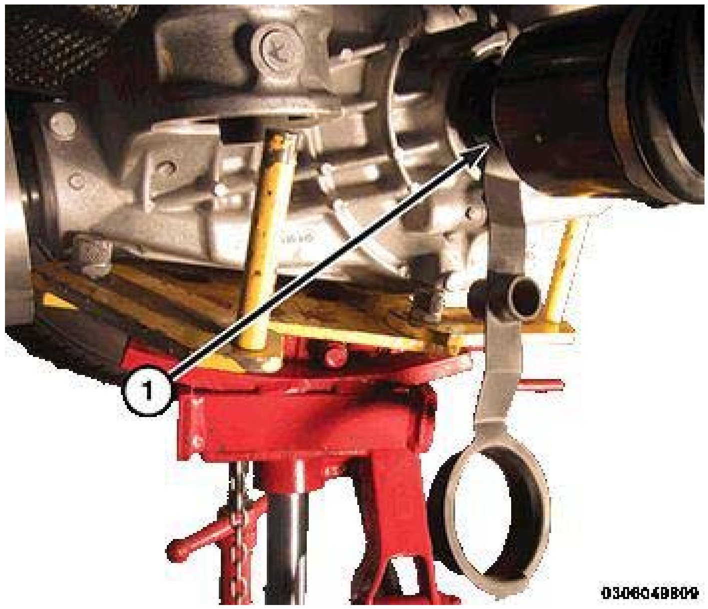

Fig. 16: Half Shaft Protector
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Do not grasp the rubber boot or the axle bar when checking for proper installation.**

4. Remove the Protector, Half Shaft, Drive (special tool #10270, Protector, Half Shaft, Drive) (1) and fully install the halfshaft in the rear axle. Verify proper installation by pulling outward on the joint by hand.
5. Raise the rear axle into position.

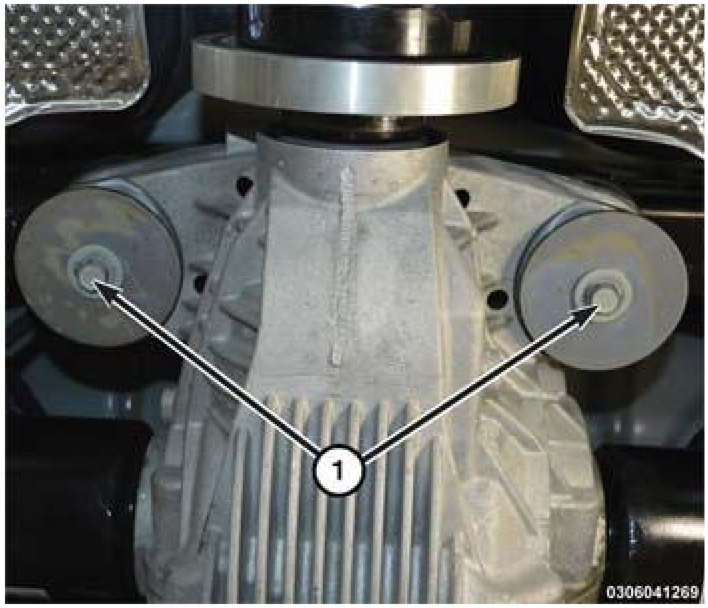

Fig. 17: Rear Axle Forward Mount Isolator Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Install the **NEW** rear axle forward mount isolator bolts (1) hand tight.

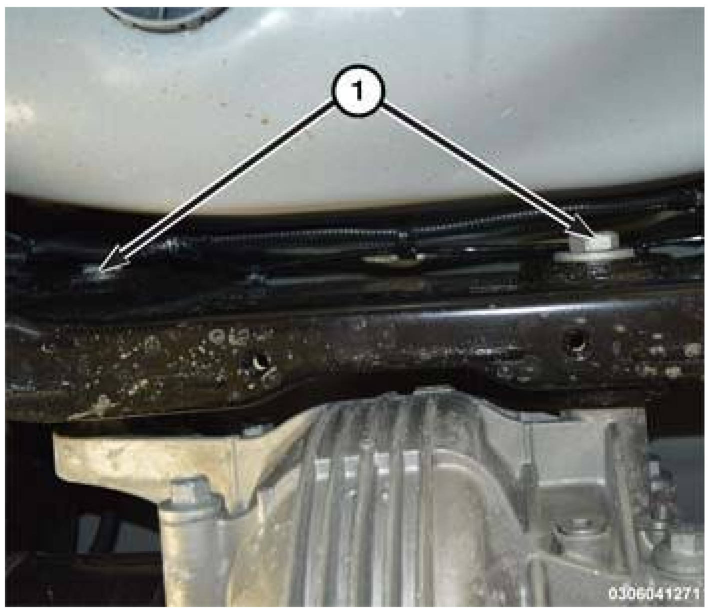

Fig. 18: Rear Axle To Crossmember Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Install the rear axle to crossmember bolts (1) hand tight.
8. Tighten the **NEW** rear axle forward mount isolator bolts to the proper specification. Refer to **SPECIFICATIONS** .
9. Tighten the rear axle to crossmember bolts to the proper specification. Refer to **SPECIFICATIONS** .
10. Again verify halfshaft inner joints are fully engaged in the axle assembly.

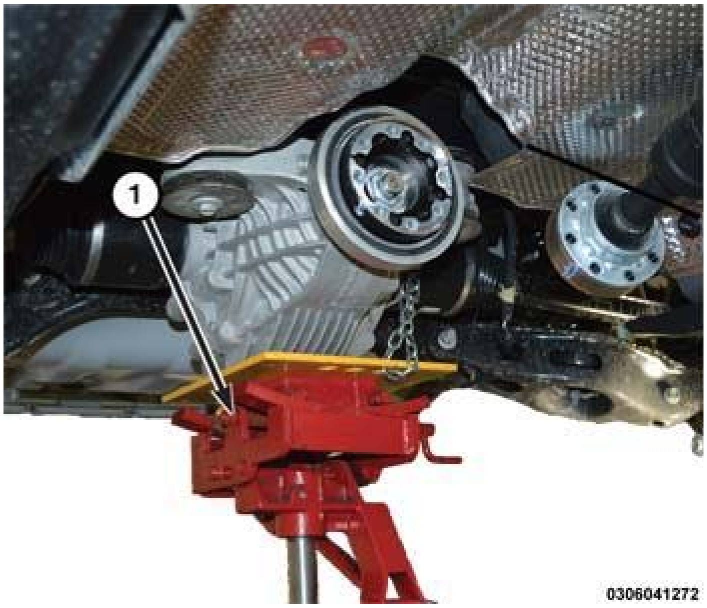

Fig. 19: Transmission Jack
Courtesy of CHRYSLER GROUP, LLC

11. Remove transmission jack (1).

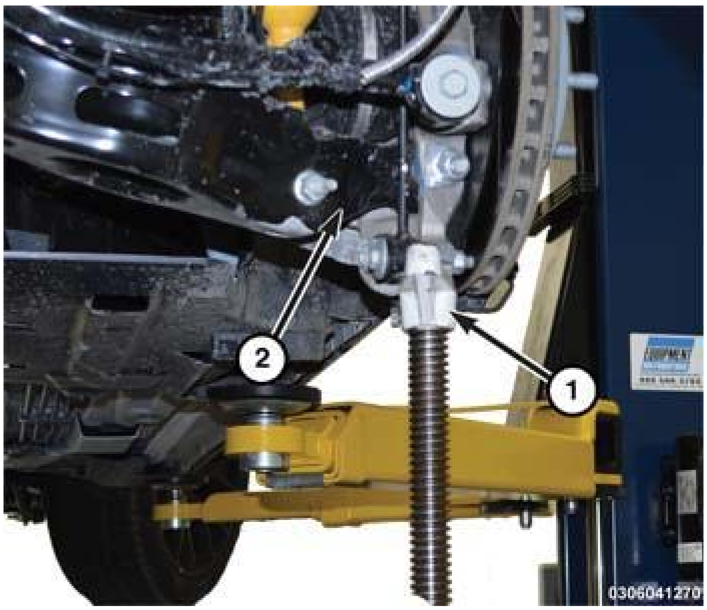

Fig. 20: Screw-Style Under-Hoist Jack Stand & Rear Suspension
Courtesy of CHRYSLER GROUP, LLC

12. If used, remove screw-type under-hoist jack stands (1).

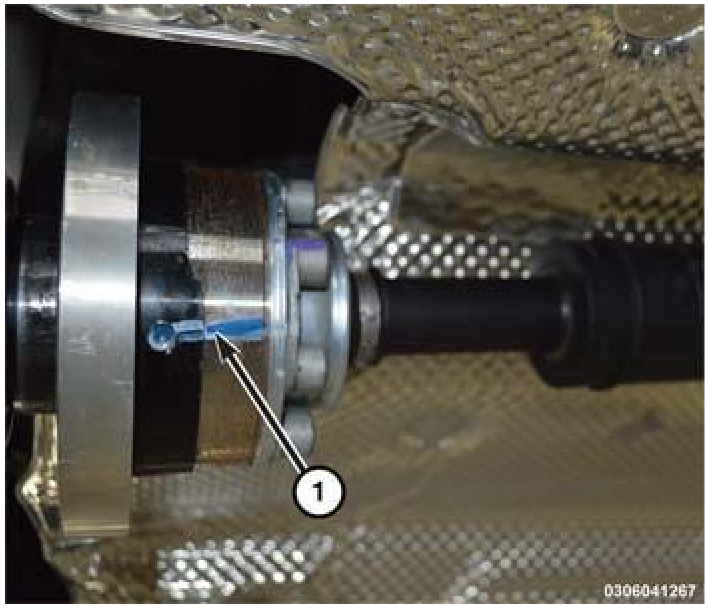

Fig. 21: Alignment Index Marks
Courtesy of CHRYSLER GROUP, LLC

13. Align drive shaft index marks (1).

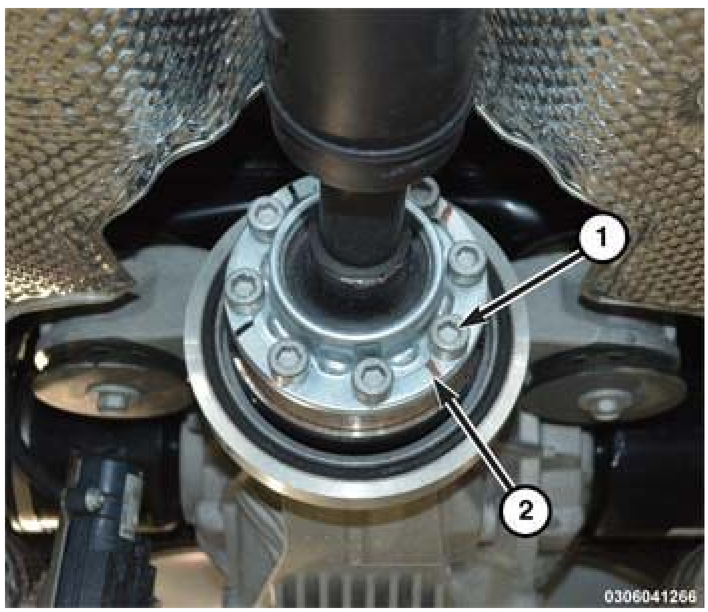

Fig. 22: Drive Shaft To Axle Flange Bolts & Washers
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Drive shaft bolts must be replaced with NEW . If NEW bolts are not available clean the old bolts and apply MoparÃ® Lock and Seal Adhesive or equivalent.**

14. Install the **NEW** drive shaft washers (2) and bolts (1) and tighten in a star pattern to 66 Nm (49 ft.-lbs.).
15. Install the rear exhaust system. Refer to **MUFFLER, EXHAUST, INSTALLATION** .

NOTE: **If significant fluid loss occurred while installing the rear axle proceed to**

step 16.

If there was no fluid loss proceed to step 19.

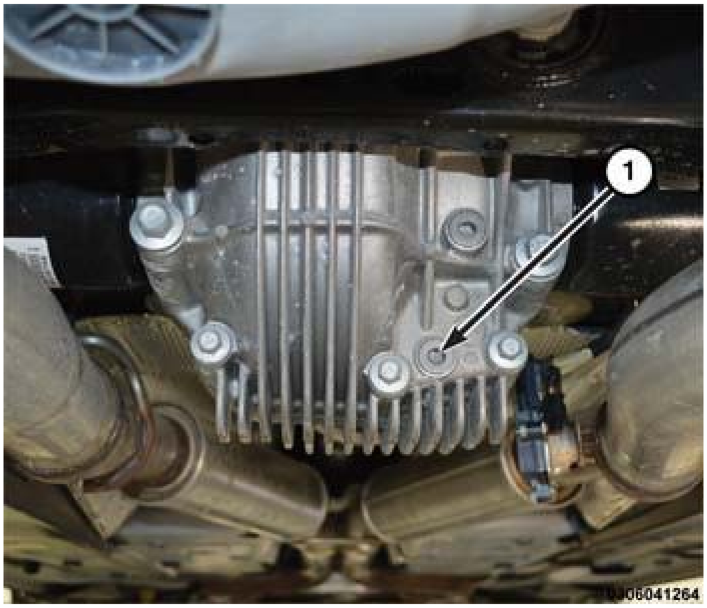

Fig. 23: Rear Axle Drain Plug
Courtesy of CHRYSLER GROUP, LLC

16. Remove rear axle drain plug (1) and drain the rear axle fluid.
17. Install the rear axle drain plug (1) and tighten to the proper specification. Refer to **SPECIFICATIONS** .

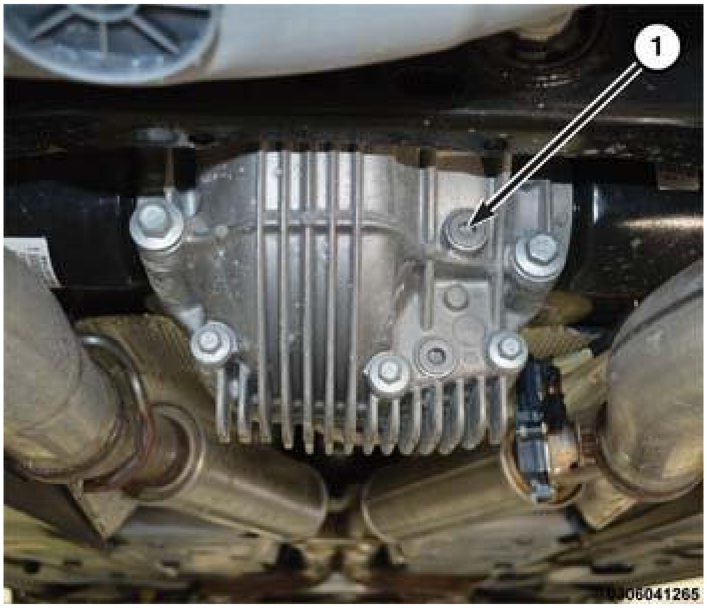

Fig. 24: Rear Axle Fill Plug
Courtesy of CHRYSLER GROUP, LLC

18. Remove the rear axle fill plug (1) and fill the rear axle with the specified fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
19. Install the rear axle fill plug (1) and tighten to the proper specification. Refer to **SPECIFICATIONS** .

20. Remove the support and lower the vehicle.

SEAL, AXLE DRIVE SHAFT

REMOVAL

AXLE SEAL

RIGHT SIDE

1. Remove halfshaft(s). Refer to **REMOVAL** .
2. Drain the rear axle fluid. Refer to **STANDARD PROCEDURE**.

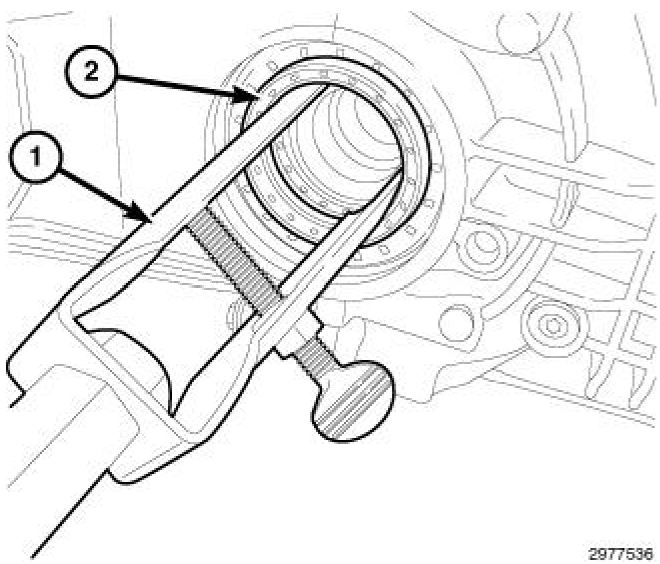

Fig. 25: Seal Remover & Axle Shaft Seal (Right)
Courtesy of CHRYSLER GROUP, LLC

3. Using seal remover (special tool #7794-A, Remover, Seal) (1) and slide hammer (special tool #C-637, Slide Hammer, Universal), remove axle shaft seal (2).
4. Visually inspect the halfshaft seal journal for damage (excessive seal groove, nicks, scratches, etc.). Replace the halfshaft if necessary.

LEFT SIDE

1. Remove the halfshaft. Refer to **REMOVAL** .
2. Drain the rear axle fluid. Refer to **STANDARD PROCEDURE**.

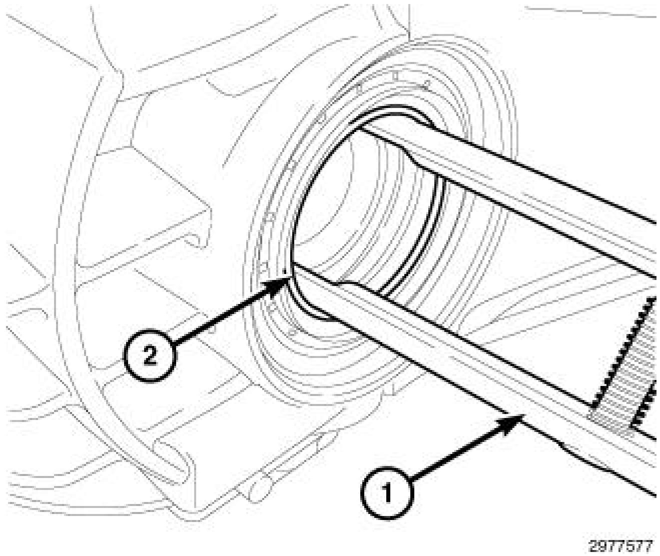

Fig. 26: Seal Remover & Axle Shaft Seal (Left)
Courtesy of CHRYSLER GROUP, LLC

3. Using seal remover (special tool #7794-A, Remover, Seal) (1) and slide hammer (special tool #C-637, Slide Hammer, Universal), remove the axle seal (2).
4. Visually inspect the halfshaft seal journal for damage (excessive seal groove, nicks, scratches, etc.). Replace the halfshaft if necessary.

INSTALLATION

AXLE SEAL

RIGHT SIDE

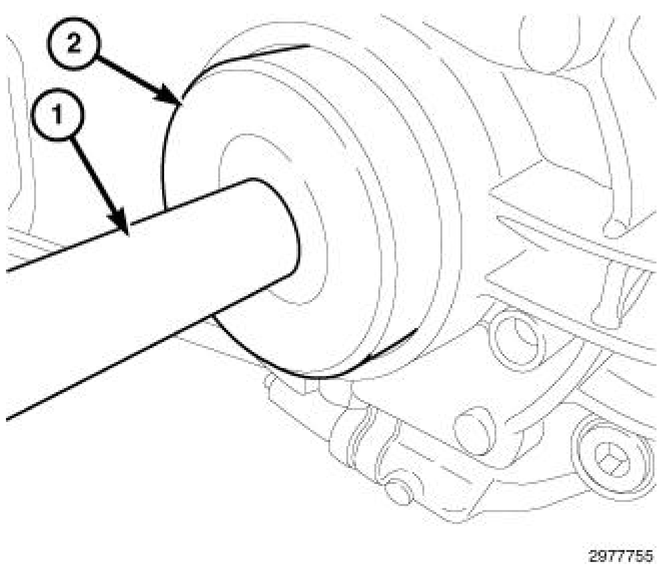

Fig. 27: Installing Axle Shaft Seal (Right)

Courtesy of CHRYSLER GROUP, LLC

1. Using Driver Handle (special tool #C-4171, Driver Handle, Universal) (1), Drive Handle Extension (special tool #C-4171-2, Extension, Drive Handle) and Installer (special tool #10267, Installer, Seal) (2), and install a **NEW** axle seal. Lubricate the inside diameter of the axle seal with the specified axle fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
2. Install the halfshaft. Refer to **INSTALLATION** .
3. Fill the rear axle with the specified fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .

LEFT SIDE

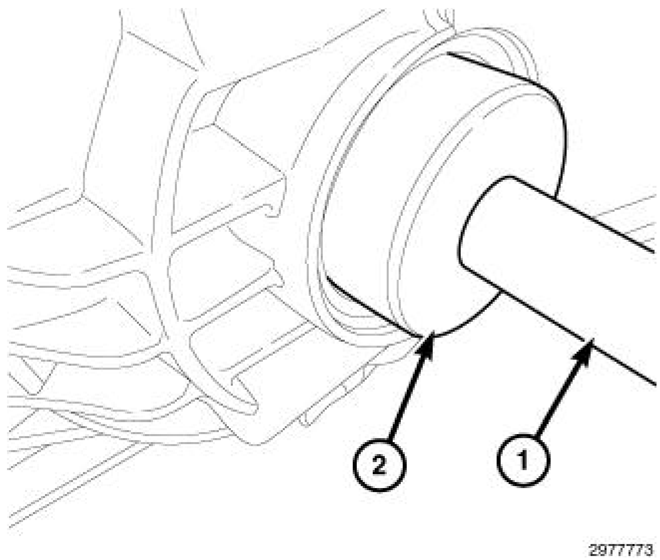

Fig. 28: Installing Axle Shaft Seal (Left)
Courtesy of CHRYSLER GROUP, LLC

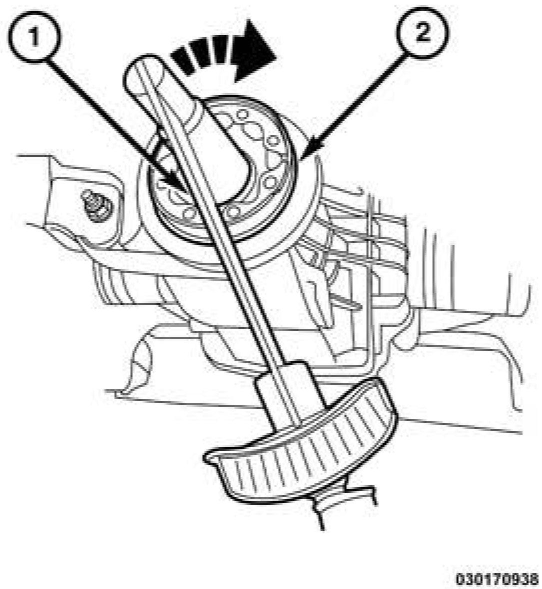
1. Using the Driver Handle (special tool #C-4171, Driver Handle, Universal) (1), Drive Handle Extension (special tool #C-4171-2, Extension, Drive Handle) and the Installer (special tool #10266, Installer, Seal) (2), install a **NEW** axle seal. Lubricate the inside diameter of the axle seal with the specified axle fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
2. Install the halfshaft. Refer to **INSTALLATION** .
3. Fill the rear axle with the specified fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .

SEAL, DRIVE PINION

REMOVAL

PINION SEAL

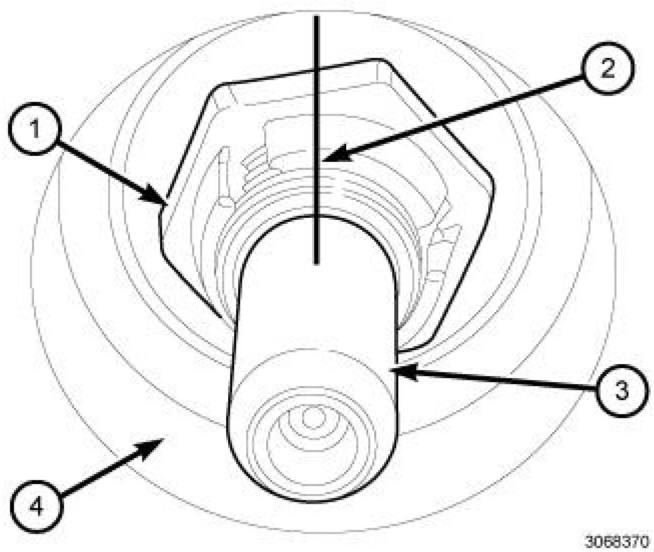
1. Remove rear axle assembly from vehicle. Refer to **REMOVAL**.



[Fig. 29: Pinion Rotational Torque](#)
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Torque reading must be taken with a constant rotational speed. Do not measure break away torque.**

2. Using a torque wrench (1), measure and record the pinion rotational torque.



[Fig. 30: Identifying Alignment Mark On Pinion Flange, Nut & Pinion Shaft](#)
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Due to axle imbalance concerns and bearing preload sensitivity, it is necessary to make sure pinion nut-to-shaft orientation is maintained. If alignment marks are not visible, apply appropriate marks before removing pinion nut.**

3. Apply an alignment index mark (2) on the pinion flange nut (1) to the pinion shaft (3) to the pinon flange (4).

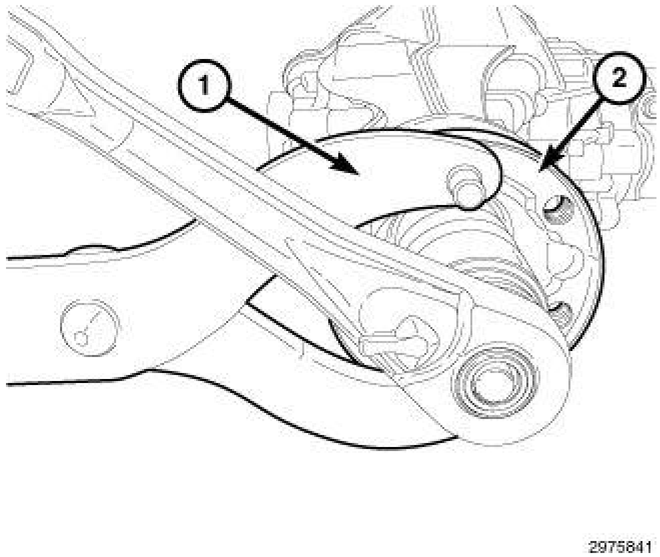


Fig. 31: Flange Wrench, Pinion Flange & Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Due to axle imbalance concerns, it is necessary to make sure pinion nut-to-shaft orientation is maintained. If alignment index marks are not visible, apply appropriate alignment index marks before removing pinion nut.**

4. Using Flange Wrench (special tool #C-3281, Holder, Flange) (1) and a 32mm socket, remove the pinion flange nut.

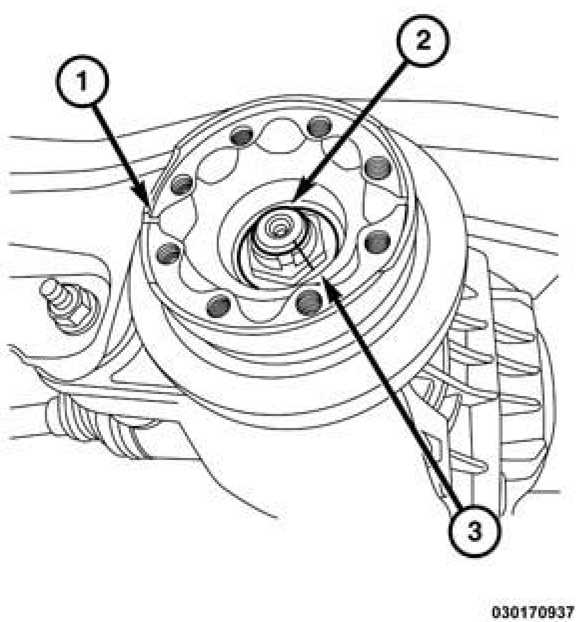

Fig. 32: Pinion Flange, Pinion Shaft & Alignment Marks
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Due to axle imbalance concerns, it is necessary to make sure pinion flange-to-shaft orientation is maintained. If alignment index marks are not visible, apply appropriate alignment index marks before removing pinion flange.**

5. Apply an alignment index mark (3) on the pinion flange (1) to the pinion shaft (2) and should be aligned after nut has been removed.
6. Using Puller (special tool #1026, Puller), remove the pinion flange from the pinion shaft.

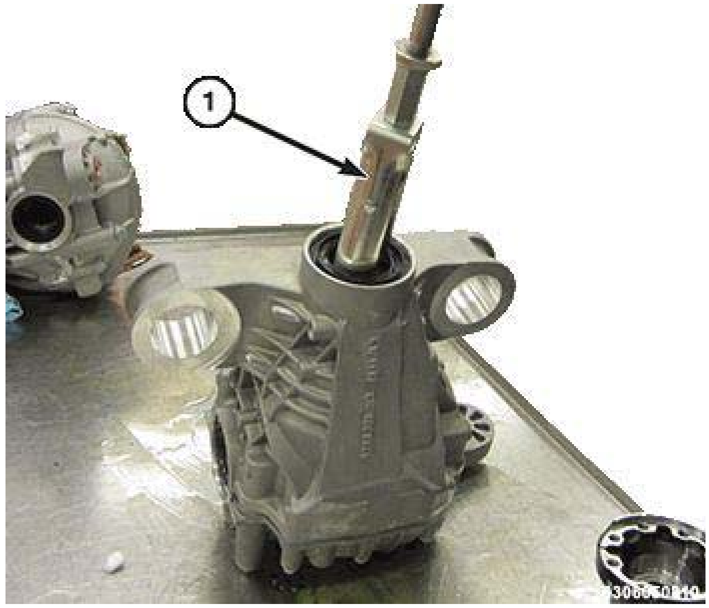

Fig. 33: Seal Remover
Courtesy of CHRYSLER GROUP, LLC

7. Using seal remover (special tool #7794-A, Remover, Seal) (1) and slide hammer (special tool #C-637, Slide Hammer, Universal), remove the pinion seal and discard.

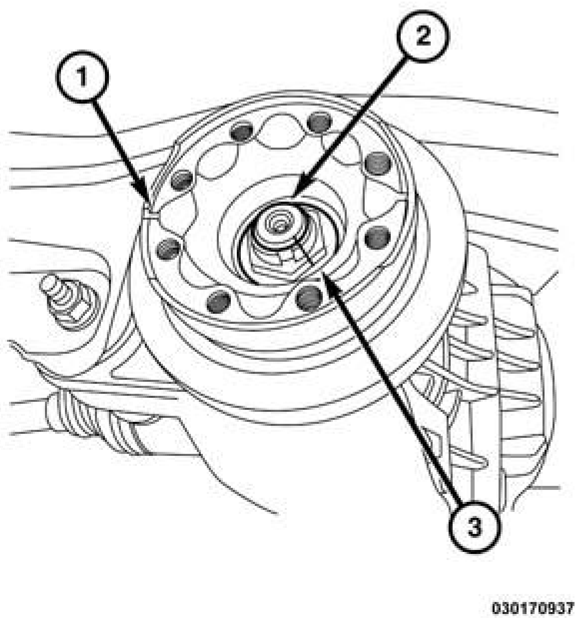
INSTALLATION

PINION SEAL

1. Clean any thread locker from pinion flange nut and the pinion shaft.
2. Lubricate the outer diameter of the flange on the sealing surface with the specified axle fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .

[Fig. 34: Driver Handle & Seal Installer]
Courtesy of CHRYSLER GROUP, LLC

3. Using Driver Handle (special tool #C-4171, Driver Handle, Universal) (1) and Installer (special tool #10269, Installer, Seal) (2), install the pinion seal until tool bottoms on the carrier.



[Fig. 35: Pinion Flange, Pinion Shaft & Alignment Marks]
Courtesy of CHRYSLER GROUP, LLC

4. Install the pinion flange into position. Align the alignment index marks (3) made during removal.
5. Using (special tool #6448A, Installer, Bearing/Gear), lightly tap on the pinion flange (1) until adequate pinion shaft threads are exposed.
6. Apply MoparÂ® Lock and Seal Adhesive Loctite 2701 to the pinion nut (2) and install the pinion flange nut.

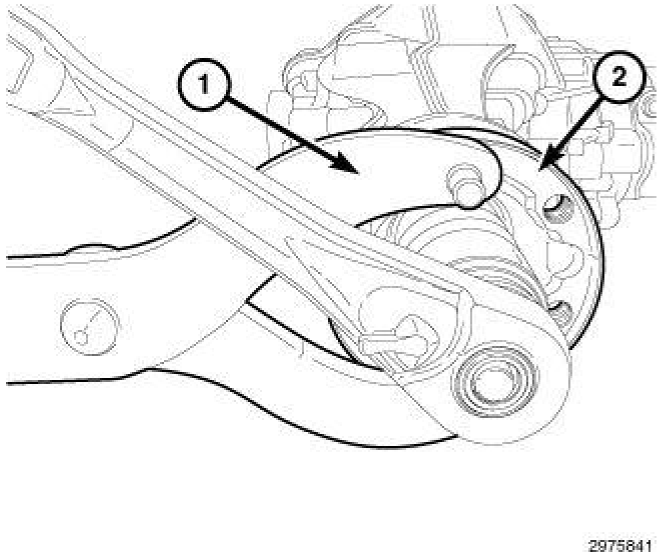


Fig. 36: Flange Wrench, Pinion Flange & Nut
Courtesy of CHRYSLER GROUP, LLC

7. Using Flange Holder (special tool #C-3281, Holder, Flange) (1) and 32mm socket tighten the pinion flange nut in small increments until the pinion nut index mark aligns with the index mark on the pinion shaft.

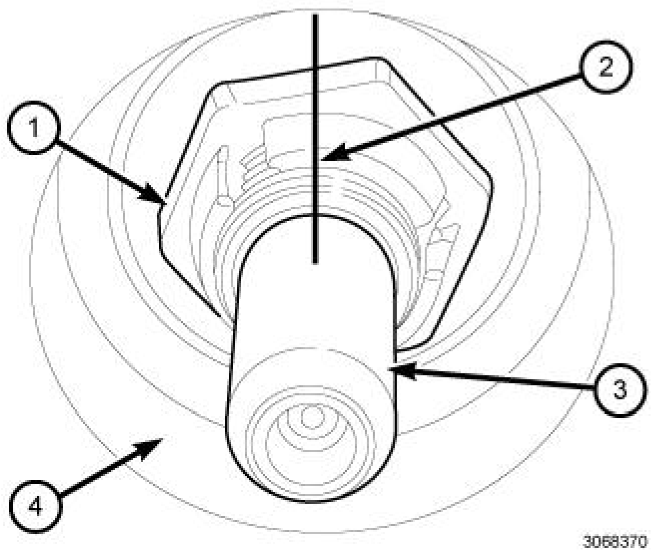

Fig. 37: Identifying Alignment Mark On Pinion Flange, Nut & Pinion Shaft
Courtesy of CHRYSLER GROUP, LLC

NOTE:	**If the pinion nut alignment index mark exceeds the pinion shaft alignment index mark the unit must be discarded. If the pinion nut alignment index mark falls short of the pinion shaft alignment index mark the unit will possibly generate an Noise, Vibration, or Harshness (NVH) concern.**

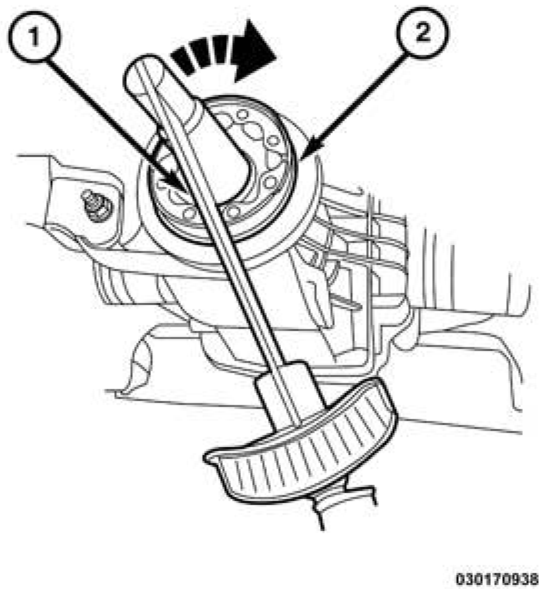

Fig. 38: Pinion Rotational Torque
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Torque reading must be taken with a constant rotational speed. Do not measure break away torque.**

8. Using a torque wrench (1), measure and record the pinion rotational torque.
9. After the torque reading has been obtained, compare the reading to the recorded reading when removing the pinion flange. The difference in the reading should be within 0 Ā± 0.2 N.m (0 Ā± 1.7 in. lbs.). Value after repair should be higher due to tighter fit of the new pinion seal.
10. Install the rear axle assembly. Refer to **INSTALLATION**.

BUSHING, FRONT

REMOVAL

FRONT BUSHING

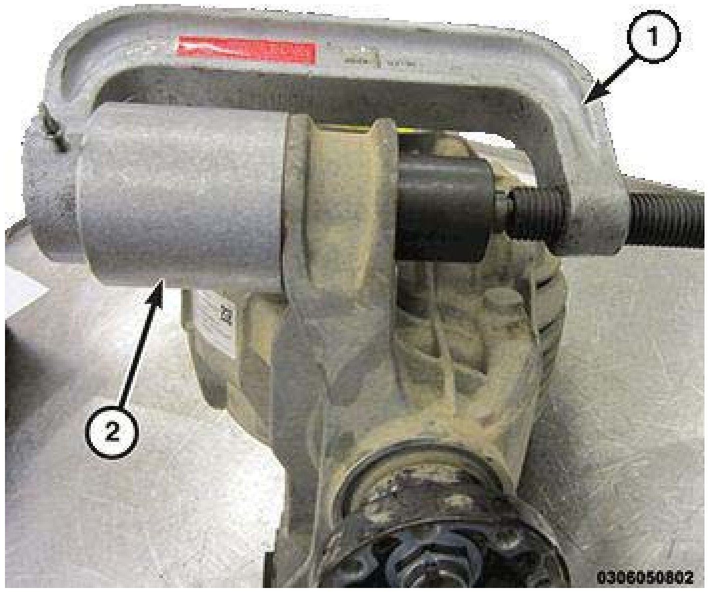
1. Remove rear axle from vehicle. Refer to **REMOVAL**.

NOTE: **195RIA axle bushing shown in illustration. 230RIA axle bushing uses the same procedure.**

NOTE: **Right Hand (RH) side shown in illustration, Left Hand (LH) similar.**

NOTE: **Take note of the bushing inner metal orientation prior to bushing removal, the replacement bushing metal must be installed in the same exact orientation.**

2. Secure the rear axle in a vice.

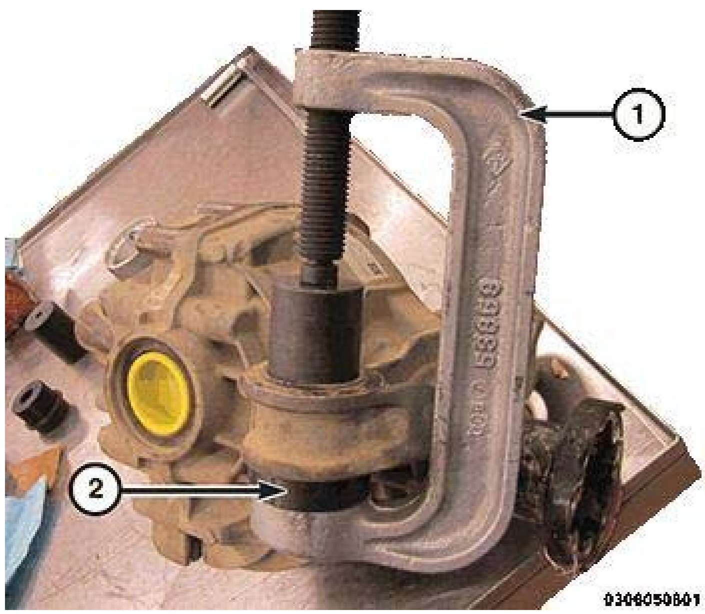


[Fig. 39: Ball Joint Installer & Receiver Cup]
Courtesy of CHRYSLER GROUP, LLC

3. Using (special tool #6289A, Installer, Ball Joint) (1) and (special tool #8405-1, Cup, Receiver) (2) remove the front bushing from the rear axle.

INSTALLATION

FRONT BUSHING



[Fig. 40: Ball Joint Installer & Ball Joint Remover]
Courtesy of CHRYSLER GROUP, LLC

NOTE: **195RIA axle bushing shown in illustration. 230RIA axle bushing uses the same procedure.**

NOTE: **Make sure the bushing inner metal orientation notches are in the same exact**

orientation as the original removed bushing inner metal.

1. Install a **NEW** bushing in the rear axle using (special tool #10106-3, Remover, Ball Joint) (2) and (special tool #6289A, Installer, Ball Joint) (1).
2. Install the rear axle assembly. Refer to **INSTALLATION**.

.

Article GUID: A00735942

2015-16 DRIVELINE/AXLES

Rear Axle - 230RIA - Challenger

DESCRIPTION

DESCRIPTION

The 230 MM RIA (Rear-Independent-Aluminum) axle is an independent assembly with an aluminum housing and machined cast iron differential. The 230 MM axle can be equipped with or without LSD (Limited Slip Differential). All SRT vehicles and manual transmission applications are equipped with LSD axle and all other applications are open differentials.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - AXLE

DIAGNOSTIC CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
WHEEL NOISE	1. Wheel loose.	1. Tighten loose lug nuts.
	2. Faulty, brinelled wheel bearing.	2. Replace wheel bearing.
LOSS OF LUBRICANT	1. Lubricant level too high.	1. Drain lubricant to the correct level.
	2. Worn axle seals.	2. Replace axle seals.
	3. Worn pinion seal.	3. Replace pinion seal.
	4. Worn/scored pinion flange journal.	4. Replace axle assembly.
	5. Axle cover not properly sealed.	5. Replace axle assembly.
	6. Vent hose/gore vent position is not vertical	6. Replace gore vent/hose assembly, install in 12 O'Clock orientation.
AXLE OVERHEATING	1. Lubricant level low.	1. Fill differential to correct level.
	2. Improper grade of lubricant.	2. Fill differential with the correct fluid type and quantity.
	3. Bearing preload too high.	3. Replace axle assembly.
	4. Insufficient ring gear backlash.	4. Replace axle assembly.
GEAR TEETH BROKE	1. Overloading.	1. Replace axle assembly.
	2. Improper adjustments.	2. Replace axle assembly.
AXLE NOISE	1. Insufficient lubricant.	1. Fill axle with the correct fluid type and quantity.
	2. Improper ring gear and pinion adjustment.	2. Replace axle assembly.

CONDITION	POSSIBLE CAUSE	CORRECTION
	3. Unmatched ring gear and pinion.	3. Replace axle assembly.
	4. Worn teeth on ring gear and/or pinion.	4. Replace axle assembly.
	5. Loose pinion bearings.	5. Replace axle assembly.
	6. Loose differential bearings.	6. Replace axle assembly.
	7. Misaligned or sprung ring gear.	7. Replace axle assembly.
	8. Housing not machined properly.	8. Replace axle assembly.

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, incorrect pinion depth, tooth contact, worn/damaged gears, or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly:

- Check for insufficient lubricant.

Differential side gears and pinions can be checked by turning the vehicle. They usually do not cause noise during straight-ahead driving when the gears are unloaded. The side gears are loaded during vehicle turns. A worn pinion shaft can also cause a snapping or a knocking noise.

BEARING NOISE

The differential and pinion bearings can produce noise when worn or damaged. Bearing noise can be either a whining, or a growling sound.

Pinion bearings have a constant-pitch noise. This noise changes only with vehicle speed. Pinion bearing noise will be higher pitched because it rotates at a faster rate.

Worn or damaged differential bearings usually produce a low pitch noise. Differential bearing noise is similar to pinion bearing noise. The pitch of differential bearing noise is also constant and varies only with vehicle speed.

Wheel hub bearings produce noise and vibration when worn or damaged. The noise generally changes when the bearings are loaded. Road test the vehicle. Turn the vehicle sharply to the left and to the right. This will load the bearings and change the noise level. Where axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 mph.

LOW SPEED KNOCK

Low speed knock is generally caused by a worn joint or by worn side-gear thrust washers. A worn pinion shaft bore will also cause low speed knock.

VIBRATION

Vibration at the rear of the vehicle is usually caused by a:

- Damaged propeller shaft.
- Missing propeller shaft balance weight(s).
- Worn or out-of-balance wheels.
- Loose wheel lug nuts.
- Worn Constant Velocity (CV) joints.
- Loose/broken springs.
- Loose pinion gear nut.
- Excessive pinion CV flange run out.
- Bent halfshaft(s).

Check for loose or damaged front-end components or engine/transmission mounts. These components can contribute to what appears to be a rear end vibration. Do not overlook engine accessories, brackets and drive belts.

All driveline components should be examined before starting any repair.

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear, can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn Constant Velocity (CV) joints.
- Worn or broken axle mount isolators.
- Loose pinion gear nut and CV flange.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

The source of a snap or a clunk noise can be determined with the assistance of a helper. Raise the vehicle on a hoist with the wheels free to rotate. Instruct the helper to shift the transmission into gear. Listen for the noise, a mechanics stethoscope is helpful in isolating the source of a noise.

STANDARD PROCEDURE

STANDARD PROCEDURE - FLUID DRAIN AND FILL

1. Drive the vehicle until the differential lubricant is at the normal operating temperature.

   NOTE: The vehicle must be LEVEL .

2. Raise and support the vehicle and hold vehicle at curb position. Refer to **HOISTING, STANDARD**

PROCEDURE .

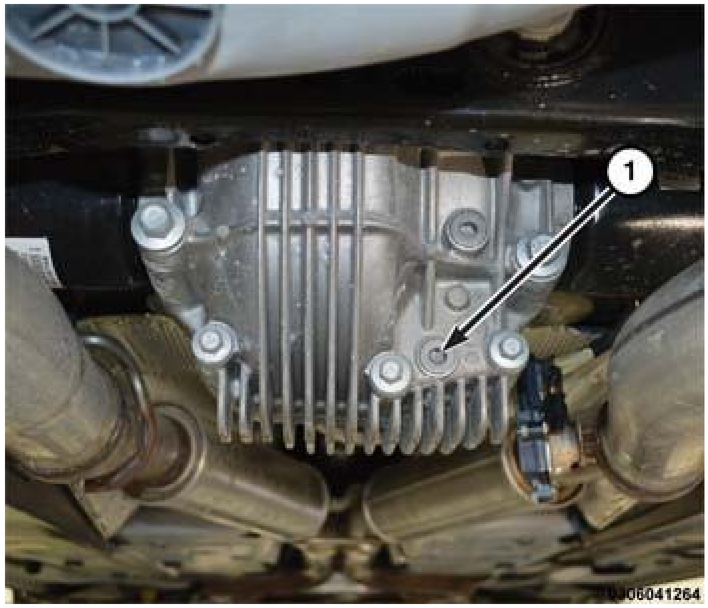


Fig. 1: Rear Axle Drain Plug
Courtesy of CHRYSLER GROUP, LLC

3. Remove the rear axle drain plug (1) and drain the lubricant completely from the axle.
4. Install the rear axle drain plug (1) and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

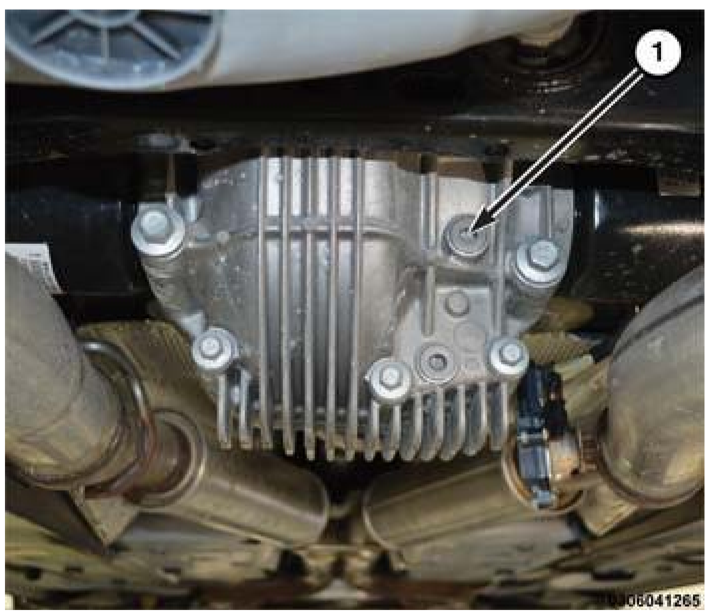

Fig. 2: Rear Axle Fill Plug
Courtesy of CHRYSLER GROUP, LLC

5. Remove the rear axle fill plug (1) and fill the rear axle with the specified amount of fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
6. Install the rear axle fill plug (1) and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

SPECIFICATIONS

TORQUE SPECIFICATIONS

REAR AXLE TORQUE SPECIFICATIONS

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.	NEW FASTENER*
Axle Drain Plug	35	26	-	Ā
Axle Fill Plug	35	26	-	Ā
Pinion Flange Nut	Refer to **SEAL, DRIVE PINION, INSTALLATION**.			Ā
Rear Axle Forward Mount Isolator Bolts	70	48	-	X
Rear Axle To Crossmember Bolts	150	111	-	Ā
***NEW FASTENER:** Do not reuse these fasteners. If removed, a new fastener must be installed and tightened to specifications.				

REMOVAL

REAR AXLE

NOTE: **This procedure requires the compression of the rear suspension to ride height. A drive-on hoist should be used. If a drive-on hoist is not used, screw-style under-hoist jack stands are required to compress the rear suspension, facilitating rear halfshaft removal.**

CAUTION: **Never grasp halfshaft assembly by the inner or outer boots. Doing so may cause the boot to pucker or crease, reducing the service life of the boot and joint. Avoid over angulating or stroking the C/V joints when handling the halfshaft.**

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the rear exhaust system. Refer to **MUFFLER, EXHAUST, REMOVAL** .

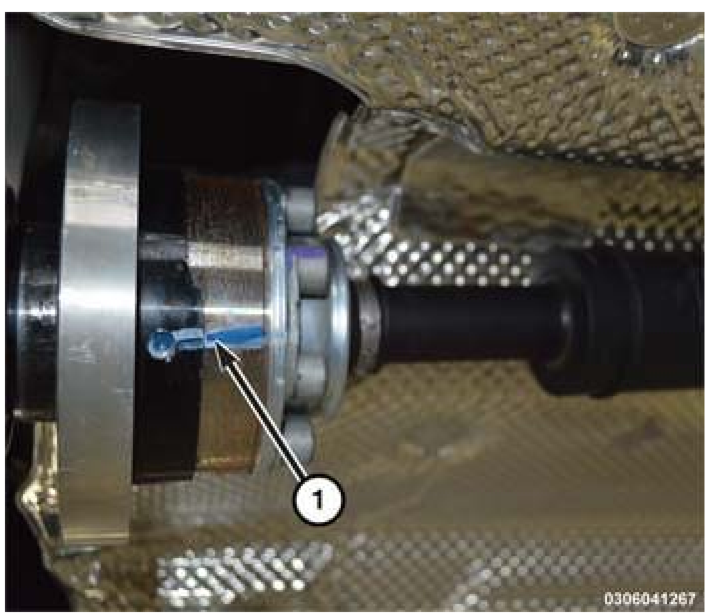

Fig. 3: Alignment Index Marks
Courtesy of CHRYSLER GROUP, LLC

3. Apply alignment index marks (1) to the drive shaft and the axle flange.

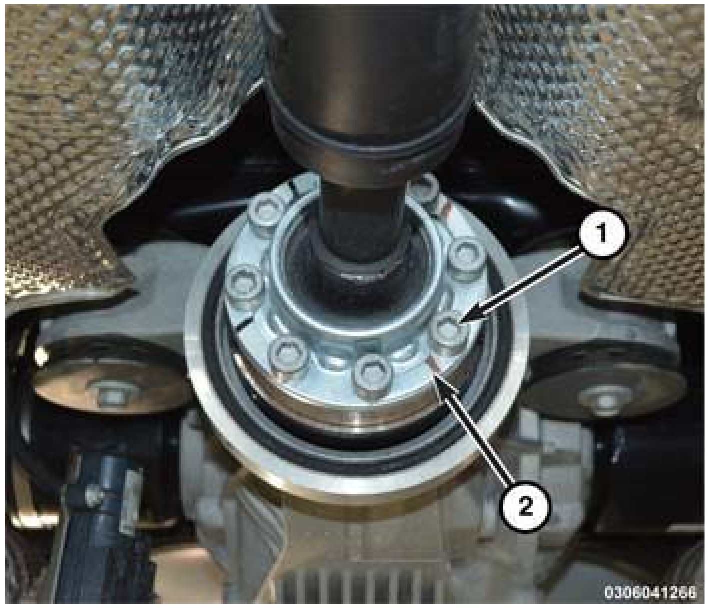

Fig. 4: Drive Shaft To Axle Flange Bolts & Washers
Courtesy of CHRYSLER GROUP, LLC

4. Remove and discard the drive shaft to axle flange bolts (1) and washers (2) and separate the drive shaft from the rear axle.

NOTE: **Do not let the drive shaft hang on the center support bearing.**

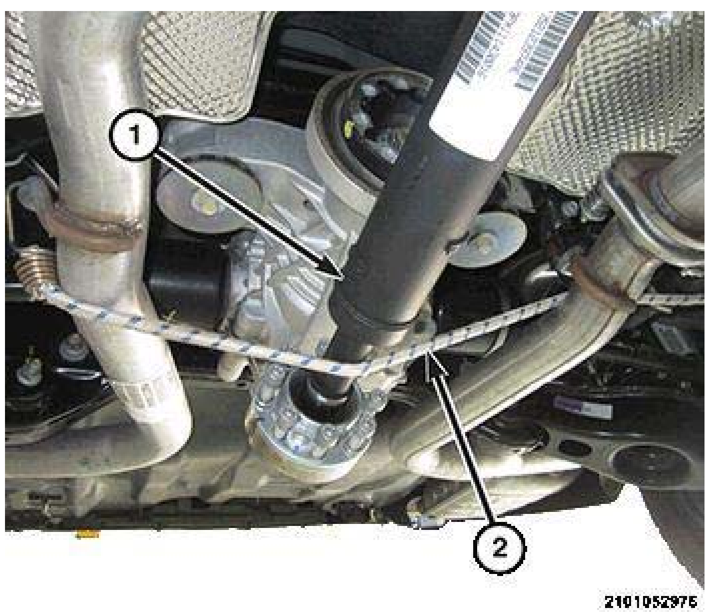

Fig. 5: Supporting Drive Shaft With Strap
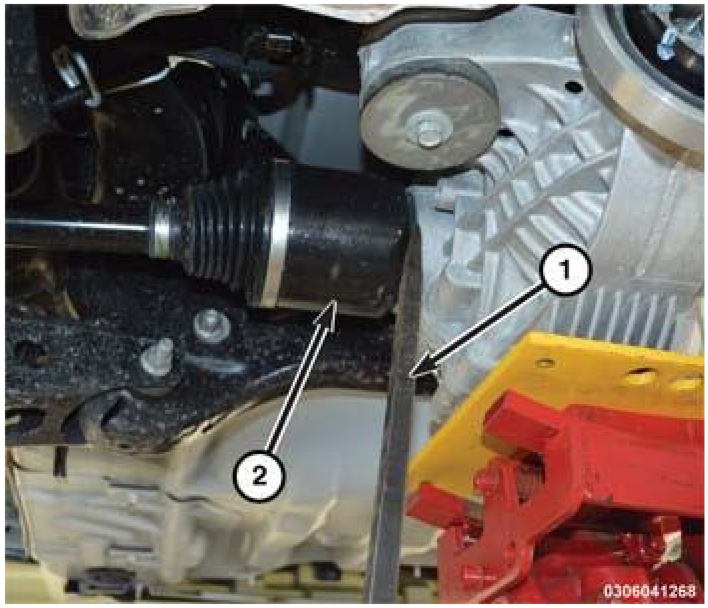
Courtesy of CHRYSLER GROUP, LLC

5. Support the drive shaft (1) with a strap (2) or equivalent.

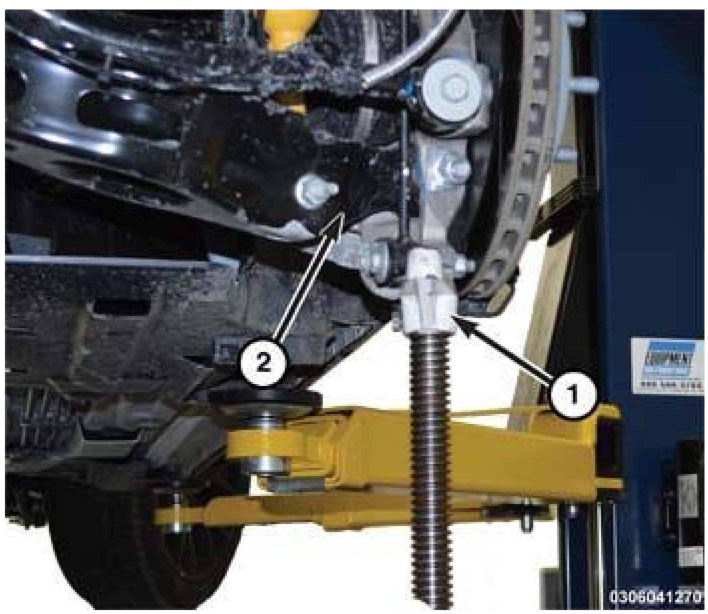


[Fig. 6: Removing Halfshaft](#)
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Do not damage the axle seal, axle seal dust cover, and halfshaft boot.**

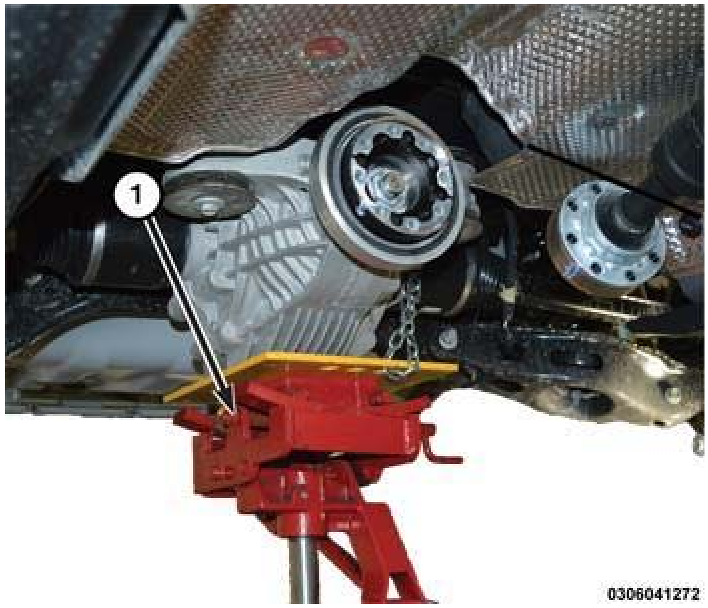
NOTE: **Left Hand (LH) side shown in illustration, Right Hand (RH) side similar.**

6. Using a suitable screwdriver (1), partially disengage the halfshafts (2) from the axle assembly.



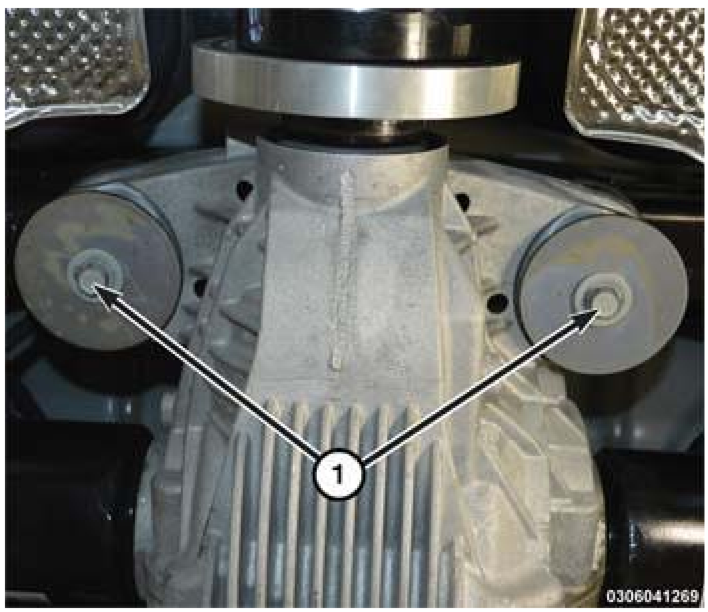
[Fig. 7: Screw-Style Under-Hoist Jack Stand & Rear Suspension](#)
Courtesy of CHRYSLER GROUP, LLC

7. If a drive-on hoist is not used, compress the rear suspension (2) using a screw-style under-hoist jack stand (1), and position a transmission jack under the rear axle assembly.



[Fig. 8: Transmission Jack](#)
Courtesy of CHRYSLER GROUP, LLC

8. Position the transmission jack (1) under the rear axle assembly.



[Fig. 9: Rear Axle Forward Mount Isolator Bolts](#)
Courtesy of CHRYSLER GROUP, LLC

9. Remove and discard the rear axle forward mount isolator bolts (1).

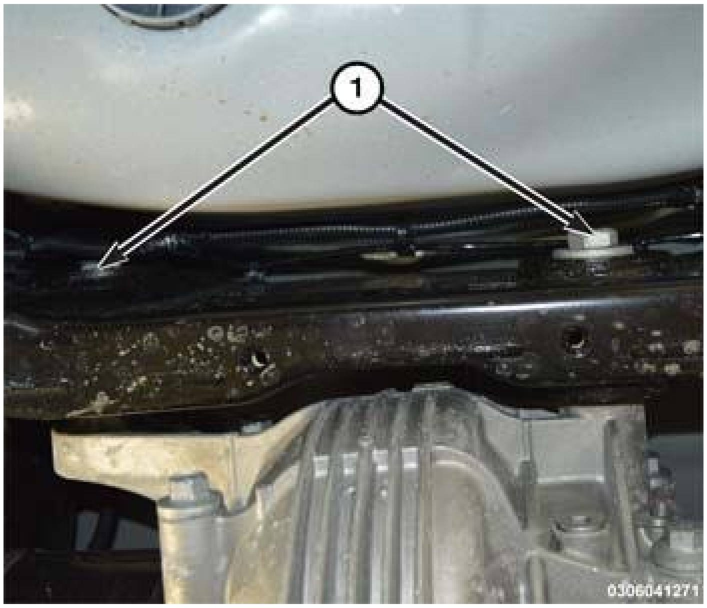


Fig. 10: Rear Axle To Crossmember Bolts
Courtesy of CHRYSLER GROUP, LLC

10. Remove the two rear axle to crossmember bolts (1) from the rear axle.

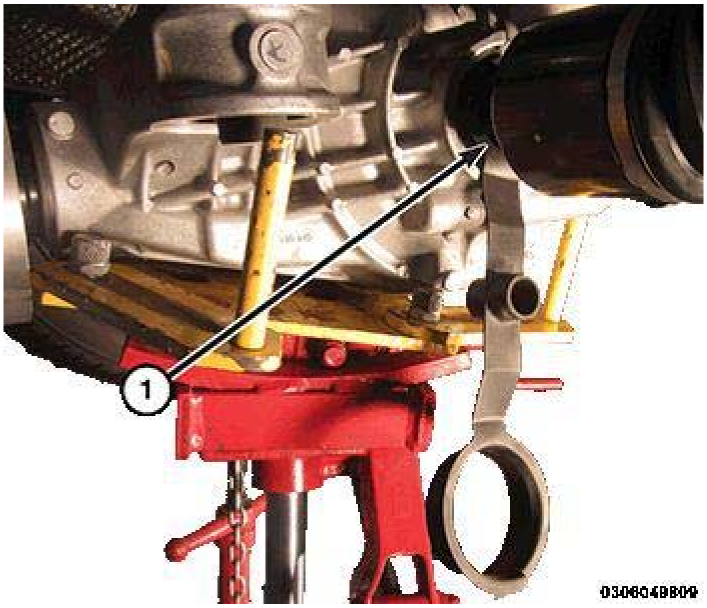

Fig. 11: Half Shaft Protector
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left Hand (LH) side shown in illustration, Right Hand (RH) side similar.

11. Install the Protector, Half Shaft, Drive (special tool #10270, Protector, Half Shaft, Drive) (1).

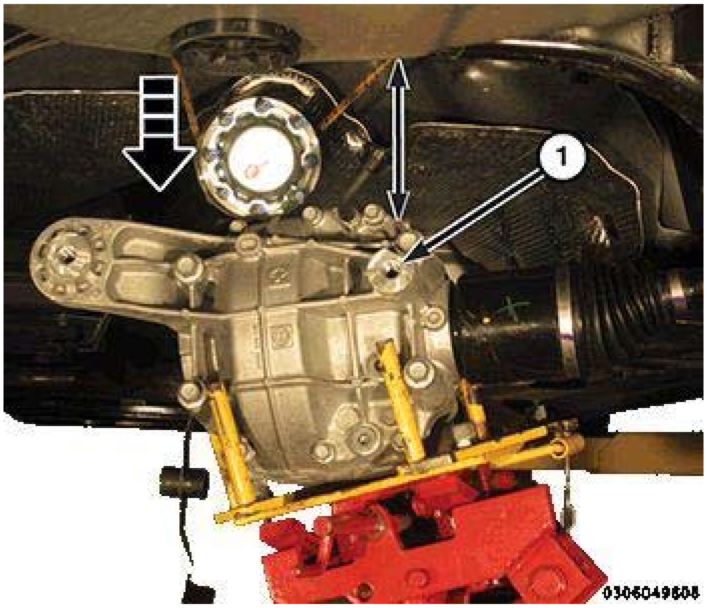

Fig. 12: Rear Axle
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left Hand (LH) side shown in illustration, Right Hand (RH) side similar.

12. Lower the rear axle (1) approximately six inches and push the rear axle assembly towards the front of the vehicle.

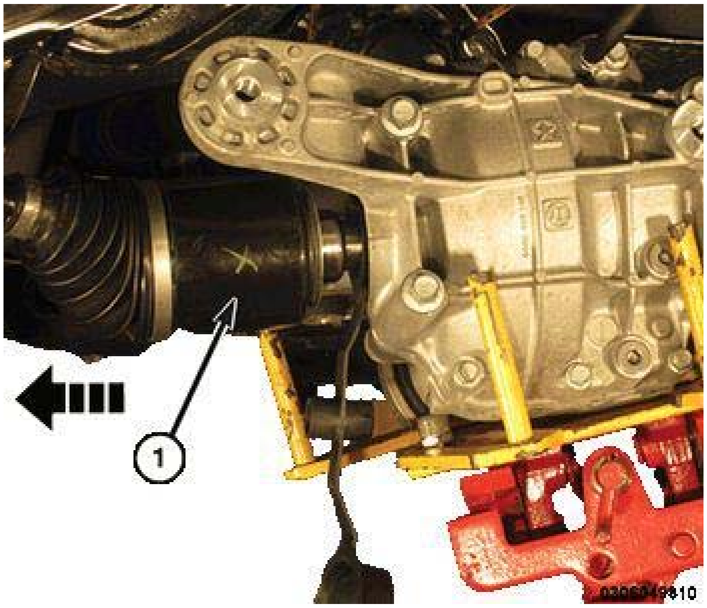

Fig. 13: Removing Halfshaft
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not allow the halfshaft splines to come in contact with the halfshaft seal.

13. With the aid of an assistant, shift the rear axle assembly in one direction and compress one halfshaft inner joint as far as possible while removing the other halfshaft (1).

14. Remove the rear axle assembly from vehicle.

INSTALLATION

REAR AXLE

1. Install new circlip(s), on the halfshaft(s).

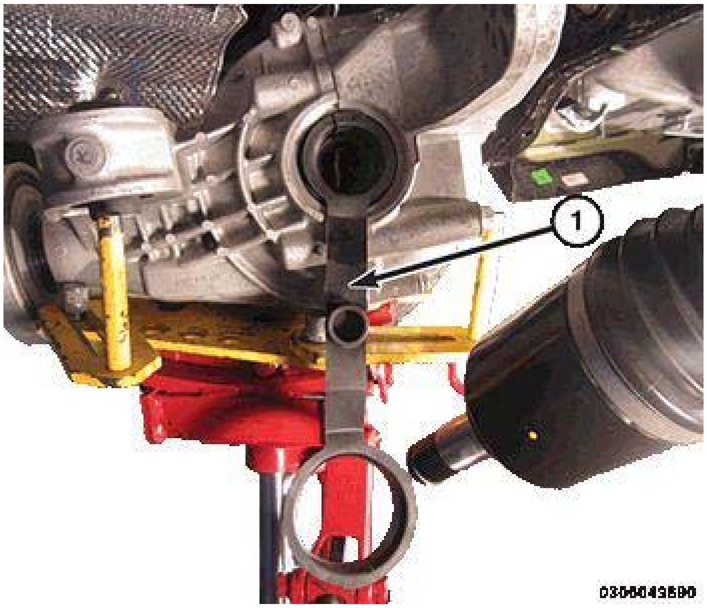

Fig. 14: Protector Installed In Rear Axle
Courtesy of CHRYSLER GROUP, LLC

2. Install the Protector, Half Shaft, Drive (special tool #10270, Protector, Half Shaft, Drive) (1) in the rear axle.

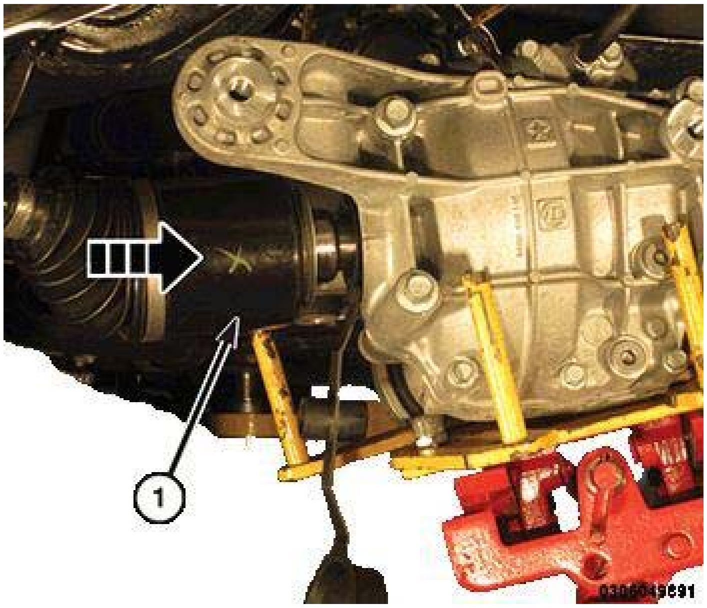

Fig. 15: Installing Halfshaft
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Use care when installing halfshaft to axle assembly. The halfshaft installation angle should be minimized to avoid damage to seal upon installation.**

NOTE: **Use care not to damage the axle seal or the seal dust cover.**

3. With the Protector, Half Shaft, Drive (special tool #10270, Protector, Half Shaft, Drive) (1) installed and the aid of an assistant, shift the rear axle assembly in one direction and compress one halfshaft inner joint as far as possible while installing the other halfshaft (1).

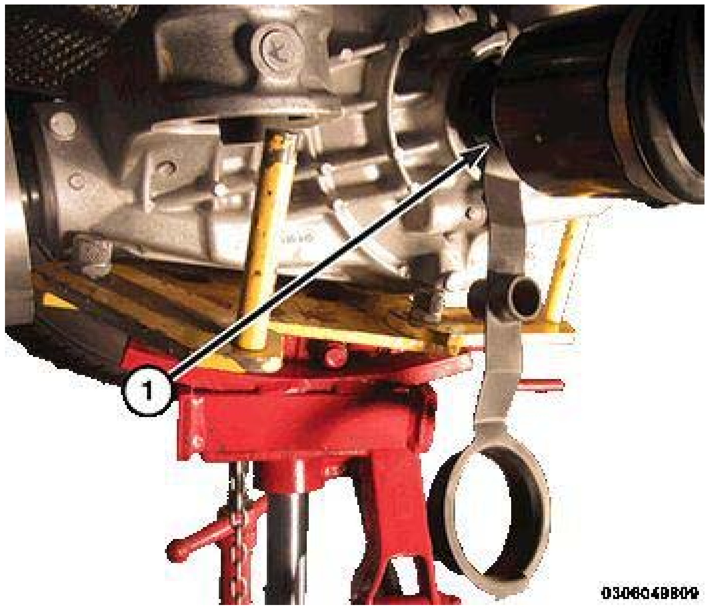

Fig. 16: Half Shaft Protector
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Do not grasp the rubber boot or the axle bar when checking for proper installation.**

4. Remove the Protector, Half Shaft, Drive (special tool #10270, Protector, Half Shaft, Drive) (1) and fully install the halfshaft in the rear axle. Verify proper installation by pulling outward on the joint by hand.
5. Raise the rear axle assembly into position.

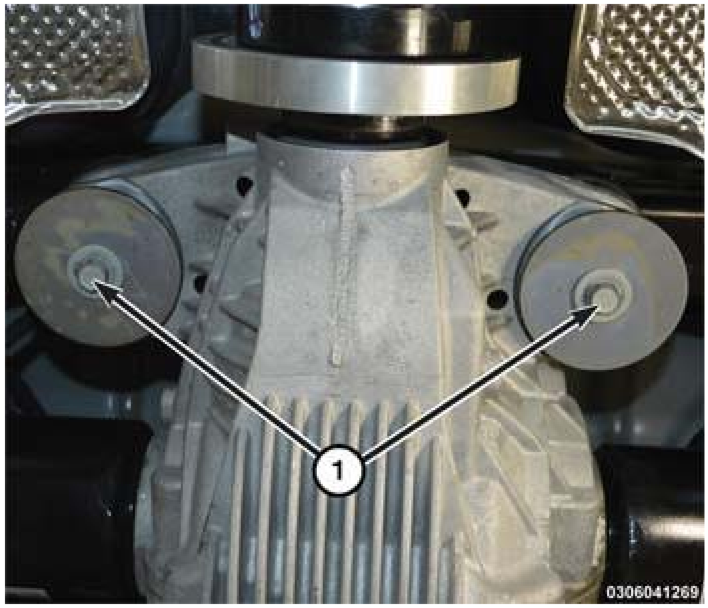

Fig. 17: Rear Axle Forward Mount Isolator Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Install the **NEW** rear axle forward mount isolator bolts (1) hand tight.

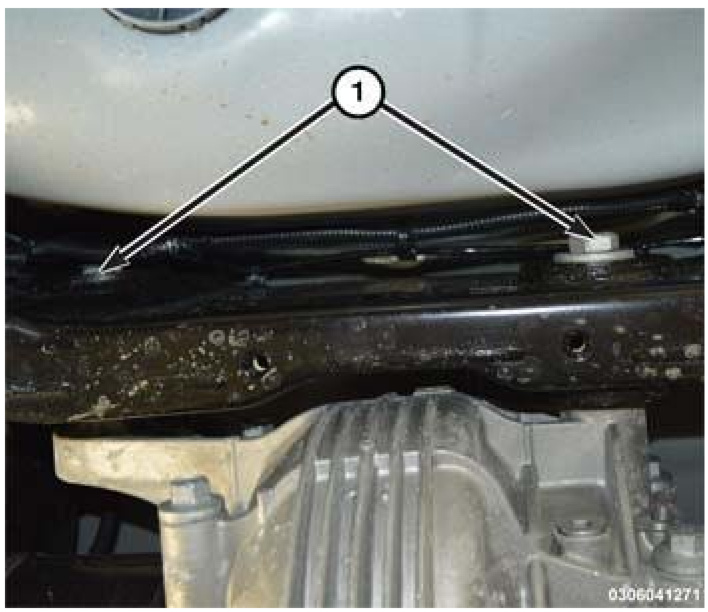

Fig. 18: Rear Axle To Crossmember Bolts
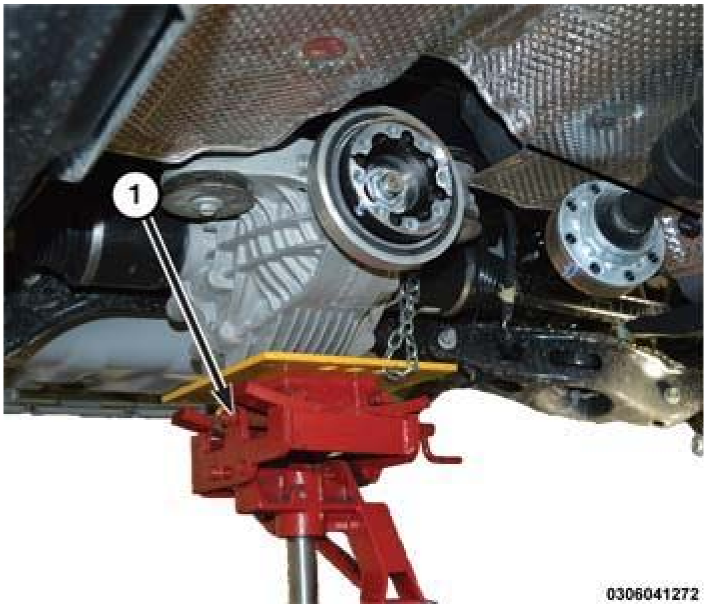
Courtesy of CHRYSLER GROUP, LLC

7. Install the rear axle to crossmember bolts (1) hand tight.
8. Tighten the **NEW** rear axle forward mount isolator bolts to the proper specifications. Refer to **SPECIFICATIONS**.
9. Tighten the rear axle to crossmember bolts to the proper specifications. Refer to **SPECIFICATIONS**.
10. Again verify halfshaft inner joints are fully engaged in the axle assembly.

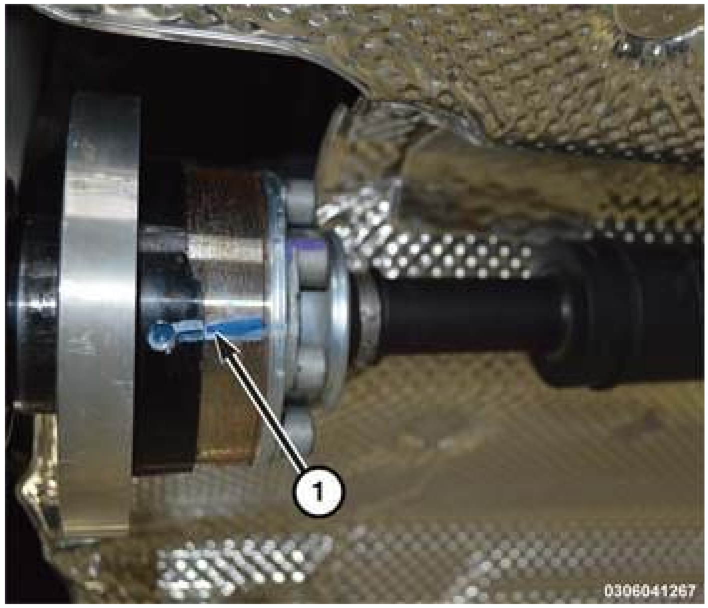


[Fig. 19: Transmission Jack](#)
Courtesy of CHRYSLER GROUP, LLC

11. Remove transmission jack (1).

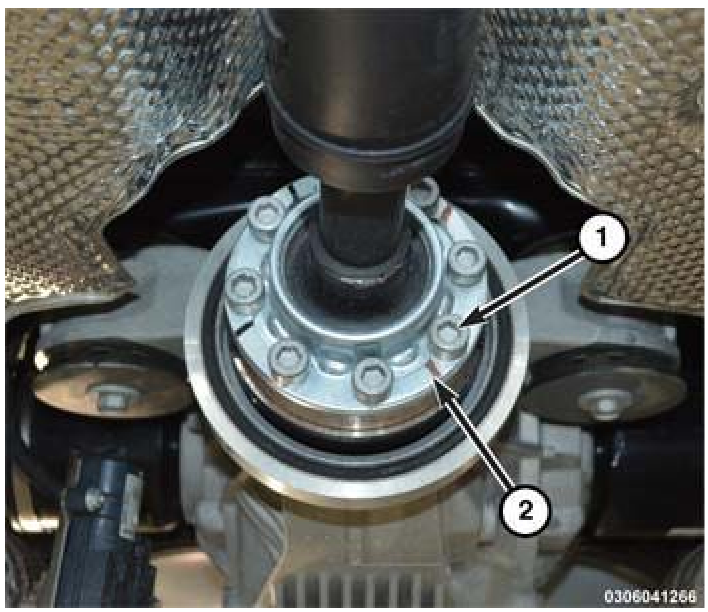
[Fig. 20: Screw-Style Under-Hoist Jack Stand & Rear Suspension](#)
Courtesy of CHRYSLER GROUP, LLC

12. If used, remove screw-type under-hoist jack stands (1).



[Fig. 21: Alignment Index Marks](#)
Courtesy of CHRYSLER GROUP, LLC

13. Align propeller shaft index marks (1).



[Fig. 22: Drive Shaft To Axle Flange Bolts & Washers](#)
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Drive shaft bolts must be replaced with NEW . If NEW bolts are not available clean the old bolts and apply MoparÃ® Lock and Seal Adhesive or equivalent.**

14. Install the **NEW** drive shaft washers (2) and bolts (1) and tighten in a star pattern to 66 Nm (49 ft.-lbs.).
15. Install the rear exhaust system. Refer to **MUFFLER, EXHAUST, INSTALLATION** .

NOTE: **If significant fluid loss occurred while installing the rear axle proceed to**

step 16.

If there was no fluid loss proceed to step 19.

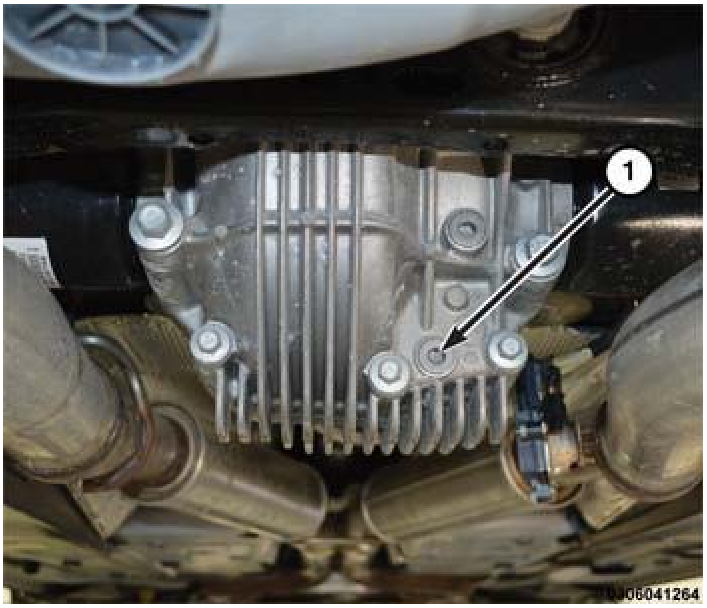


Fig. 23: Rear Axle Drain Plug
Courtesy of CHRYSLER GROUP, LLC

16. Remove rear axle drain plug (1) and drain the rear axle fluid.
17. Install the rear axle drain plug (1) and tighten to the proper specifications. Refer to **SPECIFICATIONS** .

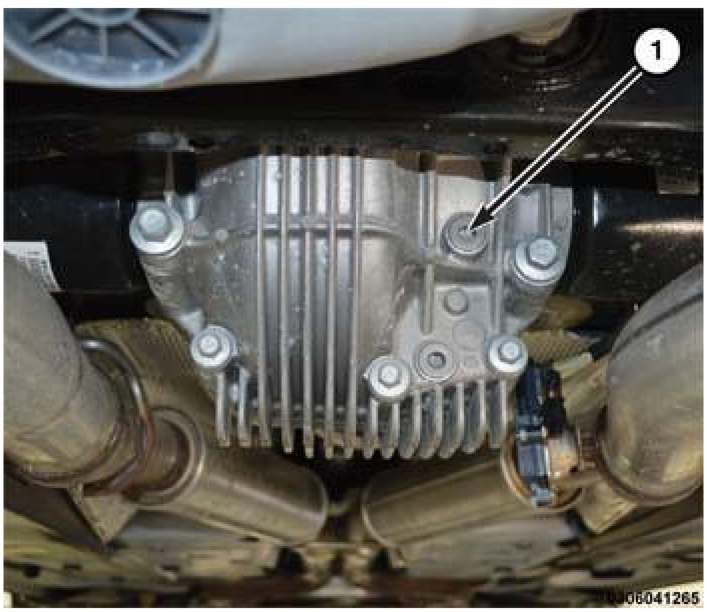

Fig. 24: Rear Axle Fill Plug
Courtesy of CHRYSLER GROUP, LLC

18. Remove the rear axle fill plug (1) and fill the rear axle with the specified fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
19. Install the rear axle fill plug (1) and tighten to the proper specifications. Refer to **SPECIFICATIONS**.

20. Remove the support and lower the vehicle.

SPECIAL TOOLS

SPECIAL TOOLS

	1026 - Puller (Originally Shipped In Kit Number(s) 9202, 9202A-CAN, 9202CC.)
	6289A - Installer, Ball Joint (Originally Shipped In Kit Number(s).)

	6448A - Installer, Bearing/Gear (Originally Shipped In Kit Number(s) 6947, 8667, 8837, 8867.)
	7794-A - Remover, Seal (Originally Shipped In Kit Number(s) 6645.)

	8405-1 - Cup, Receiver (Originally Shipped In Kit Number(s).)

	C-4171 - Driver Handle, Universal (Originally Shipped In Kit Number(s) 9202, 9202A-CAN, 9202CC, 9299, 9299CC, 9300A-CAN.)

	C-4171-2 - Extension, Drive Handle (Originally Shipped In Kit Number(s) 6672, 8659.)

SEAL, AXLE DRIVE SHAFT

REMOVAL

REMOVAL

RIGHT SIDE

1. Remove halfshaft(s). Refer to **REMOVAL** .
2. Drain the rear axle fluid. Refer to **STANDARD PROCEDURE** .

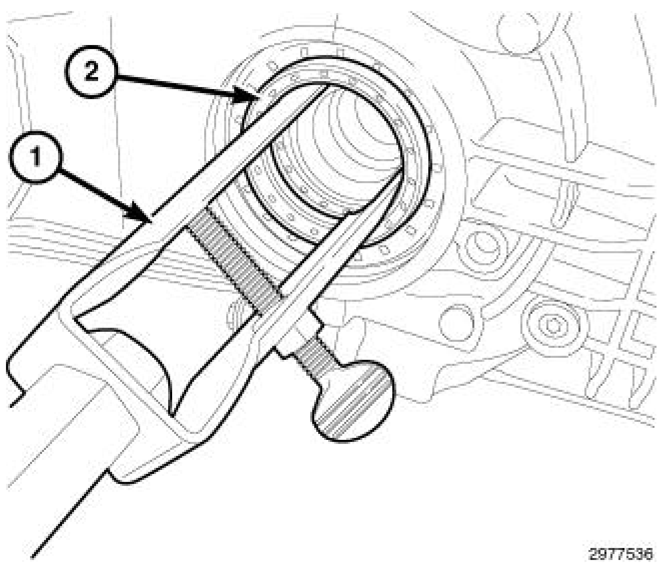

Fig. 25: Seal Remover & Axle Shaft Seal (Right)
Courtesy of CHRYSLER GROUP, LLC

3. Using seal remover (special tool #7794-A, Remover, Seal) (1) and slide hammer (special tool #C-637, Slide Hammer, Universal), remove axle shaft seal (2).
4. Visually inspect the halfshaft seal journal for damage (excessive seal groove, nicks, scratches, etc.). Replace the halfshaft if necessary.

LEFT SIDE

1. Remove the halfshaft. Refer to **REMOVAL** .
2. Drain the rear axle fluid. Refer to **STANDARD PROCEDURE** .

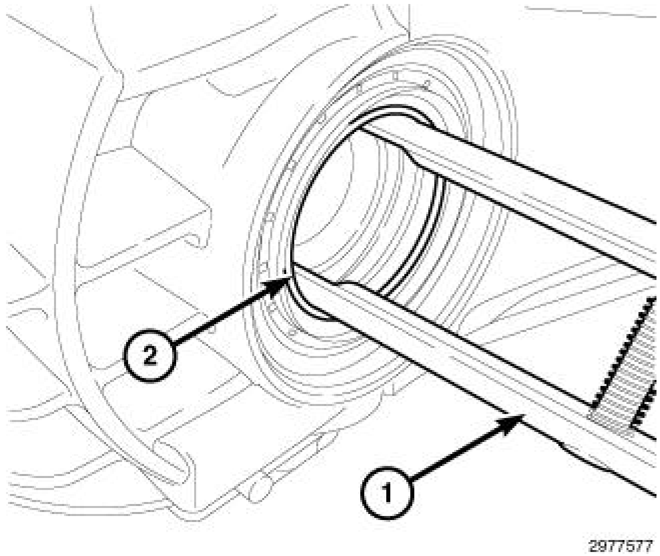

Fig. 26: Seal Remover & Axle Shaft Seal (Left)
Courtesy of CHRYSLER GROUP, LLC

3. Using seal remover (special tool #7794-A, Remover, Seal) (1) and slide hammer (special tool #C-637, Slide Hammer, Universal), remove the axle seal (2).
4. Visually inspect the halfshaft seal journal for damage (excessive seal groove, nicks, scratches, etc.). Replace the halfshaft if necessary.

INSTALLATION

INSTALLATION

RIGHT SIDE

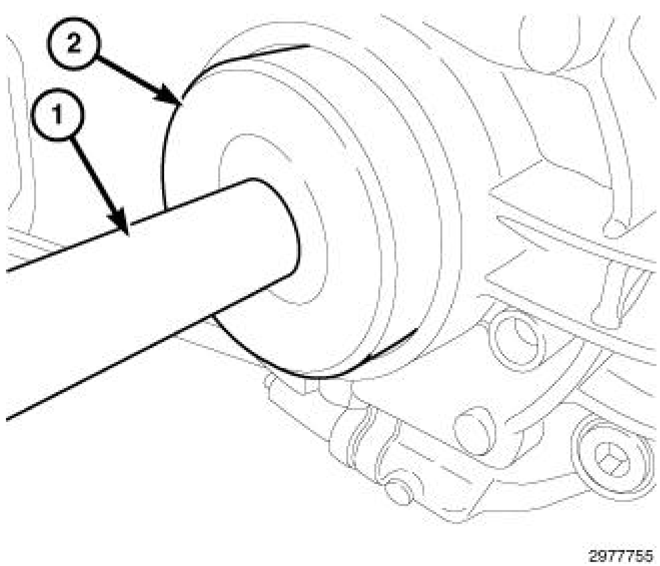

Fig. 27: Installing Axle Shaft Seal (Right)

Courtesy of CHRYSLER GROUP, LLC

1. Using Driver Handle (special tool #C-4171, Driver Handle, Universal) (1), Drive Handle Extension (special tool #C-4171-2, Extension, Drive Handle) and Installer (special tool #10267, Installer, Seal) (2), and install a **NEW** axle seal. Lubricate the inside diameter of the axle seal with the specified axle fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
2. Install the halfshaft. Refer to **INSTALLATION** .
3. Fill the rear axle with the specified fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .

LEFT SIDE

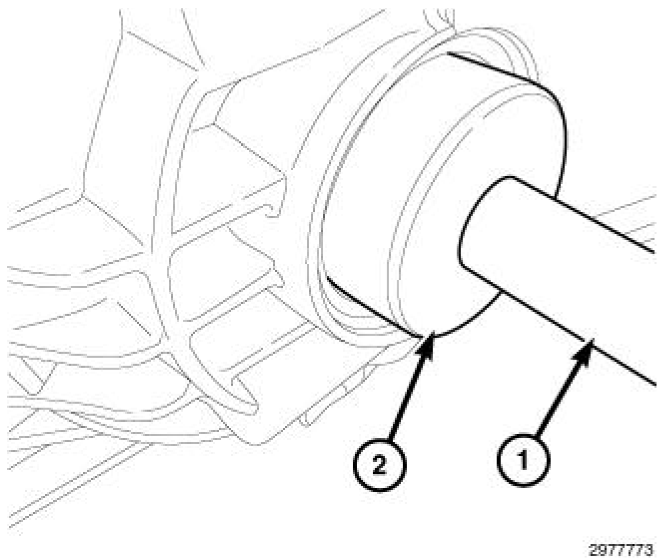

Fig. 28: Installing Axle Shaft Seal (Left)
Courtesy of CHRYSLER GROUP, LLC

1. Using the Driver Handle (special tool #C-4171, Driver Handle, Universal) (1), Drive Handle Extension (special tool #C-4171-2, Extension, Drive Handle) and the Installer (special tool #10266, Installer, Seal) (2), install a **NEW** axle seal. Lubricate the inside diameter of the axle seal with the specified axle fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
2. Install the halfshaft. Refer to **INSTALLATION** .
3. Fill the rear axle with the specified fluid. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .

SEAL, DRIVE PINION

REMOVAL

REMOVAL

1. Remove the rear axle assembly from vehicle. Refer to **REMOVAL**.

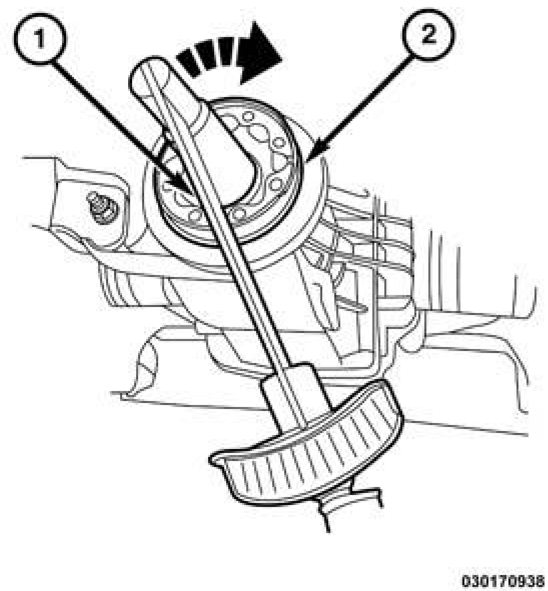

Fig. 29: Pinion Rotational Torque
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Torque reading must be taken with a constant rotational speed. Do not measure break away torque.**

2. Using a torque wrench (1), measure and record the pinion rotational torque.

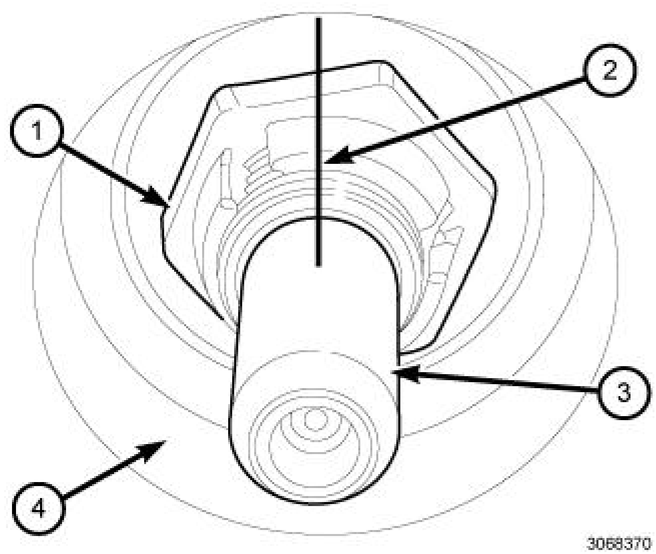

Fig. 30: Identifying Alignment Mark On Pinion Flange, Nut & Pinion Shaft
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Due to axle imbalance concerns and bearing preload sensitivity, it is necessary to make sure pinion nut-to-shaft orientation is maintained. If alignment marks are not visible, apply appropriate marks before removing pinion nut.**

3. Apply an alignment mark (2) on the pinion flange nut (1) to the pinion shaft (3) and the pinion flange (4).

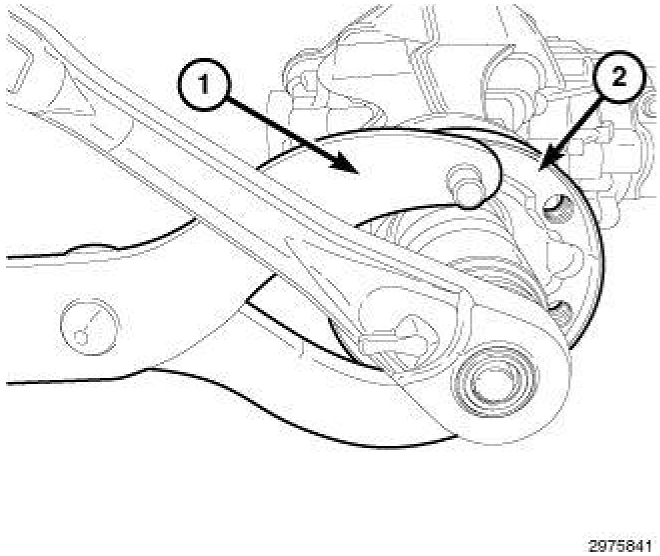

Fig. 31: Flange Wrench, Pinion Flange & Nut
Courtesy of CHRYSLER GROUP, LLC

4. Using Flange Wrench (special tool #C-3281, Holder, Flange) (1) and 32mm socket, remove the pinion flange nut.

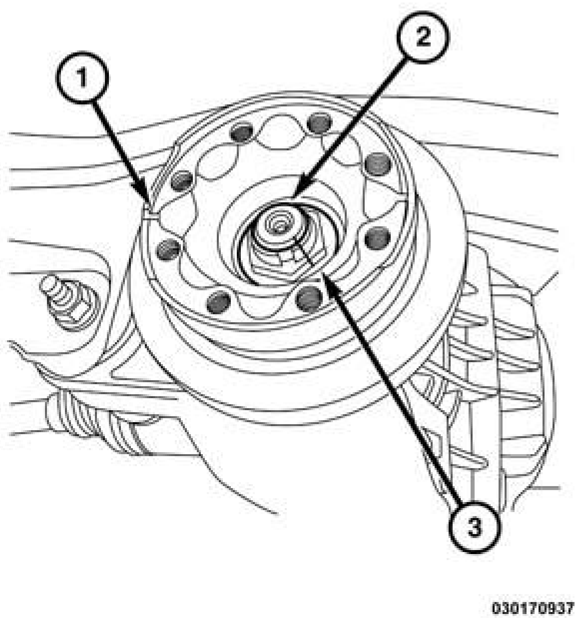

Fig. 32: Pinion Flange, Pinion Shaft & Alignment Marks
Courtesy of CHRYSLER GROUP, LLC

NOTE:	**Due to axle imbalance concerns and bearing preload sensitivity, it is necessary to make sure pinion flange-to-shaft orientation is maintained. If alignment marks are not visible, apply appropriate marks before removing pinion flange.**

5. Apply an alignment mark (3) on the pinion flange (1) to the pinion shaft (2) and should be aligned after nut has been removed.
6. Using Puller (special tool #1026, Puller), remove pinion flange from pinion shaft.

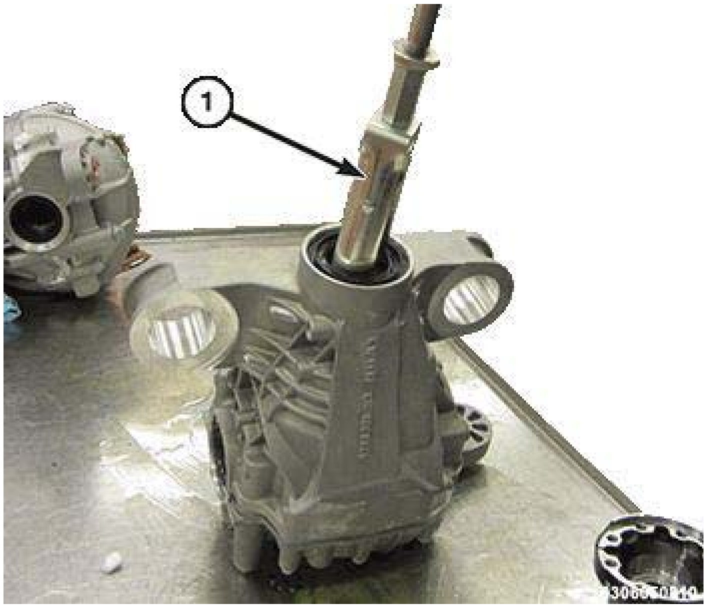

Fig. 33: Seal Remover
Courtesy of CHRYSLER GROUP, LLC

7. Using seal remover (special tool #7794-A, Remover, Seal) (1) and slide hammer (special tool #C-637, Slide Hammer, Universal), remove the pinion seal and discard.

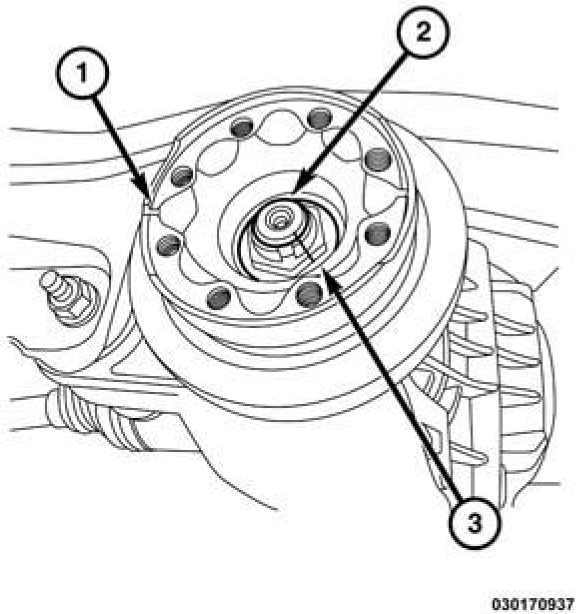
INSTALLATION

PINION SEAL

1. Clean any thread locker from pinion flange nut and the pinion shaft.
2. Apply light coating of gear lubricant to the outer diameter of the flange on the sealing surface.

[Fig. 34: Driver Handle & Seal Installer](#)
Courtesy of CHRYSLER GROUP, LLC

3. Using Driver Handle (special tool #C-4171, Driver Handle, Universal) (1) and Installer (special tool #10269, Installer, Seal) (2), install the pinion seal until tool bottoms on the carrier.



[Fig. 35: Pinion Flange, Pinion Shaft & Alignment Marks](#)
Courtesy of CHRYSLER GROUP, LLC

4. Install the pinion flange into position. Align the alignment index marks (3) made during removal.
5. Using (special tool #6448A, Installer, Bearing/Gear), lightly tap on the pinion flange (1) until adequate pinion shaft threads are exposed.
6. Apply MoparÃ® Lock and Seal Adhesive Loctite 2701 to the pinion nut (2) and install the pinion flange nut. Apply axle grease to pinion nut washer face prior to assembly.

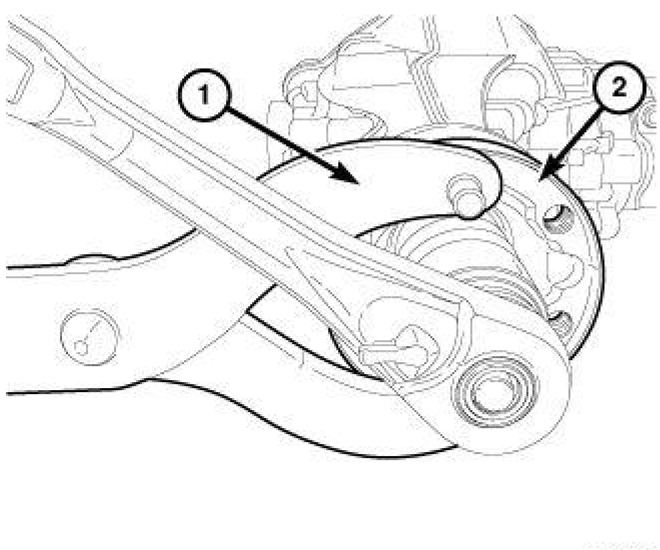


Fig. 36: Flange Wrench, Pinion Flange & Nut
Courtesy of CHRYSLER GROUP, LLC

7. Using Flange Holder (special tool #C-3281, Holder, Flange) (1) and 32mm socket tighten the pinion flange nut in small increments until the pinion nut index mark aligns with the index mark on the pinion shaft.

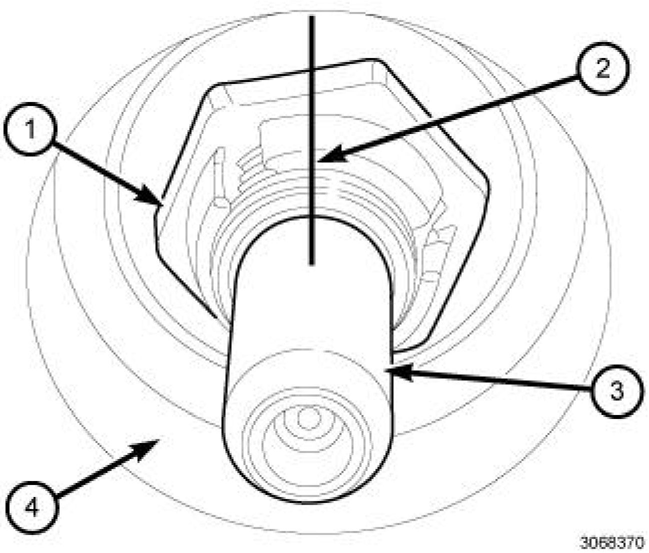

Fig. 37: Identifying Alignment Mark On Pinion Flange, Nut & Pinion Shaft
Courtesy of CHRYSLER GROUP, LLC

NOTE:	**If the pinion nut alignment index mark exceeds the pinion shaft alignment index mark the unit must be discarded. If the pinion nut alignment index mark falls short of the pinion shaft alignment index mark the unit will possibly generate an Noise, Vibration, or Harshness (NVH) concern.**

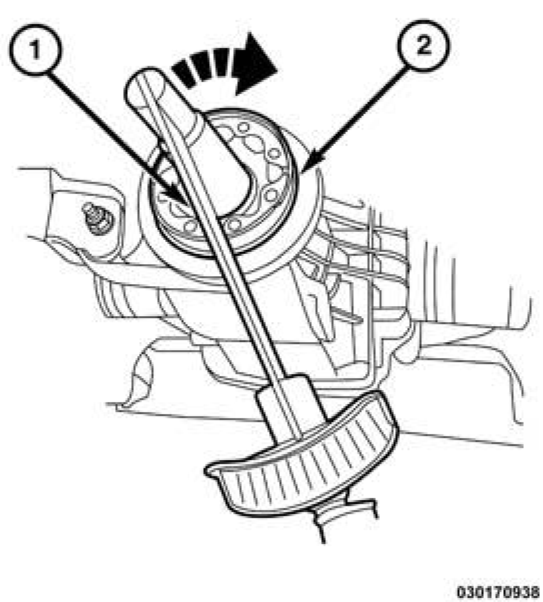

Fig. 38: Pinion Rotational Torque
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Torque reading must be taken with a constant rotational speed. Do not measure break away torque.**

8. Using a torque wrench (1), measure and record the pinion rotational torque.
9. After the torque reading has been obtained, compare the reading to the recorded reading when removing the pinion flange. The difference in the reading should be within 0 Ā± 0.2 N.m (0 Ā± 1.7 in. lbs.). Value after repair should be higher due to tighter fit of the new pinion seal.
10. Install the rear axle assembly. Refer to **INSTALLATION** .

BUSHING, FRONT

REMOVAL

FRONT BUSHING

1. Remove rear axle from vehicle. Refer to **REMOVAL**.

NOTE: **195RIA axle bushing shown in illustration. 230RIA axle bushing uses the same procedure.**

NOTE: **Right Hand (RH) side shown in illustration, Left Hand (LH) similar.**

NOTE: **Take note of the bushing inner metal orientation prior to bushing removal, the replacement bushing metal must be installed in the same exact orientation.**

2. Secure the rear axle in a vice.

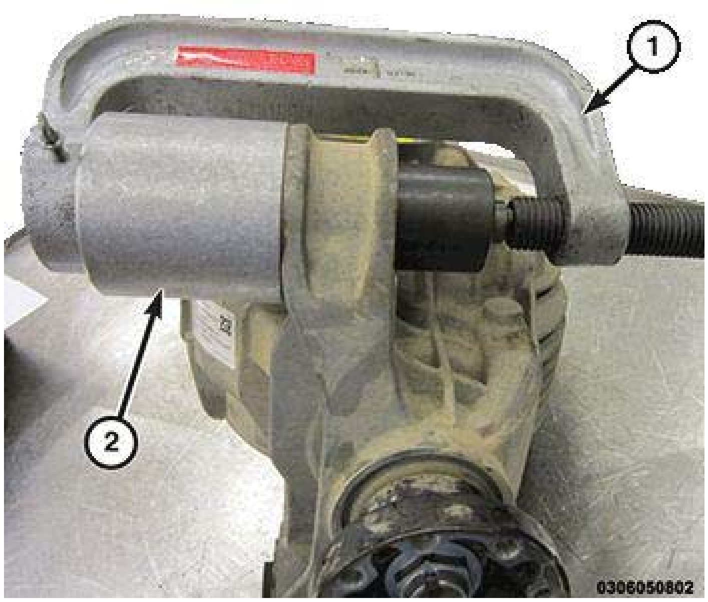

Fig. 39: Ball Joint Installer & Receiver Cup
Courtesy of CHRYSLER GROUP, LLC

3. Using (special tool #6289A, Installer, Ball Joint) (1) and (special tool #8405-1, Cup, Receiver) (2) remove the front bushing from the rear axle.

INSTALLATION

FRONT BUSHING

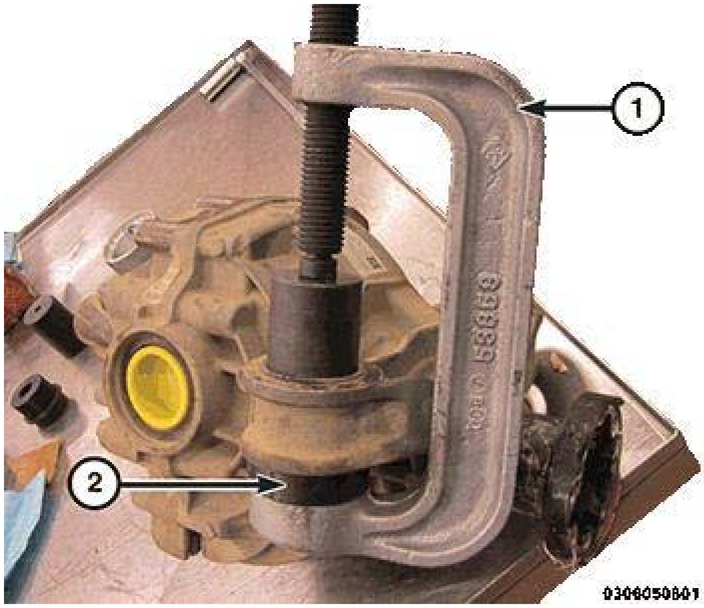

Fig. 40: Ball Joint Installer & Ball Joint Remover
Courtesy of CHRYSLER GROUP, LLC

NOTE: **195RIA axle bushing shown in illustration. 230RIA axle bushing uses the same procedure.**

NOTE: **Make sure the bushing inner metal orientation notches are in the same exact orientation as the original removed bushing inner metal.**

1. Install a **NEW** bushing in the rear axle using (special tool #10106-3, Remover, Ball Joint) (2) and (special tool #6289A, Installer, Ball Joint) (1).
2. Install the rear axle assembly. Refer to **INSTALLATION**.

2015-16 SUSPENSION

Rear Suspension - Challenger

DESCRIPTION

NON SRT

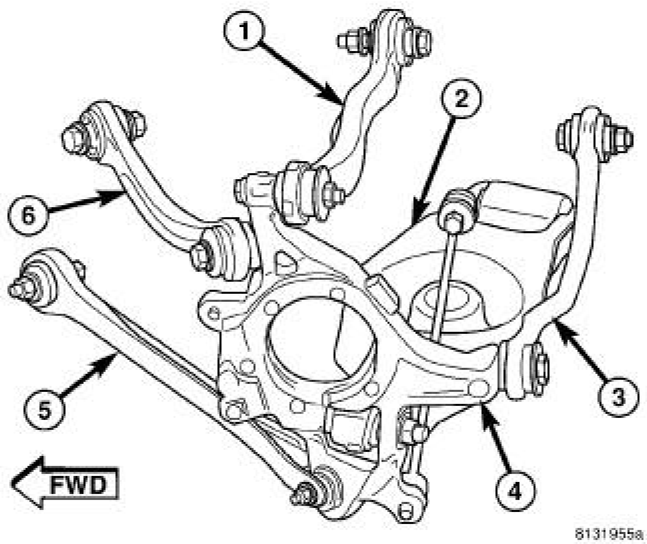

Fig. 1: Rear Suspension Components
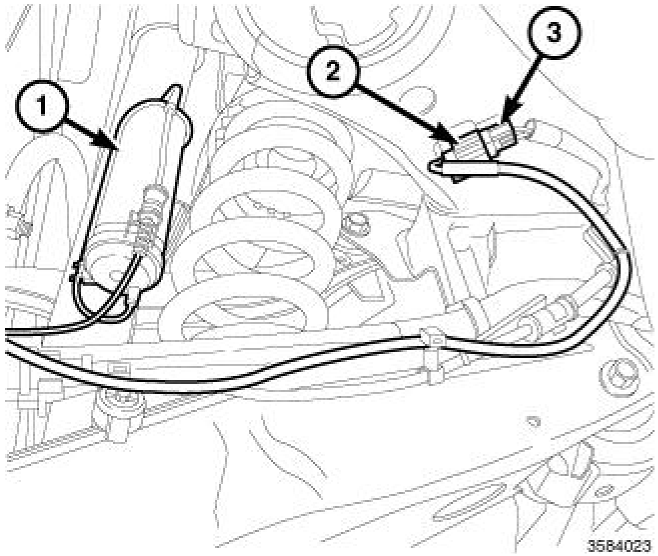
Courtesy of CHRYSLER GROUP, LLC

This vehicle utilizes a five-link rear suspension including the following major components:

- Camber Link (1)
- Compression Link (5)
- Spring Link (2)
- Tension Link (6)
- Toe Link (3)
- Coil Spring
- Crossmember
- Hub And Bearing
- Knuckle (4)
- Shock Absorber
- Stabilizer Bar

Service Procedures for the crossmember can be found in Frame And Bumpers. Refer to **CROSSMEMBER, REAR, REMOVAL** and **CROSSMEMBER, TRANSMISSION, REMOVAL** .

SRT



[Fig. 2: Shock Solenoid Assembly & ADS Harness Connector]
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Left side shown in the illustration, right side similar.**

The SRT rear suspension is part of an Active Damping System (ADS). The ADS includes unique shock absorbers, an Active Damping Control Module (ADCM), and three accelerometers that work together to modify the ride of the suspension over varying road conditions.

The Active Damping System (ADS) rear shock is similar to a conventional shock with the addition of a shock solenoid assembly (1) mounted on the side of its body with a three wire harness connector attached to it. The ADS shock assembly is serviced the same as a conventional shock absorber, with the addition of disconnecting the ADS harness connector (2) on the crossmember.

Service of all other rear suspension components remain the same as the standard components. When components differ, be sure to use only SRT components on SRT vehicles.

The rear knuckle for the SRT is different from the standard knuckle. Although similar in appearance and in service, the mounting bosses for the disc brake caliper have been moved downward to allow mounting of the Brembo four-piston brake caliper. Due to this change, an updated special tool is needed to remove the sleeve that retains the lower control arm ball joint to the knuckle.

The rear stabilizer bar diameter has been increased for the SRT but it is serviced in the same manner as the standard bar.

SPECIFICATIONS

TORQUE SPECIFICATIONS

HUB AND BEARING

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HUB BEARING - NOISE

NOTE: **The wheel bearing is designed to last for the life of the vehicle and requires no type of periodic maintenance. If it becomes necessary to replace a faulty bearing, do not replace in pairs unless parts service information specifically states to do so.**

Bearings will produce noise if worn or damaged. The noise will generally change when the bearings are loaded. A road test of the vehicle is normally required to determine if there is a bearing noise, or if it is some other component. To assist in finding the location, the following procedure, together with the **DIAGNOSTIC TABLE** , should help determine if a bearing is causing the noise, and if so which one. Keep in mind that bearing noises are not typically intermittent. If a particular vehicle road test maneuver results in noise only part of the time, it is not likely a faulty bearing.

NOTE: **Damaged bearing seals and the resulting excessive grease loss may also require bearing replacement. Moderate grease seepage from the bearing is considered normal and should not require replacement of the wheel bearing. To diagnose the hub, measure hub runout. Refer to ROTOR, BRAKE, DIAGNOSIS AND TESTING .**

DIAGNOSTIC PROCEDURE:

1. Perform a drive evaluation. Find a smooth level road surface void of traffic or obstructions. Turn off any accessories which may cause background noise. Evaluate for noise at 50 km/h (30 mph) and 100 km/h (60 mph) and with vehicle in neutral to eliminate potential drivetrain noises. With vehicle at a constant speed, steer back and forth to left and right. This will load and unload the bearings and may change the noise level. When bearing damage is slight, the noise is sometimes noticeable at lower speeds and at other times is more noticeable at higher speeds.
2. Drive evaluation results: Did the noise increase when turning right which may indicate a problem with the left bearing? Did the noise increase when turning left which may indicate a problem with the right bearing?
3. Put vehicle up on hoist. Grab the tire by pushing in on the top center and pulling out on the bottom center to check for excessive movement in the bearing.
4. Check for potential rubbing on rotating components, such as rotor splash shields, heat shields touching propshaft or halfshaft, wheel well liners contacting tire, wheel cover on wheel, etc. Any cyclic noise (once per wheel revolution for example) is not a wheel bearing fault.
5. Remove the wheel and tire assembly, disc brake caliper and brake rotor. Refer to **ROTOR, BRAKE, REMOVAL** .
6. Rotate the wheel hub, checking for resistance or roughness.
7. Any roughness or resistance to rotation may indicate dirt intrusion or a failed hub bearing. If the bearing exhibits any of these conditions, the hub & bearing will require replacement. Do not attempt to disassemble the bearing for repair.
8. Rotate the wheel hub, utilize Chassis Ears (or stethoscope) to check for noise.
9. If none of the above checks indicate a bearing failure, refer to the **DIAGNOSTIC TABLE** for other possible causes.

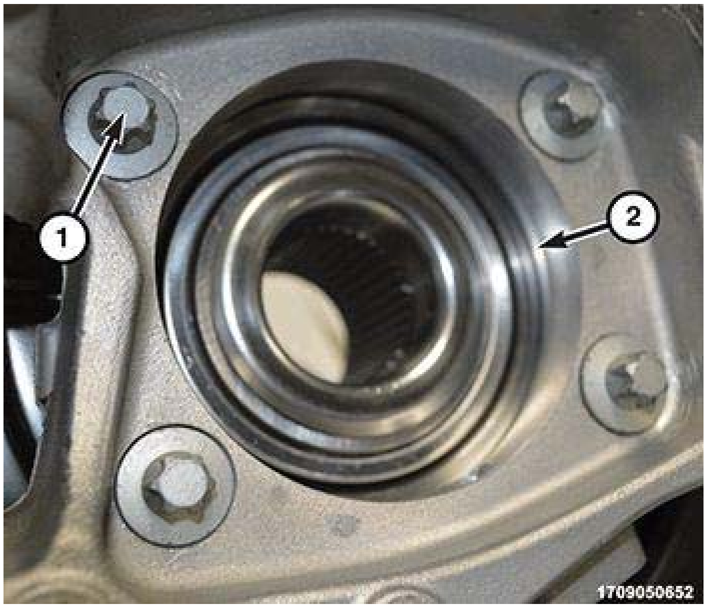
DIAGNOSTIC TABLE - HUB BEARING

CONDITION	POSSIBLE CAUSES	POTENTIAL CORRECTIONS
FRONT END WHINE ON TURNS	1. Low Power Steering Fluid Level (if applicable)	1. Fill power steering fluid reservoir to proper level, check for leaks (make sure all air is bled from system fluid)
	2. Worn Tires and/or Incorrect Wheel Alignment	2. Replace Tires, Check And Reset Wheel Alignment
	3. Defective Wheel Bearing	3. Replace Wheel Bearing
	4. Wrong Power Steering Fluid (if applicable)	4. Replace With Correct Power Steering Fluid
FRONT END GROWL OR GRINDING ON TURNS	1. Loose Wheel Lug Nuts	1. Verify Wheel Lug Nut Torque
	2. Engine Mount Grounding Against Frame Or Body Of Vehicle	2. Check For Engine Mount Hitting Frame Rail And Reposition Engine As Required
	3. Worn Tires and/or Incorrect Wheel Alignment	3. Replace Tires, Check and Reset Wheel Alignment
	4. Defective Wheel Bearing	4. Replace Wheel Bearing
	5. Worn or Broken C/V Joint	5. Replace C/V Joint
	6. Engine Not Centered, Causing Axle Half Shaft to Bottom Out	6. Center the Engine
POPPING/CLICKING/SNAPPING DURING ACCELERATION AFTER DRIVE-TO-REVERSE SHIFT, REVERSE-TO-DRIVE SHIFT OR WHILE TURNING	1. Insufficient Hub Nut Torque	1. Torque Hub Nut to Spec
	2. Insufficient Grease on Mating Surface of Axle Half Shaft Outer C/V Joint to Wheel Hub/Bearing, or Worn/Damaged Gasket	2. Separate Half Shaft From Hub and Bearing and Wipe Mating Surfaces Clean. Apply Light Coating of Wheel Bearing Grease to C/V Joint Surface and Reassemble, or Replace Gasket. Torque Hub Nut to Spec
WHINE/HUM/ROAR WITH VEHICLE GOING STRAIGHT AT A CONSTANT SPEED	1. Worn Tires and/or Incorrect Wheel Alignment	1. Replace Tires and Reset Wheel Alignment
	2. Defective Wheel Bearing	2. Replace Wheel Bearing
GROWL OR GRINDING WITH VEHICLE GOING STRAIGHT AT A CONSTANT SPEED	1. Engine Mount Grinding Against Frame or Body	1. Check and Reposition Engine as Required
	2. Defective Wheel Bearing	2. Replace Wheel Bearing
	3. Worn or Broken C/V Joint	3. Replace C/V Joint

REMOVAL

REMOVAL

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the tire and wheel assembly. Refer to **REMOVAL** .
3. Remove the rear knuckle. Refer to **KNUCKLE, REAR, REMOVAL**.

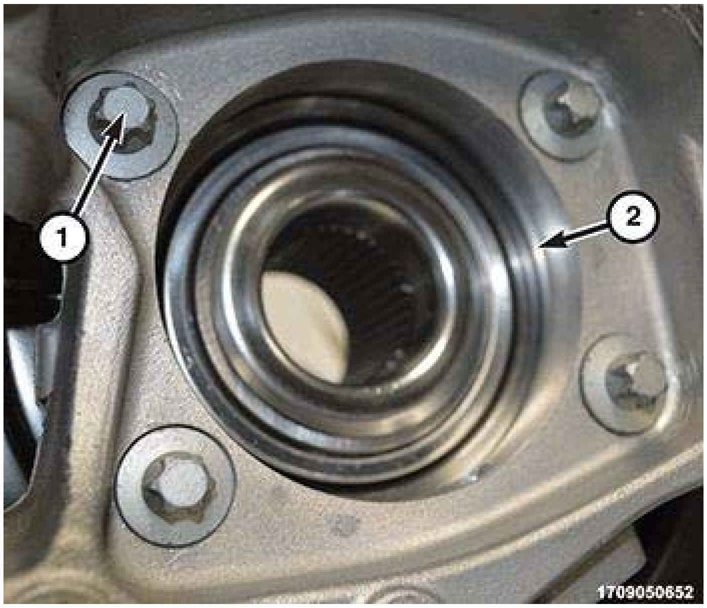


[Fig. 3: Hub, Bearing & Bolts]
Courtesy of CHRYSLER GROUP, LLC

4. Remove the four hub and bearing bolts (1).
5. Separate the hub and bearing (2) from the knuckle.

INSTALLATION

INSTALLATION



[Fig. 4: Hub, Bearing & Bolts]
Courtesy of CHRYSLER GROUP, LLC

1. Slide the hub and bearing (2) into the knuckle and position the hub and bearing to the mounting holes.
2. Install the four hub and bearing bolts (1). Tighten to the proper torque specification. Refer to SPECIFICATIONS.

3. Install the knuckle. Refer to **KNUCKLE, REAR, INSTALLATION**.
4. Verify proper adjustment of the parking brake shoes and adjust as necessary. Refer to **SHOES, PARKING BRAKE, ADJUSTMENTS** .
5. Install tire and wheel assembly. Refer to **INSTALLATION** .
6. Remove the support and lower the vehicle.

KNUCKLE, REAR

REMOVAL

REMOVAL

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the tire and wheel assembly. Refer to **REMOVAL** .

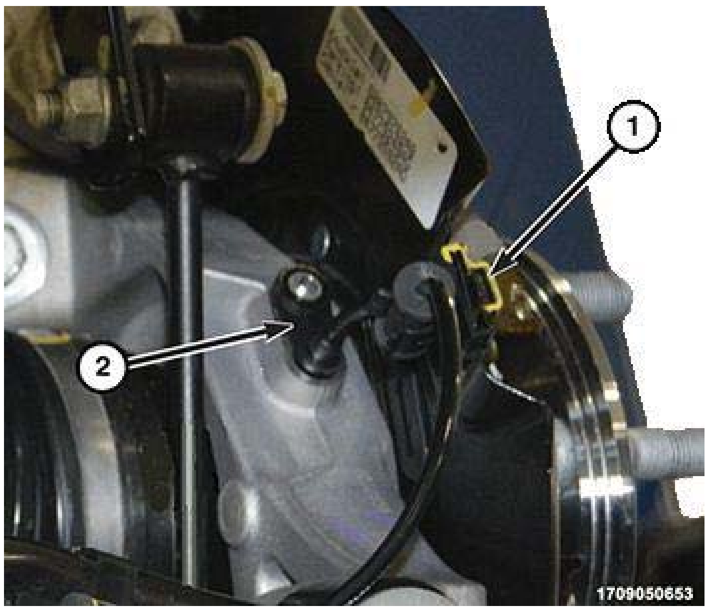


Fig. 5: Wheel Speed Sensor Connector & Knuckle
Courtesy of CHRYSLER GROUP, LLC

3. Detach the wheel speed sensor connector from the brake splash shield (1) and remove the wheel speed sensor bolt, then separate the wheel speed sensor from the knuckle (2).
4. Remove the brake rotor. Refer to **ROTOR, BRAKE, REMOVAL** .
5. Remove the parking brake shoes. Refer to **SHOES, PARKING BRAKE, REMOVAL** .

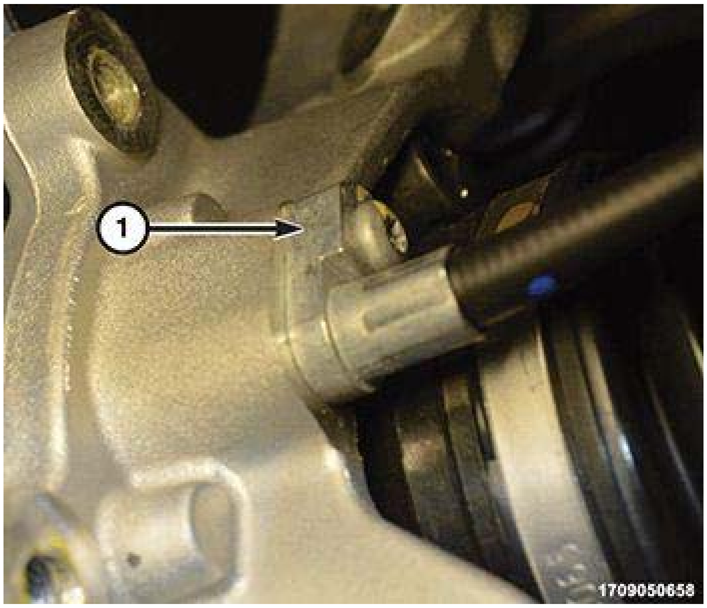

Fig. 6: Parking Brake Cable
Courtesy of CHRYSLER GROUP, LLC

6. Remove the parking brake cable (1) from the knuckle.
7. Position a suitable jack under the spring link. Raise the jack head to contact the spring link at the shock mount and secure in place.

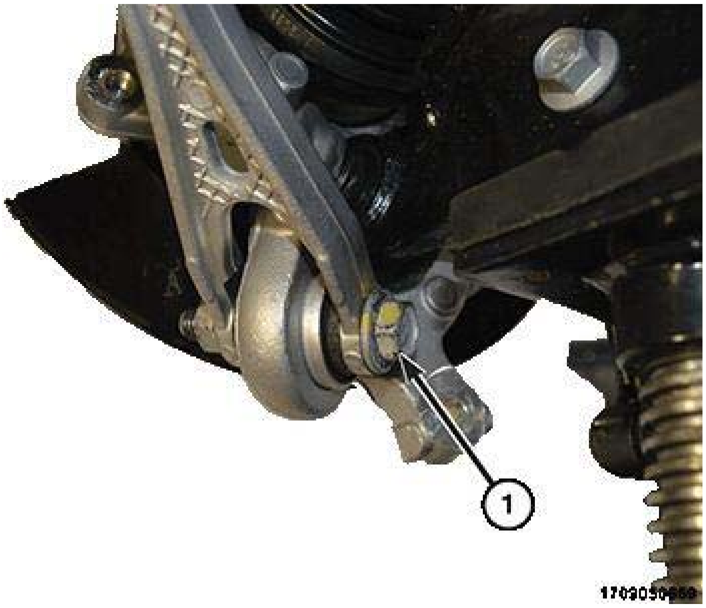

Fig. 7: Compression Link To Knuckle Bolt
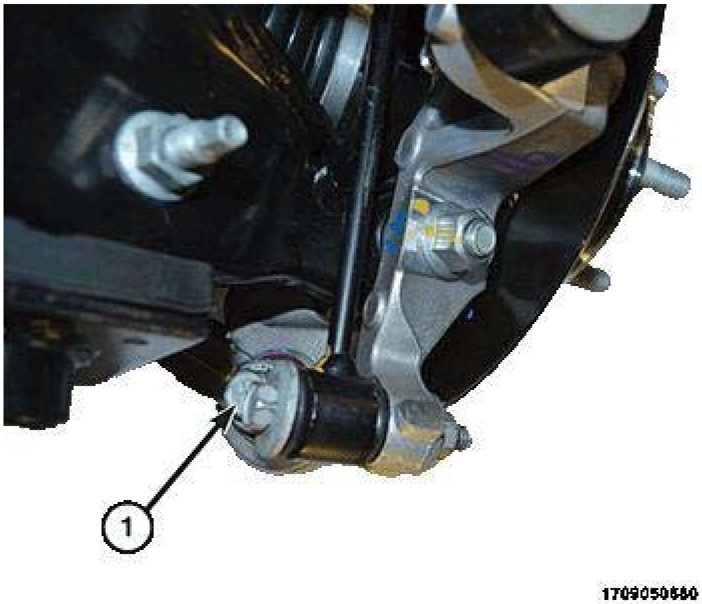
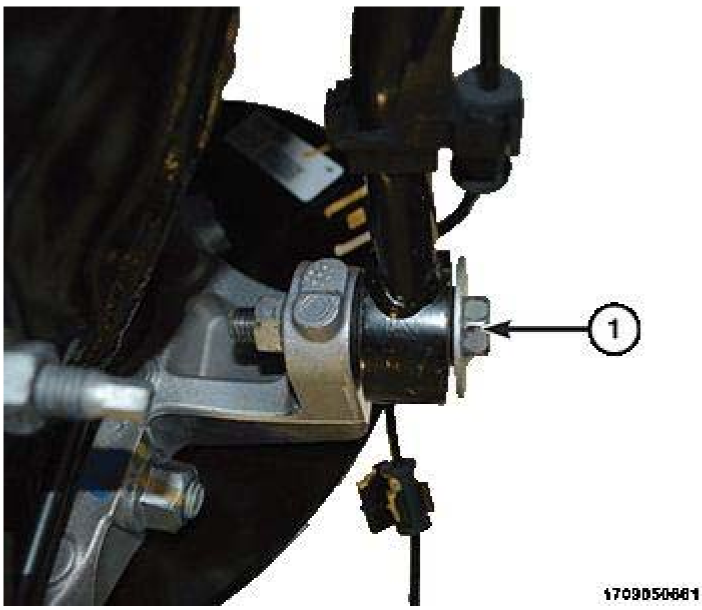
Courtesy of CHRYSLER GROUP, LLC

8. Remove the compression link to knuckle bolt (1).



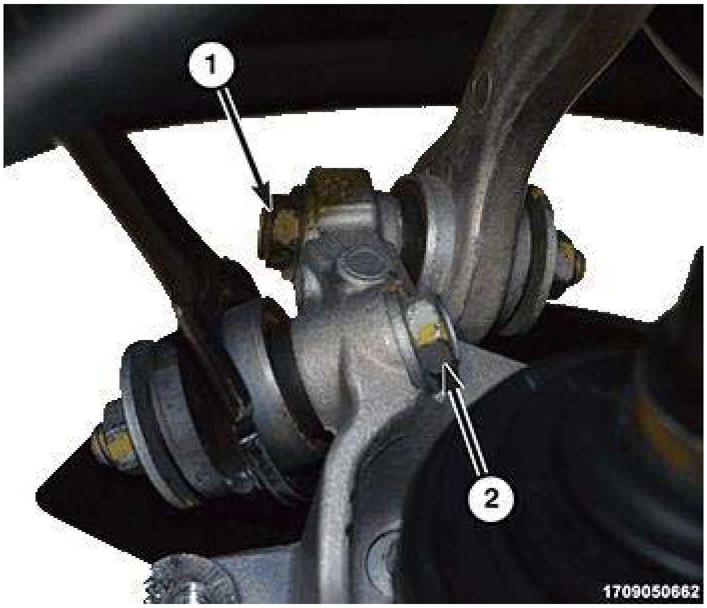
[Fig. 8: Stabilizer Link To Knuckle Bolt](#)
Courtesy of CHRYSLER GROUP, LLC

9. Remove the stabilizer link to knuckle bolt (1).



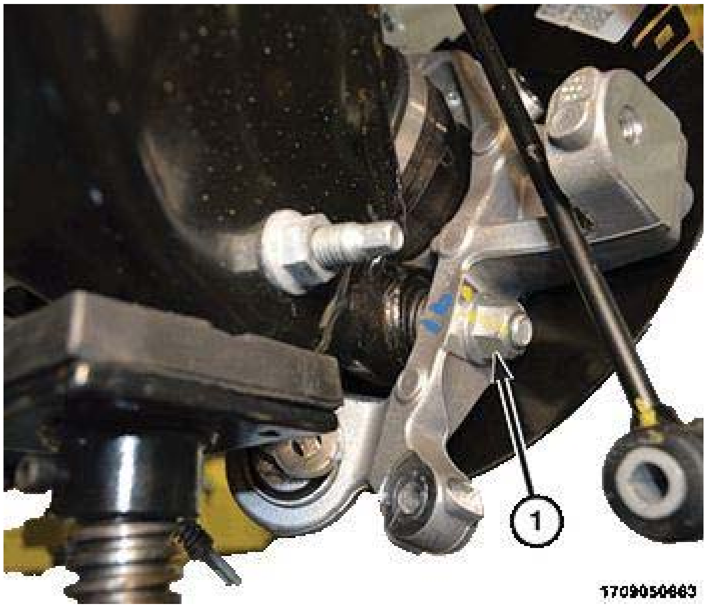
[Fig. 9: Toe Link To Knuckle Bolt](#)
Courtesy of CHRYSLER GROUP, LLC

10. Remove the toe link to knuckle bolt (1).



[**Fig. 10: Camber Link Bolt & Tension Link Bolt**]
Courtesy of CHRYSLER GROUP, LLC

11. Remove the camber link (1) and the tension link (2) to knuckle bolts.



[**Fig. 11: Spring Link Bolt**]
Courtesy of CHRYSLER GROUP, LLC

12. Remove the spring link (1) bolt.
13. Remove the knuckle.

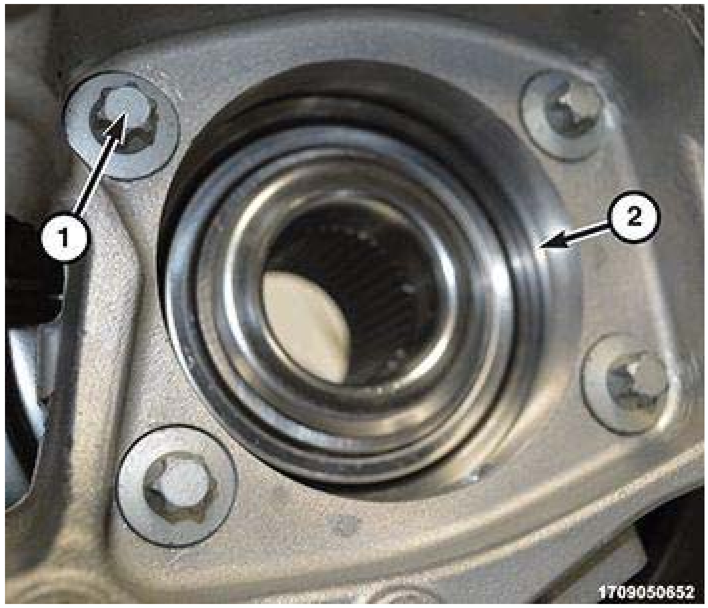


Fig. 12: Hub, Bearing & Bolts
Courtesy of CHRYSLER GROUP, LLC

14. Remove bolts (1) and separate the hub and bearing from the knuckle (2).
15. Remove the brake splash shield.
16. If necessary, remove the knuckle lower bushing as follows:

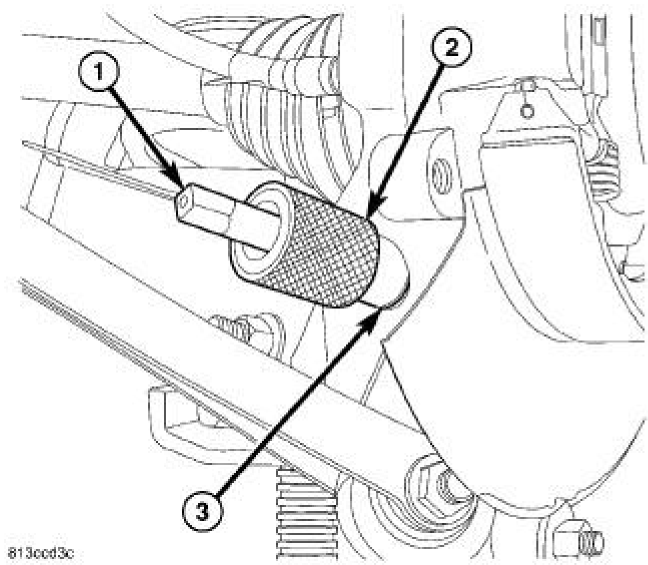

Fig. 13: Using Tap & Guide
Courtesy of CHRYSLER GROUP, LLC

NOTE: **It important to use (2), when tapping sleeve in knuckle to help keep (1), straight during use or damage to Tap may occur.**

17. Place (special tool #9361-2, Tap Guide) (2) against sleeve (3) in knuckle to keep (special tool #9361-1, Tap, Plug M16 X 2.0) (1) straight. Using Tap with an appropriate handle, cut threads approximately halfway through bushing (or about six complete threads). **It is important to back tap out, clean out**

burrs and lubricate Tap often during process.

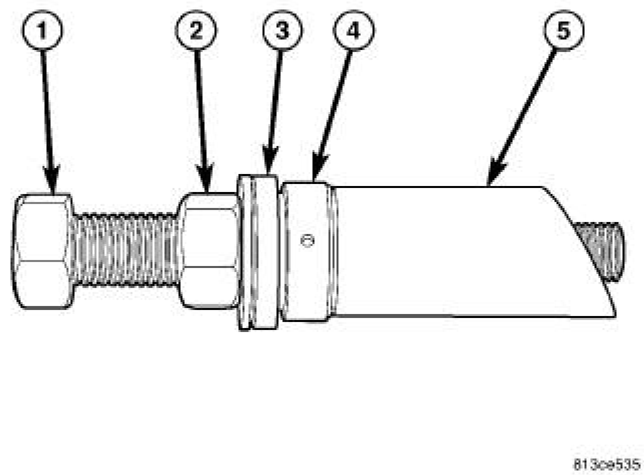

Fig. 14: Rear Knuckle Sleeve Remover/Installer
Courtesy of CHRYSLER GROUP, LLC

NOTE:	**Prior to using (special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit), lubricate bolt (1) threads to provide ease of use and promote tool longevity.**

NOTE:	**When installing thrust bearing on remover, be sure to place hardened side against nut. Place bearing outer cage against stationary component.**

18. Assemble (special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit) as shown in the illustration.
    - (1) (special tool #9361-3, Screw, Forcing)
    - (2) Nut
    - (3) Spherical Washer
    - (4) Thrust Bearing
    - (5) (special tool #9361-4, Cup, Bushing)

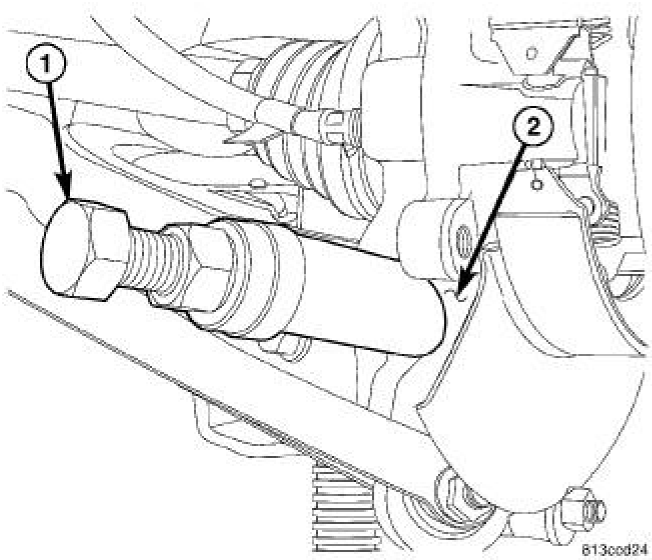

Fig. 15: Bolt & Tapped Knuckle Sleeve
Courtesy of CHRYSLER GROUP, LLC

19. Thread (special tool #9361-3, Screw, Forcing) (1) into tapped knuckle sleeve.
20. Tighten the nut down, matching Sleeve angled end with angled face of the knuckle.
21. Continue to tighten nut until knuckle sleeve is removed from the knuckle. **Discard knuckle sleeve.**

INSTALLATION

INSTALLATION

1. If necessary, install a new knuckle lower bushing as follows:

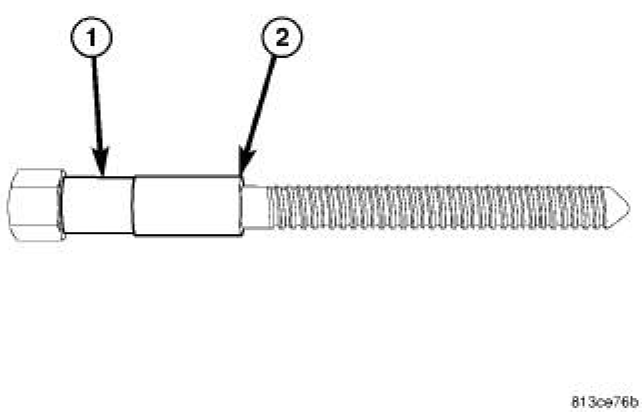

Fig. 16: Rear Knuckle Sleeve Installer
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Prior to using the Tool (special tool #9361A, Rear Knuckle Sleeve**

Remover/Installer Kit), lubricate the bolt (1) threads to provide ease of use and promote tool longevity.

2. Place the new knuckle sleeve (2) onto (special tool #9361-7, Screw, Installation) (1), and slide it up to bolt's head.
3. Starting from knuckle forward end, slide (special tool #9361-7, Screw, Installation) (1) with sleeve through knuckle.
4. Install the thrust bearing and nut. **When installing thrust bearing on Installer, make sure to install the hardened side against nut. Place bearing outer cage against stationary component.**
5. Using hand tools, hold the bolt head (1) stationary, then rotate nut to install sleeve in the knuckle. Install sleeve until nut stops turning. **Do not overtighten Nut.**
6. Remove the special tool.

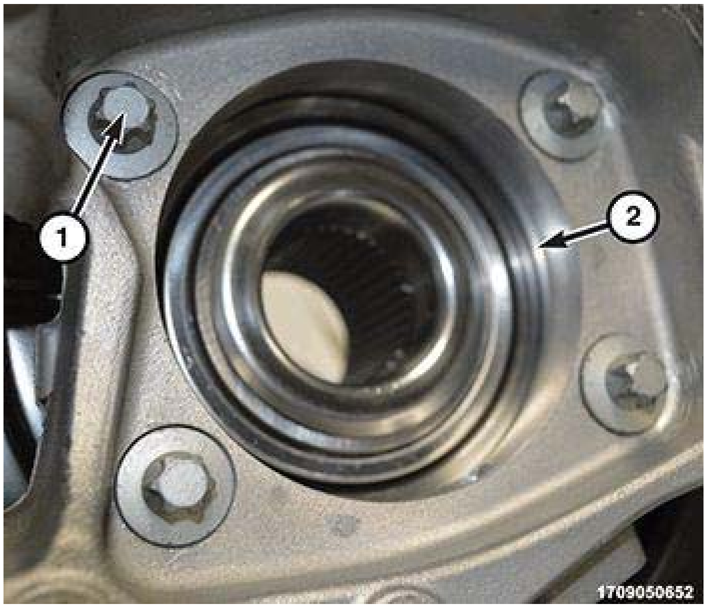

Fig. 17: Hub, Bearing & Bolts
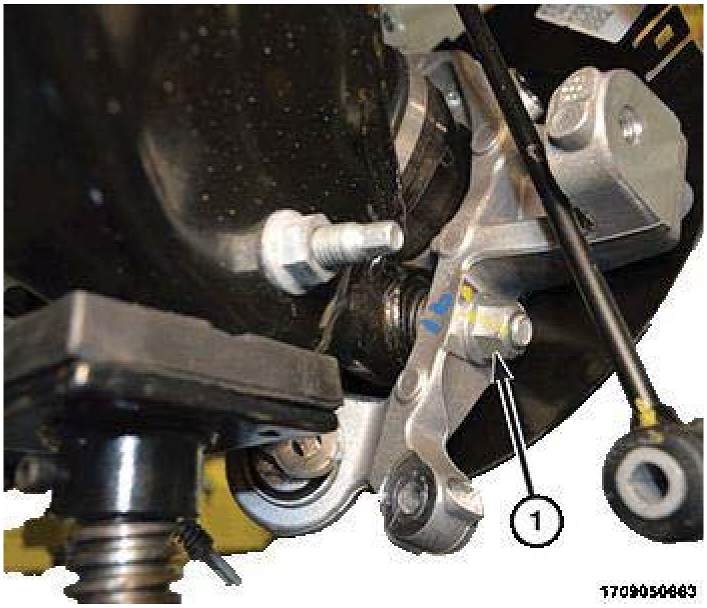
Courtesy of CHRYSLER GROUP, LLC

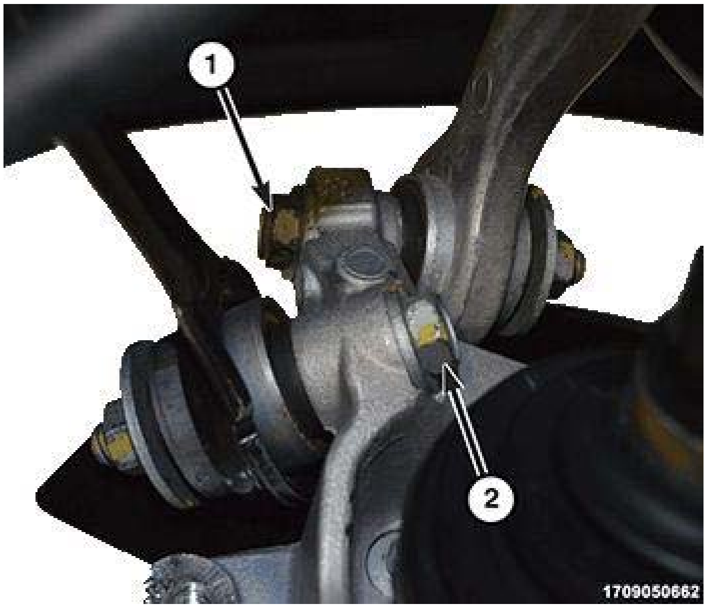
7. Install the brake splash shield and hub bearing (2) in the knuckle and install the hub and bearing bolts (1). Tighten to the proper torque specification. Refer to **SPECIFICATIONS**.



[Fig. 18: Spring Link Bolt](#)
Courtesy of CHRYSLER GROUP, LLC

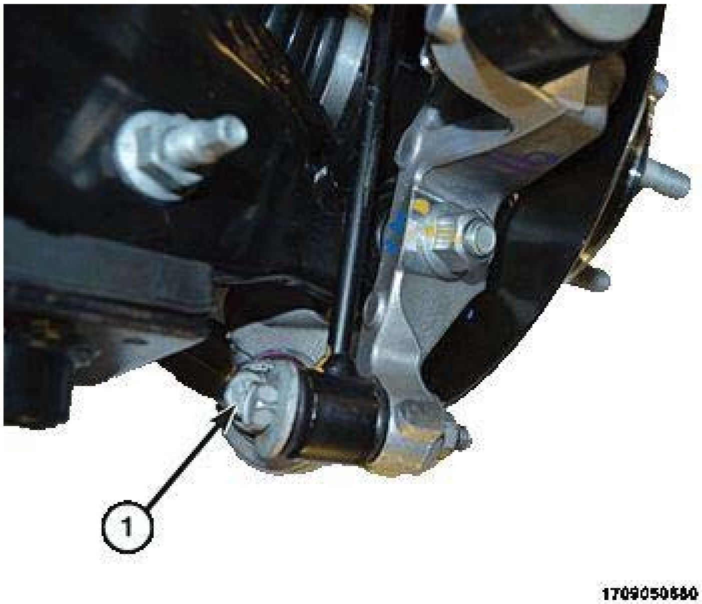
8. Position the knuckle on the vehicle and install the spring link bolt (1). **Do not tighten bolt at this time.**

NOTE: **Using a suitable tool, move the knuckle lower bushing inward to ease installation of the spring link onto the knuckle.**



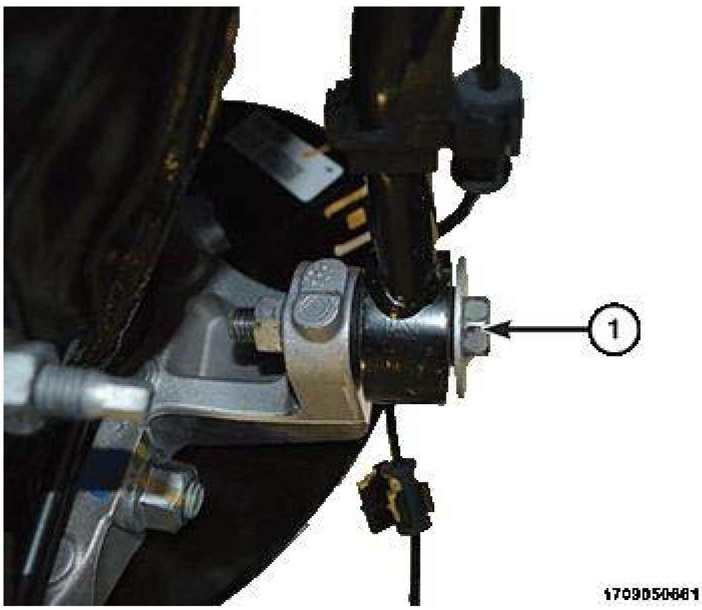
[Fig. 19: Camber Link Bolt & Tension Link Bolt](#)
Courtesy of CHRYSLER GROUP, LLC

9. Install the tension link (2) and the camber link (1) to knuckle bolts **Do not tighten bolt at this time.**



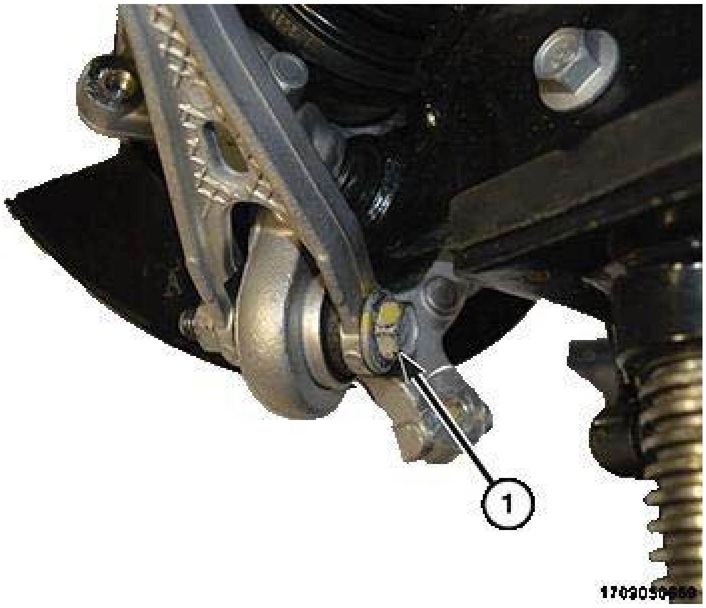
[Fig. 20: Stabilizer Link To Knuckle Bolt]
Courtesy of CHRYSLER GROUP, LLC

10. Install the stabilizer link to the knuckle bolt (1). **Do not tighten bolt at this time.**



[Fig. 21: Toe Link To Knuckle Bolt]
Courtesy of CHRYSLER GROUP, LLC

11. Install the toe link (1) to knuckle bolt. **Do not tighten bolt at this time.**



[**Fig. 22: Compression Link To Knuckle Bolt**]
Courtesy of CHRYSLER GROUP, LLC

12. Install the compression link to the knuckle bolt (1). **Do not tighten bolt at this time.**

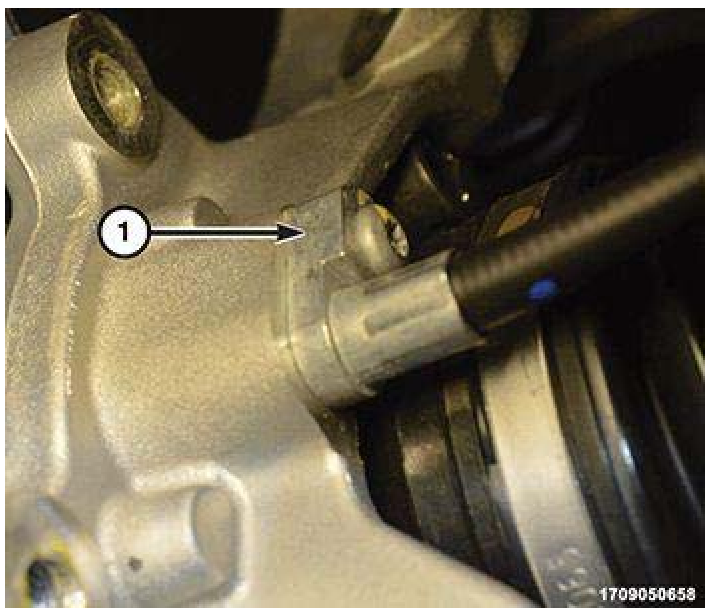


Fig. 23: Parking Brake Cable
Courtesy of CHRYSLER GROUP, LLC

13. Insert end of parking brake cable (1) into the knuckle and install the parking brake cable bolt. Tighten the parking brake cable bolt to the proper torque specification. Refer to **SPECIFICATIONS**.
14. Install the parking brake shoes. Refer to **SHOES, PARKING BRAKE, INSTALLATION** .

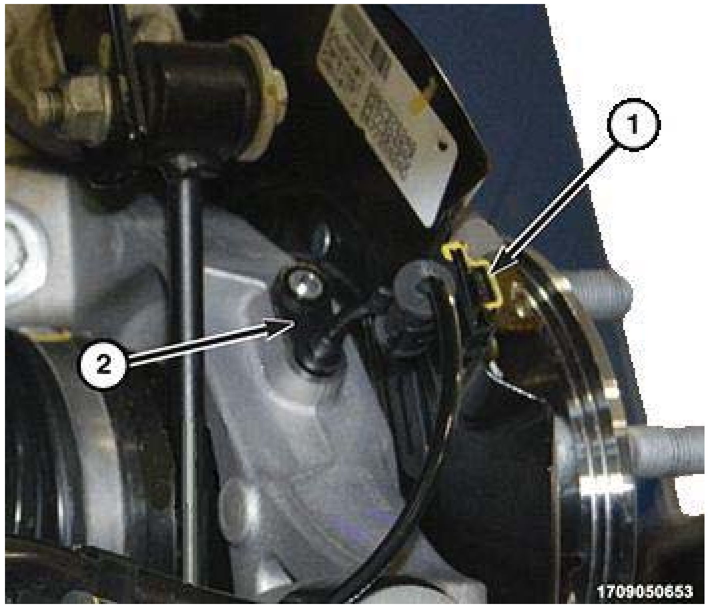

Fig. 24: Wheel Speed Sensor Connector & Knuckle
Courtesy of CHRYSLER GROUP, LLC

15. Attach the wheel speed sensor connector (1) onto the brake splash shield. Install the wheel speed sensor into the knuckle (2), then install the wheel speed sensor bolt. Tighten the wheel speed sensor bolt to proper torque specification. Refer to **SPECIFICATIONS**.

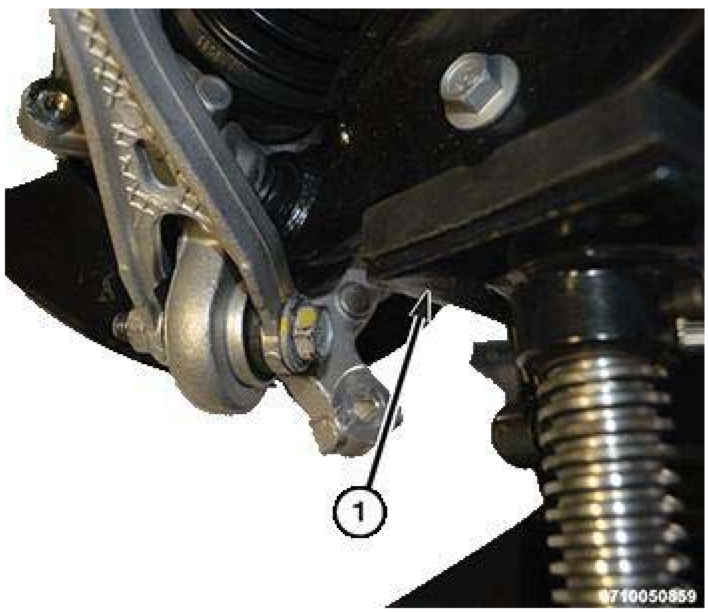

Fig. 25: Suitable Jack Under The Spring Link
Courtesy of CHRYSLER GROUP, LLC

16. Remove the support (1) from under the spring link.
17. Install the brake caliper and the brake rotor. Refer to **ROTOR, BRAKE, INSTALLATION** .
18. Lower vehicle.
19. Adjust parking brake shoes as necessary. Refer to **SHOES, PARKING BRAKE, ADJUSTMENTS** .
20. Position vehicle on alignment rack/drive-on hoist. Raise vehicle as necessary to access mounting bolts.

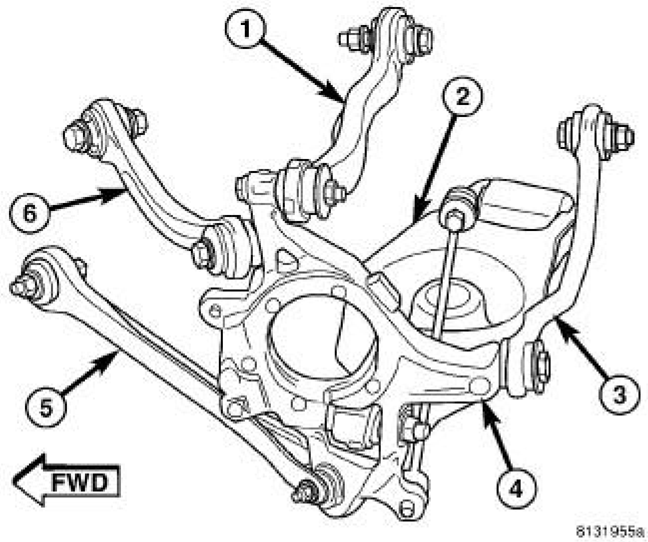

Fig. 26: Rear Suspension Components
Courtesy of CHRYSLER GROUP, LLC

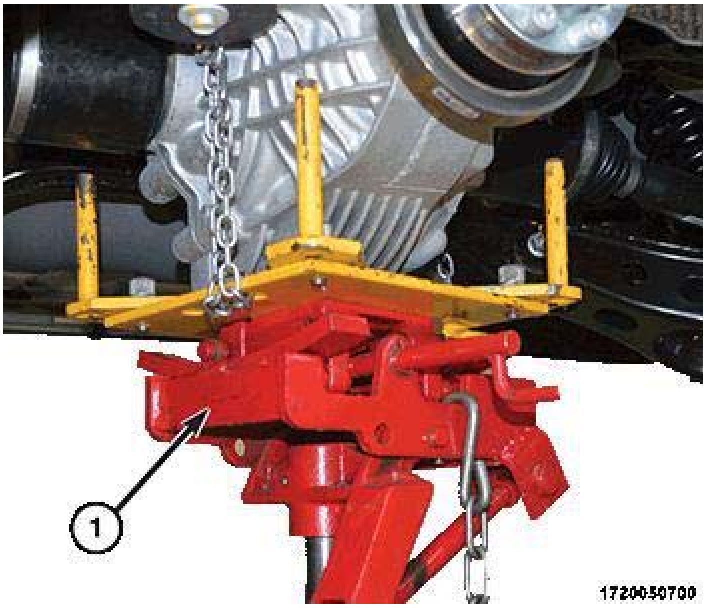
21. Tighten the following fasteners to the proper torque specification with vehicle at curb height: Refer to **SPECIFICATIONS**.
    - Camber Link (1) to Knuckle Bolt.
    - Compression Link (5) to Knuckle Bolt.
    - Stabilizer Link to Knuckle Bolt.
    - Tension Link (6) to Knuckle Bolt.
    - Toe Link (3) to Knuckle Bolt.
    - Spring Link to Knuckle Bolt.
22. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

LINK, CAMBER

REMOVAL

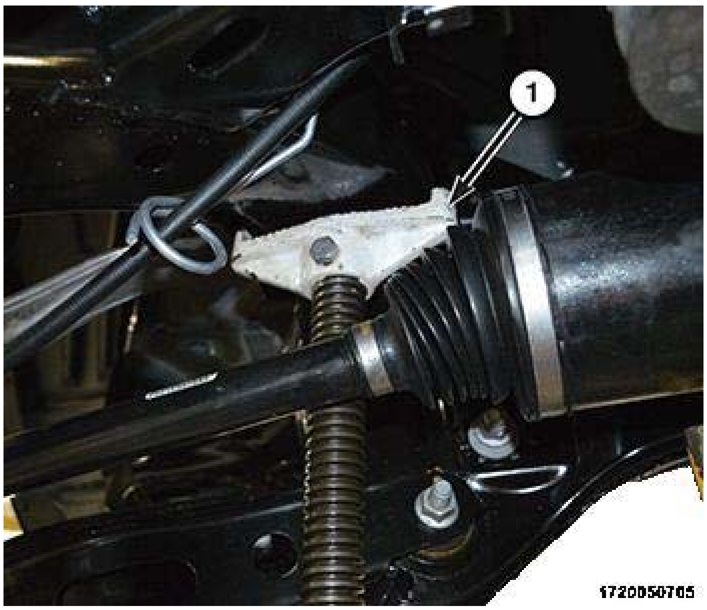
REMOVAL

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the tire and wheel assembly. Refer to **REMOVAL** .
3. For left hand side camber link service, remove the fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, REMOVAL** .
4. Remove the rear exhaust. Refer to **MUFFLER, EXHAUST, REMOVAL** .



[Fig. 27: Jack](#)
Courtesy of CHRYSLER GROUP, LLC

5. Position a suitable jack (1) under the rear axle differential. **Do not secure the jack to the stabilizer bar.**



[Fig. 28: Jack](#)
Courtesy of CHRYSLER GROUP, LLC

6. Position a suitable jack (1) to the crossmember on the repair-side of the vehicle.

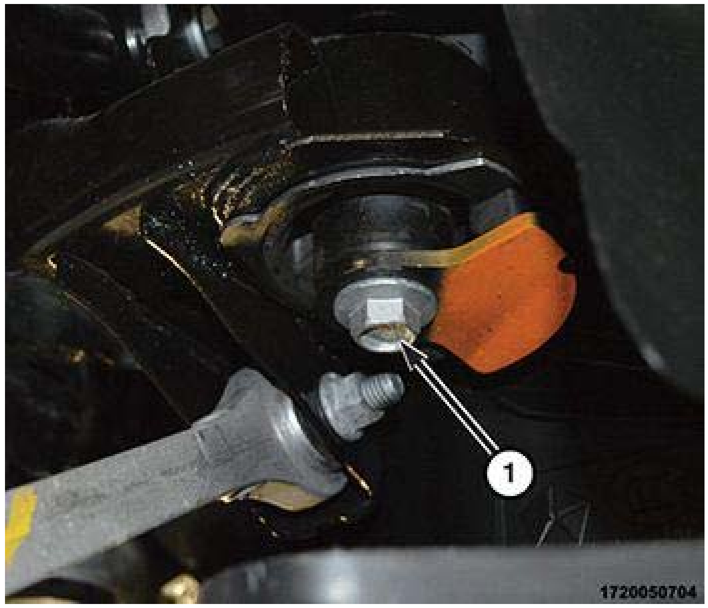


Fig. 29: Front Crossmember Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

7. Remove the front crossmember mounting bolt (1) on the repair-side of the vehicle.
   - Remove the crossmember mounting bolts on the repair-side of the vehicle. Do NOT loosen or remove crossmember mounting bolts on the opposite side of vehicle. This will require a rear wheel alignment following reinstallation to ensure proper thrust angle.

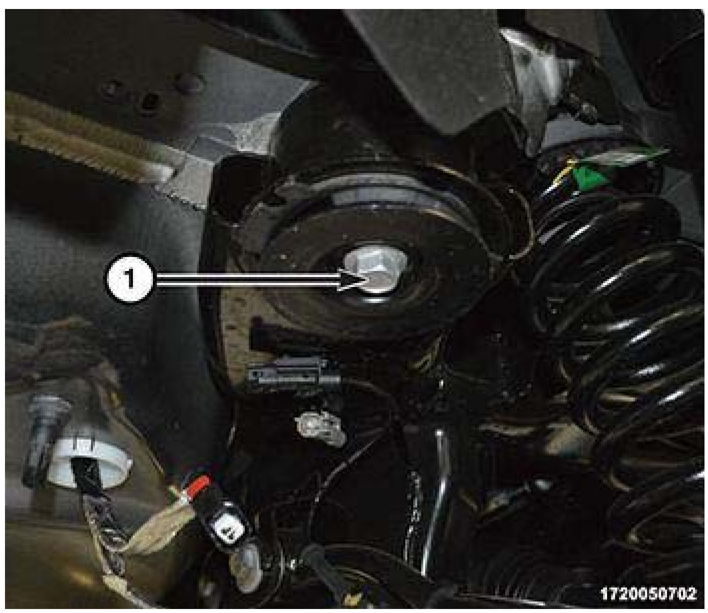

Fig. 30: Rear Crossmember Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

8. Remove the rear crossmember mounting bolt (1) on the repair-side of the vehicle.
9. Carefully lower the crossmember.

NOTE: **Do not lower the repair-side of the crossmember any further than necessary to gain access to the link mounting bolts.**

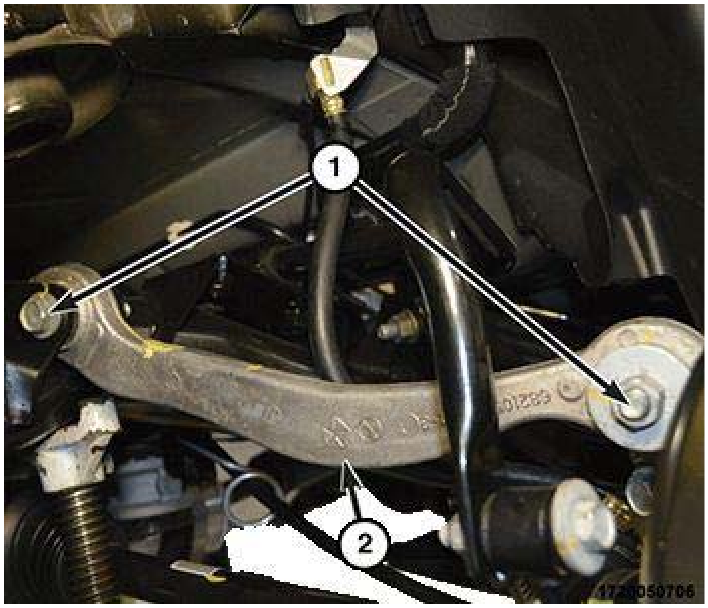

Fig. 31: Camber Link & Bolts
Courtesy of CHRYSLER GROUP, LLC

10. Remove the camber link bolts (1) and camber link (2).

INSTALLATION

INSTALLATION

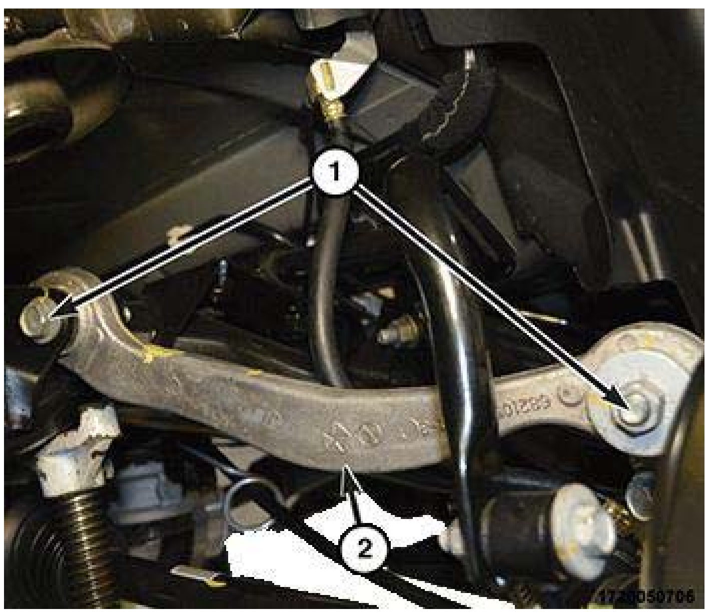

Fig. 32: Camber Link & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the camber link (2) into the bracket on the crossmember. Install the camber link to crossmember bolt (1). **Do not tighten the bolt at this time.**
2. Position the camber link (2) into the knuckle. Install the camber link to knuckle bolt (1). **Do not tighten the bolt at this time.**
3. The rear crossmember bolts are longer than the front crossmember bolts. Install them in the original

positions.

Install the crossmember bolts. **Do not fully tighten bolts at this time.**

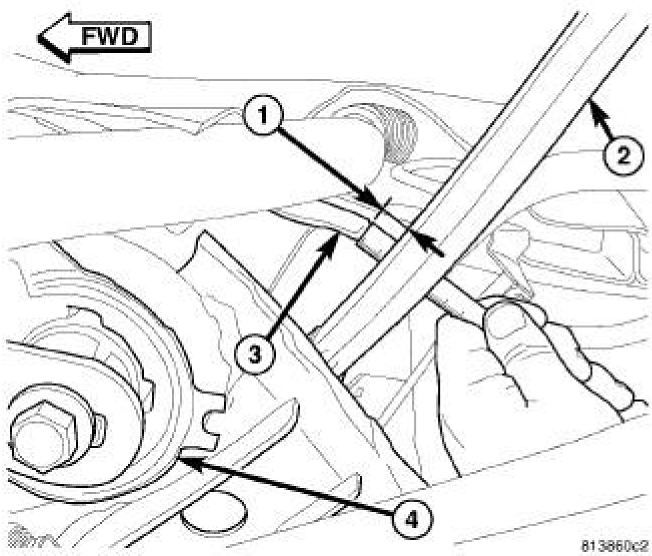

Fig. 33: Measuring Tension Link Clearance
Courtesy of CHRYSLER GROUP, LLC

4. Measure the tension link clearance as follows:
   - Measure the distance (1) from tension link (2) to body weld flange (3) directly in front of it, just outboard of front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To adjust, loosen three crossmember mounting bolts slightly, leaving one on opposite side of shift snugged to pivot from. Shift the crossmember rearward and snug the loosened bolts. Measure opposite side to be sure it has maintained a minimum 12 mm distance.
5. Tighten the crossmember bolts to the proper torque specification. Refer to **SPECIFICATIONS**.

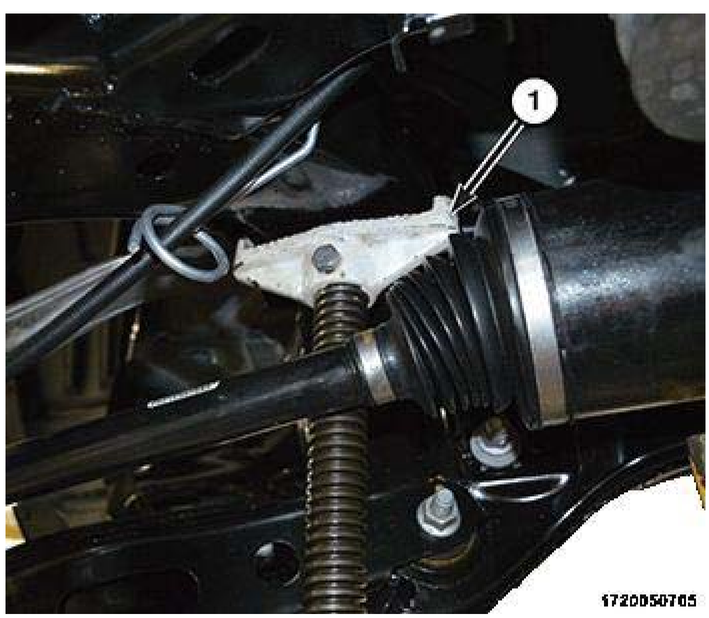

Fig. 34: Jack
Courtesy of CHRYSLER GROUP, LLC

6. Remove the support (1) from the crossmember.

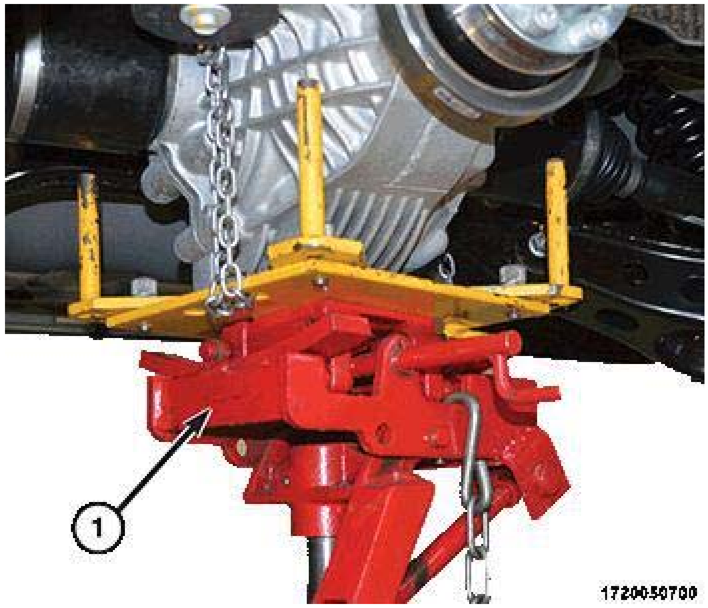

Fig. 35: Jack
Courtesy of CHRYSLER GROUP, LLC

7. Remove the support from the rear axle differential.
8. Install the rear exhaust. Refer to **MUFFLER, EXHAUST, INSTALLATION** .
9. For left hand side camber link service, install the fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, INSTALLATION** .

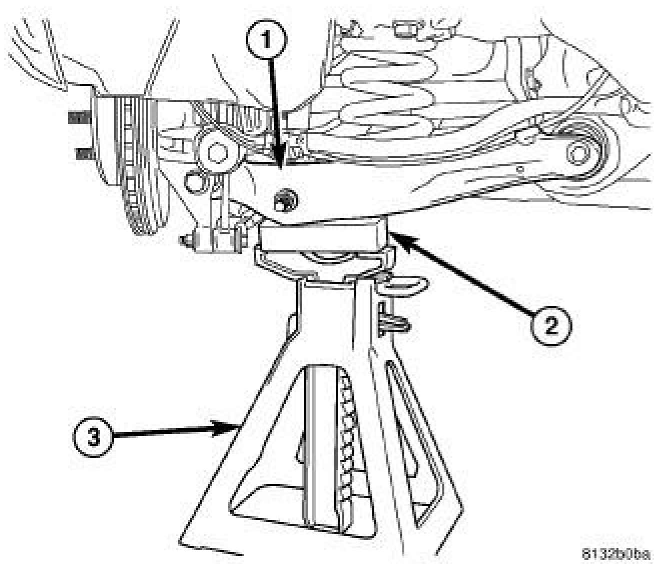

Fig. 36: Jack Stand Under Control Arm
Courtesy of CHRYSLER GROUP, LLC

10. Lower the vehicle until the front tires contact floor but the rear tires are still suspended. Place jack stands with wooden blocks under each rear suspension spring link. Lower the vehicle until the full weight is supported by the suspension.
11. Tighten the camber link to the crossmember bolt to the proper torque specification. Refer to **SPECIFICATIONS**.
12. Tighten the camber link to the knuckle bolt to the proper torque specification. Refer to **SPECIFICATIONS**.
13. Raise the vehicle and remove the jack stands.
14. Install the tire and wheel assembly. Refer to **INSTALLATION** .
15. Carry out a wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

LINK, COMPRESSION

REMOVAL

REMOVAL

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the rear tire and wheel assembly. Refer to **REMOVAL** .

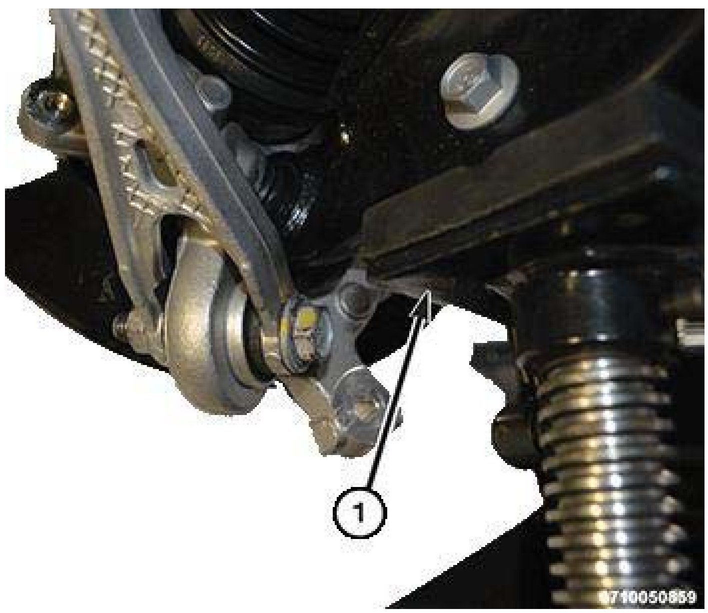

Fig. 37: Suitable Jack Under The Spring Link
Courtesy of CHRYSLER GROUP, LLC

3. Position a suitable jack (1) under the spring link.

Fig. 38: Lower Shock Absorber Bolt
Courtesy of CHRYSLER GROUP, LLC

4. Remove the lower shock absorber bolt (1) and lower the spring link.

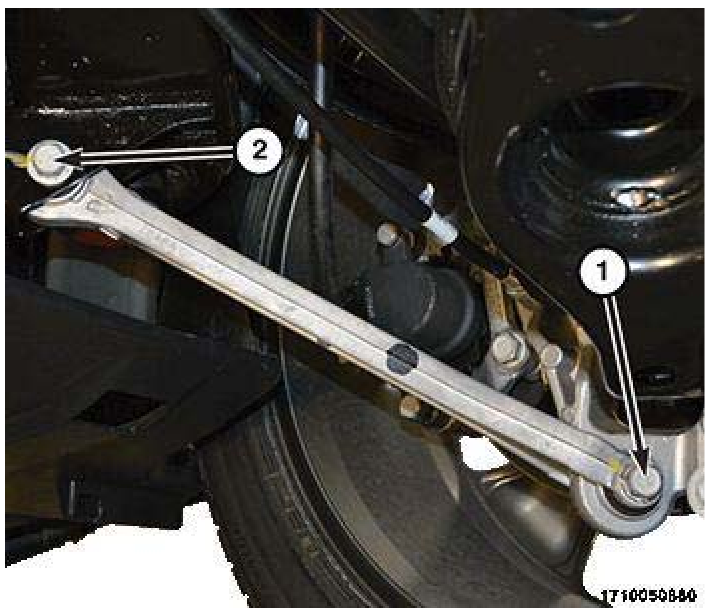

Fig. 39: Compression Link To Knuckle Bolt & Compression Link To Crossmember Bolt
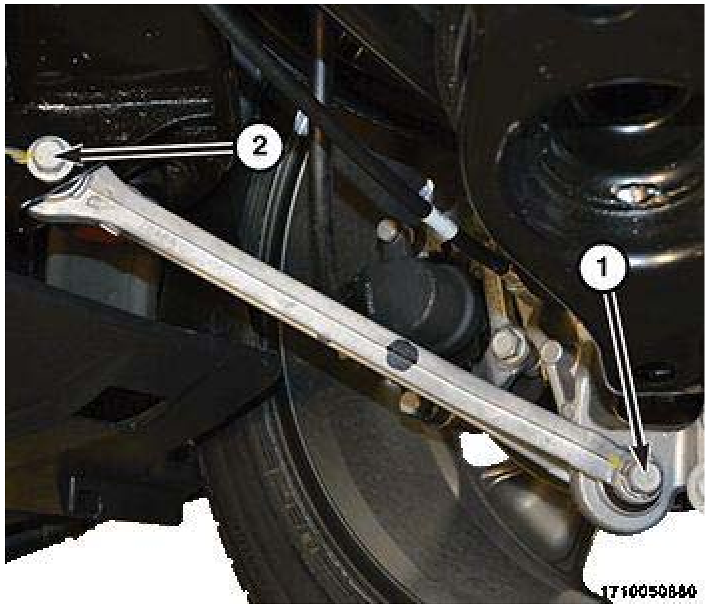
Courtesy of CHRYSLER GROUP, LLC

5. Remove the compression link to knuckle bolt (1).
6. Remove the compression link to crossmember bolt (2).
7. Remove compression link.

INSTALLATION

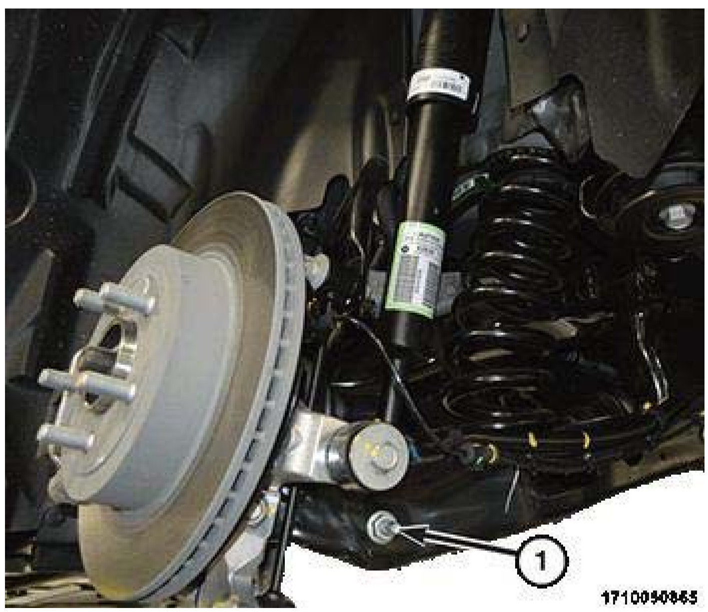
INSTALLATION

1. Position the compression link in the vehicle.



[Fig. 40: Compression Link To Knuckle Bolt & Compression Link To Crossmember Bolt]
Courtesy of CHRYSLER GROUP, LLC

2. Install the compression link to crossmember bolt (1). **Do not tighten bolt at this time.**
3. Install the compression link to knuckle bolt (2). **Do not tighten bolt at this time.**



[Fig. 41: Lower Shock Absorber Bolt]
Courtesy of CHRYSLER GROUP, LLC

4. Install the lower shock absorber bolt (1). **Do not tighten bolt at this time.**
5. Install the tire and wheel assembly. Refer to **INSTALLATION** .
6. Remove the support and lower the vehicle.
7. Position the vehicle on an alignment rack/drive-on lift. Position the vehicle to access the compression link fasteners.
8. Tighten the compression link bolts to the proper torque specification. Refer to **SPECIFICATIONS**.

9. Tighten the lower shock absorber bolt to the proper torque specification. Refer to **SPECIFICATIONS**.
10. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

LINK, SPRING

REMOVAL

REMOVAL

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the tire and wheel assembly. Refer to **REMOVAL** .

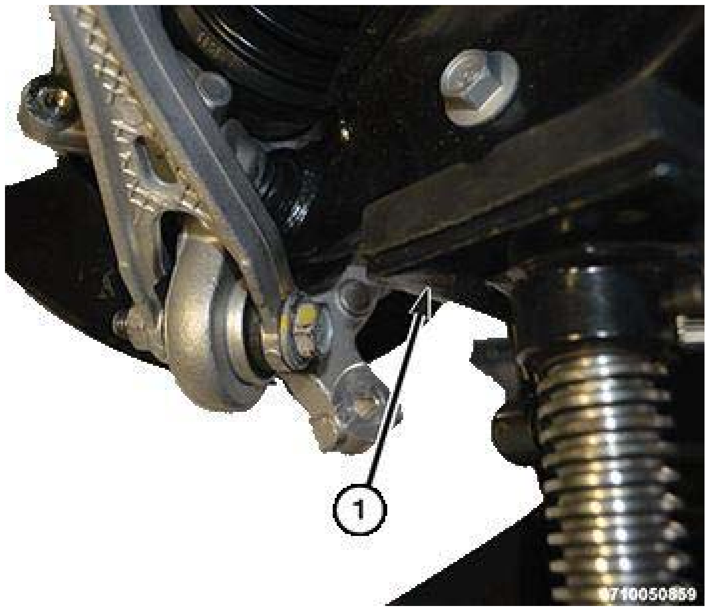


Fig. 42: Suitable Jack Under The Spring Link
Courtesy of CHRYSLER GROUP, LLC

3. Position a suitable jack (1) under the spring link.
4. Remove the shock absorber. Refer to **SHOCK ABSORBER, SUSPENSION, REMOVAL**.
5. Carefully lower the jack and remove the rear spring.

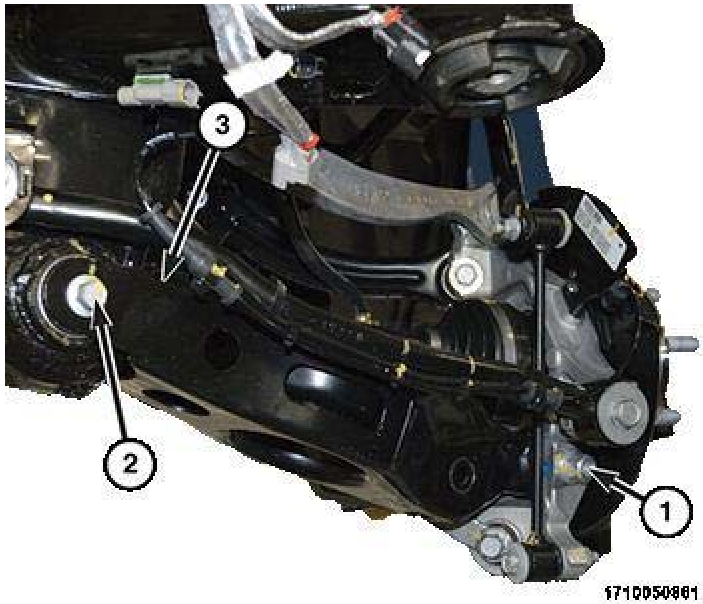

Fig. 43: Spring Link To Knuckle Bolt & Spring Link To Crossmember Bolt
Courtesy of CHRYSLER GROUP, LLC

6. Remove the spring link to knuckle bolt (1).
7. Remove the spring link to crossmember bolt (2).
8. Remove the spring link (3).

INSTALLATION

INSTALLATION

NOTE: **Using a suitable tool, move the knuckle lower bushing inward to ease installation of the spring link onto the knuckle.**

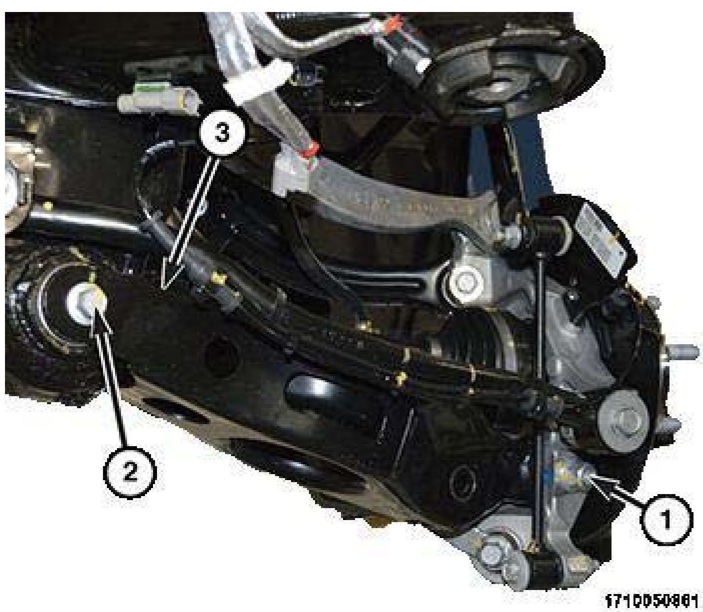

Fig. 44: Spring Link To Knuckle Bolt & Spring Link To Crossmember Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Position the spring link (3) in the vehicle and install the spring link to crossmember bolt (2). **Do not tighten bolt at this time.**
2. Install the spring link to knuckle bolt (1). **Do not tighten bolt at this time.**
3. Install the rear spring.

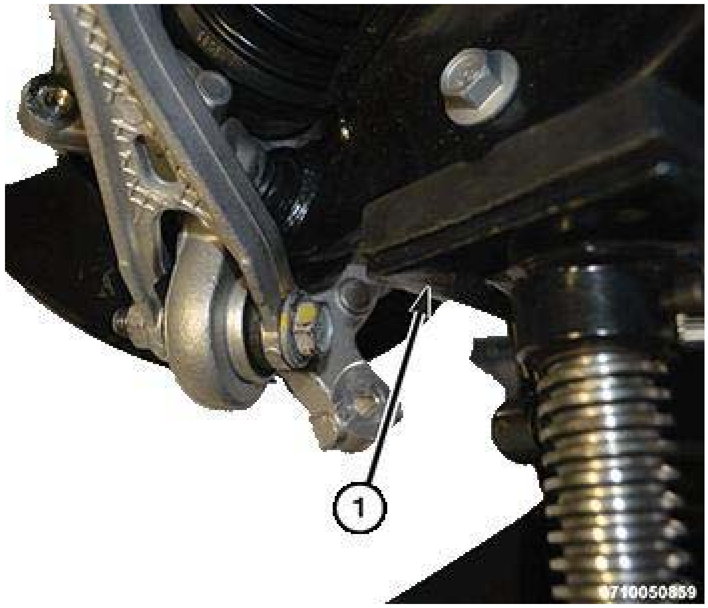

Fig. 45: Suitable Jack Under The Spring Link
Courtesy of CHRYSLER GROUP, LLC

4. Position a suitable jack (1) under the spring link.
5. Install the shock absorber **Do not tighten bolt at this time.** . Refer to **SHOCK ABSORBER, SUSPENSION, INSTALLATION**.
6. Remove the jack and lower the vehicle.
7. Position the vehicle on an alignment rack. Raise vehicle as necessary to access mounting bolts.
8. Tighten spring link to crossmember bolt to the proper torque specification. Refer to **SPECIFICATIONS**.
9. Tighten the spring link to knuckle bolt to the proper torque specification. Refer to **SPECIFICATIONS**.
10. Tighten the shock absorber bolts to the proper torque specification. Refer to **SPECIFICATIONS**.
11. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

LINK, TENSION

REMOVAL

REMOVAL

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the tire and wheel assembly. Refer to **REMOVAL** .
3. For left hand side tension link service, remove the fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, REMOVAL** .
4. Remove the rear exhaust. Refer to **MUFFLER, EXHAUST, REMOVAL** .

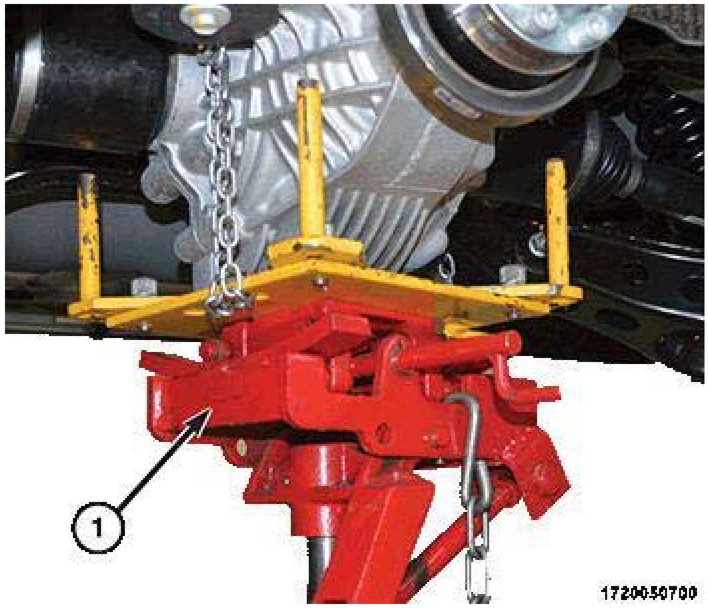

Fig. 46: Jack
Courtesy of CHRYSLER GROUP, LLC

5. Position a suitable jack under the rear axle differential. **Do not secure the jack to the stabilizer bar.**

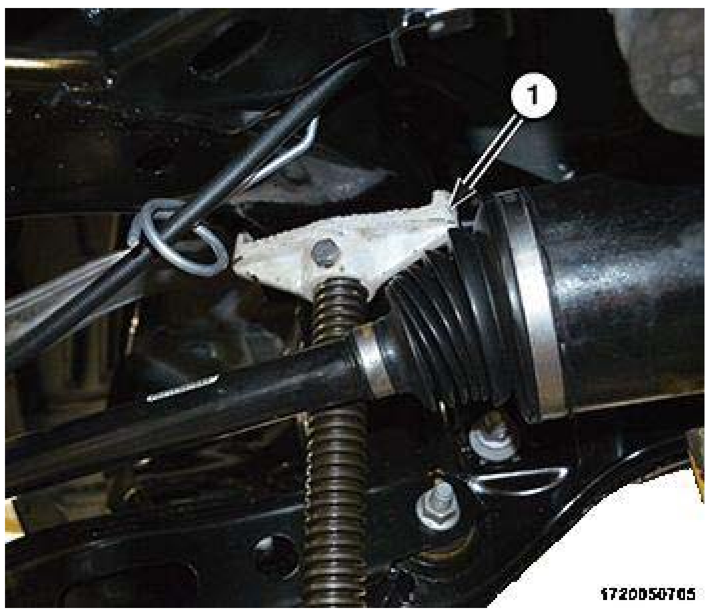

Fig. 47: Jack
Courtesy of CHRYSLER GROUP, LLC

6. Position a suitable jack (1) to the crossmember on the repair-side of the vehicle.

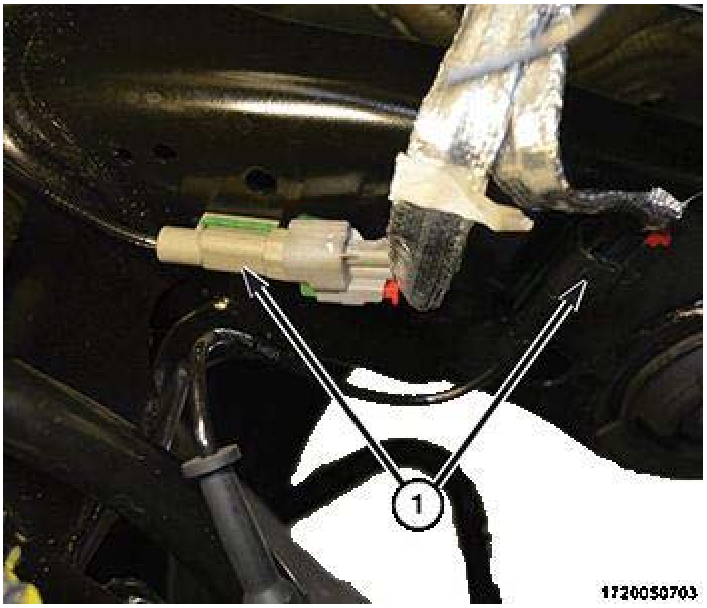

Fig. 48: Wheel Speed Sensor Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

7. Disconnect the wheel speed sensor electrical connectors (1).

Fig. 49: Shock Absorber Lower Bolt

8. Remove the lower shock absorber bolt.

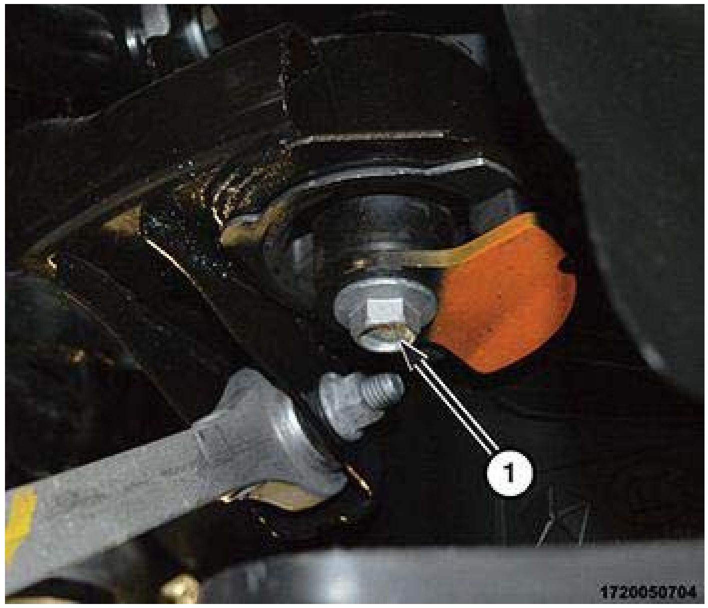

Fig. 50: Front Crossmember Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

9. Remove the front crossmember mounting bolt (1) on the repair-side of the vehicle.

NOTE: **When removing crossmember mounting bolts it is important NOT to loosen or remove crossmember mounting bolts on opposite side of vehicle. Doing so will require rear wheel alignment following reinstallation to ensure proper thrust angle.**

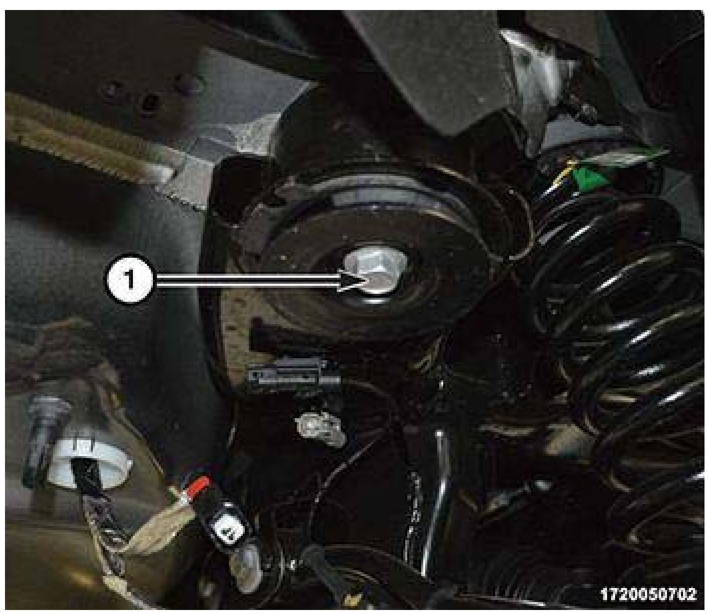

Fig. 51: Rear Crossmember Mounting Bolt
Courtesy of CHRYSLER GROUP, LLC

10. Remove the rear crossmember mounting bolt (1) on the repair-side of the vehicle.
11. **Carefully** lower the crossmember.

NOTE: Do not lower repair-side of the crossmember any further than necessary to gain access to the link mounting bolts at the crossmember.

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember (1) any further than necessary to remove shock absorber.

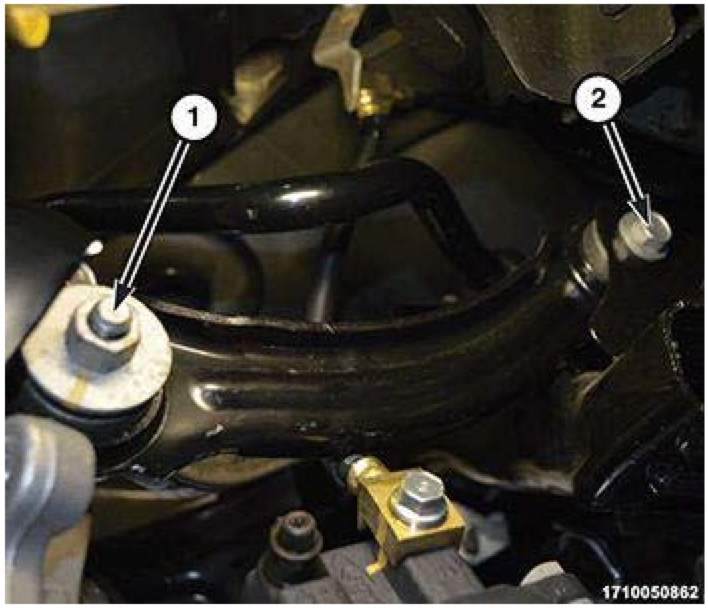

Fig. 52: Tension Link To Knuckle Bolt & Tension Link To Crossmember Bolt
Courtesy of CHRYSLER GROUP, LLC

12. Remove the tension link to knuckle bolt (1).
13. Remove the tension link to crossmember bolt (2).
14. Remove the tension link.

INSTALLATION

INSTALLATION

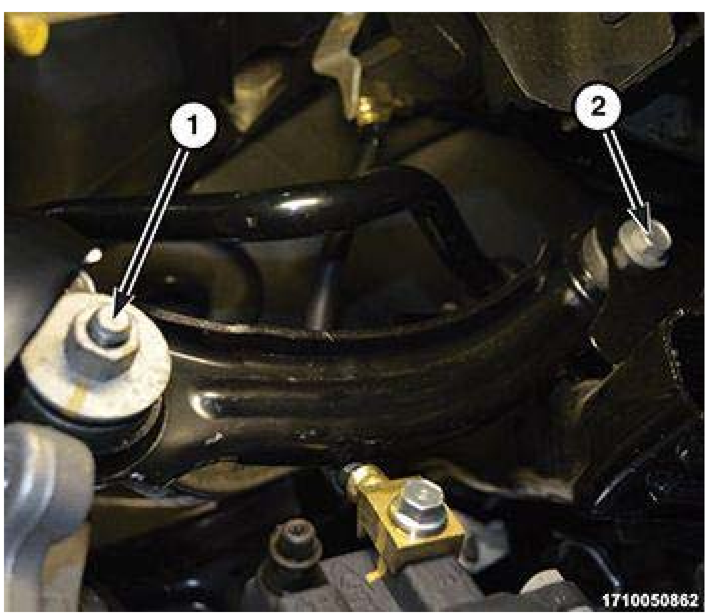

Fig. 53: Tension Link To Knuckle Bolt & Tension Link To Crossmember Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Position the tension link into the bracket on the knuckle. Install the tension link to knuckle bolt (1). **Do not tighten bolt at this time.**

NOTE: **This upper flange must be pointing forward in vehicle when the tension link is reinstalled.**

2. Position the tension link on the crossmember. Install the tension link to crossmember bolt (2). **Do not tighten bolt at this time.**
3. Carefully raise the coil spring and shock absorber, position the shock absorber into the spring link pocket and the coil spring to the spring link and chassis.

Fig. 54: Shock Absorber Lower Bolt
Courtesy of CHRYSLER GROUP, LLC

4. Install the shock absorber lower bolt (1). **Do not tighten at this time** .
5. The rear crossmember bolts are longer than the front crossmember bolts. Install them in the original positions. **Do not fully tighten bolts at this time.**

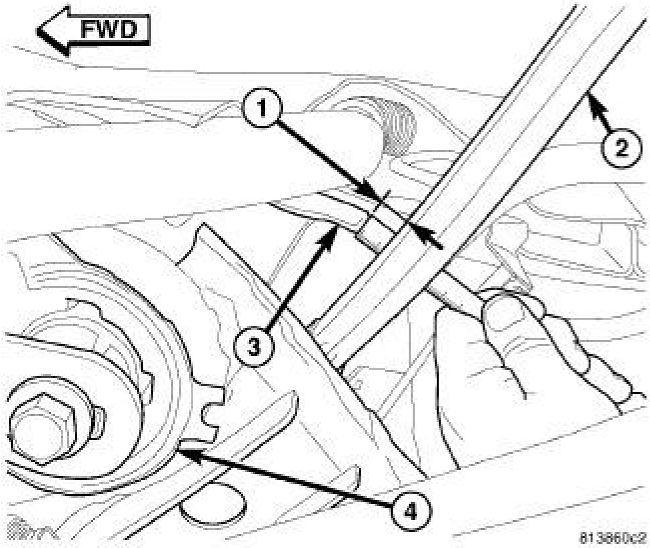

Fig. 55: Measuring Tension Link Clearance
Courtesy of CHRYSLER GROUP, LLC

6. Measure distance (1) between from tension link (2) to body weld flange (3) directly in front of it, just outboard of front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Measure opposite side to be sure it also maintains minimum 12 mm distance.

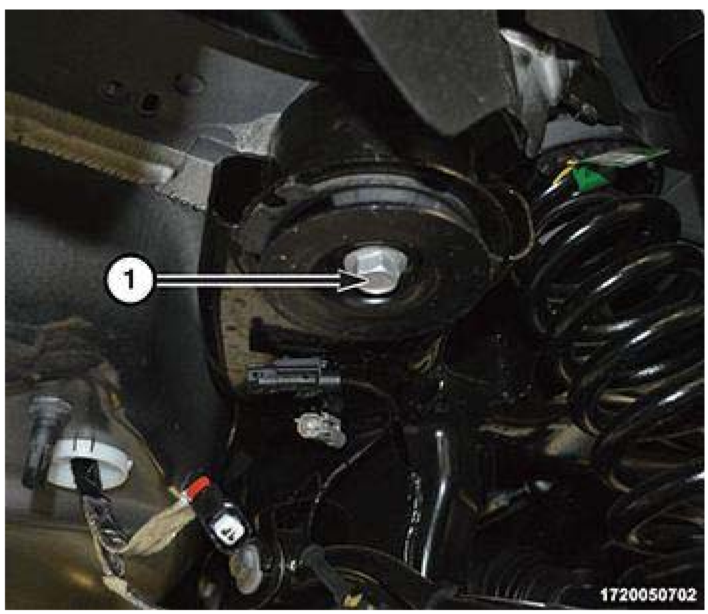

Fig. 56: Rear Crossmember Mounting Bolt

10. Remove the support (1) from the crossmember.

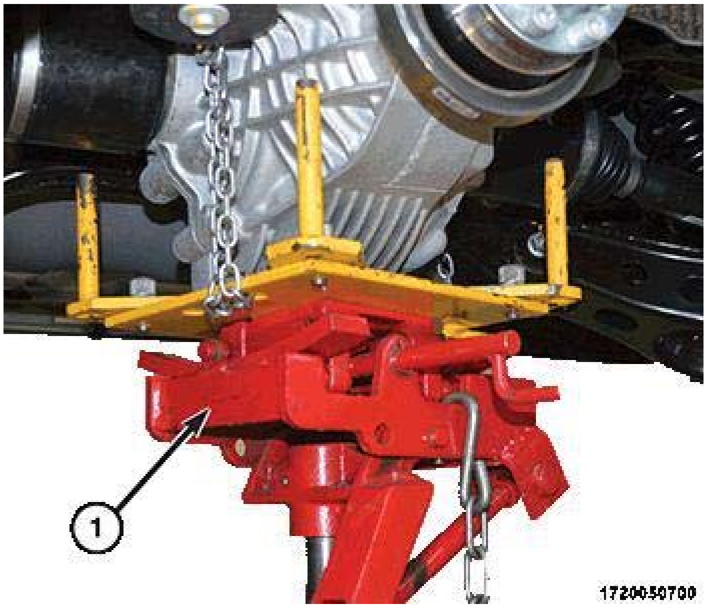

Fig. 60: Jack
Courtesy of CHRYSLER GROUP, LLC

11. Remove the support (1) from the rear axle differential.
12. Install the rear exhaust. Refer to **MUFFLER, EXHAUST, INSTALLATION** .
13. If removed, install fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, INSTALLATION** .

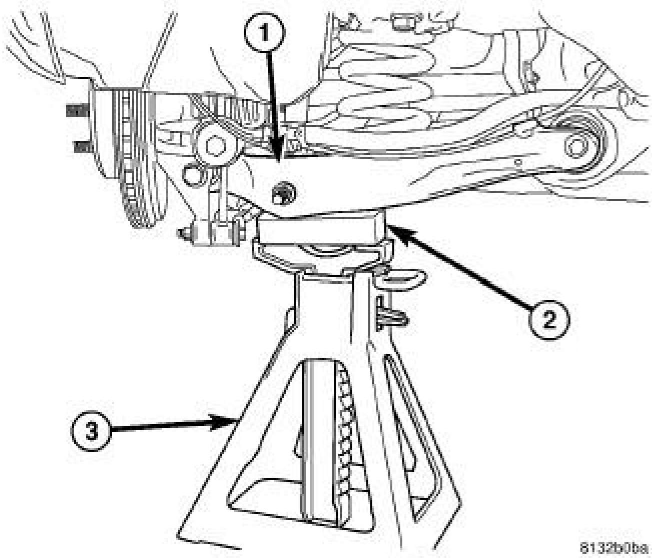

Fig. 61: Jack Stand Under Control Arm
Courtesy of CHRYSLER GROUP, LLC

14. Lower the vehicle until the front tires contact floor but rear tires are still suspended. Place jack stands (3) with wooden blocks (2) under each rear suspension spring link (1). Lower vehicle until the full the weight is supported by the suspension.
15. Tighten the tension link to crossmember bolt to the proper torque specification. Refer to **SPECIFICATIONS**.
16. Tighten the tension link to knuckle bolt to the proper torque specification. Refer to **SPECIFICATIONS**.
17. Tighten the shock absorber lower bolt to the proper torque specification. Refer to **SPECIFICATIONS**.
18. Raise the vehicle and remove the jack stands.
19. Install the tire and wheel assembly. Refer to **INSTALLATION** .
20. Lower the vehicle.
21. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

LINK, TOE

REMOVAL

LEFT LINK

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the tire and wheel assembly. Refer to **REMOVAL** .
3. Remove the fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, REMOVAL** .
4. Remove the rear exhaust. Refer to **MUFFLER, EXHAUST, REMOVAL** .

7. Separate the wheel speed sensor cable (1) from the toe link.
8. Remove toe link to knuckle bolt (2).
9. Remove the toe adjustment cam (3) to crossmember bolt.
10. Remove the toe link.

INSTALLATION

LEFT LINK

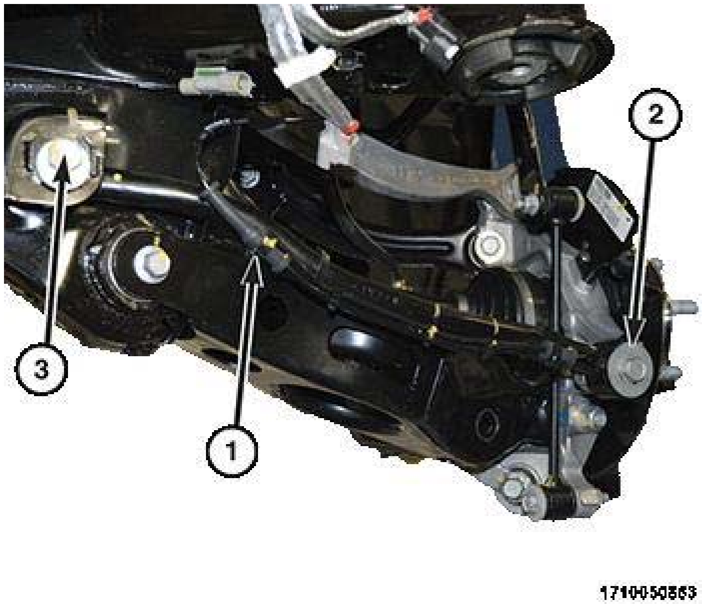

Fig. 70: Wheel Speed Sensor Cable, Toe Link To Knuckle Bolt & Adjustment Cam To Crossmember Bolt
Courtesy of CHRYSLER GROUP, LLC

1. Position the toe link to the knuckle and at the crossmember.
2. Install the cam bolt at the crossmember (3).
3. Install the toe link to knuckle bolt (2). **Do not tighten bolt at this time.**
4. Attach the wheel speed sensor cable (1) to the toe link.

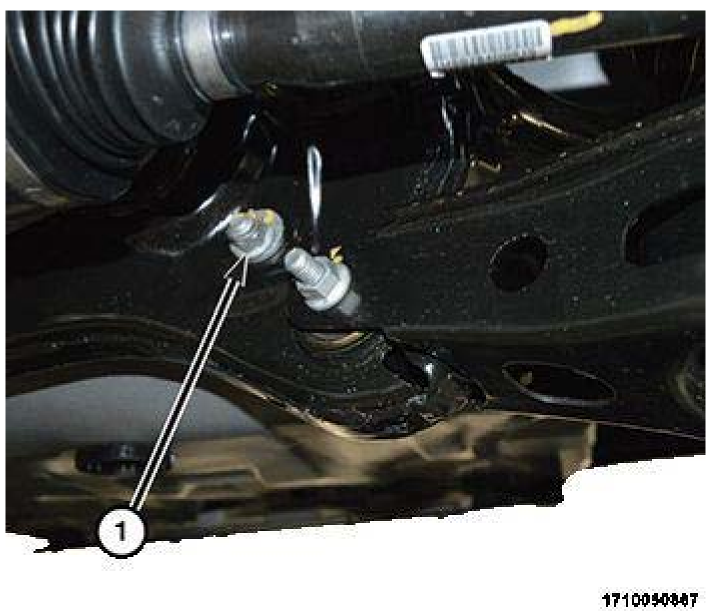

Fig. 71: Toe Link Nut
Courtesy of CHRYSLER GROUP, LLC

5. Hold the toe adjustment cam stationary (cam facing upward). Install the cam washer and toe link nut (1). **Do not tighten nut at this time.**
6. Raise the jack and position the shock absorber into the pocket in the spring link. Install the shock

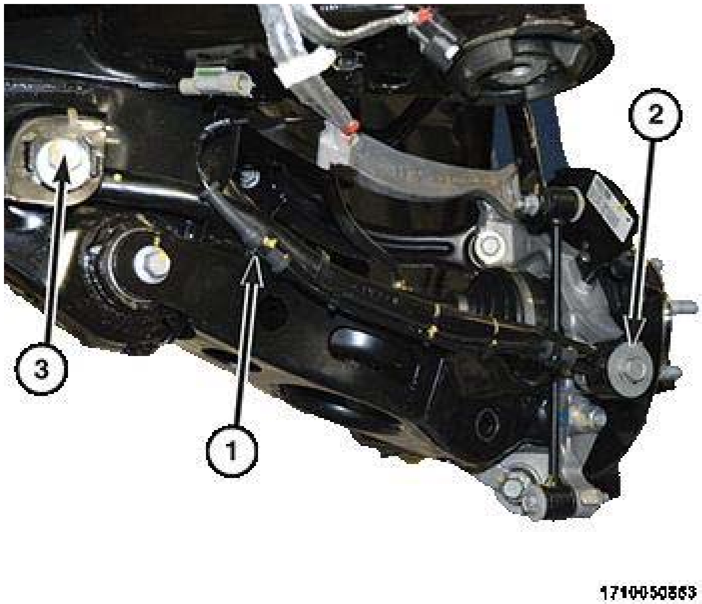
absorber lower bolt. **Do not tighten at this time.**

7. Install the fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, INSTALLATION** .
8. Install the rear exhaust. Refer to **MUFFLER, EXHAUST, INSTALLATION** .
9. Install tire and wheel assembly. Refer to **INSTALLATION** .
10. Remove the support and lower the vehicle.
11. Position the vehicle on an alignment rack. Raise the vehicle as necessary to access the mounting bolts.

Fig. 72: Shock Absorber Lower Bolt
Courtesy of CHRYSLER GROUP, LLC

12. Tighten the shock absorber lower bolt (1) to the proper torque specification. Refer to **SPECIFICATIONS**.
13. Tighten the toe link bolt at the knuckle to the proper torque specification. Refer to **SPECIFICATIONS**.
14. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .
15. Tighten the toe link bolt at the crossmember after the rear wheel alignment toe is set. Tighten the toe link nut (do not tighten at the bolt head) to the proper torque specification. Refer to **SPECIFICATIONS**.

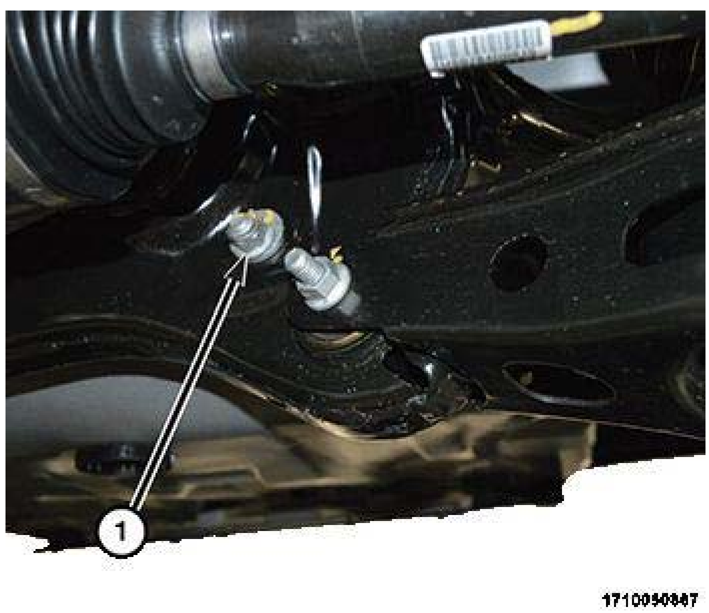
RIGHT LINK



[Fig. 73: Wheel Speed Sensor Cable, Toe Link To Knuckle Bolt & Adjustment Cam To Crossmember Bolt]

Courtesy of CHRYSLER GROUP, LLC

1. Position the toe link to the knuckle and at the crossmember.
2. Install the cam bolt at the crossmember (3).
3. Install the toe link to knuckle bolt (2). **Do not tighten bolt at this time.**
4. Attach the wheel speed sensor cable (1) to the toe link.



[Fig. 74: Toe Link Nut]

Courtesy of CHRYSLER GROUP, LLC

5. Hold the toe adjustment cam stationary (cam facing upward). Install the cam washer and toe link nut (1). **Do not tighten nut at this time.**
6. Raise the jack and position the shock absorber into the pocket in the spring link. Install the shock absorber lower bolt.**Do not tighten at this time.**

7. Install the rear exhaust. Refer to **MUFFLER, EXHAUST, INSTALLATION** .
8. Install the tire and wheel assembly. Refer to **INSTALLATION** .
9. Remove the support and lower the vehicle.
10. Position vehicle on alignment rack. Raise vehicle as necessary to access mounting bolts.

Fig. 75: Shock Absorber Lower Bolt
Courtesy of CHRYSLER GROUP, LLC

11. Tighten the shock absorber lower bolt (1) to the proper torque specification. Refer to **SPECIFICATIONS**.
12. Tighten the toe link bolt at the knuckle to the proper torque specification. Refer to **SPECIFICATIONS**.
13. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .
14. Tighten the toe link bolt at the crossmember after the rear wheel alignment toe is set. Tighten the toe link nut (do not tighten at the bolt head) to the proper torque specification. Refer to **SPECIFICATIONS**.

SHOCK ABSORBER, SUSPENSION

DESCRIPTION

NON SRT

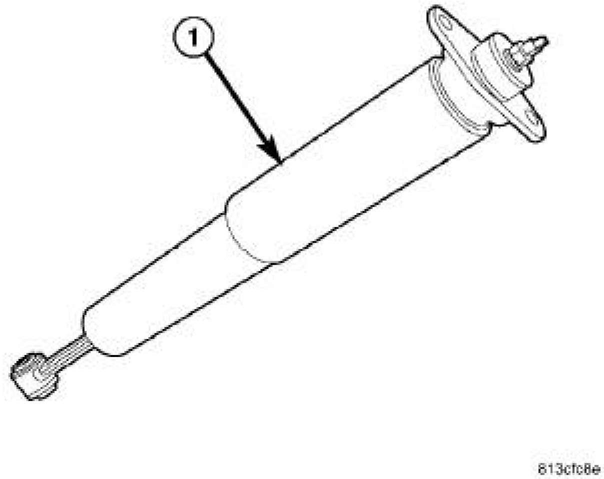


Fig. 76: Nivomat Load-Leveling Shock Absorber
Courtesy of CHRYSLER GROUP, LLC

Non-SRT vehicles have standard gas-charged shock absorbers for the rear suspension. The shock absorbers absorb and dissipate road vibration and to dampen spring oscillations. Shock absorbers also limit the suspension movement.

SRT

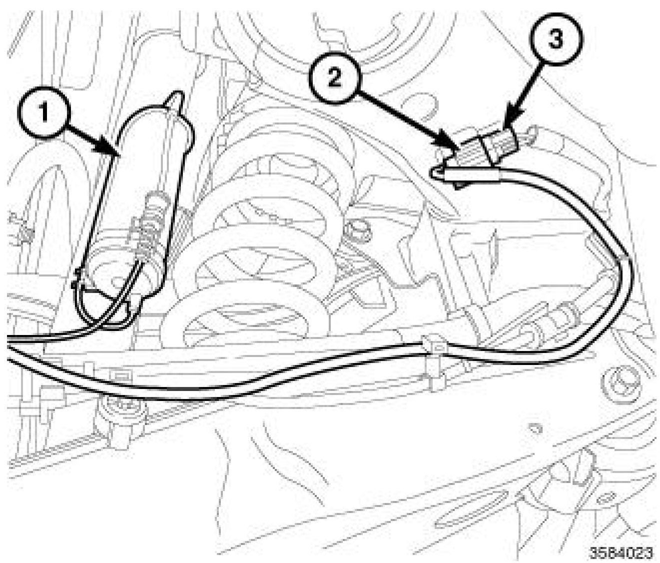

Fig. 77: Shock Solenoid Assembly & ADS Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in the illustration, right side similar.

This vehicle has Active Damping System (ADS) shock absorbers for the rear suspension. The ADS shock absorbers are serviced the same as conventional shocks, except the ADS connector (2) must be removed from the wire harness connector (3). It is important to pay close attention to which direction the shock solenoid assembly (1) is pointing when removing and installing ADS shocks.

REMOVAL

NON SRT

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the tire and wheel assembly. Refer to **REMOVAL** .

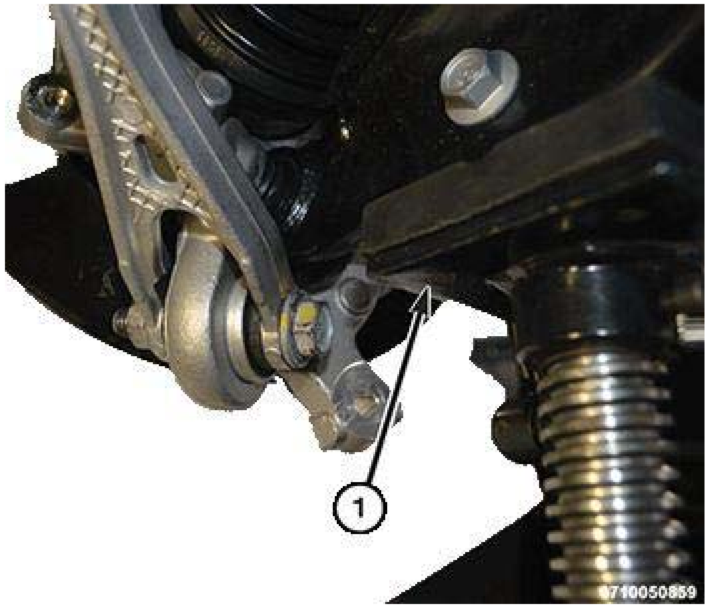

Fig. 78: Suitable Jack Under The Spring Link
Courtesy of CHRYSLER GROUP, LLC

3. Position a suitable jack under spring link.

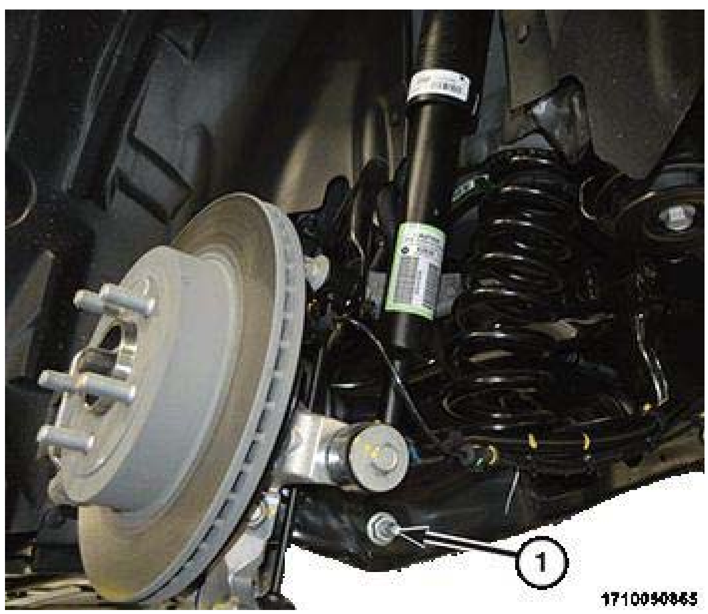

Fig. 79: Lower Shock Absorber Bolt
Courtesy of CHRYSLER GROUP, LLC

4. Remove the shock absorber (1) lower bolt (1).

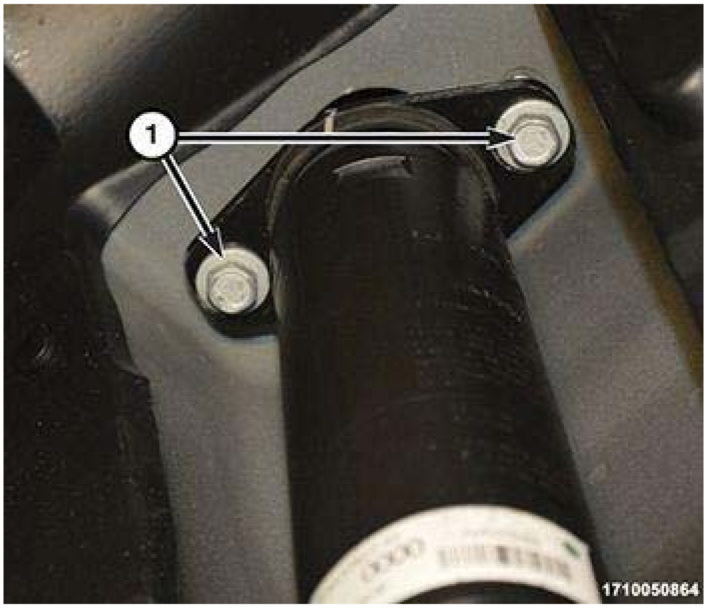

Fig. 80: Shock Absorber Upper Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Remove shock absorber upper bolts (1).
6. Lower the spring link and remove shock absorber.

SRT

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove the tire and wheel assembly. Refer to **REMOVAL** .

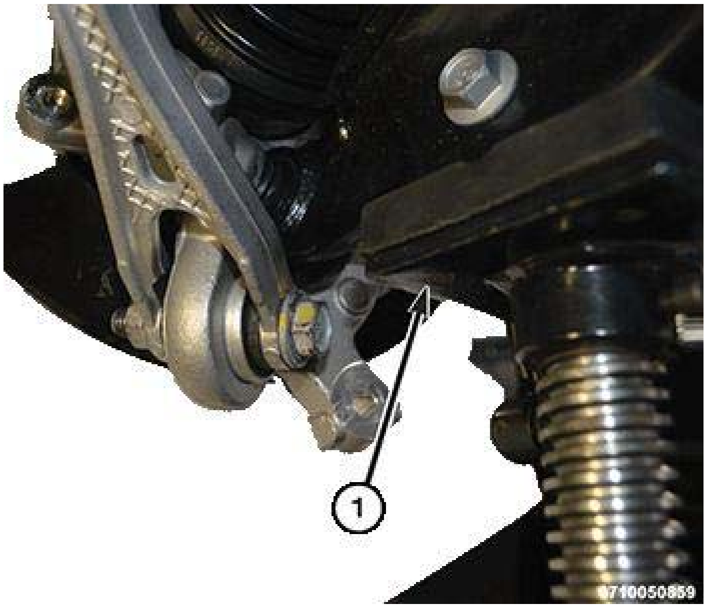

Fig. 81: Suitable Jack Under The Spring Link
Courtesy of CHRYSLER GROUP, LLC

3. Position a suitable jack under spring link.

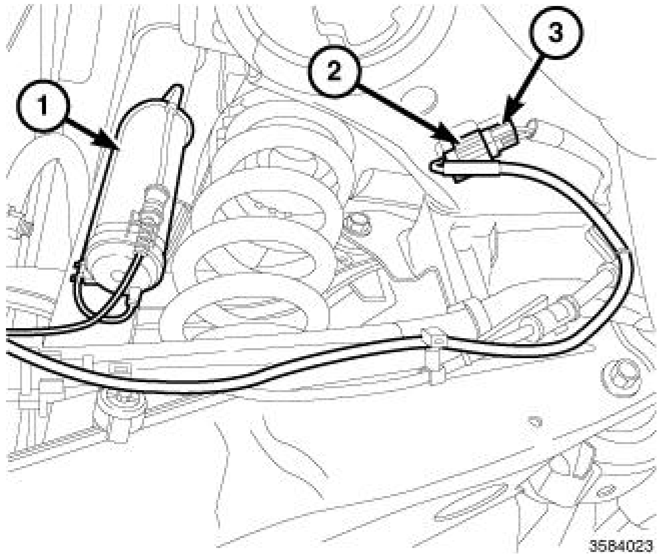

Fig. 82: Shock Solenoid Assembly & ADS Harness Connector
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the Active Damping System (ADS) shock connector (2) from the wire harness connector (3).

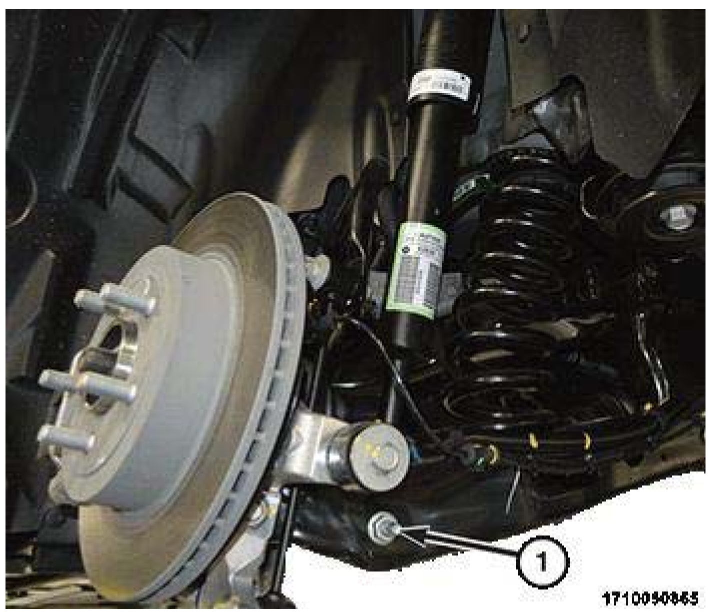

Fig. 83: Lower Shock Absorber Bolt
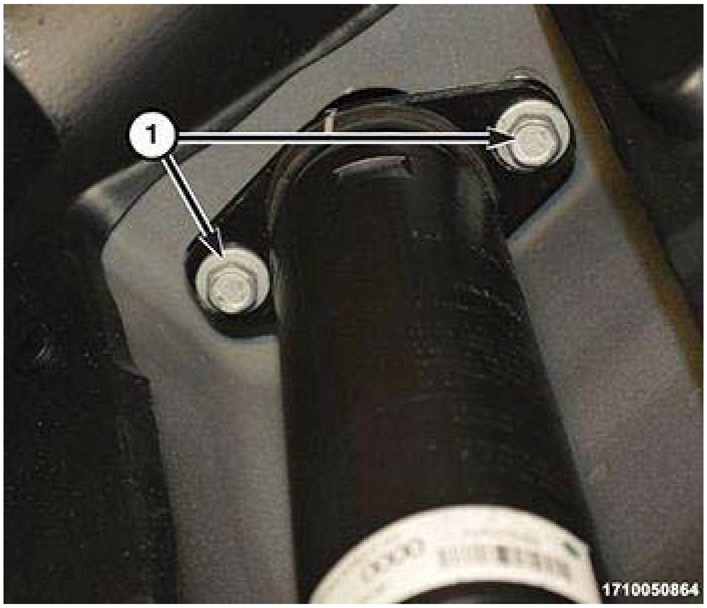
Courtesy of CHRYSLER GROUP, LLC

5. Remove the shock absorber (1) lower bolt (1).



[Fig. 84: Shock Absorber Upper Bolts](#)
Courtesy of CHRYSLER GROUP, LLC

6. Remove shock absorber upper bolts (1).
7. Lower the spring link and remove shock absorber.

INSTALLATION

NON SRT

1. Position the shock absorber in the vehicle.
2. Raise the jack and position the shock absorber into the pocket in the spring link and into the mount on the body.

[Fig. 85: Lower Shock Absorber Bolt](#)
Courtesy of CHRYSLER GROUP, LLC

3. Install the shock absorber lower bolt (1). **Do not tighten at this time.**

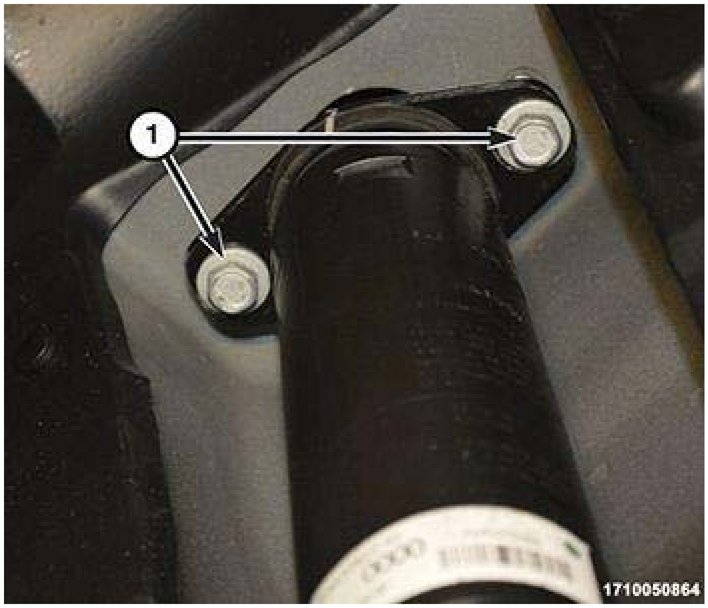


Fig. 86: Shock Absorber Upper Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Install the shock absorber upper bolts (1). Tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
5. Remove the jack from under the spring link.
6. Install the tire and wheel assembly. Refer to **INSTALLATION** .
7. Remove support and lower the vehicle.
8. Position vehicle on alignment rack/drive-on hoist. Raise vehicle as necessary to access lower mounting bolt.
9. Tighten shock absorber lower bolt to the proper torque specification. Refer to **SPECIFICATIONS**.

SRT

1. Position the shock absorber in the vehicle.
2. Raise the jack and position the shock absorber into the pocket in the spring link and into the mount on the body.

Fig. 87: Lower Shock Absorber Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Install the shock absorber lower bolt (1). **Do not tighten at this time.**

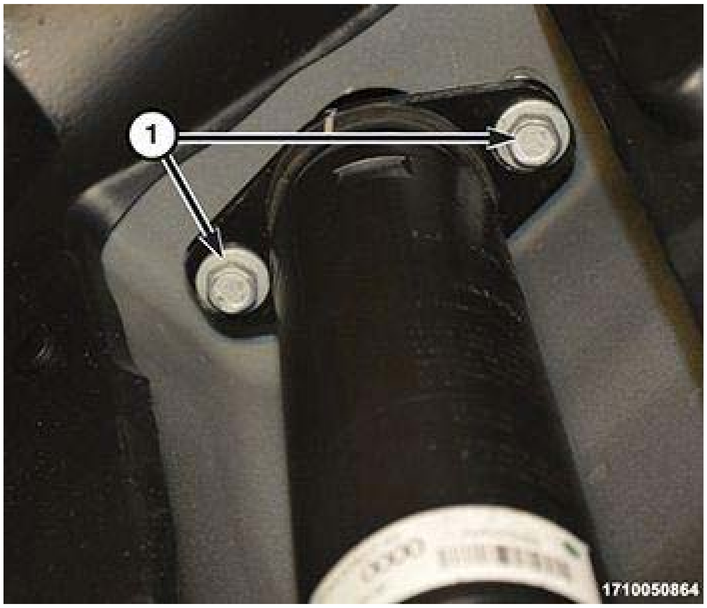

Fig. 88: Shock Absorber Upper Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Install the shock absorber upper bolts (1). Tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
5. Remove jack or from under spring link.

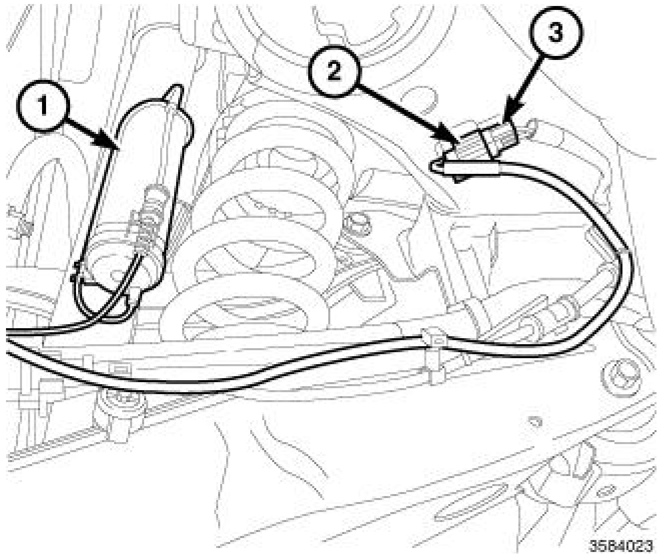

Fig. 89: Shock Solenoid Assembly & ADS Harness Connector
Courtesy of CHRYSLER GROUP, LLC

6. Connect the ADS wire harness connector (2).
7. Install the tire and wheel assembly. Refer to **INSTALLATION** .
8. Remove support and lower the vehicle.
9. Position vehicle on alignment rack/drive-on hoist. Raise vehicle as necessary to access lower mounting bolt.
10. Tighten shock absorber lower mounting nut to the proper torque specification. Refer to **SPECIFICATIONS**.

SPRING(S)

REMOVAL

REMOVAL

NOTE: **Removal process is the same for both sides of the vehicle.**

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the tire and wheel assembly. Refer to **REMOVAL** .
4. Remove rear crossmember assembly. Refer to **CROSSMEMBER, REAR, REMOVAL** or **CROSSMEMBER, TRANSMISSION, REMOVAL** .
5. Slowly lower jack until crossmember is low enough to remove coil spring. **Do not lower jack any further than necessary to remove spring.**

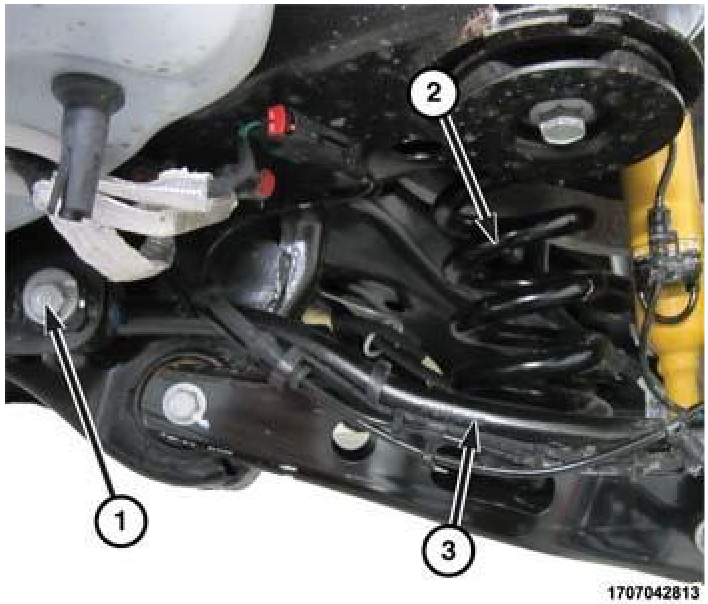

Fig. 90: Removing/Installing Coil Spring
Courtesy of CHRYSLER GROUP, LLC

6. Remove coil spring (2) and isolators.

INSTALLATION

INSTALLATION

NOTE: **Installation process is the same for both sides of the vehicle.**

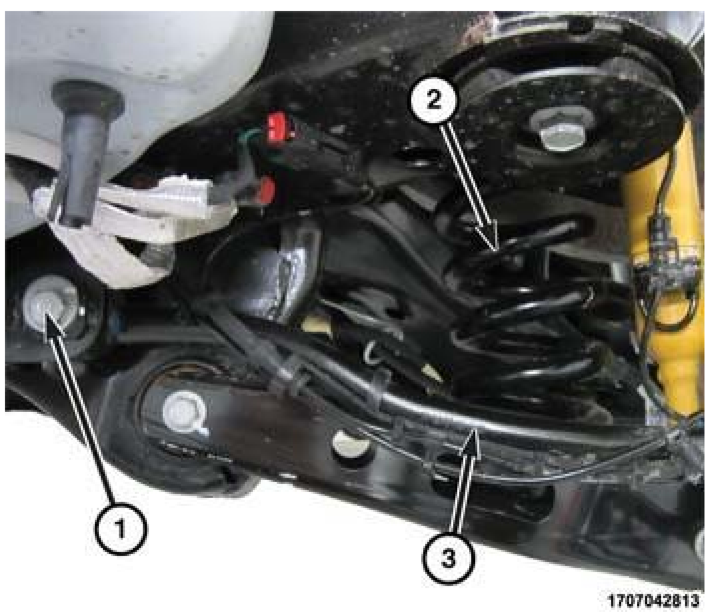

Fig. 91: Removing/Installing Coil Spring
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Rear coil springs are interchangeable.**

1. Install coil spring (2) with isolators into spring pocket of spring link fitting lower isolator to shape of

pocket, then align top of spring with body mount.

2. Install rear crossmember assembly. Refer to **CROSSMEMBER, REAR, INSTALLATION** or **CROSSMEMBER, TRANSMISSION, INSTALLATION** .
3. Install the tire and wheel assembly. Refer to **INSTALLATION** .
4. Remove the support and lower the vehicle.
5. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.

STABILIZER BAR, REAR SUSPENSION

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector first before disconnecting the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the tire and wheel assembly. Refer to **REMOVAL** .
4. Remove the rear crossmember assembly. Refer to **CROSSMEMBER, REAR, REMOVAL** or **CROSSMEMBER, TRANSMISSION, REMOVAL** .

Fig. 92: Stabilizer Bar Bushing Retainer Bolt & Stabilizer Link To Stabilizer Bar Bolt And Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Mark the location of the stabilizer bushings prior to removing the stabilizer bar bushing clamps, this will be essential for the installation process.**

5. On each end, remove the stabilizer link to stabilizer bar bolt and nut (2).
6. Remove the four stabilizer bar bushing retainer bolts (1) and retainer brackets.
7. Remove stabilizer bar with bushings and retainers.

8. Remove retainers from bushings.
9. Remove bushings from stabilizer bar utilizing slits in bushings.

INSTALLATION

INSTALLATION

Fig. 93: Stabilizer Bar Bushing Retainer Bolt, Stabilizer Link To Stabilizer Bar Bolt And Nut
Courtesy of CHRYSLER GROUP, LLC

1. Install isolators on stabilizer bar utilizing slits in bushings. Install each isolator so its slit faces forward and flat side is positioned toward crossmember once installed.
2. Install retainers onto the bushings.

NOTE: **Be sure to center the stabilizer bar before tightening down, utilizing the marks made during the removal. Failure to do so could cause damage to other suspension components.**

3. Install stabilizer bar with bushings and retainers on crossmember.
4. Install the four stabilizer bar bushing retainer bolts (1). **Do not tighten at this time.**
5. On each side, install the stabilizer link to stabilizer bar bolt and nut (2) and tighten to the proper torque specification. Refer to **SPECIFICATIONS**.
6. Tighten the four stabilizer bar bushing retainer bolts (1) to the proper torque specification. Refer to **SPECIFICATIONS**.
7. Install the rear crossmember assembly. Refer to **CROSSMEMBER, REAR, INSTALLATION** or **CROSSMEMBER, TRANSMISSION, INSTALLATION** .
8. Install the tire and wheel assembly. Refer to **INSTALLATION** .
9. Remove the support and lower the vehicle.
10. Connect the negative battery cable. If equipped with an Intelligent Battery Sensor (IBS), connect the IBS connector.

2015-16 RESTRAINTS

Service Information - Challenger

WARNING

WARNING

WARNING: To avoid serious or fatal injury on vehicles equipped with the Supplemental Restraint System (SRS), never attempt to repair the electrically conductive circuits or wiring components related to the SRS for which there is no MOPAR wiring repair kit. It is important to use ONLY the recommended splicing kit and procedure. For applicable and available MOPAR wiring repair kits, please visit the MOPAR Connection Repair Kit Web Site. Inappropriate repairs can compromise the conductivity and current carrying capacity of those critical electrical circuits, which may cause SRS components not to deploy when required, or to deploy when not required. Only minor cuts or abrasions of wire and terminal insulation where the conductive material has not been damaged, or connector insulators where the integrity of the latching and locking mechanisms have not been compromised may be repaired using appropriate methods.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler MoparÂ® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury on vehicles equipped with side curtain or seat (pelvic and thorax) airbags, disable the Supplemental Restraint System (SRS) before attempting any Occupant Restraint Controller (ORC) diagnosis or service. The ORC contains a rollover sensor, which enables the system to deploy the side curtains or seat airbags in the event of a vehicle rollover event. If an ORC is accidentally rolled during service while still connected to battery power, the side curtain and seat airbags will deploy. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid potential physical injury or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the Occupant Restraint Controller (ORC) capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 12 inches (30 centimeters) of an electronic module or wiring harness, then that module or harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens.

WARNING: To avoid serious or fatal injury, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate or bring into contact with electricity. Do not store at temperatures exceeding 93Ā° C (200Ā° F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 17.24 kPa (2500 psi). Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury when handling a seat belt tensioner retractor or buckle, proper care should be exercised to keep fingers out from under the retractor or buckle cover and away from the seat belt webbing or cable where it exits from the retractor or buckle cover.

WARNING: To avoid serious or fatal injury, replace all Supplemental Restraint System (SRS) components only with parts specified in the Chrysler MoparĀ® Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection.

WARNING: To avoid serious or fatal injury, the fasteners, screws, and bolts originally used for the Supplemental Restraint System (SRS) components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the SRS. Anytime a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the Chrysler MoparĀ® Parts Catalog.

WARNING: To avoid serious or fatal injury when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down. Failure to follow these instructions may result in possible serious or fatal injury.

DESCRIPTION

SUPPLEMENTAL RESTRAINT SYSTEM

A Supplemental Restraint System (SRS) is standard factory-installed safety equipment on this vehicle. Available supplemental occupant restraints for this vehicle include both active and passive types. Active restraints are those which require the vehicle occupants to take some action to employ, such as fastening and adjusting a seat belt; while passive restraints require no action by the vehicle occupants to be employed. Additional information on each of these subsystems of the SRS can be found elsewhere within this service information.

ACTIVE RESTRAINTS

The active restraints for this vehicle include:

- **Child Restraint Anchors** - All vehicles are equipped with three, fixed-position, child seat upper tether anchors for the rear seating. These upper anchors are integral to the rear shelf panel support. Two lower anchors are also provided for each rear seating position. The lower anchors are integral to an isofix cross member welded to the center floor panel beneath the rear seat. These lower anchors are accessed from the front of the rear seat where the seat back meets the seat cushion.
- **Front Seat Belts** - Both front seating positions are equipped with three-point seat belt systems employing lower B-pillar mounted inertia latch-type emergency locking retractors, fixed B-pillar mounted webbing guides, a traveling webbing guide on the outboard side of each front seat head restraint, a fixed lower seat belt anchor secured to the inboard side of the floor sill, and a traveling end-release seat belt buckle secured to the inboard side of the seat frame. The passenger side front seat belt retractor is switchable to an automatic locking retractor for compatibility with child seats. The driver and passenger side front seat belt buckles each include an integral seat belt switch that detects whether the front seat belts have been fastened.
- **Rear Seat Belts** - All three rear seating positions are equipped with three-point seat belt systems. The outboard seating position belts employ C-pillar mounted inertia latch-type emergency locking retractors, fixed position upper C-pillar mounted turning loops and fixed lower seat belt anchors secured to the lower C-pillar. The center position retractor is secured to the rear shelf panel and the fixed lower center seat belt anchor is secured to the floor panel. All three rear seat belts have fixed end-release seat belt buckles secured to the floor panel, a double buckle unit on the right side and a single buckle unit on the left side. Both outboard rear seat belt retractors are switchable to an automatic locking retractor for compatibility with child seats.

PASSIVE RESTRAINTS

Fig. 1: SRS Logo
Courtesy of CHRYSLER GROUP, LLC

The passive restraints available for this vehicle include the following:

- **Active Head Restraints** - Inertia-based Active Head Restraints (AHR) are standard equipment for both front seating positions in this vehicle.
- **Dual Front Airbags** - A multistage Driver AirBag (DAB) and front Passenger AirBag (PAB) are standard in this vehicle. This airbag system consists of passive, inflatable, Supplemental Restraint System (SRS) components and vehicles with this equipment can be readily identified by the **SRS - AIRBAG** logo molded into the DAB trim cover in the center of the steering wheel and also into the PAB door on the top of the instrument panel above the glove box. Vehicles with the airbag system can also be identified by the airbag indicator, which will illuminate in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) from four to six seconds as a bulb test each time the status of the ignition switch transitions to On. Pyrotechnic-type seat belt tensioners are also integral for the driver and passenger front seat belts of all airbag equipped vehicles to work in conjunction with the dual front and side curtain airbags.
- **Seat Airbags** - Front seat integrated Seat AirBags (SAB) (also known as pelvic and thoracic airbags) are standard equipment in all markets. This airbag system consists of passive, inflatable, SRS components and vehicles with this equipment can be readily identified by a sewn tag with the **SRS - AIRBAG** logo located on the outboard side of the front seat back trim cover.
- **Side Curtain Airbags** - Side curtain airbags (also known as Side AirBag Inflatable Curtains/SABIC) are standard equipment for this vehicle when it is also equipped with dual front airbags. This airbag system consists of passive, inflatable, SRS components and vehicles with this equipment can be readily identified by a molded identification trim button with the **SRS - AIRBAG** logo located on the top of each B-pillar upper trim panel near the headliner.

The SRS includes the following major components, which are described in further detail elsewhere in this service information:

- **Active Head Restraints** - One Active Head Restraint (AHR) is located atop each front seat back unit.
- **Airbag Indicator** - The airbag indicator is integral to the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC), which is located on the instrument panel in front of the driver.
- **Clockspring** - The clockspring is located near the top of the steering column, directly beneath the

steering wheel.

- **Driver Airbag** - The Driver AirBag (DAB) is located in the center of the steering wheel, beneath the DAB trim cover.
- **Driver Knee Blocker** - The driver knee blocker is a static structural unit secured to the back side of and integral to the instrument panel steering column opening cover.
- `
- **Front Impact Sensor** - Two front impact sensors are used on vehicles equipped with dual front airbags, one left side and one right side. One sensor is located on the back side of each vertical member of the Front End Module (FEM) structural support.
- **Occupant Detection Sensor** - An Occupant Detection Sensor (ODS) is located on the top of the seat cushion of the passenger side front seat.
- **Occupant Restraint Controller** - The Occupant Restraint Controller (ORC) is located on a mount on the floor panel transmission tunnel forward of the transmission gear selector, and is concealed below the instrument panel.
- **Passenger Airbag** - The Passenger AirBag (PAB) is located in the instrument panel, beneath the PAB door on the top of the instrument panel above the glove box on the passenger side of the vehicle.
- **Passenger Knee Blocker** - The passenger knee blocker is a static structural reinforcement that is integral to and concealed within the glove box door.
- **Seat Airbag** - A Seat AirBag (SAB) (also known as a pelvic and thoracic airbag) is secured to each outboard front seat back frame, where it is concealed beneath the seat back trim cover and foam.
- **Seat Belt Tensioner** - A seat belt tensioner is integral to both front seat belt retractor units and both front seat buckle units. The seat belt retractor tensioner units are secured to each lower inner quarter panel and are concealed behind the lower quarter panel trim. The seat belt buckle tensioner units are located on the inboard rear corner of each front seat cushion frame.
- **Seat Track Position Sensor** - Certain vehicles may include a Seat Track Position Sensor (STPS) that may be located on the inboard side of one of the seat adjuster tracks on both the driver and the passenger front seats.
- **Side Curtain Airbag** - A standard equipment side curtain airbag (also known as a Side AirBag Inflatable Curtain/SABIC) is secured to each inside roof side rail above the headliner, and extends from the A-pillar to just beyond the C-pillar.
- **Side Impact Sensor** - Six side impact sensors are standard equipment on vehicles equipped with side curtain airbags, three on each side of the vehicle. One pressure-type sensor is located on each right and left side door hardware module carrier, while one acceleration-type sensor is located on each B-pillar and C-pillar. These sensors are each concealed behind the adjacent interior trim components.

The ORC and the IC each contain a microcontroller and programming that allow them to communicate with each other using the Controller Area Network (CAN) data bus. This method of communication is used by the ORC for control of the airbag indicator in the IC. Refer to **COMMUNICATION, DESCRIPTION** .

Hard wired circuitry connects the SRS components to each other through the electrical system of the vehicle. These hard wired circuits are integral to several wire harnesses, which are routed throughout the vehicle and retained by many different methods. These circuits may be connected to each other, to the vehicle electrical system, and to the SRS components through the use of a combination of soldered splices, splice block connectors, and many different types of wire harness terminal connectors and insulators. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper

wire and connector repair procedures, further details on wire harness routing and retention, as well as pin out and location views for the various wire harness connectors, splices and grounds.

OPERATION

SUPPLEMENTAL RESTRAINT SYSTEM

The Supplemental Restraint System (SRS) is comprised of two primary subsystems: Active Restraints and Passive Restraints. Additional operational details on each of these subsystems of the SRS can be found elsewhere within this service information.

ACTIVE RESTRAINTS

The primary passenger restraints in this or any other vehicle are the standard equipment factory-installed seat belts and child restraint anchors. Seat belts and child restraint anchors are referred to as an active restraint because the vehicle occupants are required to physically fasten and properly adjust these restraints in order to benefit from them.

PASSIVE RESTRAINTS

The passive restraints are referred to as Supplemental Restraint System (SRS) components because they were designed and are intended to enhance the protection for the occupants of the vehicle **only** when used in conjunction with the seat belts. They are referred to as passive restraints because the vehicle occupants are not required to do anything to make them operate; however, the vehicle occupants must be wearing their seat belts in order to obtain the maximum safety benefit from the factory-installed SRS components. In addition, each front seat occupant must have their Active Head Restraint (AHR) unit properly adjusted in order to obtain its maximum safety benefit.

The SRS electrical circuits are continuously monitored and controlled by a microcontroller and software contained within the Occupant Restraint Controller (ORC). An airbag indicator in the Instrument Cluster (IC) (also known as the Common Instrument Cluster/CIC) illuminates from four to six seconds as a bulb test each time the status of the ignition switch transitions to On or Start. Following the bulb test, the airbag indicator is turned On or Off by the ORC to indicate the status of the SRS. If the airbag indicator comes On at any time other than during the bulb test, it indicates that there is a problem in the SRS electrical circuits. Such a problem may cause airbags not to deploy when required, or to deploy when not required.

Deployment of the SRS components depends upon the angle and severity of an impact. Deployment is not based upon vehicle speed; rather, deployment is based upon the rate of deceleration as measured by the forces of gravity (G force) upon the acceleration-type impact sensors, or by a pressure wave within a front door as measured by the pressure-type impact sensor. When an impact is severe enough, the microcontroller within the ORC signals the inflator of the appropriate airbag units to deploy their airbag cushions.

The front seat belt retractor and buckle tensioners are provided with a deployment signal by the ORC in conjunction with the front airbags. The side curtain airbags (also known as the Side AirBag Inflatable Curtains/SABIC) and the Seat AirBags (SAB) (also known as pelvic and thoracic airbags) are provided with a deployment signal individually by the ORC based upon a side impact sensor input for the same side of the vehicle. The ORC also contains a rollover sensor. Should the vehicle roll over and not cause any impact sensor to signal the need for a deployment, the rollover sensor in the ORC will deploy the SABIC units, the SAB units and under certain conditions, will also actuate the front seat belt retractor and anchor buckle tensioners.

During a frontal vehicle impact, the static knee blockers work in concert with properly fastened and adjusted seat belts to restrain both the driver and the front seat passenger in the proper position for an airbag deployment. The knee blockers also absorb and distribute the crash energy from the driver and the front seat passenger to the structure of the instrument panel. The seat belt tensioners remove the slack from the front seat belts to provide further assurance that the driver and front seat passenger are properly positioned and restrained for an airbag deployment.

Typically, the vehicle occupants recall more about the events preceding and following a collision than they do of an airbag deployment itself. This is because the airbag deployment and deflation occur very rapidly. In a typical 48 kilometer-per-hour (30 mile-per-hour) barrier impact, from the moment of impact until the airbags are fully inflated takes about 40 milliseconds. Within one to two seconds from the moment of impact, the airbags are almost entirely deflated. The times cited for these events are approximations, which apply only to a barrier impact at the given speed. Actual times will vary somewhat, depending upon the vehicle speed, impact angle, severity of the impact, and the type of collision.

When the ORC monitors a problem in any of the SRS circuits or components, including the seat belt tensioners, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit and sends an electronic message to the IC to turn On the airbag indicator. The hard wired circuits between components related to the SRS may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SRS or the electronic controls and communication between other modules and devices that provide features of the SRS. The most reliable, efficient and accurate means to diagnose the SRS or the electronic controls and communication related to SRS operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate Diagnostic & Testing article.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - SUPPLEMENTAL RESTRAINT SYSTEM

The hard wired circuits between modules and components related to the Supplemental Restraint System (SRS) may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate SYSTEM WIRING DIAGRAMS article. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin out information and location views for the various wire harness connectors, splices and grounds.

However, conventional diagnostic methods will not prove conclusive in the diagnosis of the SRS or the electronic controls and communication between other modules and devices that provide features of the SRS. The most reliable, efficient and accurate means to diagnose the SRS or the electronic controls and communication related to SRS operation, as well as the retrieval or erasure of a DTC requires the use of a diagnostic scan tool. Refer to the appropriate Diagnostic & Testing article.

In addition to a diagnostic scan tool that contains the latest version of the proper diagnostic software, certain diagnostic procedures for the SRS may require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate Diagnostic & Testing article.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

STANDARD PROCEDURE

HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS

At no time should any source of electricity be permitted near the inflator on the back of a non-deployed airbag or seat belt tensioner. When carrying a non-deployed airbag, the trim cover or airbag cushion side of the unit should be pointed away from the body to minimize injury in the event of an accidental deployment. If the airbag unit is placed on a bench or any other surface, the trim cover or airbag cushion side of the unit should be face up to minimize movement in the event of an accidental deployment.

When handling a non-deployed seat belt tensioner, take proper care to keep fingers out from under the retractor or buckle cover and away from the seat belt webbing or cable where it exits from the retractor or buckle cover. In addition, the Supplemental Restraint System (SRS) should be disarmed whenever any steering wheel, steering column, seat belt tensioner, airbag, impact sensor or instrument panel components require diagnosis or service. Failure to observe this warning could result in accidental airbag deployment and possible personal injury.

All damaged, ineffective or non-deployed airbags and seat belt tensioners which are replaced on vehicles are to be handled and disposed of properly. If an airbag or seat belt tensioner unit is ineffective or damaged and non-deployed, refer to the Hazardous Substance Control System for information regarding the potentially hazardous properties of the subject component and the proper safe handling procedures. Then dispose of all non-deployed and deployed airbags and seat belt tensioners in a manner consistent with state, provincial, local and federal regulations.

SERVICE AFTER A SUPPLEMENTAL RESTRAINT SYSTEM DEPLOYMENT

Any vehicle which is to be returned to use following a Supplemental Restraint System (SRS) component deployment must have the deployed restraints replaced. In addition, the following guidelines MUST be observed.

- **Following ANY major vehicle impact damage in the vicinity of an impact sensor or the ORC -** It is critical that the mounting surfaces and mounting brackets for the Occupant Restraint Controller (ORC), front impact sensors and side impact sensors located within the proximity of the impact damage be closely inspected and restored to their original conditions. Because the ORC and each impact sensor are used by the SRS to monitor or confirm the direction and severity of a vehicle impact, improper orientation or insecure fastening of these components may cause airbags not to deploy when required, or to deploy when not required.
- **Following ANY airbag deployment event -** The Lower Anchors and Tethers for CHildren (LATCH) provisions, the upper tether anchors (if equipped) and all interior trim panels must also be inspected.

- **If an active head restraint is deployed** - An inertia-based Active Head Restraint (AHR) unit that is undamaged following a deployment automatically resets itself. These units are designed with the intention of reuse.
- **If the driver airbag is deployed** - If the Driver AirBag (DAB) has been deployed, the DAB, the clockspring, the steering wheel, the steering column assembly including the intermediate shaft and coupler, both front seat belt retractor and tensioner assemblies, and all other seat belt retractors and buckles in use must be replaced. The front impact sensors must be inspected.
- **If the passenger airbag is deployed** - If the Passenger AirBag (PAB) has been deployed, the PAB, the instrument panel and the PAB wire harness or connector must be replaced.
- **If a seat airbag is deployed** - If a Seat AirBag (SAB) (also known as the pelvic and thoracic airbag) has been deployed, the SAB, the SAB jumper wire harness, the thermoplastic SAB chute, the seat back frame, the seat back foam, the seat back trim cover and the side impact sensors on the same side of the vehicle as the deployed airbag must be replaced. Both front seat belt retractor and tensioner assemblies, and all other seat belt retractors and buckles in use must be replaced.
- **If a seat belt tensioner is deployed** - The seat belt tensioners are deployed in conjunction with the front airbags, but can also be deployed with a Seat AirBag (SAB) (also known as the pelvic and thoracic airbag) or side curtain airbags (also known as Side AirBag Inflatable Curtains/SABIC). All seat belt tensioners must be replaced if any airbag in the vehicle has been deployed.
- **If a side curtain airbag is deployed** - If a side curtain airbag (also known as Side AirBag Inflatable Curtain/SABIC) has been deployed, the SABIC, the upper A and C-pillar trim, the upper quarter trim and the side impact sensors on the same side of the vehicle as the deployed airbag must be replaced. The headliner, both front seat belt retractor and tensioner assemblies, and all other seat belt retractors and buckles in use must be replaced. For vehicles with an optional sunroof, the sunroof and the sunroof drain tubes and hoses must be inspected.

The components identified with the deployed SRS components in the preceding list are not intended for reuse and will be damaged or weakened as a result of an airbag deployment, which may or may not be obvious during a visual inspection. All other vehicle components should be closely inspected following any SRS component deployment, but are to be replaced only as required by the extent of the visible damage incurred.

SQUIB CIRCUIT DAMAGE

In addition to the preceding guidelines, be aware that the heat created by the initiator during an airbag or tensioner deployment will cause collateral damage to the connected wiring (squib circuits) and connector insulators. There are two methods by which an airbag or seat belt tensioner may be connected to the vehicle electrical system. The first method involves a short pigtail harness and connector insulator that are integral to the airbag or tensioner unit and are replaced as a unit with the service replacement airbag or seat belt tensioner. This connection method typically requires no additional wiring repair following a deployment.

However, the second connection method involves a wire harness takeout and connector insulator that are connected directly to the airbag or tensioner initiator or squib. These direct-connect type take outs and connector insulators **MUST** be repaired following an airbag or seat belt tensioner deployment using the approved Supplemental Restraint System Wiring Repairs procedure. Refer to STANDARD PROCEDURE.

AIRBAG SQUIB STATUS

Multistage airbags with multiple initiators (squibs) must be checked to determine that all squibs were used during the deployment event. The Driver AirBag (DAB) and Passenger AirBag (PAB) in this vehicle are

deployed by electrical signals generated by the Occupant Restraint Controller (ORC) through the driver or passenger squib 1 and squib 2 circuits to the two initiators in the airbag inflators. Typically, both initiators are used and all potentially hazardous chemicals are burned during an airbag deployment event. However, it is possible for only one initiator to be used; therefore, it is always necessary to confirm that both initiators have been used in order to avoid the improper handling or disposal of potentially live pyrotechnic or hazardous materials. The following procedure should be performed using a diagnostic scan tool to verify the status of both airbag squibs before either deployed airbag is removed from the vehicle for disposal.

CAUTION: Deployed front airbags having two initiators (squibs) in the airbag inflator may or may not have live pyrotechnic material within the inflator. Do not dispose of these airbags unless you are certain of complete deployment. Refer to the Hazardous Substance Control System for information regarding the potentially hazardous properties of the subject component and the proper safe handling procedures. Then dispose of all non-deployed and deployed airbags and seat belt tensioners in a manner consistent with state, provincial, local and federal regulations.

1. Be certain that the diagnostic scan tool contains the latest version of the proper diagnostic software. Connect the scan tool to the 16-way Data Link Connector (DLC). The DLC is located on the driver side lower edge of the instrument panel, outboard of the steering column.
2. Transition the status of the ignition switch to On.
3. Using the scan tool, read and record the active (current) Diagnostic Trouble Code (DTC) data.

Using the active DTC information, refer to the **Airbag Squib Status** table to determine the status of both DAB squibs and both PAB squibs.

<table>
<tr><th colspan="3">AIRBAG SQUIB STATUS</th></tr>
<tr><th>IF THE ACTIVE DTC IS:</th><th>CONDITIONS</th><th>SQUIB STATUS</th></tr>
<tr><td>Driver or Passenger Squib 1 open</td><td rowspan="2">AND the stored DTC minutes for both Driver or Passenger squibs are within 15 minutes of each other</td><td rowspan="2">Both Squib 1 and 2 were used.</td></tr>
<tr><td>Driver or Passenger Squib 2 open</td></tr>
<tr><td>Driver or Passenger Squib 1 open</td><td rowspan="2">AND the stored DTC minutes for Driver or Passenger Squib 2 open is GREATER than the stored DTC minutes for Driver or Passenger Squib 1 by 15 minutes or more</td><td rowspan="2">Squib 1 was used; Squib 2 is live.</td></tr>
<tr><td>Driver or Passenger Squib 2 open</td></tr>
<tr><td>Driver or Passenger Squib 1 open</td><td rowspan="2">AND the stored DTC minutes for Driver or Passenger Squib 1 open is GREATER than the stored DTC minutes for Driver or Passenger Squib 2 by 15 minutes or more</td><td rowspan="2">Squib 1 is live; Squib 2 was used.</td></tr>
<tr><td>Driver or Passenger Squib 2 open</td></tr>
<tr><td>Driver or Passenger Squib 1 open</td><td>AND Driver or Passenger Squib 2 open is NOT an active code</td><td>Squib 1 was used; Squib 2 is live.</td></tr>
<tr><td>Driver or Passenger Squib 2 open</td><td>AND Driver or Passenger Squib 1 open is NOT an active code</td><td>Squib 1 is live; Squib 2 was used.</td></tr>
</table>

NOTE: If none of the Driver or Passenger Squib 1 or 2 open are active codes, the status

of the airbag squibs is unknown. In this case the airbag should be handled and disposed of as if the squibs were both live.

CLEANUP PROCEDURE

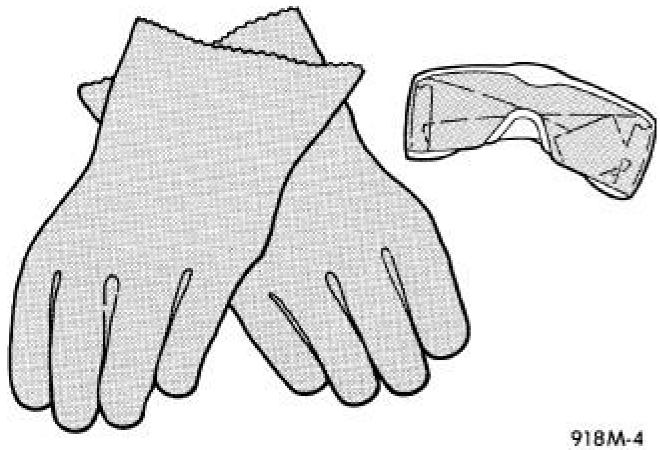

Fig. 2: Safety Glasses & Rubber Gloves
Courtesy of CHRYSLER GROUP, LLC

Following a Supplemental Restraint System (SRS) component deployment, the vehicle interior will contain a powdery residue. This residue consists primarily of harmless particulate by-products of the small pyrotechnic charge that initiates the propellant used to deploy a SRS component. However, this residue may also contain traces of sodium hydroxide powder, a chemical by-product of the propellant material that is used to generate the inert gas that inflates the airbag. Since sodium hydroxide powder can irritate the skin, eyes, nose, or throat, be certain to wear safety glasses, rubber gloves, and a long-sleeved shirt during cleanup.

WARNING: **To avoid serious or fatal injury, if you experience skin irritation during cleanup, run cool water over the affected area. Also, if you experience irritation of the nose or throat, exit the vehicle for fresh air until the irritation ceases. If irritation continues, see a physician.**

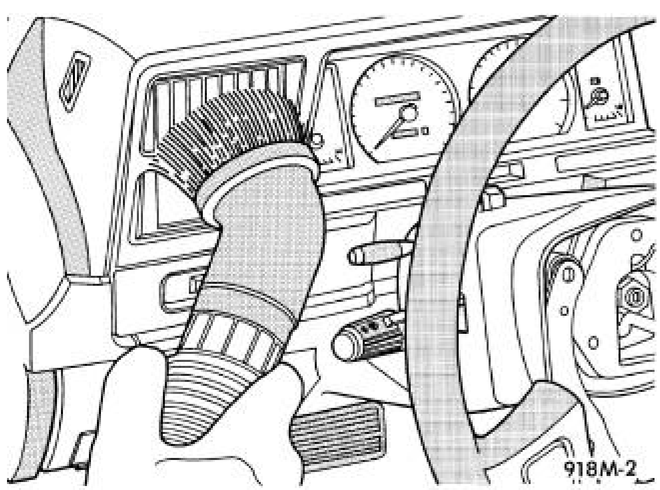

Fig. 3: Vacuum Cleaner
Courtesy of CHRYSLER GROUP, LLC

1. Begin the cleanup by using a vacuum cleaner to remove any residual powder from the vehicle interior. Clean from outside the vehicle and work your way inside, so that you avoid kneeling or sitting on a non-cleaned area.
2. Be certain to vacuum the heater and air conditioning outlets as well. Run the heater and air conditioner blower on the lowest speed setting and vacuum any powder expelled from the outlets.

CAUTION: Deployed front airbags having two initiators (squibs) in the airbag inflator may or may not have live pyrotechnic material within the inflator. Do not dispose of these airbags unless you are certain of complete deployment. Refer to the AIRBAG SQUIB STATUS heading within this information. All damaged, ineffective, or non-deployed Supplemental Restraint System (SRS) components which are replaced on vehicles are to be handled and disposed of properly. If an airbag or seat belt tensioner unit is ineffective or damaged and non-deployed, refer to the Hazardous Substance Control System for information regarding the potentially hazardous properties of the subject component and the proper safe handling procedures. Then dispose of all non-deployed and deployed airbags and seat belt tensioners in a manner consistent with state, provincial, local and federal regulations.

3. Next, remove the deployed SRS components from the vehicle. Refer to the appropriate service removal procedures.
4. You may need to vacuum the interior of the vehicle a second time to recover all of the powder.

SUPPLEMENTAL RESTRAINT STORAGE

Airbags and seat belt tensioners must be stored in their original, special container until they are used for service. Also, they must be stored in a clean, dry environment away from sources of extreme heat, sparks and high electrical energy. Always place or store any airbag on a surface with its trim cover or airbag cushion side facing up, to minimize movement in case of an accidental deployment.

SUPPLEMENTAL RESTRAINT SYSTEM VERIFICATION TEST

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbags, airbag curtains, knee blocker, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect the IBS/negative battery cable assembly from the negative battery post, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

NOTE: The following procedure should be performed using a diagnostic scan tool to verify proper Supplemental Restraint System (SRS) operation following the service or replacement of any SRS component. Refer to the appropriate Diagnostic & Testing procedures.

1. During the following test, the negative cable remains disconnected and isolated from the battery, as it was during the Supplemental Restraint System (SRS) component removal and installation procedures.

2. Be certain that the diagnostic scan tool contains the latest version of the proper diagnostic software. Connect the scan tool to the 16-way Data Link Connector (DLC). The DLC is located on the driver side lower edge of the instrument panel, near the steering column opening cover and outboard of the steering column.
3. Transition the status of the ignition switch to On and exit the vehicle with the scan tool.
4. Check to be certain that nobody is in the vehicle, then reconnect the negative cable to the battery. If equipped with an Intelligent Battery Sensor (IBS), reconnect the IBS connector.
5. Using the scan tool, read and record the active (current) Diagnostic Trouble Code (DTC) data.
6. Next, use the scan tool to read and record any stored (historical) DTC data.
7. If any DTC is found in Step 5 or Step 6, Refer to the appropriate Diagnostic & Testing article.
8. Use the scan tool to erase the stored DTC data. If any problems remain, the stored DTC data will not erase. Refer to the appropriate Diagnostic & Testing article to diagnose any stored DTC that will not erase. If the stored DTC information is successfully erased, go to Step 9.
9. Transition the status of the ignition switch to Off for about 15 seconds, and then back to On. Observe the airbag indicator in the instrument cluster. It should light from four to six seconds, and then go out. This indicates that the SRS is functioning normally and that the repairs are complete. If the airbag indicator fails to light, or lights and stays On, there is still an active SRS fault or malfunction. Refer to the appropriate Diagnostic & Testing article to diagnose the problem.

SUPPLEMENTAL RESTRAINT SYSTEM WIRING REPAIRS

It is important when repairing any Supplemental Restraint System (SRS) electrical circuits to use the recommended splicing kit and procedure. For applicable and available MOPAR wiring repair kits, please visit the MOPAR Connection Repair Kit Web Site.

This recommended procedure involves crimping the wires together with a splice band, soldering the crimped connection and, finally, sealing and protecting the repair. The crimp and solder ensure a strong mechanical bond that will always pass a pull test while also maintaining the conductivity and current carrying capacity of the circuit. The adhesive sealant and heat shrink tubing ensures the splice repair will perform as well or better than the original wire and be safe from potential corrosion or short circuits.

There is no limit to the number of splice repairs that can be made in one harness using this procedure. However, as has been past practice, multiple adjacent splices should be offset from each other. This wiring splice repair procedure is approved for harness side repairs only. Repairs and splices to pigtail wires on SRS components such as airbag units, seat belt tensioner units or clocksprings are not approved or recommended.

REPAIR PROCEDURE

CAUTION: If additional wire is needed when making a splice repair to any wire, it is important that the same or next larger size wire gauge be used. Refer to the appropriate SYSTEM WIRING DIAGRAMS article for the original wire gauge size.

1. Remove 13 millimeters (0.50 inch) of insulation from each wire that needs to be spliced.

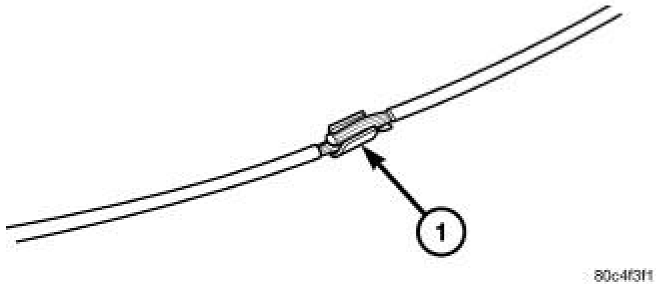

Fig. 4: Splice Band
Courtesy of CHRYSLER GROUP, LLC

2. Place a piece of adhesive sealant-lined heat shrink tubing (Part Number 04778570 or equivalent) over the wire on one side of the splice. Be certain the length of tubing will be sufficient to cover and seal the entire repair area.
3. Place the strands of the wires being spliced so that they are overlapping each other within the splice band (1).

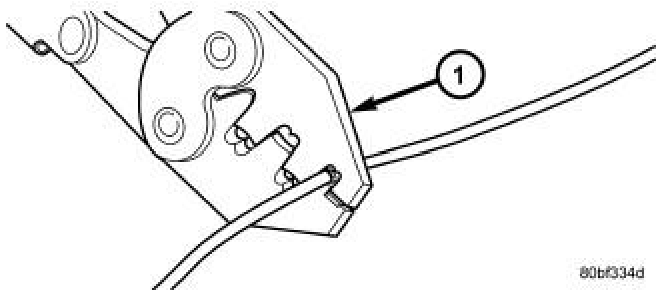

Fig. 5: Crimping Tool
Courtesy of CHRYSLER GROUP, LLC

4. Using a crimping tool (1) (MOPAR Part Number 05019912AA, Miller Special Tool Number (special tool #10042, Crimper, Wire/Terminal) or equivalent) crimp the splice band and wires together securely.

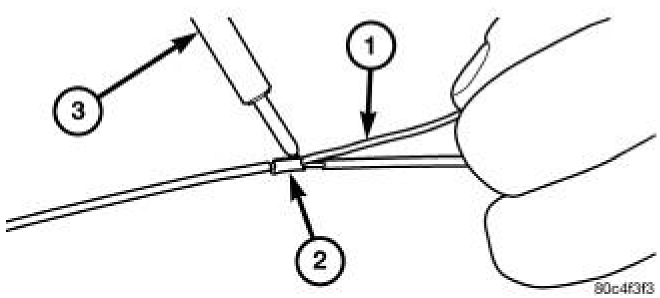

Fig. 6: Solder Splice
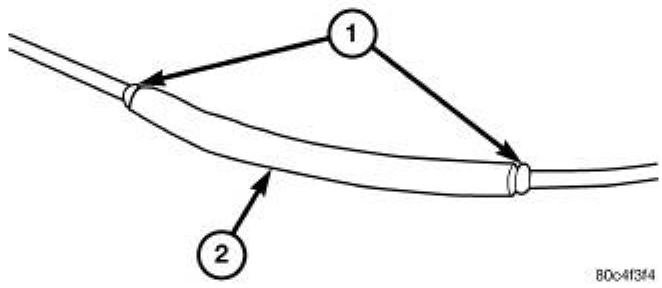
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Never use acid core solder for electrical wiring repairs.

5. Using rosin core type solder (1) only and a suitable soldering iron (3), solder the wire and splice band connection (2) together.



[Fig. 7: Heat Shrink Tube]
Courtesy of CHRYSLER GROUP, LLC

6. Center the heat shrink tubing (2) over the splice joint repair and heat using a suitable heat gun. Heat the joint until the tubing is tightly sealed and sealant (1) begins to ooze out of both ends of the tubing.

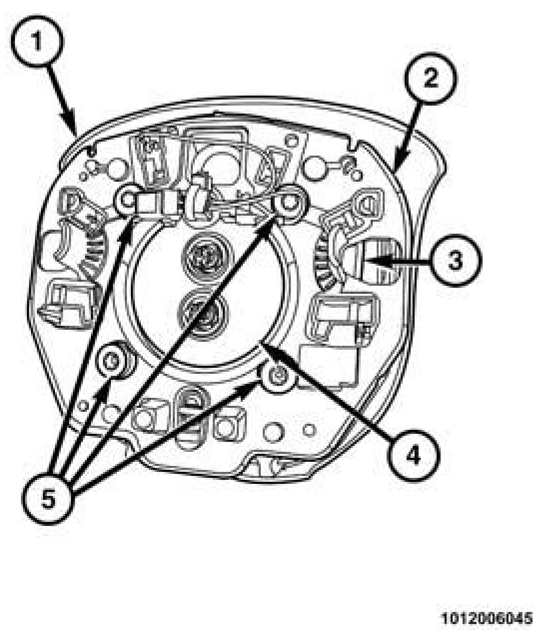
AIR BAG, DRIVER

DESCRIPTION

DESCRIPTION

[Fig. 8: Steering Wheel & Protective Trim Cover]
Courtesy of CHRYSLER GROUP, LLC

The injection molded, thermoplastic Driver AirBag (DAB) protective trim cover (2) is the most visible part of the DAB. The DAB is located in the center of the steering wheel (1), where it is secured by a spring wire retainer integral to the fixing plate to two hooks of the steering wheel armature within the hub cavity of the steering wheel. An injection molded, bright emblem with the Dodge logo or the SRT logo is applied to the center of the trim cover.



[Fig. 9: Trim Cover, Floating Horn Switch/Fixing Plate Unit, Spring Wire Retainer, Airbag Inflator & Screws]
Courtesy of CHRYSLER GROUP, LLC

Concealed beneath the DAB trim cover (1) are the folded airbag cushion, the airbag housing, the airbag inflator

(4) and the retainers that secure the inflator to the housing. The airbag cushion, housing and inflator are secured within an integral receptacle molded into the back of the trim cover. The vertical walls of this receptacle have numerous integral window features that are engaged by numerous hook features around the perimeter of the DAB housing. Once the trim cover is fully seated onto the housing, it can only be removed by cutting it off. The DAB housing also has four well nuts, to which four screws (5) are fastened to secure the spring wire retainer (3) and the floating horn switch/fixing plate unit (2) to the back of the housing.

The DAB used in this vehicle is a multistage-type that complies with revised federal airbag standards to deploy with less force than those used in some prior vehicles. A radial deploying fabric airbag cushion with internal tethers is used. The airbag inflator is a dual-initiator, non-azide, pyrotechnic-type unit and is secured to the airbag housing. Two keyed and color-coded connector receptacles on the two inflator initiators are connected to the vehicle electrical system through two jacketed, two-wire pigtail harnesses from the clockspring.

The DAB cannot be repaired, and must be replaced if deployed, ineffective or in any way damaged. The DAB trim cover and the floating horn switch are serviced only as a unit with the DAB.

OPERATION

OPERATION

The multistage Driver AirBag (DAB) is deployed by electrical signals generated by the Occupant Restraint Controller (ORC) through the DAB squib 1 and squib 2 circuits to the two initiators in the airbag inflator. By using two initiators, the airbag can be deployed at multiple levels of force. The force level is controlled by the ORC to suit the monitored impact conditions by providing one of several delay intervals between the electrical signals provided to the two initiators. The longer the delay between these signals, the less forcefully the airbag will deploy.

When the ORC sends the proper electrical signals to each initiator, the electrical energy generates enough heat to initiate a small pyrotechnic charge which, in turn ignites chemical pellets within the inflator. Once ignited, these chemical pellets burn rapidly and produce a large quantity of inert gas. The inflator is sealed to the back of the DAB housing and a diffuser in the inflator directs all of the inert gas into the airbag cushion, causing the cushion to inflate. As the cushion inflates, the DAB trim cover will split at predetermined breakout lines, then fold back out of the way. Following a deployment, the airbag cushion quickly deflates by venting the inert gas towards the instrument panel through vent holes within the fabric used to construct the back (steering wheel side) panel of the cushion.

Some of the chemicals used to create the inert gas may be considered hazardous while in their solid state before they are burned, but they are securely sealed within the airbag inflator. Typically, both initiators are used and all potentially hazardous chemicals are burned during an airbag deployment event. However, it is possible for only one initiator to be used during a deployment due to a Supplemental Restraint System (SRS) fault; therefore, it is necessary to always confirm that both initiators have been used in order to avoid the improper disposal of potentially live pyrotechnic or hazardous materials. Refer to **STANDARD PROCEDURE**.

The inert gas that is produced when the chemicals are burned during a deployment is harmless. However, a small amount of residue from the burned chemicals may cause some temporary discomfort if it contacts the skin, eyes, or breathing passages. If skin or eye irritation is noted, rinse the affected area with plenty of cool, clean water. If breathing passages are irritated, move to another area where there is plenty of clean, fresh air to breath. If the irritation is not alleviated by these actions, contact a physician.

The ORC monitors the condition of the driver airbag through circuit resistance. If any fault is detected the ORC

will illuminate the airbag indicator in the instrument cluster and store a Diagnostic Trouble Code (DTC). Proper diagnosis of the DAB inflator and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate Diagnostic & Testing article.

REMOVAL

REMOVAL

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

WARNING: **To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag cushion and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.**

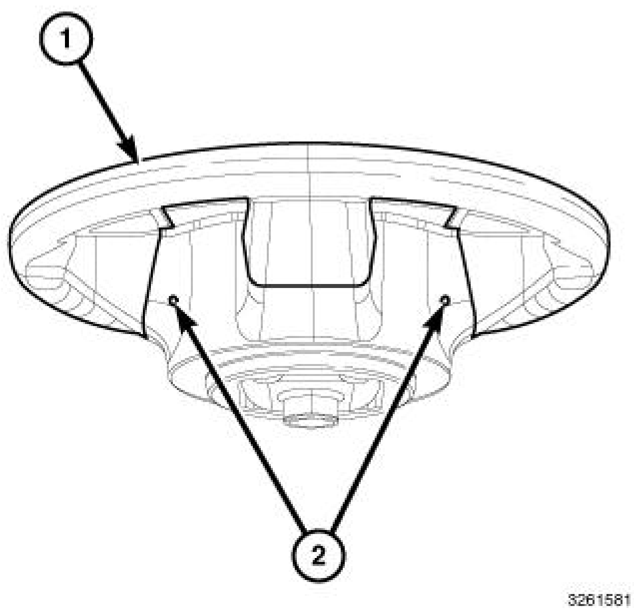


Fig. 10: Access Holes & Steering Wheel
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The following procedure is for replacement of an ineffective or damaged Driver AirBag (DAB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the DAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to**

STANDARD PROCEDURE.

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. Locate the access holes (2) in the lower surface of the steering wheel (1) hub rear trim cover near each of the two horizontal spokes.

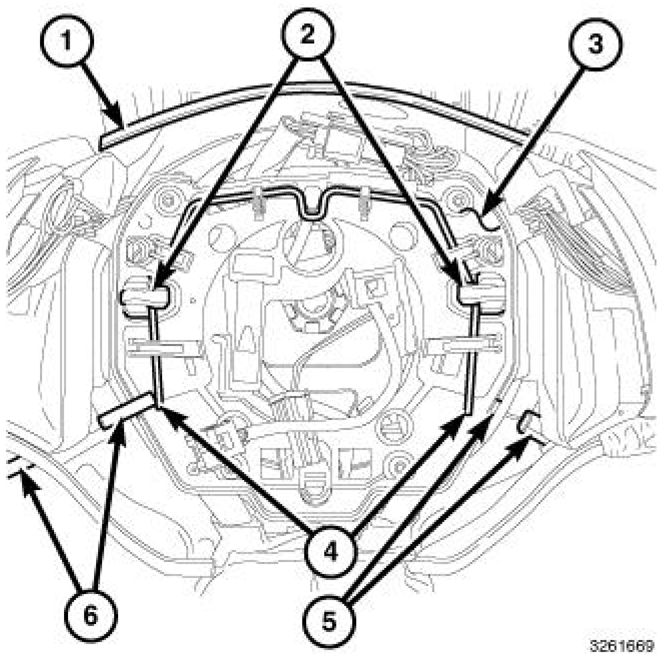

Fig. 11: Driver AirBag (DAB) Mounting/Horn Switch Plate, Retainer Spring, Hooks & Steering Wheel Hub Cavity
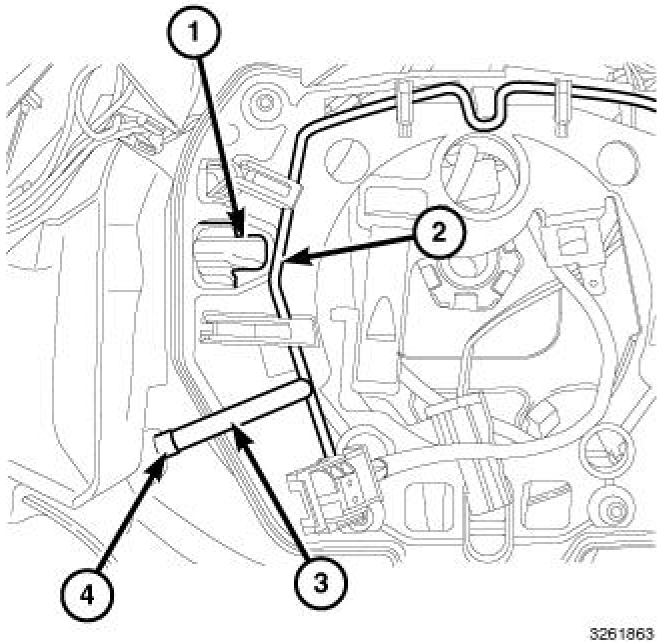
Courtesy of CHRYSLER GROUP, LLC

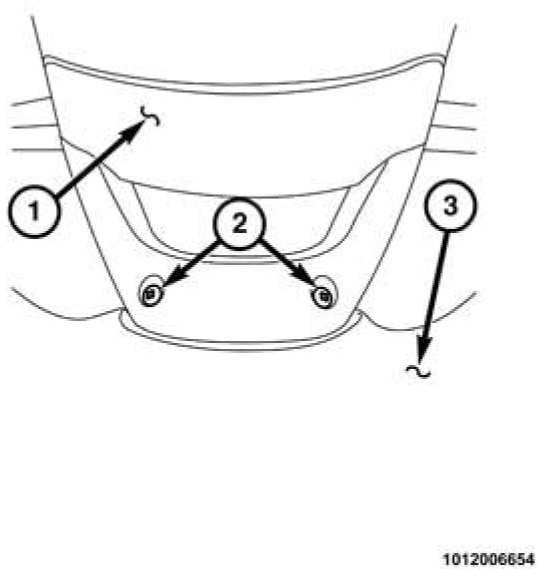
NOTE: **The graphic for this procedure shows the Driver AirBag (DAB) mounting/horn switch plate (3) and the retainer spring (4) engaged under the hooks (2) of the armature within the steering wheel hub cavity (1) without the DAB trim cover, cushion, housing and inflator present. This was done to provide graphical clarity of the components involved in DAB retention. The DAB trim cover, cushion, housing and inflator can only be removed as a unit with the mounting/horn switch plate and retainer spring as outlined in the following procedure.**

3. Insert an appropriately sized pin punch or Allen wrench through one of the steering wheel access holes. A guide and notch (5) integral to each side of the steering wheel hub rear trim cover (1) and the mounting/horn switch plate (3) will assist in directing the tool to the ends of the retainer spring (4).



[Fig. 12: Special Tool, Groove, Retainer Spring & Hook](#)
Courtesy of CHRYSLER GROUP, LLC

4. When the tool (3) makes contact with the retainer spring (2), push inward (toward the steering column) on the tool far enough to disengage the retainer spring from under the hook (1) of the steering wheel armature.



[Fig. 13: Lower Rear Spoke Cover, Screws & Steering Wheel](#)
Courtesy of CHRYSLER GROUP, LLC

NOTE:	**It is not necessary, but may prove helpful to remove the two screws (2) that secure the lower rear spoke cover (1) to the back of the steering wheel (3) and remove the cover. It will then be possible to observe the Allen**

wrench or pin punch contacting and releasing the retainer spring.

5. Pull the released side of the DAB away from the steering wheel far enough to insert a trim stick or another long and thin obstacle between the released side of the DAB trim cover and the steering wheel hub cavity. This will help to prevent the released end of the retainer spring from becoming accidentally engaged again, while the opposite end of the retainer spring is being released.
6. Repeat Steps 3 and 4 for the opposite end of the retainer spring.

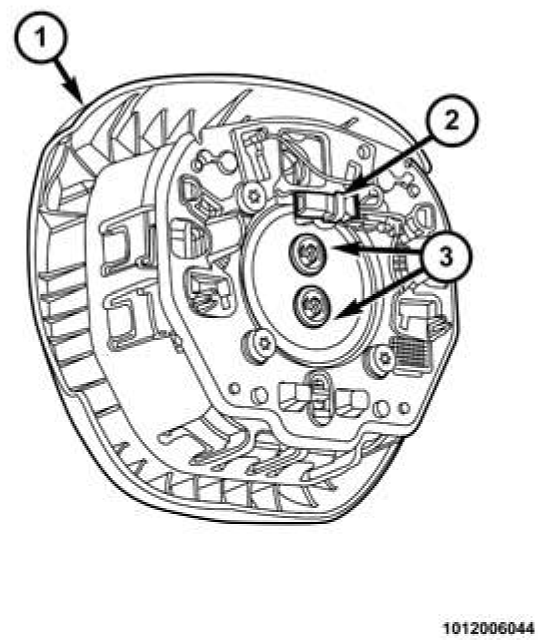


Fig. 14: DAB, Horn Switch & DAB Inflator Initiators
Courtesy of CHRYSLER GROUP, LLC

7. Pull the DAB (1) away from the steering wheel far enough to access the clockspring pigtail wire connections to the horn switch (2) and the DAB inflator initiators (3).
8. Disconnect the clockspring pigtail wire connector from the floating horn switch plate connector on the back of the switch plate.

CAUTION: **Do not pull on the clockspring pigtail wires or pry on the connector insulators to disengage them from the Driver AirBag (DAB) inflator initiator connector receptacles. Improper removal of these pigtail wires and their connector insulators can result in damage to the airbag circuits or the connector insulators.**

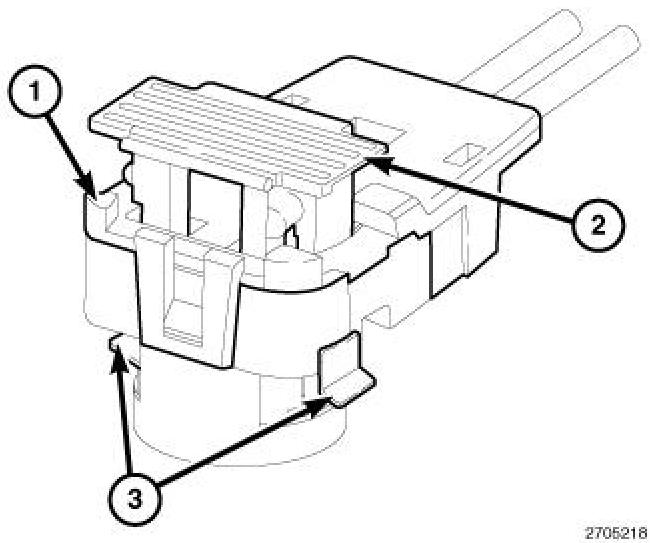

Fig. 15: Clockspring DAB Pigtail Wire Connector Insulators, Latches & Connector Position Assurance (CPA) Lock
Courtesy of CHRYSLER GROUP, LLC

9. The clockspring DAB pigtail wire connector insulators (1) are secured by integral latches (3) and a Connector Position Assurance (CPA) lock (2) to the airbag tether cutter and inflator connector receptacles, which are located on the back of the floating horn switch plate and the DAB housing. Pull the lock straight out from the connector insulator, then pull the insulators straight out from the connector receptacles to disengage and disconnect them.
10. Remove the DAB and floating horn switch plate from the steering wheel as a unit.
11. If the DAB has been deployed, the clockspring and the steering column must also be replaced. Refer to **CLOCKSPRING, REMOVAL** and **COLUMN, REMOVAL** .

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the Driver AirBag (DAB), or becoming entrapped between the DAB cushion and the DAB trim cover. Failure to observe this warning could result in occupant injuries upon airbag deployment.

WARNING: To avoid serious or fatal injury, the driver airbag trim cover must never be painted. Replacement airbags are serviced with trim covers in the original colors. Paint may change the way in which the material of the trim cover

responds to an airbag deployment. Failure to observe this warning could result in occupant injuries upon airbag deployment.

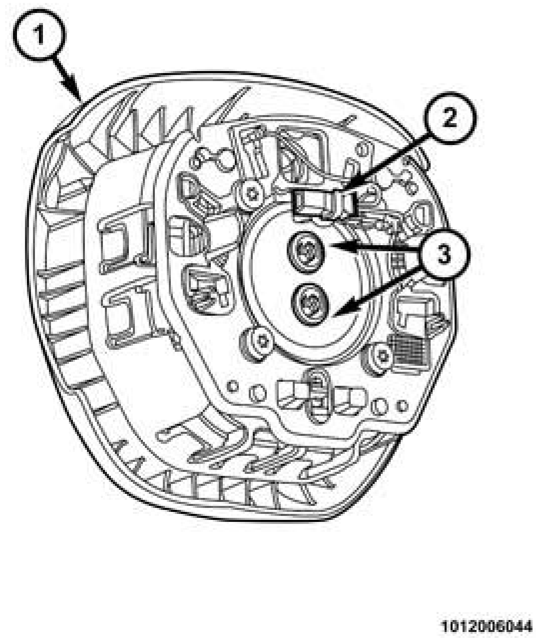

Fig. 16: DAB, Horn Switch & DAB Inflator Initiators
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The following procedure is for replacement of an ineffective or damaged Driver AirBag (DAB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the DAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to STANDARD PROCEDURE.**

1. Position the Driver AirBag (DAB) and floating horn switch unit (1) close enough to the steering wheel to access the clockspring pigtail wire connections to the horn switch (2) and the DAB inflator initiators (3).
2. Reconnect the clockspring pigtail wire connectors to the airbag inflator initiator connector receptacles by pressing straight in on the connector insulator. Be certain to engage each keyed and color-coded connector to the matching connector receptacle. Be certain that each connector is fully engaged in its receptacle, then push the connector lock straight into the connector to lock it into place.
3. Reconnect the clockspring pigtail wire connector to the floating horn switch connector on the back of the mounting/horn switch plate.
4. Carefully position the DAB and floating horn switch unit into the steering wheel hub cavity while tugging lightly upward on the clockspring pigtail wires for the airbag and tucking the wires into the upper hub cavity of the steering wheel. Be certain that none of the steering wheel wiring is pinched between the airbag housing or the horn switch and the steering wheel armature.
5. Using both hands, push firmly and evenly on both sides of the DAB trim cover until both ends of the spring retainer have snapped into place under the hooks within the hub cavity of the steering wheel.

6. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

AIR BAG, PASSENGER

DESCRIPTION

DESCRIPTION

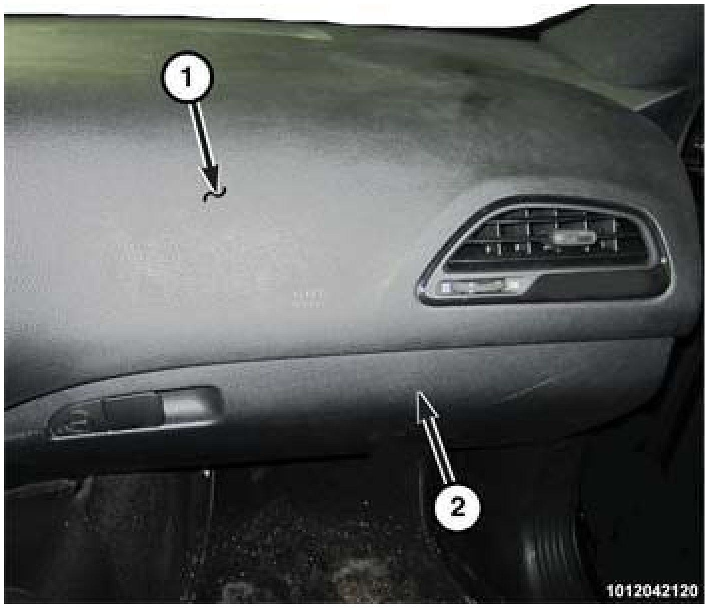

Fig. 17: Instrument Panel Top Pad & Glove Box
Courtesy of CHRYSLER GROUP, LLC

The horizontal surface of the instrument panel top pad (1) above the glove box (2) is the most visible part of the Passenger Airbag (PAB). The PAB door is integral to the top of the instrument panel top pad forward of and above the glove box on the instrument panel in front of the front seat passenger seating position.

Located below the PAB door area of the instrument panel top pad, the molded thermoplastic PAB retainer or chute is secured to the underside of the top pad. The retainer defines the PAB door breakout area of the top pad and serves as the receptacle for the PAB cushion and housing.

Three small window openings on the forward and rearward flanges of the receptacle receive mating hook formations of the airbag housing, which locate and secure the housing to the top pad. The center window in the rearward flange of the receptacle and the center hook on the rearward side of the housing have a reduced width to ensure the that the PAB cannot be incorrectly oriented during installation.

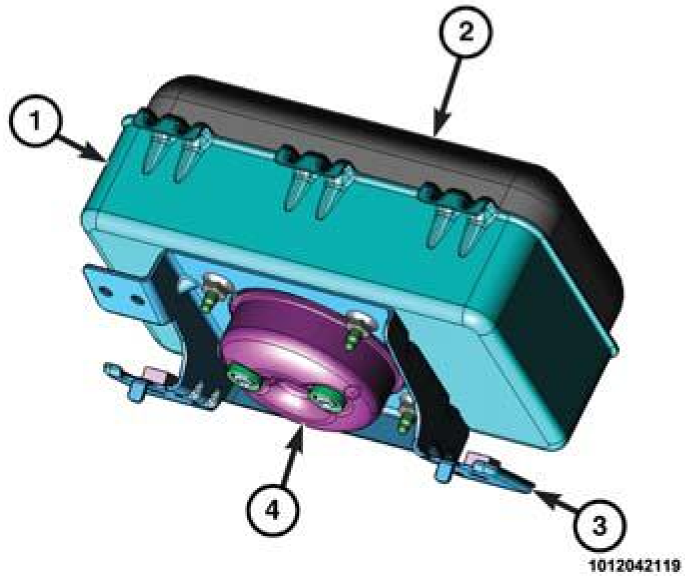

Fig. 18: PAB Housing, Airbag Cushion, Mounting Bracket & Inflator
Courtesy of CHRYSLER GROUP, LLC

The PAB unit is also secured by a stamped metal mounting bracket (3) and two screws to the instrument panel structural support. The PAB unit used in this vehicle is a multistage type that complies with revised federal airbag standards to deploy with less force than those used in some prior vehicles. The PAB unit consists of a housing (1), the airbag cushion (2) and the two-stage airbag inflator (4). The PAB inflator, the mounting bracket and the airbag cushion retainer are secured to the housing by four studs and four nuts. The airbag housing contains the folded airbag cushion, the inflator diffuser and the cushion retainer. A rectangular fabric cushion is used.

The PAB inflator is a non-azide, pyrotechnic-type unit that is secured to and sealed within the airbag housing. A dedicated take out and connectors of the instrument panel wire harness with keyed, color-coded insulators connects the two inflator initiators to the vehicle electrical system and are secured to a tab on the outboard side of the PAB mounting bracket.

The PAB cannot be repaired, and must be replaced if deployed, ineffective or in any way damaged. The PAB door and chute or retainer are serviced only as a unit with the instrument panel top pad. If the PAB is deployed, the top pad must also be replaced.

OPERATION

OPERATION

The multistage Passenger AirBag (PAB) is deployed by electrical signals generated by the Occupant Restraint Controller (ORC) through the PAB squib 1 and squib 2 circuits to the two initiators in the airbag inflator. By using two initiators, the PAB can be deployed at multiple levels of force. The force level is controlled by the ORC to suit the monitored impact conditions by providing one of several delay intervals between the electrical signals provided to the two initiators. The longer the delay between these signals, the less forcefully the airbag cushion will deploy.

When the ORC sends the proper electrical signals to each initiator, the electrical energy generates enough heat to initiate a small pyrotechnic charge which, in turn, ignites chemical pellets within the inflator. Once ignited,

these chemical pellets burn rapidly and produce a large quantity of inert gas. The inflator is sealed to the airbag cushion and a diffuser in the inflator directs all of the inert gas into the cushion, causing the cushion to inflate. As the cushion inflates, the PAB door area of the instrument panel cover will split at predetermined tear seam lines concealed on the underside of the cover, then the door will pivot up over the top of the instrument panel and out of the way. Following a deployment, the airbag cushion quickly deflates by venting the inert gas through vent holes within the fabric used to construct the back (windshield side) of the cushion.

Typically, both initiators are used during a PAB deployment event. However, it is possible for only one initiator to be used during a deployment due to an airbag system fault; therefore, it is necessary to always confirm that both initiators have been used in order to avoid the improper disposal of potentially live pyrotechnic materials. Refer to **STANDARD PROCEDURE**.

The ORC monitors the condition of the passenger airbag through circuit resistance. If any fault is detected the ORC will illuminate the airbag indicator in the instrument cluster and store a Diagnostic Trouble Code (DTC). Proper diagnosis of the PAB inflator and squib circuits requires the use of a diagnostic scan tool and may also require the use of the SRS Load Tool special tool along with the appropriate Load Tool Jumpers and Adapters. Refer to the appropriate Diagnostic & Testing article.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.

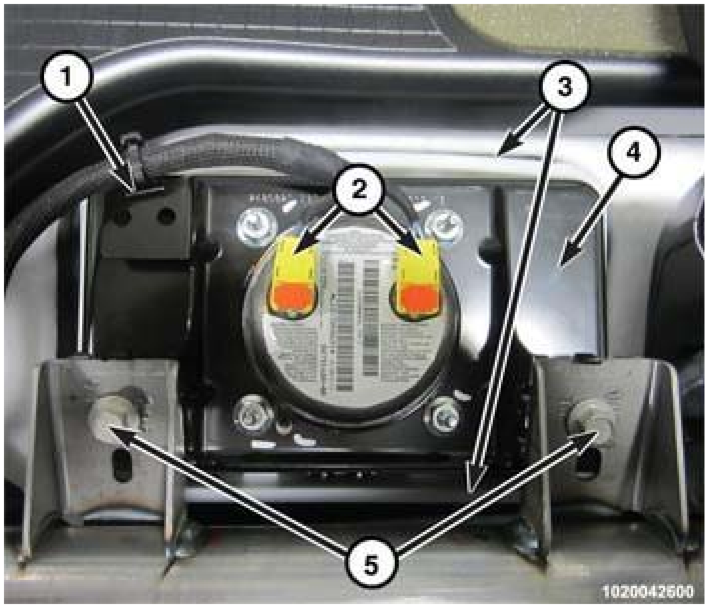

Fig. 19: PAB Housing, Bracket, Inflator Connector Receptacles, Wire Harness & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The following procedure is for replacement of an ineffective or damaged Passenger AirBag (PAB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the PAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to STANDARD PROCEDURE.**

1. Disconnect and isolate the negative cable from the battery. If equipped with an Intelligent Battery Sensor (IBS), disconnect the IBS connector before disconnecting the negative cable from the battery. Wait two minutes for the system capacitor to discharge before further service.
2. Remove the Passenger AirBag (PAB) and the instrument panel from the vehicle as a unit. Refer to **PANEL, INSTRUMENT, REMOVAL** .
3. Place the instrument panel and PAB unit on a suitable work surface with the top cover facing down.

   NOTE: **If the instrument panel top cover will be reused, be certain to take the proper precautions to prevent the top cover from receiving cosmetic damage during the following procedures.**

4. Disconnect the two instrument panel wire harness connectors (2) from the PAB inflator connector receptacles. These wire connector insulators are secured by an integral Connector Position Assurance (CPA) lock to the inflator connector receptacles. Pull the lock straight back from the connector insulator, then pull the insulator straight out from the connector receptacle to disengage and disconnect it.
5. Disengage the routing clip (1) of the instrument panel wire harness take out for the PAB from the tab on the outboard side of the PAB mounting bracket.
6. Remove the two screws (5) that secure the PAB bracket to the instrument panel structural support.
7. Remove the top cover and PAB unit from the instrument panel. Refer to **COVER, INSTRUMENT PANEL, REMOVAL** .

8. Disengage each of the hooks on one side of the PAB housing (4) from the windows in the forward or rearward vertical walls of the PAB retainer or chute (3) on the underside of the top cover. To disengage the hooks, use hand pressure to pull the adjacent edge of the PAB housing firmly and evenly upward out of the retainer receptacle, while at the same time pulling the upper edge of the receptacle wall outward far enough to disengage the hooks.
9. With all of the hooks on one side of the PAB housing disengaged from the retainer, rotate that side of the housing upward far enough to disengage the hooks on the opposite side of the housing from the retainer.
10. With all of the hooks disengaged, lift the PAB housing, inflator and cushion as a unit from the receptacle of the PAB retainer or chute on the underside of the instrument panel top cover.

INSTALLATION

INSTALLATION

WARNING: **To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.**

WARNING: **To avoid serious or fatal injury when removing a deployed airbag, rubber gloves, eye protection, and a long-sleeved shirt should be worn. There may be deposits on the airbag unit and other interior surfaces. In large doses, these deposits may cause irritation to the skin and eyes.**

WARNING: **To avoid serious or fatal injury, use extreme care to prevent any foreign material from entering the passenger airbag, or becoming entrapped between the passenger airbag cushion and the instrument panel top pad. Failure to observe this warning could result in occupant injuries upon airbag deployment.**

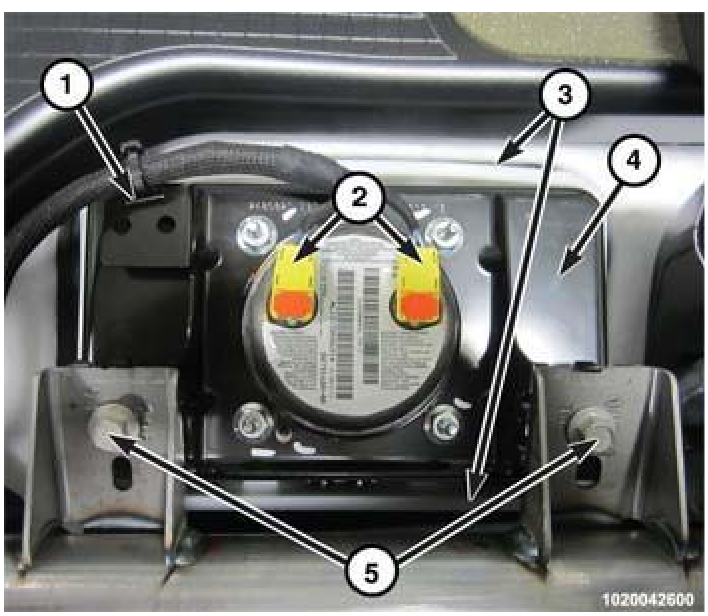

Fig. 20: PAB Housing, Bracket, Inflator Connector Receptacles, Wire Harness & Fasteners
Courtesy of CHRYSLER GROUP, LLC

NOTE: **The following procedure is for replacement of an ineffective or damaged Passenger AirBag (PAB). If the airbag is ineffective or damaged, but not deployed, review the recommended procedures for Handling Non-Deployed Supplemental Restraints. Refer to STANDARD PROCEDURE. If the PAB has been deployed, review the recommended procedures for Service After A Supplemental Restraint Deployment before removing the airbag from the vehicle. Refer to STANDARD PROCEDURE.**

1. Place the instrument panel top cover on a suitable work surface with the receptacle of the PAB retainer or chute (3) facing up.

   NOTE: **Be certain to take the proper precautions to prevent the top cover from receiving cosmetic damage during the following procedures.**

2. Carefully position the PAB housing (4) to the PAB retainer or chute receptacle. The side of the PAB housing with the narrowed center hook faces rearward in the vehicle.
3. Engage all of the hooks on one side of the PAB housing through the windows on the same side of the PAB retainer or chute, then rotate the opposite side of the PAB housing downward into the receptacle.
4. Inspect around the perimeter of the PAB making certain each of the hooks on the PAB housing is fully engaged through the windows in the forward and rearward vertical walls of the PAB retainer or chute receptacle.
5. Reinstall the top cover and PAB unit onto the instrument panel. Refer to **COVER, INSTRUMENT PANEL, INSTALLATION** .
6. Engage the routing clip (1) of the instrument panel wire harness take out for the PAB with the tab on the outboard side of the PAB mounting bracket.
7. Reconnect the two instrument panel wire harness connectors (2) to the PAB inflator connector receptacles. Be certain to engage each keyed and color-coded connector to the matching connector receptacle. Be certain that each connector is fully engaged in its receptacle, then push the Connector Position Assurance (CPA) lock straight into the connector to lock it into place.
8. Install and tighten the two screws (5) that secure the PAB mounting bracket to the instrument panel structural support. Tighten the screws to **SPECIFICATIONS**.
9. Reinstall the instrument panel, instrument panel top cover and PAB into the vehicle as a unit. Refer to **PANEL, INSTRUMENT, INSTALLATION** .
10. Do not reconnect the negative cable to the battery at this time. The Supplemental Restraint System (SRS) Verification Test procedure should be performed following service of any SRS component. Refer to **STANDARD PROCEDURE**.

AIR BAG, SEAT

DESCRIPTION

DESCRIPTION
